- (c) In the event that a properly registered 406 MHz ELT activates, the Cospas-Sarsat satellite system can decode the owner's information and provide that data to the appropriate search and rescue (SAR) center. In the United States, NOAA provides the alert data to the appropriate U.S. Air Force Rescue Coordination Center (RCC) or U.S. Coast Guard Rescue Coordination Center. That RCC can then telephone or contact the owner to verify the status of the aircraft. If the aircraft is safely secured in a hangar, a costly ground or airborne search is avoided. In the case of an inadvertent 406 MHz ELT activation, the owner can deactivate the 406 MHz ELT. If the 406 MHz ELT equipped aircraft is being flown, the RCC can quickly activate a search. 406 MHz ELTs permit the Cospas-Sarsat satellite system to narrow the search area to a more confined area compared to that of a 121.5 MHz or 243.0 MHz ELT. 406 MHz ELTs also include a low-power 121.5 MHz homing transmitter to aid searchers in finding the aircraft in the terminal search phase.
- (d) Each analog ELT emits a distinctive downward swept audio tone on 121.5 MHz and 243.0 MHz.
- (e) If "armed" and when subject to crash-generated forces, ELTs are designed to automatically activate and continuously emit their respective signals, analog or digital. The transmitters will operate continuously for at least 48 hours over a wide temperature range. A properly installed, maintained, and functioning ELT can expedite search and rescue operations and save lives if it survives the crash and is activated.
- (f) Pilots and their passengers should know how to activate the aircraft's ELT if manual activation is required. They should also be able to verify the aircraft's ELT is functioning and transmitting an alert after a crash or manual activation.
- (g) Because of the large number of 121.5 MHz ELT false alerts and the lack of a quick means of verifying the actual status of an activated 121.5 MHz or 243.0 MHz analog ELT through an owner registration database, U.S. SAR forces do not respond as quickly to initial 121.5/243.0 MHz ELT alerts as the SAR forces do to 406 MHz ELT alerts. Compared to the almost instantaneous detection of a 406 MHz ELT, SAR forces' normal practice is to wait for confirmation of an overdue aircraft or similar notification. In some cases, this confirmation process can take hours. SAR forces can initiate a response to 406 MHz alerts in minutes compared to the potential delay of hours for a 121.5/243.0 MHz ELT. Therefore, due to the obvious advantages of 406 MHz beacons and the significant disadvantages to the older 121.5/243.0 MHz beacons, and considering that the International Cospas-Sarsat Program stopped the monitoring of 121.5/243.0 MHz by satellites on February 1, 2009, all aircraft owners/operators are highly encouraged by both NOAA and the FAA to consider making the switch to a digital 406 MHz ELT beacon. Further, for non-aircraft owner pilots, check the ELT installed in the aircraft you are flying, and as appropriate, obtain a personal locator beacon transmitting on 406 MHz.

b. Testing.

US 6-2

SECTION 2. EMERGENCY SERVICES AVAILABLE TO PILOTS

1. ELTs should be tested in accordance with the manufacturer's instructions, preferably in a shielded or screened room or specially designed test container to prevent the broadcast of signals which could trigger a false alert.
2. When this cannot be done, aircraft operational testing is authorized as follows:
 - (a) Analog 121.5/243 MHz ELTs should only be tested during the first 5 minutes after any hour. If operational tests must be made outside of this period, they should be coordinated with the nearest FAA Control Tower. Tests should be no longer than three audible sweeps. If the antenna is removable, a dummy load should be substituted during test procedures.
 - (b) Digital 406 MHz ELTs should only be tested in accordance with the unit's manufacturer's instructions.
 - (c) Airborne tests are not authorized.

c. False Alarms.

1. Caution should be exercised to prevent the inadvertent activation of ELTs in the air or while they are being handled on the ground. Accidental or unauthorized activation will generate an emergency signal that cannot be distinguished from the real thing, leading to expensive and frustrating searches. A false ELT signal could also interfere with genuine emergency transmissions and hinder or prevent the timely location of crash sites. Frequent false alarms could also result in complacency and decrease the vigorous reaction that must be attached to all ELT signals.
2. Numerous cases of inadvertent activation have occurred as a result of aerobatics, hard landings, movement by ground crews and aircraft maintenance. These false alarms can be minimized by monitoring 121.5 MHz and/or 243.0 MHz as follows:
 - (a) In flight when a receiver is available.
 - (b) Before engine shut down at the end of each flight.
 - (c) When the ELT is handled during installation or maintenance.
 - (d) When maintenance is being performed near the ELT.
 - (e) When a ground crew moves the aircraft.
 - (f) If an ELT signal is heard, turn off the aircraft's ELT to determine if it is transmitting. If it has been activated, maintenance might be required before the unit is returned to the "ARMED" position. You should contact the nearest Air Traffic facility and notify it of the inadvertent activation.

d. Inflight Monitoring and Reporting.

1. Pilots are encouraged to monitor 121.5 MHz and/or 243.0 MHz while inflight to assist in identifying possible emergency ELT transmissions. On receiving a signal, report the following information to the nearest air traffic facility:
 - (a) Your position at the time the signal was first heard.

US 6-2
SECTION 2. EMERGENCY SERVICES AVAILABLE TO PILOTS

- (b) Your position at the time the signal was last heard.
- (c) Your position at maximum signal strength.
- (d) Your flight altitudes and frequency on which the emergency signal was heard: 121.5 MHz or 243.0 MHz. If possible, positions should be given relative to a navigation aid. If the aircraft has homing equipment, provide the bearing to the emergency signal with each reported position.

6-2-5 FAA K-9 EXPLOSIVES DETECTION TEAM PROGRAM

- a. The FAA's Office of Civil Aviation Security Operations manages the FAA K-9 Explosives Detection Team Program which was established in 1972. Through a unique agreement with law enforcement agencies and airport authorities, the FAA has strategically placed FAA-certified K-9 teams (a team is one handler and one dog) at airports throughout the country. If a bomb threat is received while an aircraft is in flight, the aircraft can be directed to an airport with this capability. The FAA provides initial and refresher training for all handlers, provides single purpose explosive detector dogs, and requires that each team is annually evaluated in five areas for FAA certification: aircraft (widebody and narrowbody), vehicles, terminal, freight (cargo), and luggage. **If you desire this service, notify your company or an FAA air traffic control facility.**
- b. The following list shows the locations of current FAA K-9 teams:

TABLE 6-2-1 FAA Sponsored Explosives Detection Dog/Handler Team Locations

Airport Symbol	Location
ATL	Atlanta, Georgia
BHM	Birmingham, Alabama
BOS	Boston, Massachusetts
BUF	Buffalo, New York
CLT	Charlotte, North Carolina
ORD	Chicago, Illinois
CVG	Cincinnati, Ohio
DFW	Dallas, Texas
DEN	Denver, Colorado
DTW	Detroit, Michigan
IAH	Houston, Texas
JAX	Jacksonville, Florida
MCI	Kansas City, Missouri
LAX	Los Angeles, California

US 6-2
SECTION 2. EMERGENCY SERVICES AVAILABLE TO PILOTS
TABLE 6-2-1 FAA Sponsored Explosives Detection Dog/Handler Team Locations (continued)

Airport Symbol	Location
MEM	Memphis, Tennessee
MIA	Miami, Florida
MKE	Milwaukee, Wisconsin
MSY	New Orleans, Louisiana
MCO	Orlando, Florida
PHX	Phoenix, Arizona

SLC	Salt Lake City, Utah
SFO	San Francisco, California
SJU	San Juan, Puerto Rico
SEA	Seattle, Washington
STL	St. Louis, Missouri
TUS	Tucson, Arizona
TUL	Tulsa, Oklahoma

- c. If due to weather or other considerations an aircraft with a suspected hidden explosive problem were to land or intended to land at an airport other than those listed in b above, it is recommended that they call the FAA's Washington Operations Center (telephone 202-267-3333, if appropriate) or have an air traffic facility with which you can communicate contact the above center requesting assistance.

6-2-6 SEARCH AND RESCUE

- a. **General.** SAR is a lifesaving service provided through the combined efforts of the federal agencies signatory to the National SAR Plan, and the agencies responsible for SAR within each state. Operational resources are provided by the U.S. Coast Guard, DOD components, the Civil Air Patrol, the Coast Guard Auxiliary, state, county and local law enforcement and other public safety agencies, and private volunteer organizations. Services include search for missing aircraft, survival aid, rescue, and emergency medical help for the occupants after an accident site is located.
- b. **National Search and Rescue Plan.** By federal interagency agreement, the National Search and Rescue Plan provides for the effective use of all available facilities in all types of SAR missions. These facilities include aircraft, vessels, pararescue and ground rescue teams,

US 6-2
SECTION 2. EMERGENCY SERVICES AVAILABLE TO PILOTS

and emergency radio fixing. Under the plan, the U.S. Coast Guard is responsible for the coordination of SAR in the Maritime Region, and the USAF is responsible in the Inland Region. To carry out these responsibilities, the Coast Guard and the Air Force have established Rescue Coordination Centers (RCCs) to direct SAR activities within their regions. For aircraft emergencies, distress, and urgency, information normally will be passed to the appropriate RCC through an ARTCC or FSS.

- c. **Coast Guard Rescue Coordination Centers.** (See TBL 6-2-2.)

f. **Emergency and Overdue Aircraft.**

1. ARTCCs and FSSs will alert the SAR system when information is received from any source that an aircraft is in difficulty, overdue, or missing.
 - (a) Radar facilities providing radar flight following or advisories consider the loss of radar and radios, without service termination notice, to be a possible emergency. Pilots receiving VFR services from radar facilities should be aware that SAR may be initiated under these circumstances.
 - (b) A filed flight plan is the most timely and effective indicator that an aircraft is overdue. Flight plan information is invaluable to SAR forces for search planning and executing search efforts.
2. Prior to departure on every flight, local or otherwise, someone at the departure point should be advised of your destination and route of flight if other than direct. Search efforts are often wasted and rescue is often delayed because of pilots who thoughtlessly takeoff without telling anyone where they are going. File a flight plan for *your* safety.
3. According to the National Search and Rescue Plan, "The life expectancy of an injured survivor decreases as much as 80 percent during the first 24 hours, while the chances of survival of uninjured survivors rapidly diminishes after the first 3 days."

US 6-2

SECTION 2. EMERGENCY SERVICES AVAILABLE TO PILOTS

4. An Air Force Review of 325 SAR missions conducted during a 23-month period revealed that "Time works against people who experience a *distress* but are not on a flight plan, since 36 hours normally pass before family concern initiates an (alert)."

g. VFR Search and Rescue Protection.

1. To receive this valuable protection, *file a VFR or DVFR Flight Plan* with an FAA FSS. For maximum protection, file only to the point of first intended landing, and refile for each leg to final destination. When a lengthy flight plan is filed, with several stops en route and an ETE to final destination, a mishap could occur on any leg, and unless other information is received, it is probable that no one would start looking for you until 30 minutes after your ETA at your final destination.
2. If you land at a location other than the intended destination, report the landing to the nearest FAA FSS and advise them of your original destination.
3. If you land en route and are delayed more than 30 minutes, report this information to the nearest FSS and give them your original destination.
4. If your ETE changes by 30 minutes or more, report a new ETA to the nearest FSS and give them your original destination. Remember that if you fail to respond within one-half hour after your ETA at final destination, a search will be started to locate you.
5. It is important that you *close your flight plan IMMEDIATELY AFTER ARRIVAL AT YOUR FINAL DESTINATION WITH THE FSS DESIGNATED WHEN YOUR FLIGHT PLAN WAS FILED. The pilot is responsible for closure of a VFR or DVFR flight plan; they are not closed automatically.* This will prevent needless search efforts.
6. The rapidity of rescue on land or water will depend on how accurately your position may be determined. If a flight plan has been followed and your position is on course, rescue will be expedited.

h. Survival Equipment.

1. For flight over uninhabited land areas, it is wise to take and know how to use survival equipment for the type of climate and terrain.
2. If a forced landing occurs at sea, chances for survival are governed by the degree of crew proficiency in emergency procedures and by the availability and effectiveness of water survival equipment.

i. Body Signal Illustrations.

1. If you are forced down and are able to attract the attention of the pilot of a rescue airplane, the body signals illustrated on these pages can be used to transmit messages to the pilot circling over your location.
2. Stand in the open when you make the signals.
3. Be sure the background, as seen from the air, is not confusing.
4. Go through the motions slowly and repeat each signal until you are positive that the pilot understands you.

US 6-2

SECTION 2. EMERGENCY SERVICES AVAILABLE TO PILOTS

j. Observance of Downed Aircraft.

1. Determine if crash is marked with a yellow cross; if so, the crash has already been reported and identified.
2. If possible, determine type and number of aircraft and whether there is evidence of survivors.
3. Fix the position of the crash as accurately as possible with reference to a navigational aid. If possible, provide geographic or physical description of the area to aid ground search parties.
4. Transmit the information to the nearest FAA or other appropriate radio facility.
5. If circumstances permit, orbit the scene to guide in other assisting units until their arrival or until you are relieved by another aircraft.
6. Immediately after landing, make a complete report to the nearest FAA facility, or Air Force or Coast Guard Rescue Coordination Center. The report can be made by a long distance collect telephone call.

SECTION 3. DISTRESS AND URGENCY PROCEDURES

6-3-1 DISTRESS AND URGENCY COMMUNICATIONS

- a. A pilot who encounters a *distress* or *urgency* condition can obtain assistance simply by contacting the air traffic facility or other agency in whose area of responsibility the aircraft is operating, stating the nature of the difficulty, pilot's intentions and assistance desired. *Distress* and *urgency* communications procedures are prescribed by the International Civil Aviation Organization (ICAO), however, and have decided advantages over the informal procedure described above.
- b. *Distress* and *urgency* communications procedures discussed in the following paragraphs relate to the use of air ground voice communications.
- c. The initial communication, and if considered necessary, any subsequent transmissions by an aircraft in *distress* should begin with the signal MAYDAY, preferably repeated three times. The signal PAN-PAN should be used in the same manner for an *urgency* condition.
- d. *Distress* communications have absolute priority over all other communications, and the word MAYDAY commands radio silence on the frequency in use. *Urgency* communications have priority over all other communications except *distress*, and the word PAN-PAN warns other stations not to interfere with *urgency* transmissions.
- e. Normally, the station addressed will be the air traffic facility or other agency providing air traffic services, on the frequency in use at the time. If the pilot is not communicating and receiving services, the station to be called will normally be the air traffic facility or other agency in whose area of responsibility the aircraft is operating, on the appropriate assigned frequency. If the station addressed does not respond, or if time or the situation dictates, the *distress* or *urgency* message may be broadcast, or a collect call may be used, addressing "Any Station (Tower) (Radio) (Radar)."
- f. The station addressed should immediately acknowledge a *distress* or *urgency* message, provide assistance, coordinate and direct the activities of assisting facilities, and alert the appropriate search and rescue coordinator if warranted. Responsibility will be transferred to another station only if better handling will result.
- g. All other stations, aircraft and ground, will continue to listen until it is evident that assistance is being provided. If any station becomes aware that the station being called either has not received a *distress* or *urgency* message, or cannot communicate with the aircraft in difficulty, it will attempt to contact the aircraft and provide assistance.
- h. Although the frequency in use or other frequencies assigned by ATC are preferable, the following emergency frequencies can be used for distress or urgency communications, if necessary or desirable:

121.5 MHz and 243.0 MHz. Both have a range generally limited to line of sight. 121.5 MHz is guarded by direction finding stations and some military and civil aircraft. 243.0 MHz is guarded by military aircraft. Both 121.5 MHz and 243.0 MHz are guarded by military towers, most civil towers, and radar facilities. Normally ARTCC emergency frequency capability does not extend to radar coverage limits. If an ARTCC does not respond when called on 121.5 MHz or 243.0 MHz, call the nearest tower.

US 6-3

SECTION 3. DISTRESS AND URGENCY PROCEDURES

6-3-2 OBTAINING EMERGENCY ASSISTANCE

- a. A pilot in any *distress* or *urgency* condition should *immediately* take the following action, not necessarily in the order listed, to obtain assistance:
1. Climb, if possible, for improved communications, and better radar and direction finding detection. However, it must be understood that unauthorized climb or descent under IFR conditions within controlled airspace is prohibited, except as permitted by 14 CFR Section 91.3(b).
 2. If equipped with a radar beacon transponder (civil) or IFF/SIF (military):
 - (a) Continue squawking assigned Mode A/3 discrete code/VFR code and Mode C altitude encoding when in radio contact with an air traffic facility or other agency providing air traffic services, unless instructed to do otherwise.
 - (b) If unable to immediately establish communications with an air traffic facility/agency, squawk Mode A/3, Code 7700/Emergency and Mode C.
 3. Transmit a *distress* or *urgency* message consisting of *as many* as necessary of the following elements, preferably in the order listed:
 - (a) If *distress*, MAYDAY, MAYDAY, MAY-DAY; if *urgency*, PAN-PAN, PAN-PAN, PAN-PAN.
 - (b) Name of station addressed.
 - (c) Aircraft identification and type.
 - (d) Nature of *distress* or *urgency*.
 - (e) Weather.
 - (f) Pilots intentions and request.
 - (g) Present position, and heading; or if *lost*, last known position, time, and heading since that position.
 - (h) Altitude or flight level.
 - (i) Fuel remaining in minutes.
 - (j) Number of people on board.
 - (k) Any other useful information.

REFERENCE—*Pilot/Controller Glossary Term — Fuel Remaining.*

- b. After establishing radio contact, comply with advice and instructions received. Cooperate. Do not hesitate to ask questions or clarify instructions when you do not understand or if you cannot comply with clearance. Assist the ground station to control communications on the frequency in use. Silence interfering radio stations. Do not change frequency or change to another ground station unless absolutely necessary. If you do, advise the ground station of the new frequency and station name prior to the change, transmitting in the blind if neces-

US 6-3

SECTION 3. DISTRESS AND URGENCY PROCEDURES

sary. If two-way communications cannot be established on the new frequency, return immediately to the frequency or station where two-way communications last existed.

- c. When in a distress condition with bailout, crash landing or ditching imminent, take the following additional actions to assist search and rescue units:
1. Time and circumstances permitting, transmit as many as necessary of the message elements in subparagraph a3 above, and any of the following that you think might be helpful:
 - (a) ELT status.
 - (b) Visible landmarks.
 - (c) Aircraft color.
 - (d) Number of persons on board.
 - (e) Emergency equipment on board.
 2. Actuate your ELT if the installation permits.
 3. For bailout, and for crash landing or ditching if risk of fire is not a consideration, set your radio for continuous transmission.
 4. If it becomes necessary to ditch, make every effort to ditch near a surface vessel. If time permits, an FAA facility should be able to get the position of the nearest commercial or Coast Guard vessel from a Coast Guard Rescue Coordination Center.
 5. After a crash landing, unless you have good reason to believe that you will not be located by search aircraft or ground teams, it is best to remain with your aircraft and prepare means for signaling search aircraft.

6-3-3 DITCHING PROCEDURES

FIGURE 6-3-1

Single Swell (15 knot wind)

US 6-3

SECTION 3. DISTRESS AND URGENCY PROCEDURES

FIGURE 6-3-2

Double Swell (15 knot wind)

SECTION 3. DISTRESS AND URGENCY PROCEDURES

FIGURE 6-3-4

(50 knot wind)

Aircraft with low landing speeds - land into the wind.

Aircraft with high landing speeds - choose compromise heading between wind and swell.

Both - land on back side of swell.

FIGURE 6-3-5

Wind-Swell-Ditch Heading

a. A successful aircraft ditching is dependent on three primary factors. In order of importance they are:

1. **Sea conditions and wind.**
2. **Type of aircraft.**
3. **Skill and technique of pilot.**

b. **Common oceanographic terminology.**

1. **Sea.** The condition of the surface that is the result of both waves and swells.
2. **Wave** (or Chop). The condition of the surface caused by the local winds.
3. **Swell.** The condition of the surface which has been caused by a distance disturbance.

US 6-3

SECTION 3. DISTRESS AND URGENCY PROCEDURES

4. **Swell Face.** The side of the swell toward the observer. The backside is the side away from the observer. These definitions apply regardless of the direction of swell movement.
 5. **Primary Swell.** The swell system having the greatest height from trough to crest.
 6. **Secondary Swells.** Those swell systems of less height than the primary swell.
 7. **Fetch.** The distance the waves have been driven by a wind blowing in a constant direction, without obstruction.
 8. **Swell Period.** The time interval between the passage of two successive crests at the same spot in the water, measured in seconds.
 9. **Swell Velocity.** The speed and direction of the swell with relation to a fixed reference point, measured in knots. There is little movement of water in the horizontal direction. Swells move primarily in a vertical motion, similar to the motion observed when shaking out a carpet.
 10. **Swell Direction.** The direction *from* which a swell is moving. This direction is not necessarily the result of the wind present at the scene. The swell may be moving into or across the local wind. Swells, once set in motion, tend to maintain their original direction for as long as they continue in deep water, regardless of changes in wind direction.
 11. **Swell Height.** The height between crest and trough, measured in feet. The vast majority of ocean swells are lower than 12 to 15 feet, and swells over 25 feet are not common at any spot on the oceans. Successive swells may differ considerably in height.
- c. In order to select a good heading when ditching an aircraft, a basic evaluation of the sea is required. Selection of a good ditching heading may well minimize damage and could save your life. It can be extremely dangerous to land into the wind without regard to sea conditions; the swell system, or systems, must be taken into consideration. Remember one axiom—**AVOID THE FACE OF A SWELL.**
1. In ditching parallel to the swell, it makes little difference whether touchdown is on the top of the crest or in the trough. It is preferable, however, to land on the top or back side of the swell, if possible. After determining which heading (and its reciprocal) will parallel the swell, select the heading with the most into the wind component.
 2. If only one swell system exists, the problem is relatively simple—even with a high, fast system. Unfortunately, most cases involve two or more swell systems running in different directions. With more than one system present, the sea presents a confused appearance. One of the most difficult situations occurs when two swell systems are at right angles. For example, if one system is eight feet high, and the other three feet, plan to land parallel to the primary system, and on the down swell of the secondary system. If both systems are of equal height, a compromise may be advisable—select an intermediate heading at 45 degrees down swell to both systems. When landing down a secondary swell, attempt to touch down on the back side, not on the face of the swell.

US 6-3

SECTION 3. DISTRESS AND URGENCY PROCEDURES

3. If the swell system is formidable, it is considered advisable, in landplanes, to accept more crosswind in order to avoid landing directly into the swell.
 4. The secondary swell system is often from the same direction as the wind. Here, the landing may be made parallel to the primary system, with the wind and secondary system at an angle. There is a choice to two directions paralleling the primary system. One direction is downwind and down the secondary swell, and the other is into the wind and into the secondary swell, the choice will depend on the velocity of the wind versus the velocity and height of the secondary swell.
- d. The simplest method of estimating the wind direction and velocity is to examine the wind-streaks on the water. These appear as long streaks up and down wind. Some persons may have difficulty determining wind direction after seeing the streaks on the water. Whitecaps fall forward with the wind but are overrun by the waves thus producing the illusion that the foam is sliding backward. Knowing this, and by observing the direction of the streaks, the wind direction is easily determined. Wind velocity can be estimated by noting the appearance of the whitecaps, foam and wind streaks.
1. The behavior of the aircraft on making contact with the water will vary within wide limits according to the state of the sea. If landed parallel to a single swell system, the behavior of the aircraft may approximate that to be expected on a smooth sea. If landed into a heavy swell or into a confused sea, the deceleration forces may be extremely great—resulting in breaking up of the aircraft. Within certain limits, the pilot is able to minimize these forces by proper sea evaluation and selection of ditching heading.
 2. When on final approach the pilot should look ahead and observe the surface of the sea. There may be shadows and whitecaps—signs of large seas. Shadows and whitecaps close together indicate short and rough seas. Touchdown in these areas is to be avoided. Select and touchdown in any area (only about 500 feet is needed) where the shadows and whitecaps are not so numerous.
 3. Touchdown should be at the *lowest* speed and rate of descent which permit safe handling and optimum nose up attitude on impact. Once first impact has been made, there is often little the pilot can do to control a landplane.
- e. Once preditching preparations are completed, the pilot should turn to the ditching heading and commence let-down. The aircraft should be flown low over the water, and slowed down until ten knots or so above stall. At this point, additional power should be used to overcome the increased drag caused by the nose up attitude. When a smooth stretch of water appears ahead, cut power, and touchdown at the best recommended speed as fully stalled as possible. By cutting power when approaching a relatively smooth area, the pilot will prevent overshooting and will touchdown with less chance of planing off into a second uncontrolled landing. Most experienced seaplane pilots prefer to make contact with the water in a semi-stalled attitude, cutting power as the tail makes contact. This technique eliminates the chance of misjudging altitude with a resultant heavy drop in a fully stalled condition. Care must be taken not to drop the aircraft from too high altitude or to balloon due to excessive speed. The altitude above water depends on the aircraft. Over glassy smooth water, or at night without sufficient light, it is very easy, for even the most experienced pilots to misjudge altitude by 50

US 6-3

SECTION 3. DISTRESS AND URGENCY PROCEDURES

feet or more. Under such conditions, carry enough power to maintain nine to twelve degrees nose up attitude, and 10 to 20 percent over stalling speed until contact is made with the water. The proper use of power on the approach is of great importance. If power is available on one side only, a little power should be used to flatten the approach; however, the engine should not be used to such an extent that the aircraft cannot be turned against the good engines right down to the stall with a margin of rudder movement available. When near the stall, sudden application of excessive unbalanced power may result in loss of directional control. If power is available on one side only, a slightly higher than normal glide approach speed should be used. This will ensure good control and some margin of speed after leveling off without excessive use of power. The use of power in ditching is so important that when it is certain that the coast cannot be reached, the pilot should, if possible, ditch before fuel is exhausted. The use of power in a night or instrument ditching is far more essential than under daylight contact conditions.

1. If no power is available, a greater than normal approach speed should be used down to the flare-out. This speed margin will allow the glide to be broken early and more gradually, thereby giving the pilot time and distance to feel for the surface - decreasing the possibility of stalling high or flying into the water. When landing parallel to a swell system, little difference is noted between landing on top of a crest or in the trough. If the wings of aircraft are trimmed to the surface of the sea rather than the horizon, there is little need to worry about a wing hitting a swell crest. The actual slope of a swell is very gradual. If forced to land into a swell, touchdown should be made just after passage of the crest. If contact is made on the face of the swell, the aircraft may be swamped or thrown violently into the air, dropping heavily into the next swell. If control surfaces remain intact, the pilot should attempt to maintain the proper nose above the horizon attitude by rapid and positive use of the controls.
- f. **After Touchdown.** In most cases drift, caused by crosswind can be ignored; the forces acting on the aircraft after touchdown are of such magnitude that drift will be only a secondary consideration. If the aircraft is under good control, the "crab" may be kicked out with rudder just prior to touchdown. This is more important with high wing aircraft, for they are laterally unstable on the water in a crosswind and may roll to the side in ditching.

REFERENCE—*This information has been extracted from Appendix H of the "National Search and Rescue Manual."*

6-3-4 SPECIAL EMERGENCY (AIR PIRACY)

- a. A special emergency is a condition of air piracy, or other hostile act by a person(s) aboard an aircraft, which threatens the safety of the aircraft or its passengers.
- b. The pilot of an aircraft reporting a special emergency condition should:
 1. If circumstances permit, apply *distress* or *urgency* radio-telephony procedures. Include the details of the special emergency.

REFERENCE—AIM, Paragraph 6-3-1, *Distress and Urgency Communications.*

US 6-3

SECTION 3. DISTRESS AND URGENCY PROCEDURES

2. If circumstances do not permit the use of prescribed *distress* or *urgency* procedures, transmit:
- (a) On the air/ground frequency in use at the time.
 - (b) As many as possible of the following elements spoken distinctly and in the following order:
 - (1) Name of the station addressed (time and circumstances permitting).
 - (2) The identification of the aircraft and present position.
 - (3) The nature of the special emergency condition and pilot intentions (circumstances permitting).
 - (4) If unable to provide this information, use code words and/or transponder as follows:

Spoken Words

TRANSPONDER SEVEN FIVE ZERO ZERO

Meaning

I am being hijacked/forced to a new destination

Transponder Setting

Mode 3/A, Code 7500

NOTE: Code 7500 will never be assigned by ATC without prior notification from the pilot that the aircraft is being subjected to unlawful interference. The pilot should refuse the assignment of Code 7500 in any other situation and inform the controller accordingly. Code 7500 will trigger the special emergency indicator in all radar ATC facilities.

- c. Air traffic controllers will acknowledge and confirm receipt of transponder Code 7500 by asking the pilot to verify it. If the aircraft is not being subjected to unlawful interference, the pilot should respond to the query by broadcasting in the clear that the aircraft is not being subjected to unlawful interference. Upon receipt of this information, the controller will request the pilot to verify the code selection depicted in the code selector windows in the transponder control panel and change the code to the appropriate setting. If the pilot replies in the affirmative or does not reply, the controller will not ask further questions but will flight follow, respond to pilot requests and notify appropriate authorities.
- d. If it is possible to do so without jeopardizing the safety of the flight, the pilot of a hijacked passenger aircraft, after departing from the cleared routing over which the aircraft was operating, will attempt to do one or more of the following things, insofar as circumstances may permit:
 - 1. Maintain a true airspeed of no more than 400 knots, and preferably an altitude of between 10,000 and 25,000 feet.

US 6-3

SECTION 3. DISTRESS AND URGENCY PROCEDURES

2. Fly a course toward the destination which the hijacker has announced.
- e. If these procedures result in either radio contact or air intercept, the pilot will attempt to comply with any instructions received which may direct the aircraft to an appropriate landing field or alter the aircraft's flight path off its current course, away from protected airspace.

6-3-5 FUEL DUMPING

- a. Should it become necessary to dump fuel, the pilot should immediately advise ATC. Upon receipt of information that an aircraft will dump fuel, ATC will broadcast or cause to be broadcast immediately and every 3 minutes thereafter the following on appropriate ATC and FSS radio frequencies:

EXAMPLE: Attention all aircraft-fuel dumping in progress over-(location) at (altitude) by (type aircraft) (flight direction).

- b. Upon receipt of such a broadcast, pilots of aircraft affected, which are not on IFR flight plans or special VFR clearances, should clear the area specified in the advisory. Aircraft on IFR flight plans or special VFR clearances will be provided specific separation by ATC. At the termination of the fuel dumping operation, pilots should advise ATC. Upon receipt of such information, ATC will issue, on the appropriate frequencies, the following:

EXAMPLE: ATTENTION ALL AIRCRAFT — FUEL DUMPING BY — (type aircraft) — TERMINATED.

US 6-4

SECTION 4. TWO-WAY RADIO COMMUNICATIONS FAILURE

6-4-1 TWO-WAY RADIO COMMUNICATIONS FAILURE

- a. It is virtually impossible to provide regulations and procedures applicable to all possible situations associated with two-way radio communications failure. During two-way radio communications failure, when confronted by a situation not covered in the regulation, pilots are expected to exercise good judgment in whatever action they elect to take. Should the situation so dictate they should not be reluctant to use the emergency action contained in 14 CFR Section 91.3(b).
- b. Whether two-way communications failure constitutes an emergency depends on the circumstances, and in any event, it is a determination made by the pilot. 14 CFR Section 91.3(b) authorizes a pilot to deviate from any rule in Subparts A and B to the extent required to meet an emergency.
- c. In the event of two-way radio communications failure, ATC service will be provided on the basis that the pilot is operating in accordance with 14 CFR Section 91.185. A pilot experiencing two-way communications failure should (unless emergency authority is exercised) comply with 14 CFR Section 91.185 quoted below:

1. **General.** Unless otherwise authorized by ATC, each pilot who has two-way radio communications failure when operating under IFR must comply with the rules of this section.
2. **VFR conditions.** If the failure occurs in VFR conditions, or if VFR conditions are encountered after the failure, each pilot must continue the flight under VFR and land as soon as practicable.

NOTE: *This procedure also applies when two-way radio failure occurs while operating in Class A airspace. The primary objective of this provision in 14 CFR Section 91.185 is to preclude extended IFR operation by these aircraft within the ATC system. Pilots should recognize that operation under these conditions may unnecessarily as well as adversely affect other users of the airspace, since ATC may be required to reroute or delay other users in order to protect the failure aircraft. However, it is not intended that the requirement to "land as soon as practicable" be construed to mean "as soon as possible." Pilots retain the prerogative of exercising their best judgment and are not required to land at an unauthorized airport, at an airport unsuitable for the type of aircraft flown, or to land only minutes short of their intended destination.*

3. **IFR conditions.** If the failure occurs in IFR conditions, or if subparagraph 2 above cannot be complied with, each pilot must continue the flight according to the following:

(a) **Route.**

- (1) By the route assigned in the last ATC clearance received;
- (2) If being radar vectored, by the direct route from the point of radio failure to the fix, route, or airway specified in the vector clearance;
- (3) In the absence of an assigned route, by the route that ATC has advised may be expected in a further clearance; or

US 6-4

SECTION 4. TWO-WAY RADIO COMMUNICATIONS FAILURE

- (4) In the absence of an assigned route or a route that ATC has advised may be expected in a further clearance by the route filed in the flight plan.
- (b) **Altitude.** At the HIGHEST of the following altitudes or flight levels FOR THE ROUTE SEGMENT BEING FLOWN:
- (1) The altitude or flight level assigned in the last ATC clearance received;
 - (2) The minimum altitude (converted, if appropriate, to minimum flight level as prescribed in 14 CFR Section 91.121(c)) for IFR operations; or
 - (3) The altitude or flight level ATC has advised may be expected in a further clearance.

NOTE: *The intent of the rule is that a pilot who has experienced two-way radio failure should select the appropriate altitude for the particular route segment being flown and make the necessary altitude adjustments for subsequent route segments. If the pilot received an "expect further clearance" containing a higher altitude to expect at a specified time or fix, maintain the highest of the following altitudes until that time/fix:*

- (1) the last assigned altitude; or*
- (2) the minimum altitude/flight level for IFR operations.*

Upon reaching the time/fix specified, the pilot should commence climbing to the altitude advised to expect. If the radio failure occurs after the time/fix specified, the altitude to be expected is not applicable and the pilot should maintain an altitude consistent with 1 or 2 above. If the pilot receives an "expect further clearance" containing a lower altitude, the pilot should maintain the highest of 1 or 2 above until that time/fix specified in subparagraph (c) Leave clearance limit, below.

EXAMPLE:

1. A pilot experiencing two-way radio failure at an assigned altitude of 7,000 feet is cleared along a direct route which will require a climb to a minimum IFR altitude of 9,000 feet, should climb to reach 9,000 feet at the time or place where it becomes necessary (see 14 CFR Section 91.177(b)). Later while proceeding along an airway with an MEA of 5,000 feet, the pilot would descend to 7,000 feet (the last assigned altitude), because that altitude is higher than the MEA.
2. A pilot experiencing two-way radio failure while being progressively descended to lower altitudes to begin an approach is assigned 2,700 feet until crossing the VOR and then cleared for the approach. The MOCA along the airway is 2,700 feet and MEA is 4,000 feet. The aircraft is within 22 NM of the VOR. The pilot should remain at 2,700 feet until crossing the VOR because that altitude is the minimum IFR altitude for the route segment being flown.

US 6-4

SECTION 4. TWO-WAY RADIO COMMUNICATIONS FAILURE

3. The MEA between a and b: 5,000 feet. The MEA between b and c: 5,000 feet. The MEA between c and d: 11,000 feet. The MEA between d and e: 7,000 feet. A pilot had been cleared via a, b, c, d, to e. While flying between a and b the assigned altitude was 6,000 feet and the pilot was told to expect a clearance to 8,000 feet at b. Prior to receiving the higher altitude assignment, the pilot experienced two-way failure. The pilot would maintain 6,000 to b, then climb to 8,000 feet (the altitude advised to expect). The pilot would maintain 8,000 feet, then climb to 11,000 at c, or prior to c if necessary to comply with an MCA at c. (14 CFR Section 91.177(b).) Upon reaching d, the pilot would descend to 8,000 feet (even though the MEA was 7,000 feet), as 8,000 was the highest of the altitude situations stated in the rule (14 CFR Section 91.185).

(c) Leave clearance limit.

- (1) When the clearance limit is a fix from which an approach begins, commence descent or descent and approach as close as possible to the expect further clearance time if one has been received, or if one has not been received, as close as possible to the Estimated Time of Arrival (ETA) as calculated from the filed or amended (with ATC) Estimated Time En Route (ETE).
- (2) If the clearance limit is not a fix from which an approach begins, leave the clearance limit at the expect further clearance time if one has been received, or if none has been received, upon arrival over the clearance limit, and proceed to a fix from which an approach begins and commence descent or descent and approach as close as possible to the estimated time of arrival as calculated from the filed or amended (with ATC) estimated time en route.

6-4-2 TRANSPONDER OPERATION DURING TWO-WAY COMMUNICATIONS FAILURE

- a. If an aircraft with a coded radar beacon transponder experiences a loss of two-way radio capability, the pilot should adjust the transponder to reply on Mode A/3, Code 7600.
- b. The pilot should understand that the aircraft may not be in an area of radar coverage.

6-4-3 REESTABLISHING RADIO CONTACT

- a. In addition to monitoring the NAVAID voice feature, the pilot should attempt to reestablish communications by attempting contact:
 1. On the previously assigned frequency; or
 2. With an FSS or with New York Radio or San Francisco Radio.
- b. If communications are established with an FSS or New York Radio or San Francisco Radio, the pilot should advise that radio communications on the previously assigned frequency have been lost giving the aircraft's position, altitude, last assigned frequency and then request further clearance from the controlling facility. The preceding does not preclude the use of 121.5

US 6-4

SECTION 4. TWO-WAY RADIO COMMUNICATIONS FAILURE

MHz. There is no priority on which action should be attempted first. If the capability exists, do all at the same time.

NOTE: *New York Radio and San Francisco Radio are operated by Collins Aerospace, Incorporated (formerly ARINC) under contract with the FAA for communications services. These Radio facilities have the capability of relaying information to/from ATC facilities throughout the country.*

US 6-5

SECTION 5. AIRCRAFT RESCUE AND FIRE FIGHTING COMMUNICATIONS

6-5-1 DISCRETE EMERGENCY FREQUENCY

- a. Direct contact between an emergency aircraft flight crew, Aircraft Rescue and Fire Fighting Incident Commander (ARFF IC), and the Airport Traffic Control Tower (ATCT), is possible on an aeronautical radio frequency (Discrete Emergency Frequency [DEF]), designated by Air Traffic Control (ATC) from the operational frequencies assigned to that facility.
- b. Emergency aircraft at airports without an ATCT, (or when the ATCT is closed), may contact the ARFF IC (if ARFF service is provided), on the Common Traffic Advisory Frequency (CTAF) published for the airport or the civil emergency frequency **121.5 MHz**.

6-5-2 RADIO CALL SIGNS

Preferred radio call sign for the ARFF IC is "(location/facility) **Command**" when communicating with the flight crew and the FAA ATCT.

EXAMPLE: *LAX Command.*

Washington Command.

6-5-3 ARFF EMERGENCY HAND SIGNALS

In the event that electronic communications cannot be maintained between the ARFF IC and the flight crew, standard emergency hand signals as depicted in FIG 6-5-1 through FIG 6-5-3 should be used. These hand signals should be known and understood by all cockpit and cabin aircrew, and all ARFF firefighters.

FIGURE 6-5-1

Recommend Evacuation

RECOMMEND EVACUATION - Evacuation recommended based on ARFF IC's assessment of external situation.

Arm extended from body, and held horizontal with hand upraised at eye level. Execute beckoning arm motion angled backward. Nonbeckoning arm held against body.

NIGHT - same with wands.

US 6-5

SECTION 5. AIRCRAFT RESCUE AND FIRE FIGHTING COMMUNICATIONS

FIGURE 6-5-2

Recommend Stop

RECOMMEND STOP - Recommend evacuation in progress be halted. Stop aircraft movement or other activity in progress.

Arms in front of head-
Crossed at wrists.

NIGHT - same with wands.

FIGURE 6-5-3

Emergency Contained

EMERGENCY CONTAINED - No outside evidence of dangerous condition or "all-clear."

Arms extended outward and down at a 45 degree angle. Arms moved inward below waistline simultaneously until wrists crossed, then extended outward to starting position (umpire's "safe" signal).

NIGHT - same with wands.

**UNITED STATES
ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES**

GENERAL

In general, the Emergency, Unlawful Interference, Communications Failure, Interception and Search and Rescue procedures are in conformity with the Standards, Recommended Practices and Procedures contained in ICAO Annexes and Documents.

EMERGENCY

A pilot in any distress or urgency condition should climb, if possible, for improved communications, and better radar and direction finding detection. However, it must be understood that unauthorized climb or descent under IFR conditions within controlled airspace is prohibited, except as permitted by FAR 91.3(b) (in an emergency the pilot in command may deviate from any rule to the extent required to meet that emergency).

If unable to immediately establish communications with an air traffic facility/agency, squawk Mode A/3, Code 7700/Emergency and Mode C.

INTERCEPT AND ESCORT

If specifically requested by a pilot in difficulty or if a distress condition is declared, Search and Rescue (SAR) coordinators will take steps to intercept and escort an aircraft. Steps may be initiated for intercept and escort if an urgency condition is declared and unusual circumstances make such action advisable.

It is the pilot's prerogative to refuse intercept and escort service. Escort services will normally be provided to the nearest adequate airport. Should the pilot receiving escort services continue on to another location after reaching a safe airport, or decide not to divert to the nearest safe airport, the escort aircraft is not obligated to continue and further escort is discretionary.

EXPLOSIVES DETECTION (DOG HANDLER TEAMS)

At many major airports a program has been established by the FAA to make available explosives detection dog/handler teams. These teams were established so that an aircraft in flight that receives a bomb threat can be directed to an airport with a dog handler team. The following list contains those locations that presently have a team in existence. If you desire this service, notify your company or an FAA facility.

If due to weather or other considerations an aircraft with a suspected hidden explosive problem were to land or intending to land at an airport other than those listed, it is recommended to call the FAA's Washington Operations Center (telephone 202-267-3333) or have an air traffic facility contact the above center requesting assistance.

MINIMUM FUEL ADVISORY

Be aware that this is not an emergency situation but merely an advisory that indicates an emergency situation is possible should any undue delay occur.

Advise ATC of “minimum fuel” status when fuel supply has reached a state where, upon reaching destination, any undue delay is not acceptable.

A minimum fuel advisory does not imply a need for traffic priority. If the remaining usable fuel supply suggests the need for traffic priority to ensure a safe landing, declare an emergency, account low fuel, and report the fuel remaining in minutes.

UNLAWFUL INTERFERENCE

SPECIAL EMERGENCIES (AIR PIRACY)

A special emergency is a condition of air piracy, or other hostile act by a person(s) aboard an aircraft, which threatens the safety of the aircraft or its passengers.

The pilot of an aircraft reporting a special emergency condition should:

- a. If circumstances permit, apply distress or urgency radiotelephony procedures. Include the details of the special emergency.

UNITED STATES ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

- b. If circumstances do not permit the use of prescribed distress or urgency procedures, transmit on the airground frequency in use at the time as many as possible of the following elements spoken distinctly and in the following order:
1. Name of the station addressed (time and circumstances permitting);
 2. The identification of the aircraft and present position;
 3. The nature of the special emergency condition and pilot intentions (circumstances permitting);
 4. If unable to provide this information, use code words and/or transponder setting as follows:
 - *Spoken Words* — “TRANSPONDER SEVEN FIVE ZERO ZERO”.
 - *Meaning* — “Am being hijacked/forced to a new destination”;
 - *Transponder Setting* — Mode 3/A, Code 7500.

If it is possible to do so without jeopardizing the safety of the flight, the pilot of a hijacked passenger aircraft, after departing from the cleared routing over which the aircraft was operating, will attempt to do one or more of the following, insofar as circumstances may permit:

- a. Maintain a true airspeed of no more than 400 kt, and preferably an altitude between 10,000' and 25,000'.
- b. Fly a course toward the destination which the hijacker has announced.

If these procedures result in either radio contact or an air intercept, the pilot will attempt to comply with any instructions received which may direct him to an appropriate landing field or alter the aircraft's flight path off its current course, away from protected airspace.

COMMUNICATIONS FAILURE

Unless otherwise authorized by ATC, each pilot who has two way communications failure when operating under IFR shall comply with the following conditions.

If the failure occurs in VFR conditions, or if VFR conditions are encountered after the failure, the pilot shall continue the flight under VFR and land as soon as practicable. This procedure also applies while operating in Class “A” airspace.

NOTE: It is not intended that the requirement to “land as soon as practicable” be construed to mean “as soon as possible”. The pilot retains the prerogative of exercising his/her best judgement and is not required to land at an unauthorized airport, at an airport unsuitable for the type of aircraft flown, or to land only minutes short of the destination airport.

If the failure occurs in IFR conditions, or if VFR conditions cannot be complied with, the pilot shall continue the flight according to the following requirements.

ROUTE REQUIREMENTS

- a. By the route assigned in the last ATC clearance received;

UNITED STATES ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

- b. If being radar vectored, by the direct route from the point of radio failure to the fix, route, or airway specified in the vector clearance;
- c. In the absence of an assigned route, by the route that ATC has advised may be expected in a further clearance; or
- d. In the absence of an assigned route or a route that ATC has advised may be expected in a further clearance, by the route filed in the flight plan.

ALTITUDE REQUIREMENTS

At the highest of the following altitudes or flight levels for the route segment being flown:

- a. The altitude or flight level assigned in the last ATC clearance received;
- b. The minimum altitude (converted, if appropriate, to the minimum flight level) for IFR operations; or
- c. The altitude or flight level ATC has advised may be expected in a further clearance.

NOTE:

- a. *The intent of the rule is that a pilot who has experienced two way radio failure should select the appropriate altitude for the particular route segment being flown and make the necessary altitude adjustments for subsequent route segments. If the pilot received an "expect further clearance" containing a higher altitude to expect at a specified time or fix, he/ she should maintain the highest of the following altitudes until that time or fix:*
 - 1. *His/her last assigned altitude; or*
 - 2. *The minimum altitude/flight level for IFR operations.*
- b. *Upon reaching the time/fix specified, the pilot should commence climb to the altitude he/she was advised to expect. If the radio failure occurs after the time/fix specified, the altitude to be expected is not applicable and the pilot should maintain an altitude consistent with 1.a. or b. above.*
- c. *If the pilot receives an "expect further clearance" containing a lower altitude, the pilot should maintain the highest of 1.a. or b. above until that time/fix specified for "Leave Clearance Limit" in the following paragraphs.*

LEAVE CLEARANCE LIMIT

When the clearance limit is a fix from which an approach begins, commence descent or descent and approach as close as possible to the "expect further clearance" time if one has been received, or if one has not been received, as close as possible to the estimated time of arrival as calculated from the filed or amended (with ATC) estimated time enroute.

If the clearance limit is not a fix from which an approach begins, leave the clearance limit at the expect further clearance time if one has been received, or if none has been received, upon arrival over the clearance limit, and proceed to a fix from which an approach begins and commence descent or descent and approach as close as possible to the estimated time of arrival as calculated from the filed or amended (with ATC) time enroute.

ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES**

SEARCH AND RESCUE

VISUAL EMERGENCY SIGNALS

NOTE: Visual Emergency Signals are in addition to ICAO Ground-Air Visual Codes for use by Survivors and Rescue Units.

If you are forced down and are able to attract the attention of the pilot of a rescue airplane, the body signals illustrated can be used to transmit messages as the aircraft circles over your location. Stand in the open when making the signals. Be sure that the background, as seen from the air, is not confusing. Go through the motions slowly and repeat each signal until you are positive that the pilot understands you.

VISUAL EMERGENCY SIGNALS

Emergency

Emergency Procedures - Atlantic

**ATLANTIC
SHANWICK OCEANIC ACC EVACUATION PROCEDURE**

SHANWICK OCEANIC ACC EVACUATION PROCEDURE

GENERAL

Should Shanwick OACC be evacuated the potential would exist for a major disruption to Air Traffic Control (ATC) within the Shanwick OCA and Scottish Radar units. The HF radio communications for the Shanwick Oceanic Center are remotely located, so will not be affected.

In the event that Shanwick OACC is evacuated, Gander Oceanic will assume responsibility for the provision of Air Traffic Services (ATS) within the Shanwick OCA to the best of their ability.

As soon as possible after evacuation a contingency message will be sent to the operators and agencies that receive the NAT track message. A NOTAM shall also be issued. Recipients of both messages shall advise the affected traffic.

On receipt of the contingency message pilots are requested to broadcast to other flights on 121.50 and 123.45. A listening watch on these frequencies must be maintained.

HF congestion is likely. Communications should be kept to a necessary minimum. Unnecessary route changes will not be issued.

The procedures outlined below are to be used as guidance for pilots in the immediate aftermath of a sudden withdrawal of the ATC service as described above.

PROCEDURES - WESTBOUND FLIGHTS

In the event that Shanwick OACC must be evacuated, only aircraft with received and acknowledged Oceanic Clearances shall be permitted to transit Shanwick OCA.

If unable to obtain or acknowledge an Oceanic Clearance, flights should plan to reroute around the Shanwick OCA or to land at an appropriate aerodrome.

Due to the uncertainty surrounding the contingency situation pilots are strongly advised to reroute around the Shanwick OCA or to land at an appropriate aerodrome even if they are in receipt of an acknowledged Oceanic Clearance.

Aircraft operating with a received and acknowledged Oceanic Clearance can, at pilot's discretion, continue, but must expect a limited ATC service within the Shanwick FIR. Due to the remote location of the HF service provider communications will be unaffected.

WESTBOUND FLIGHTS WITHIN SCOTTISH FIR

If Scottish radar is subject to evacuation also, pilots of flights operating within the Scottish FIR may elect to continue, the flight must be operated in accordance with the last received and acknowledged Oceanic Clearance from eastern boundary until last specified route point, normally landfall.

Whilst operating within the Scottish FIR all flights are requested to make position reports on the last assigned frequency, stating position, level and next fix.

Flights may also elect to contact Scottish FIR airfields for assistance.

The following communications procedures have been developed in accordance with the Traffic Information Broadcast by Aircraft (TIBA) procedures recommended by ICAO (Annex 11 - Air Traf-

ATLANTIC SHANWICK OCEANIC ACC EVACUATION PROCEDURE

fic Services, Attachment C). These procedures should be applied when completing an altitude change to comply with the Oceanic Clearance.

At least 3 minutes prior to the commencement of a climb or descent the flight should broadcast on the last assigned frequency, 121.50, 243.00 and 123.45 the following:

- ALL STATIONS;
- (callsign);
- (direction);
- DIRECT FROM (landfall fix) TO (oceanic entry point);
- LEAVING FLIGHT LEVEL (number) FOR FLIGHT LEVEL (number) AT (distance) (direction) FROM (oceanic entry point) AT (time).

When the level change begins, the flight should make the following broadcast:

- ALL STATIONS;
- (callsign);
- (direction);
- DIRECTION FROM (landfall fix) TO (oceanic entry point);
- LEAVING FLIGHT LEVEL (number) NOW FOR FLIGHT LEVEL (number).

When level, the flight should make the following broadcast:

- ALL STATIONS;
- (callsign);
- MAINTAINING FLIGHT LEVEL (number).

WESTBOUND FLIGHTS WITHIN THE SHANWICK OCEANIC CONTROL AREA

Gander Oceanic shall endeavor to provide an ATC service throughout the Shanwick OCA as soon as evacuation commences.

All flights should establish communication with the next agency at the earliest opportunity stating current position, cleared flight level, next position and estimate, and subsequent position. This also applies to flights using automated position reports (ADS/FMC) because those reports may not have been received by the next agency.

When ADS equipped flights are notified of a Shanwick evacuation they must revert to voice position reporting until clear of Shanwick OCA, or notified otherwise. Pilots should note that they may be asked to log-on to CYQX when within the Shanwick OCA. They should not initiate this action until instructed to do so.

Any flights involved in level changes should complete the maneuver as soon as possible in accordance with the clearance.

If unable to establish radio contact, flights may use SATCOM voice or satellite telephone to provide position reports.

**ATLANTIC
SHANWICK OCEANIC ACC EVACUATION PROCEDURE**

Flights may request their flight dispatch offices to forward position reports, if sending position reports to multiple ATS units or if otherwise unable to forward position reports.

PROCEDURES FOR EASTBOUND FLIGHTS WITHIN THE SHANWICK OCEANIC CONTROL AREA

Gander Oceanic shall endeavor to provide an ATC service throughout the Shanwick OCA as soon as evacuation commences.

Flights operating with a received and acknowledged Oceanic Clearance will be expected to continue in accordance with the last clearance issued unless otherwise advised by ATC.

When ADS equipped flights are notified of a Shanwick evacuation they must revert to voice position reporting until clear of Shanwick OCA, or notified otherwise. Pilots should note that they may be asked to logon to CYQX when within the Shanwick OCA. They should not initiate this action until instructed to do so.

Any flights involved in level changes should complete the maneuver as soon as possible in accordance with the clearance.

If unable to establish radio contact, flights may use SATCOM voice or satellite telephone to provide position reports.

Flights making automatic position reports are required to make voice position reports whilst within the Shanwick OCA, unless advised otherwise.

Communications with the next ATSU should be established at the earliest opportunity. Where no contact can be established, Shanwick Radio should be contacted on HF for advice.

PROCEDURES EASTBOUND FLIGHTS ENTERING THE SCOTTISH FIR

Unless instructed otherwise, flights entering the Scottish FIR should use the following contingency routes:

- a. RATSU DCT GUNPA contact Reykjavik Oceanic Control - 126.750;
- b. LUSEN DCT ELKOG DCT ORVIK contact Polaris Control - 135.675;
- c. ATSIX DCT AKIVO DCT KLONN contact Polaris Control - 136.275;
- d. ORTAV DCT ODPEX DCT ELSAN contact Copenhagen Control - 134.680;
- e. BALIX DCT NINEX DCT ASKAM contact Maastricht Control - 132.085;
- f. ADODO DCT AMTAP DCT ROKAN DCT TOPPA contact Maastricht Control - 132.085;
- g. ERAKA DCT ETSOM DCT ERKIT contact London Control - 128.130;
- h. ETILO DCT EVNAL DCT DCS DCT LAKEY contact London Control - 132.860;
- i. GOMUP DCT GINGA DCT SOSIM contact London Control - 135.580.

Flights operating close to the Reykjavik or Shannon northern boundaries should, where possible, establish communications with those units in order to negotiate a reroute to avoid the Scottish FIR.

**ATLANTIC
SHANWICK OCEANIC ACC EVACUATION PROCEDURE****PROCEDURES FOR FLIGHTS FLIGHT PLANNED TO ENTER SHANWICK OCA
FROM OTHER OCEANIC CENTERS**

Flights within Reykjavik or Santa Maria Oceanic Airspace, can anticipate a large reroute to avoid the Shanwick OCA and Scottish FIR. Reykjavik and Santa Maria will issue advice on procedures to be followed.

**ATLANTIC
GANDER ACC EVACUATION PROCEDURES****AIRCRAFT PROCEDURES — WESTBOUND****AIRCRAFT NOT IN RECEIPT OF AN OCEANIC CLEARANCE**

In the event that Gander ACC must be evacuated, only aircraft with received and acknowledged oceanic clearances will be permitted to transit the Gander OCA.

If unable to obtain or acknowledge an oceanic clearance, flights should plan to re-route around the Gander OCA or to land at an appropriate airport. Request the appropriate re-clearance on the current frequency. Frequency congestion is likely.

AIRCRAFT IN RECEIPT OF AN ACKNOWLEDGED OCEANIC CLEARANCE

Aircraft operating with a received and acknowledged oceanic clearance should proceed in accordance with the clearance. Flights should not request changes in altitude, speed or route except for reasons of flight safety.

Any flights involved in level changes should complete the maneuver as soon as possible in accordance with any restrictions provided with the clearance.

CONTACT PROCEDURES

On receipt of an emergency evacuation message, pilots are requested to broadcast to other flights on 121.5, 243.0 and 123.45. A listening watch on these frequencies and the current frequency should be maintained until the flight exits the Gander OCA and FIR.

All flights within the Gander OCA should transmit position reports on any available HF or VHF frequency to Shanwick Radio either directly or through another agency or flight.

Flights should establish communication with the next agency at the earliest opportunity stating current position, cleared flight level, next position and estimate, and subsequent position. This also applies to flights using automated position reports (ADS/FMC) because those reports may not have been received by the next agency.

Flights within the Gander OCA should initially establish contact with Shanwick Radio. Flights within the Gander FIR should contact Montreal Center or Moncton Center, depending on their oceanic exit point as described in Table 2. Flights about to exit the Gander OCA into the New York OCA, the Reykjavik Oceanic CTA, the Santa Maria OCA, or the Sondrestrom FIR should contact New York ARINC, Iceland Radio, Santa Maria Radio or Sondrestrom Radio as appropriate.

If unable to establish radio contact, flights may use SATCOM voice or satellite telephone to provide position reports.

TABLE 1

Oceanic Center	Telephone Number	SATCOM Imarsat Short Code
Gander Shift Manager	001 709 651 5207	N/A

Flights may request their flight dispatch offices to forward position reports, if sending position reports to multiple ATS Units or if otherwise unable to forward position reports.

**ATLANTIC
GANDER ACC EVACUATION PROCEDURES**

Based on where they exit oceanic airspace, flights shall proceed in accordance with the following table, until communication is established with, and a re-clearance issued by the next agency.

NOTE: The landfill fix is the fix after the oceanic exit point.

TABLE 2

IF flight is routed over	The flight shall then proceed:	Next control agency and frequency:

AIRCRAFT PROCEDURES — EASTBOUND

AIRCRAFT NOT IN RECEIPT OF AN OCEANIC CLEARANCE

In the event that Gander ACC must be evacuated, only aircraft with received and acknowledged oceanic clearances will be permitted to transit the Gander OCA.

If unable to obtain or acknowledge an oceanic clearance, flights should plan to re-route around the Gander OCA or land at an appropriate airport. Flights may be required to re-route around the Gander FIR as well. Flights should request the appropriate re-clearance from Montreal or Moncton Center. Frequency congestion is likely.

AIRCRAFT IN RECEIPT OF AN ACKNOWLEDGED OCEANIC CLEARANCE

Aircraft operating with a received and acknowledged ocean clearance should proceed in accordance with the clearance. Flights should not request changes in altitude, speed or route except for reasons of flight safety or to comply with the oceanic clearance.

Flights west of 50 west longitude should contact either Montreal or Moncton Center, depending on which of those was the previous agency, using the previous assigned frequency.

The Eastbound Organized Track System will be extended to begin at fixes on or near the western boundary between the Gander FIR and the Moncton and Montreal FIRs as follows:

**ATLANTIC
GANDER ACC EVACUATION PROCEDURES**

TABLE 3

Contingency fix	Landfall fix	Oceanic Entry Point defined in OTS message
KENKI		AVPUT
MUSVA		CLAVY
BERUS		EMBOK
GRIBS		KETLA
MIBNO		MAXAR
PEPKI		PIDSO

NANSO	RAFIN	VODOR
LOMPI	JAROM	TALGO

Flights at or east of 50 west longitude should initially contact Shanwick Radio. Flights about to exit the Gander OCA should contact New York ARINC, Santa Maria Radio, Iceland Radio or Sondrestrom Radio as appropriate. The following information should be provided.

**ATLANTIC
GANDER ACC EVACUATION PROCEDURES**

- a. Call sign
- b. Current position
- c. Current flight level and cleared oceanic flight level (if different from the current level)
- d. Assigned Mach or speed
- e. Next waypoint and estimate
- f. Subsequent waypoint

If a level change is required to comply with the oceanic clearance, the flight should request clearance from Montreal or Moncton Center. If unable to obtain an ATC clearance, the flight should climb or descend so as to cross the oceanic entry point at the cleared oceanic flight level.

The following communications procedures have been developed in accordance with the Traffic Information Broadcast by Aircraft (TIBA) procedures recommended by ICAO (Annex 11 – Air Traffic Services, Attachment C – not published herein). These procedures should be applied, unless otherwise instructed by Moncton or Montreal Center when completing an altitude change to comply with the oceanic clearance.

At least 3 minutes prior to the commencement of a climb or descent the flight should broadcast on the last assigned frequency, 121.5, 243.0 and 123.45 the following:

ALL STATIONS

(call sign)

(direction)

DIRECT FROM (landfall fix) TO (oceanic entry point)

LEAVING FLIGHT LEVEL (number) FOR FLIGHT LEVEL (number) AT (distance) (direction) FROM (oceanic entry point) AT (time)

When the level change begins, the flight should make the following broadcast

ALL STATIONS

(call sign)

(direction)

DIRECT FROM (landfall fix) TO (oceanic entry point)

LEAVING FLIGHT LEVEL (number) NOW FOR FLIGHT LEVEL (number)

When level, the flight should make the following broadcast

ALL STATIONS

(call sign)

MAINTAINING FLIGHT LEVEL (number)

**ATLANTIC
GANDER ACC EVACUATION PROCEDURES**

When ADS equipped flights are notified of a Gander evacuation they must revert to voice position reporting until clear of Gander OCA, or notified otherwise. Pilots should note that they may be asked to log-on to EGGX when within the Gander OCA; they should not initiate this action until instructed to do so.

ATLANTIC SEARCH AND RESCUE FACILITIES

ATLANTIC

Emergency

State Rules and Procedures - Atlantic

GREENLAND
ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

GENERAL

In general, the Emergency, Unlawful Interference, Communications Failure, Interception and Search and Rescue procedures are in conformity with the Standards, Recommended Practices and Procedures in ICAO Annexes and Documents.

EMERGENCY

EMERGENCY FREQUENCY 121.5MHz

Aircraft flying within Nuuk FIR shall continuously guard the VHF emergency frequency 121.5MHz, except for such periods when the aircraft is carrying out communication on other VHF frequencies, or when airborne equipment limitations or cockpit duties do not permit simultaneous guarding of two frequencies.

KANGERLUSSUAQ

In case of an emergency situation at Kangerlussuaq outside published operational hours, which requires ATC Service, contact FIC Nuuk.

EMERGENCY DESCENT PROCEDURES

An aircraft that is not MNPS/RVSM-approved and is unable to maintain a flight level above MNPS/RVSM airspace should descend to a flight level below MNPS/RVSM airspace.

An aircraft compelled to make a descent through MNPS airspace, whether continuing to destination or turning back, should, if its descent will conflict with an organized track:

- a. plan to descend to a level below FL280;
- b. prior to passing FL410, proceed to a point midway between a convenient pair of organized tracks prior to entering that track system from above;
- c. while descending between FL410 and FL280, maintain a track that is midway between and parallel with the organized tracks; and
- d. contact ATC as soon as practicable and request a revised ATC clearance.

COMMUNICATIONS FAILURE

GENERAL

The pilot shall attempt to contact either another aircraft or any ATC facility and inform it of the difficulty and request that information be relayed to the ATC facility with whom communications are intended.

COMMUNICATIONS FAILURE PRIOR TO ENTERING NAT REGION

If operating with a received and acknowledged oceanic clearance, the pilot shall enter oceanic airspace at the cleared oceanic entry point, level and speed and proceed in accordance with the received and acknowledged oceanic clearance. Any level or speed changes required to comply with the oceanic clearance shall be completed within the vicinity of the oceanic entry point.

GREENLAND
ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

If operating without a received and acknowledged oceanic clearance, the pilot shall enter oceanic airspace at the first oceanic entry point, level and speed, as contained in the filed flight plan, and proceed via the filed flight plan route to landfall. That first oceanic level and speed shall be maintained to landfall.

COMMUNICATIONS FAILURE PRIOR TO EXITING NAT REGION

Cleared on filed flight plan route

The pilot shall proceed in accordance with the last received and acknowledged oceanic clearance, including level and speed, to the last specified oceanic route point, normally landfall, and then continue on the filed flight plan route. The pilot shall maintain the last assigned oceanic level and speed to landfall and, after passing the last specified oceanic route point, shall conform with the relevant State procedures/regulations.

Cleared on other than filed flight plan route

The pilot shall proceed in accordance with the last received and acknowledged oceanic clearance, including level and speed, to the last specified oceanic route point, normally landfall. After passing this point, the pilot shall conform with the relevant State procedures/regulations and rejoin the filed flight plan route by proceeding, via the published ATS route structure where possible, to the next significant point ahead as contained in the filed flight plan.

EQUIPMENT TO BE CARRIED ON ALL INTERNAL AND CERTAIN TRANSITING FLIGHTS

On all internal flights and on transiting flights with single-engined and those multi-engined aircraft not capable to maintain the prescribed minimum safe altitude in the event of engine failure the following emergency equipment shall be carried:

a. Signaling Equipment

1. an emergency locator transmitter;
2. two signal flares of the day and night type;
3. eight red signal cartridges and a means of firing them;
4. a signal sheet (minimum 1x1m) in a reflecting colour;
5. a signal mirror;
6. an electric hand torch;

b. Survival Equipment

1. a compass;
2. a knife;
3. a sleeping bag with waterproof inner lining or a rescue blanket (Astron) per person;
4. four boxes of matches in waterproof container;
5. a ball of string;

GREENLAND
ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

6. a cooking stove with fuel and accompanying mess tins.

During winter conditions and when flying over the icecap the following shall additionally be carried:

1. a snow saw or snow shovel;
2. candles with a burning time about 2 hours per person. The minimum shall be not less than candles giving a burning time of 40 hours;
3. tent(s) for all on board. If dinghies are carried, the tent(s) need not to be carried.

c. Emergency Provisions

Emergency rations equivalent to 2000 calories per person. The rations can consist of e.g.: Vacuum dried soup, coffee powder, sugar, chocolate, dried fruit, pemmican, or the like.

It is recommended that life vests be carried for everyone on board and that roofed dinghies sufficient to accommodate everyone on board be carried.

EMERGENCY LOCATOR TRANSMITTER (ELT)

One emergency locator transmitter (ELT) able to function on its own power continuously outside the aircraft at least 48 hours and to transmit simultaneously on the frequencies 121.5MHz and 406.0MHz shall be carried.

ICELAND

ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

GENERAL

In general, the Emergency, Unlawful Interference, Communications Failure, Interception and Search and Rescue procedures are in conformity with the Standards, Recommended Practices and Procedures in ICAO Annexes and Documents.

EMERGENCY DESCENT PROCEDURES**Descent through the MNPS airspace**

An ACFT that is not MNPS/RVSM-approved and is unable to maintain a flight level above MNPS/RVSM airspace should descend to a flight level below MNPS/RVSM airspace.

An ACFT compelled to make a descent through MNPS airspace, whether continuing to destination or turning back, should, if its descent will conflict with an organized track:

- a. plan to descend to level below FL280;
- b. prior to passing FL410, proceed to a point midway between a convenient pair of organized tracks prior to entering that track system from above;
- c. while descending between FL410 and FL280, maintain a track that is midway between and parallel with the organized tracks; and
- d. contact ATC as soon as practicable and request a revised ATC clearance.

COMMUNICATIONS FAILURE

In VMC: ICAO Procedure.

In IMC: ICAO Procedure, supplemented as follows:

AIRCRAFT UNDER RADAR VECTORS

If communication is lost with an aircraft being vectored the pilot is expected to proceed by the most direct route practicable to the navaid/position/route as specified in the last clearance.

AIRCRAFT OPERATING WITHIN NAT REGION

Pilot shall attempt to contact either another aircraft or any ATC facility and inform it of the difficulty and request that information be relayed to the ATC facility with whom communication are intended.

Prior to Entering NAT Region

If operating **with** a received and acknowledged oceanic clearance, the pilot shall enter oceanic airspace at cleared oceanic entry point, level and speed, if applicable, and proceed in accordance with the received and acknowledged oceanic clearance. Any level or speed changes required to comply with the oceanic clearance shall be completed within the vicinity of the oceanic entry point.

If operating **without** a received and acknowledged oceanic clearance, the pilot shall enter the oceanic airspace at the first oceanic entry point, level and speed, if applicable, as contained in the

ICELAND

ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

FPL and proceed via filed flight plan route to landfall. That first oceanic level and speed shall be maintained to landfall.

Prior to Exiting NAT Region

If cleared **on filed flight plan route**, the pilot shall proceed in accordance with the last received and acknowledged oceanic clearance, including level and speed, if applicable, to the last specified oceanic route point, normally landfall, then continue on the filed flight plan route.

The pilot shall maintain the last assigned oceanic level and speed, if applicable, to landfall and, after passing the last specified oceanic route point, the pilot shall conform with relevant State procedures/regulations.

If cleared **on other than filed flight plan route**, the pilot shall proceed in accordance with the last received and acknowledged oceanic clearance, including level and speed, if applicable, to the last specified oceanic route point, normally landfall. After passing this point, the pilot shall conform with the relevant State procedures/regulations and rejoin the filed flight plan route by proceeding, via the published ATS route structure where possible, to the next significant point ahead as contained in the flight plan.

NOTE: The relevant State procedures/regulations to be followed by aircraft in order to rejoin its filed flight plan route are specified in detail in the appropriate National Aeronautical Information Publication.

Use of Satellite Communications (SATCOM)

When operating in BIRD and BGGL FIRs, aircrews unable to make position reports via VHF or CPDLC, ADS-C or FMC are expected to use HF or SATCOM telephone if so equipped. SATCOM voice communications should be made to Iceland radio, short code is 425105. The numbers 425101 and 425103 are connected at Reykjavik ATC center and remain valid for aircrews encountering emergencies.

COMMUNICATION FAILURE IN CTR

If aircraft experiences communication failure in Control Zone the pilot shall select code 7600 on its transponder and enter traffic circuit via the nearest reporting point on VFR route and follow the circuit to final approach of runway-in-use. Observe other traffic and signals from the control tower. Do not land unless serious conditions exists or steady green signal is received from the control tower. After landing continue the landing run to the nearest exit and vacate the runway as quickly as possible. ATC can find out if the aircraft has an operating receiver by asking the aircraft to squawk IDENT or by rocking the aircraft.

EQUIPMENT TO BE CARRIED ON BOARD

Signaling Equipment

All airplanes when operated on extended flights over water shall be equipped with a survival radio equipment, operating on VHF:

- if over water away from land suitable for making an emergency landing at a distance of more than 185km (100NM);

ICELAND

ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

- in case of single-engined airplanes, and more than 370km (200NM);
- in case of multi-engined airplanes capable of continuing flight with one engine inoperative.

Survival Equipment

All single-engined airplanes on flights over designated land areas, when flying in Icelandic territorial airspace shall be equipped with life-saving equipment sufficient to ensure the safety of the crew and passengers for at least 24 hours in the event of an emergency landing. The life-saving equipment shall be appropriate to circumstances and may include winter sleeping bags, warm clothes and emergency provisions.

All airplanes that is unable to maintain minimum altitude on extended flights over water shall have a readily accessible watertight immersion suit including clothes which provides thermal protection for each occupant at a distance of more than 93km (50NM) away from land suitable for making an emergency landing.

Airport Directory

Airport Directory

Airport Data - Canada

CANADA LEGEND

LOCATION

Airports are listed alphabetically by location name. The airport name is included in parenthesis when different from the location name. A cross-reference by airport name is provided. Diagrams for IFR airports are located with the applicable approach charts.

Registered airports are not subject to an ongoing inspection program. Pilots intending to use these airports should obtain current information from the owner/operator.

AIRPORT LOCATION IDENTIFIER

Each airport is assigned a four-letter Jeppesen NavData (ICAO) identifier. The identifier is located to the right of the location name.

Ox 3 = High pressure-replacement bottles

Ox 4 = Low pressure-replacement bottles

AIRCRAFT RESCUE AND FIRE FIGHTING (ARFF)

The operator of an airport providing aircraft rescue and fire-fighting services publishes a number which corresponds to the critical category for fire-fighting available to respond to an aircraft emergency.

This number will be shown in the airport listings as "Fire" followed by the category number (e.g., Fire 5).

If different category numbers are published for one airport, the lowest category number will be shown. The higher category number with the relevant note (e.g., Fire 7 PTO, Fire 7 PPR, etc.) can be found within the airport information block.

The following table identifies the critical category for aircraft rescue and fire-fighting as it relates to the aircraft size, the quantities of water and complementary extinguishing agents, the minimum

CANADA LEGEND

number of aircraft rescue and fire-fighting vehicles, and the total discharge capacity. For ease of interpretation, the table is a combination of the two tables found in CAR 303.

Acft Category	Acft Overall Length	Maximum Fuselage Width	Quantity of water (in liters)	Quantity of Complementary agents (in kilograms)	Minimum number of ARFF vehicles	Total Discharge Capacity (in liters per minute)
1	less than 9m	2m	230	45	1	230

sible winter maintenance equipment on Rwy
outside Ops hrs. Migratory bird activity APR-
MAY and SEP-OCT.

Several areas of Class F restricted airspace
(CYRs) have been established in the Alma area
for flight testing of Unmanned Air Vehicles
(UAVs). These CYRs are activated occasionally
by NOTAM with 48 hours prior notice. No
person shall operate an aircraft within an active
CYR unless the flight has been authorized by
the User Agency as stated in the Designated
Airspace Handbook (DAH). When CYR651 is

active and access to the Alma airport is
required, to avoid delays, pilots should make
prior arrangements with the Unmanned Aerial
Systems Centre of Excellence for authorization
to operate within the CYR. Pilots can contact
Alma UNICOM MF for authorization but, unless
the flight is essential such as medical evacua-
tion flight, police, emergency, etc., access may
be delayed. Once authorized, pilots must enter
and exit CYR651 from the northeast, and oper-
ations are restricted to circuit procedures for
arrivals and departures from the airport only.

Rwy 13/31 Aircraft Group Number (AGN) IIIA:
Wingspan less than 118' (36m), outer main

CAUTION: Hazardous high speed wind tunnel heat exhaust N45 28 07 W73 42 38 (approximately 0.5 NM SSE threshold 24L) may cause mechanical turbulence. Surface to 1000 AGL. Construction activity in front of displaced Thr 06L. Acft on final Apch may be overflying construction activity.

For Noise Abatement see 10-4 and 10-4A.

A380, A124, A346, B748 & B773: Right turn prohibited from A4 or A2 to A.

A380, A124, A346, B748 & B773: Left turn difficult from A1 to A. Use of A3 or holding bay 24L recommended.

A380, A340-500/600, A350-1000 & B777: Right turn prohibited from A4 to D.

Taxiway L and R restricted to aircraft with less than 118' (36m) wingspan and 210,541 lbs (95,500 KG) or less.

Taxiway Q uncontrolled, restricted to aircraft wingspans less than 118' (36m).

Left turns on B from B1 and B3, prohibited for aircraft with wingspans 36m (118') or more.

Turns from A4 right (North) on A not recommended for aircraft with wingspans less than 36m (118') oversteer required, and prohibited to aircraft with wingspans 36m (118') or more.

Aircraft with wingspans of 36m (118') or more prohibited from using south ramp between the terminal building and the aeroquay.

Holding bays capacity: 2 aircraft with wingspans of less than 36m (118'). Aircraft with wingspans of 36m (118') or greater: Holding bay 06L: use North line, Holding bay 24R: use centre line, Holding bay 24L: use South line, Holding bay 06R: 2 aircraft simultaneously: aircraft with wingspans of less than 65m (213') use South line and aircraft with wingspans of 65m (213') or greater use North line.

Rwy 06L/24R, 06R/24L and 10/28 Aircraft Group Number (AGN) V: Wingspan less than 214' (65.23m), outer main gear span 46' (14m).

Twy L, Q and R Aircraft Group Number (AGN) IIB: Wingspan less than 118' (36m), outer main gear span 30' (9m).

Twy JC Aircraft Group Number (AGN) V: Wingspan less than 214' (65.23m), outer main gear span less than 46' (14m).

Twy JC: One-way Tfc NE-bound.

Twy E Btwn Rwy 06L/24R and Twy B Clsd.

Apron Procedures: Prior to taxiing, obtain IFR clearance, then contact Apron Control and specify your position and runway cleared for.

EASTERN CANADA

IFR clearance read back with Montreal Tower Clearance Delivery shall include aircraft call sign, assigned SID name and transponder code.

Multilateration - Pilots must keep their transponder on at all times when maneuvering on the airport (turned on prior to brake release and on arrival, on until final engine shutdown). Pilots that do not have a transponder code issued by ATC must squawk 1000 when taxiing.

Jet A-1 fuel system icing inhibitor available.

Between Gates 47 and 49 prohibited to aircraft with wingspans of 118' (36m) or more.

Guide line between Gates 73 and 85 prohibited to aircraft with a wingspan of 119' (36m) or more.

Customs: Customs clearance at secondary
apron 1200-0500Z 1hr PNR.

CAUTION: High speed wind tunnel exhaust
hazardous to 500' AGL. Twy G: Bridge railing
28" high. Bridge restricted to aircraft under
122,000 lbs. Migratory birds in airport vicinity
Mar-Apr and Sep-Oct.

TWY M, P, Q and T: restricted to aircraft not
exceeding 60,000 lbs.

TWY G uncontrolled.

Above 15 degrees celsius, no aircraft with more
than 100 passenger or over 85,000 lbs is
authorized to perform 180 degrees turns on any
Rwy without permission 613-248-2013.

De-icing Bays: E line Avbl to Acft wingspan less
than 119' (36m). Bay 2 - May be used by air-
craft with the wingspans 65m (213') or less. If
CC/K used, the Taxi must be on the West taxi
line only with crossover to/from Bay 2. Bay 5 -
May be used by aircraft with the wingspans
80m (262') or less. If CC/K used, taxi must be
on the west taxi line only with crossover to/from
Bay 5.

Rwy 04/22, Twys M, P, Q and T Aircraft Group
Number (AGN) II: Wingspan less than 79'

(24.1m), outer main gear span less than 20'
(6m).

Rwy 07/25 and Rwy 14/32 Aircraft Group
Number (AGN) V:Wingspan less than 214'
(65.23m), outer main gear span less than 46'
(14m).

Pilots to call appropriate fixed base operator
prior to landing on private advisory frequency
and request customs be advised of intended
location for clearance.

All departure aircraft to contact clearance deliv-
ery.

The grade of sand which is used extensively on
the apt during winter months may pose a FOD
hazard to some aircraft. Formations and other
line astern flight ops should adopt procedures
to avoid ingestion.

For practice IFR approaches to active IFR run-
ways during peak hours Mon-Fri, 1315-1400Z
and 1930-2400Z contact Montreal Flight Plan-
ning 514-633-3211 or 800-633-1353 for possi-
ble delays and runway information.

Low and High pressure oxygen servicing PNR.

Customs.

CAUTION: Be alert to Rwy 06L/24R crossing clearances, be prepared to stop short of 06L/24R. Readback of all rwy holding instructions is required.

General aviation aircraft must clear customs at the fixed base operator of their choice. Ramp charges may apply.

Departures from holding bay inner centerlines Rwy 06L/D6, 24R/C5 and 05/H6 subtract 263' from declared distances.

Twy D4, D5 south of Rwy 06L/24R: Angled runway hold positions in effect.

Twy K is uncontrolled and is restricted to Acft with wingspans of 135' (41.15m) (B757W) or less and an Aircraft Load Rating of 9.0 or less. Other aircraft may be authorized with prior approval from operator. Design speed for twys C2, B2, H3, D1, D2, D3, D4, D5, D7 & D8 is 50 kt (93 kph). Design speed for Twys J2, F1, F2, F3 & F4 is 45 kt (85 kph). All other rapid exits designed for an exit speed of 35 kt (65kph).

Normal Rwy 23 departures are from Twy H. Rwy 23 departures do not enter Twy Q without specific clearance from ATC. Aircraft requiring full length must notify ground control on initial contact.

During CAT II/III arrivals, Rwy 05 departures shall be from Twy H6.

Twys W & Y restricted to Acft with wingspans less than 118' (36m). At all T1, T1 East Hold, T3, Infield & FedEx Apron/Parking areas, all aircraft must contact the applicable Apron Advisory prior to engine start at gate, pushback or taxi. FedEx Apron restricted to aircraft with wingspans 170' (51.9m) or less. Taxilane between 3C and 4C restricted to aircraft with wingspans less than 118' (36m). Wingspans of 213' (64.9m) permitted to Gate C27 Code E. Asphalt apron surface E of positions 5G and 6F to 101A restricted to Acft with wingspans of 93'

EASTERN CANADA

(28.4m) (DH8-400) or less & an aircraft load rating of 9.0 or less. Outer/East loop between 7E-8E restricted to Acft with wingspans less than 118' (36m) and Inner/East loop between 7D-8D restricted to Acft with wingspans 79.9m/262' or less. Simultaneous use of lane 7 and 8 max wingspan 64.9m/213' Code E. Outer/Northloop between 9C-9D-10D-10C restricted to Acft with wingspans less than 118' (36m). Strict adherence to taxiway centerline required between Twy DR and Twy DV and on taxiways 10 through 13E. Taxiway 10 restricted to aircraft with wingspans 167' (50.9m) or less. Proceed only to gates assigned by Apron Advisory. Discretionary oversteering required for Acft with wingspan of 124' (38m) (B757) or greater:

- Rwy 06L onto twys E, D3 and D5
- Rwy 24R onto twys D3, E, D4 and D/D6 south-bound.

A340-500/600, B777-300, & A380 discretionary oversteering required at all intersections.

Noise abatement procedures apply to all aircraft, (VFR and IFR) weather permitting 0400-1200Z.

DE-ICING OPERATIONS
CENTRAL DE-ICING FACILITY (CDF)

Pad 1 and 5

- Centre lane will accommodate all Acft.
- Acft with wingspans less than 118' (36m) may use North/South lanes.

Pads 2, 3, 4 and 6

- Centre lanes will accommodate Acft with wingspans 231' (64.9m) and smaller.
- Acft with wingspans less than 118' (36m) may use North/South lanes.

1. Prior to departing Parking Position, contact CLNC DEL/APRON/GND (as applicable) and advise, "ACFT DE-ICING REQUIRED".

2. On Twys T, V and E, hold short of ICE# and when directed by Ground Control monitor Pad Control on 131.17. Follow Pad Control taxi instructions to the entrance of the de-icing pad.

3. When directed by Pad Control contact ICEMAN on the assigned freq (129.62 or 131.37).

4. Follow verbal instructions, guidance displays and lights (as applicable) into staging and/or de-icing bays.

5. Once Acft is in final stop position, brakes are set and Acft configured for de-icing, etc ICEMAN and advise, "BRAKES SET, ACFT CONFIGURED, READY TO DE-ICE". At this time, pass along any specific fluid and/or treatment requirements.

6. After de-icing, do not move Acft. Contact Pad Control on 131.17 when instructed by ICEMAN to obtain taxi instruction.

7. Follow Pad Control instruction to designated exit points. When instructed by Pad Control contact Ground Control on assigned freq.

8. Specific Acft operations plan in effect for Acft with wingspans 214' (65m) up to 262' (79.9m). Restrictions in place include:

- For Central De-icing Facility (CDF) operations, no turns from taxiway E into any of the de-icing pads are permitted. The only taxi routes permitted for de-icing are via taxiway Tinto Pad 5 and via taxiway V into Pad 1.

All aircraft operating on a scheduled and repetitive basis to/from the aerodrome are required to obtain a slot for all operations.

Training flights are not permitted in the Toronto Control Zone from 0000-0700 LT. For O/T PPR from National Traffic Management Unit (FLOW Ctl).

All maintenance runs/runups must be conducted in accordance with GTAA Apron & Maintenance Run Procedures (available from airport operator). Upon approval contact Apron Coordinator frequency.

with wingspan of 118' or less. Twy Y: right turn on YB restricted to Acft with wingspan of 118' or less. Twy YB: left turn on C restricted to Acft with wingspan of 118' or less. Left turn on Y restricted to Acft with wingspan of 118' or less.

Aprons I, VII, IX, X & West De-Ice: PPR Airport Ops is required.

DE-ICING PROCEDURES: 1. Contact CALGARY DE-ICE on 129.5 30 min prior to push-back with acft type and estimated push-back time. 2. Contact CALGARY DE-ICE on 129.5 5min prior to push-back to confirm treatment type and DE-ICE pad assignment. 3. Follow normal pushback procedures and advise Apr Advisory E or W DE-ICE pad has been assigned. 4. E Pad- Enter from Twy J at Twy JQ. When instructed by Gnd Ctl, Ctc PAD Ctl on 129.125 prior to entering pad. 5. W Pad- Enter from Twy J at TwyJV. When instructed by Gnd Ctl, Ctc PAD Ctl on 122.35 prior to entering pad. 6. Follow PAD Ctl instructions, signboards and guidance lines to the assigned staging Psn or de-icing bay and confirm "BRAKES SET" when in Psn with nosewheel on stopbar. **CAUTION:** The wingtip to tail clearance for Acft taxiing in the east pad from JQ behind staged Acft is only assured when the staged Acft nosewheel is on the stopbar. 7. If assigned a staging bay, monitor PAD Ctl until further instructed. 8. When directed by PAD Ctl, Ctc ICEMAN (E 123.350, W 122.725) and confirm "BRAKES SET, Acft CONFIGURED FOR DE-ICE." 9. When de-ice is complete, do not move Acft. When directed by ICEMAN, Ctc PAD Ctl on assigned Freq. 10. Advise PAD Ctl when ready to taxi. PAD Ctl will assign appropriate Gnd Ctl Freq to obtain taxi clearance. 11. Queuing is not permitted on Twy J, staging Psn are provided on both E and W pads, reference DE-ICE Facility diagram.

EAST DE-ICE: Apron taxilane up to Bay 5 will accommodate Acft with wingspans of 213' (65m) and smaller. Apron taxilane Bay 6 to Bay 9 will accommodate Acft with wingspans of 118'

(36m) and smaller. Acft in staging positions must place nosewheel on stopbar to ensure clearance to taxilane.

Acft less than 6614lbs (3000 kg) not authorized for arr or dep 2300-0500Z except helicopters.

Pilots are to open/close VFR Flight Plans with Edmonton FIC via phone or Edmonton Radio when practicable.

PPR for Balloon flight in Calgary Control Zone. Balloon flight is required to maintain minimum of 4NM from any Rwy. Clearance and discrete transponder code required prior to entering Control Zone. Contact Edmonton ACC.

Training flights: No ab initio training. Private pilot's license minimum required for operations in controlled zone. Training flights prohibited, no arrival or departure during peak hours (1600-2200LT).

PPR for Training Flights, contact VFR/IFR: 888-882-2254.

Multilateration: Aircraft transponders must be kept on at all times when manoeuvring on the airport (turned on prior to brake release and on arrival, on until final engine shutdown). Pilots that do not have a transponder code issued by ATC must squawk 1000 when taxiing.

B787-10 AVAILABLE TAXIWAYS: D, D3, D5, D7, D9, DT, DY, E (South of Rwy 08R/26L) H (North of Rwy 08R/26L), J, JA, JB, JC, K, L (West of J), M, M4, M5, M6, M7, M8, M10, P, T, R and V. Discretionary oversteer Rqd at every Int.

Aircraft larger than a B767 access/egress S1-S2 via Twy G only.

Uncontrolled vehicles crossings: DS, DT, DU, DV, DY, F, H (north of H4), J, JA, JB, JC, K, N7, P, Q, R, S, T, V.

Uncontrolled taxiways: C (South of F), F, J (between K and L), Q, DR, DS, DT, DU, DV, and DW.

Twy A: (East of E); Restricted to B767/A310 and smaller.

Twy A2: Restricted to Lear 60/DH8-300 and smaller.

Twy B: Restricted to B767/A310 and smaller.

Twy C: (South of F); Restricted to B737/A321 and smaller.

Twy C: (North of F): Restricted to B767/A310 and smaller.

Twy D: (Eastbound): No left turns onto H by A321/B737-900 and larger.

Twy D: (Westbound): No left turns onto H. Right hand turns onto Twy DR - discretionary oversteer required.

Twy D and D5: Restricted from simultaneous use by aircraft larger than B767/A310.

Twy D2: Restricted to CRJ-900 and smaller.

Twy D7: No RH turns onto D.

Twy DR and DS: Restricted to B767/A310 and smaller.

TwyDW: Restricted to B757/A321 and smaller.

Twy E: North of D restricted to A330/B787-10 and smaller.

Twy F: (West of C): Restricted to B767/A310 and smaller.

Twy F: (East of C): Restricted to CRJ-900 and smaller.

Twy G: Restricted to A310/B767 and smaller.

Twy H: (Southbound): No right turns onto A, L, or H4, no right turns onto D by B737-900/A321 & larger. No left turns onto D1.

Twy H: (Northbound): No left turns onto V. No right turns onto D. No right turns onto L for B767/A310 and larger.

Twy H: (S of rwy 08R/26L): Restricted to B767/A310 and smaller.

Twy H2: available to B767, A310 and smaller.

Twy J: (Southbound): Turns onto L restricted to B767/A310 and smaller. Restricted to B747-400 & smaller south of K.

Twy J: (Northbound): No left turns onto K by Acft B767/A310 and larger. Restricted to B747-400 & smaller south of parking position W2.

Twy L: Entry and exit at Apron VI restricted to B737/A321 and smaller. No right turns onto V.

Twys M1-M6: (rapid exit): Design speed in wet conditions is 50kt (95Kmh).

Twy M3: not available for A340-600, B777-300, A350-900, A350-1000, B787-10 and larger.

Twy M4: No left or right turns onto M for A340-600, B777-300, A350-900, A350-1000, B787-10 and larger.

Twy M7: available to A380, B747-800, AN124.

Twy M11 closed.

Twy P: Right turn onto M restricted to B767/A310 & smaller.

Twy S: Restricted to B767/A310 and smaller.

Twy V: No left turns onto L.

PPR YVR Operations for all engine airtstarts or crossbleed starts on aprons I, II, III, IV, V, VI, VIII.

Apron I, II, III, IV, V, VI and VIII: PPR Airport Operations is required.

WESTERN CANADA

Apron I: Restricted to CRJ-900/SF34 and smaller.

Apron III - Jets towed in and out.

Apron IV: Restricted to B757/A321 and smaller. Acft stand taxilane east of DW restricted to Convair CV-580 and smaller.

Apron VI bypass (taxilane centerline amber lighting): Simultaneous use of dual taxilanes restricted to narrow body aircraft.

Apron VI (horseshoe): Taxilanes restricted to B737/A321 and smaller.

Apron VI: East bypass restricted to B737 and smaller. Pushbacks from remote parking positions E1-E3 to west taxilane. Pushbacks from remote parking positions E10-E19 to south taxilane.

All Acft on Aprn VI use minimum thrust dueto jet blast.

Apron VIII: Restricted to B767/A310 and smaller.

Run-ups, crossbleed starts, airstarts and jet engine starts on gate (Apron VI only): PPR contact airport operator.

Aircraft pushing back from gates 40 thru 43 contact GroundControl (North) 127.15 MHz.

Advice ATC if ground crew not present at gate.

Rwy 13/31 Aircraft Group Number (AGN) V: Wingspan less than 214' (65.23m), outer main gear span less than 46' (14m).

Airport Directory

Airport Data - United States

**UNITED STATES
LEGEND**

Airports within each state are listed by city name, followed by airport name, when different. The information below is shown for each airport. Diagrams are provided for VFR airports only. Diagrams for IFR airports are located with the applicable IFR Approach Chart.

UNITED STATES LEGEND

The top line of **Airport Information** contains the city name followed by airport name, Jeppesen NavData (ICAO) identifier, and either an IFR or VFR label.

This line of **Airport Information** contains the airport elevation followed by Latitude/Longitude coordinates and the bearing and distance from one VOR facility.

ASPEN (-PITKIN CO/SARDY) KASE IFR
7815'. N39 13.4 W106 52.1 DBL 163°/13.0nm.
Right Tfc 33. ARFF Index A. Lndg Rights Apt.
Apt of Entry.
LT +7(+6DT) =UTC.

Rwys: 15/33 7004'x100' (ASPHALT-PFC) MIRL.
15: REIL, VASI-L.

Remarks: Airport closed 30 minutes after SS-0700LT for general operators. Pilots operating after curfew will be prosecuted. Hang gliders, paragliders, hot air balloons and glider operations on and in vicinity of airport up to 18,000' MSL. Review of airplane performance recommended including density altitude, weight and balance and climb performance. Airport located in valley with high mountainous terrain from 12,500' to 14,000' in near proximity. PCL - 118.85. MIRL Rwy 15/33, VASI-L Rwy 15.

Communications: *ATIS 120.4. *ASPEN App/Dep 123.8. *DENVER Ctr App/Dep 134.5.
*Tower 118.85. Ground 121.9. UNICOM 122.95.

Services: Fuel: 100LL, Jet A. Repairs: small airframe, large airframe, recip engine, turbo engine, jet engine, propeller. Misc: tiedown, hangar, deicing, oxygen, acft parts, refreshments, courtesy car, 24 hr phone, preheat, APU, pilot lounge, daytime parking, overnight parking. Restaurants: nearby. Rental Cars: Avis, Budget, Eagle, Hertz. Lodging: Inn at Aspen.

ASPEN BASE OPERATIONS, (303) 920-2016, fax-925-5210, unicom-122.95, Credit Cards: MC, VISA, MultiService, Avcard, Texaco.

This block contains **Airport Information** such as runways that use non-standard right traffic patterns, airports that have landing rights and airports of entry, as well as conversion factors for local time to UTC. The ARFF information relates to crash, fire, and rescue service equipment availability (FAR 139). See reverse side for further explanation.

The **Runway** information includes length, width, surface type, and surface treatment. Also included is lighting common to the entire runway length and runway slope. Individual runway ends follow with information concerning lighting unique to that runway end as well as LDA (Landing Distance Available) information. Lighting and surface treatment abbreviations used are shown in the table below.

The **Remarks** block contains notes regarding the airport, runways, and PCL (pilot controlled lighting) instructions when available.

The **Communications** block contains the communications information for the airport. This includes ATIS, D-ATIS, AWOS, ASOS, Approach and Departure frequencies, Center frequencies when used, Tower, Ground, Cinc Del, Pre-Taxi, Traffic (Multicom) and UNICOM frequencies. Radar availability is denoted with a " (R) " and the common traffic advisory frequency is abbreviated CTAF. Part time frequencies are denoted with a " * ". Cinc (GCO) and Radio (GCO) are Ground Communications Outlets for use only on the ground, and require keying mike 4 times for Clearance Delivery, and 6 times for Radio (FSS).

The **Services** information is a comprehensive listing of all services available on the airport. This includes info on fuel availability, repairs, miscellaneous services, restaurants on the airport and/or nearby, rental car facilities, and lodging nearby the airport.

Lighting Abbreviations:

LDIN	= Sequenced Flashing Lead-in Lights
MALSR	= Medium Intensity Approach Light System with Runway Alignment Indicator Lights
RAIL	= Runway Alignment Indicator Lights
REIL	= Runway End Identification Lights
RL	= Low or unknown Intensity Rwy Edge Lights
MIRL	= Medium Intensity Runway Edge Lights
HIRL	= High Intensity Runway Edge Lights
TDZ	= Touchdown Zone Lights
CL	= Centerline Lights
VASI	= Visual Approach Slope Indicator
AVASI	= Abbreviated Visual Approach Slope Indicator (-R or -L = right/left side)
PAPI	= Precision Approach Path Indicator

FBOs (Fixed Based Operators) at the airport are individually listed here. This information includes the name of the FBO, phone numbers, fax numbers, unicom & arinc frequencies, and usable credit cards.

Runway Treatment Abbreviations:

GRVD	= Grooved
AFSC	= Aggregate Friction Seal Coat
PFC	= Porous Friction Courses
WC	= Wire Combed

Rwy 33 Right-Hand Circuit.

Mon-Sun 1400-0600Z ATND SKD Mon-Sun 1400-0600Z.

PPR for takeoff Rwy 15; contact General Aviation (FBO).

Birds & other wildlife on & in vicinity of runways; watch for wildlife on or near runways.

All arriving aircraft from 0300-0600Z must announce CTAF when they are 20, 15, 10, and 5 miles out and on short final. Equipment may be on the runway.

CAUTION: high traffic intersection; aircraft routinely hold short of Twy A4 on Twy A when inbound to Terminal or GA Ramp.

Airport located in high mountain valley with mountainous terrain from 12,500'-14,000' MSL in near proximity to airport. Numerous unlighted obstructions. All adverse weather situations magnified in the mountains. Operations during periods of reduced visibility discouraged for pilots unfamiliar with area.

COLORADO

Unless ceilings are at least 2000' above highest terrain & visibility is 15 miles or more, mountain flying is not recommended.

For all general aviation operations between 30 minutes after SS to 0600Z the following applies: aircraft equipped as required under FAR 91.205(D) for instrument flight - pilot is instrument rated; VFR pilot-in-command has completed at least one takeoff or landing in the preceding 12 months at KASE. IFR: execute approach/departure procedures with ATC clearance.

Airport restricted to maximum aircraft wingspan of 95'. Terrain will not allow for normal traffic patterns; high rates of descent may be required due to terrain & local procedures.

Hang glider, Para glider, hot air balloon & glider operations on & in vicinity of airport up to 18,000' MSL.

TPA: 9023' MSL (1185' AGL) light aircraft; 9523' MSL (1685' AGL) heavy aircraft.

Noise abatement procedures in effect; contact Airport Operations.

Unique VFR departure procedures exist, call Airport Operations or General Aviation (FBO) for more information.

Uncontrolled traffic on the ramps. Rwy 33 run-up area not visible from ATCT.

Due to high approach minimums pilots may need a IFR alternate even though weather is forecast to be higher than 2000-3.

Aircraft requiring IFR should file flight plan with Flight Service 45 minutes prior to estimated departure.

All commercial aircraft advise prior to pushback onto Twy A.

Patrick AFB (KCOF) Class D airspace is in
close proximity to Merritt Island airport and
KCOF crossing Rwy 11/29 has the same orien-
tation as Merritt Island airport.

Noise sensitive airport. Voluntary noise abate-
ment procedure in effect. Climb out at best
angle (Vx), turn crosswind at 700' (Mid-river, if
possible) and merge with downwind traffic at
1000' pattern altitude. No touch and go opera-
tions between 8 pm and 8 am. No repetitive
flight operations at the airport between 8 pm
and 7 am. No repetitive flight operations on
Sunday and national holidays. In lieu of touch
and go operations perform full stop, taxi back
operations. Avoid flying at low altitudes over
noise sensitive areas (Newfound Harbor Dr).

Banner towing in vicinity of airport.

ATND SKD H24. Customs: O/R

All runways; touch and go operations, low
approaches, and practice instrument
approaches are not permitted.

Group VI aircraft (Lockheed Galaxy C-5, Anto-
nov AN-124 & AN-125) with a wingspan of
greater than 214' are restricted from using Twy
F east of Ramp 5 north & west of Twy D.

All aircraft with wingspans greater than 214' are
required to use taxi speeds not greater than 15
MPH on Twys A, L, M, and SJ.

When aircraft with wingspans greater than 214'
are present on the field, all other aircraft must
adhere to the taxiway centerline on Twys L &
M, Twys E & F, and Twys SC & SJ between SG
& R due to separation between the parallel taxi-
ways.

GEORGIA

Aircraft with wingspan greater than 214' should expect to use Rwy 09L/27R & 09R/27L.

Two aircraft with wingspans greater than or equal to 225' may not taxi simultaneously on adjacent parallel Twys L/M except west of L7 at speeds less than 15 MPH.

Aircraft with wingspan greater than 171' are restricted from using Twy V. Aircraft with wingspan greater than 171' are required to use taxi speeds less than 15 MPH when passing aircraft with wingspan greater than 214' on Twy L/M (east of L7).

No aircraft with wingspan greater than 213' may pass another aircraft with wingspan greater than or equal to 225' on Twy L/M east of L7.

No aircraft with wingspan greater than or equal to 225' may taxi on Twy M between L14 & L16, Twy N between P & SC, and Twy N between U & K.

Aircraft with wingspan greater than 171' and/or tail height greater than 45' are restricted from using Twy W. During Twy W operations Rwy 27R intersection departures from Twy LBor Twy LC can expect the following distances with runway remaining: from Twy LB 11,040' (TORA/TODA) & 12,140' (ASDA); from Twy LC 10,810' (TORA/TODA) & 11,910' (ASDA). Aircraft may request the full length of Rwy 27R for departure upon initial contact with ATC.

Rwy 09L departures can expect intersection departure from M2 with runway remaining 11,440' (TORA/TODA) & 10,780' (ASDA).

Noise and operations monitoring system (NOMS) program in effect; call the Atlanta Department of Aviation 770-436-6473 for more information.

Preferential runway use in effect; expect to use Rwy 08R/26L & 09L/27R for departures; Rwy 08L/26R & 09R/27L are used primarily for arrivals.

Runups are permitted at various sites; coordinate use of city facilities, movement areas, allowable non-movement areas with Depart-

ment of Aviation Operations, 404-787-6095; and coordinate the use of the airlines facilities with them.

ASDE-X IN USE. Operate transponders with altitude reporting mode and ADS-B (if equipped) enabled on all airport surfaces.

Rwy 13/31 limited to aircraft not exceeding 95,000 lbs certified maximum takeoff weight - dual wheel. Aircraft with published maximum takeoff weight exceeding 95,000 lbs must seek prior permission at least 48 hrs in advance by submitting to Airport Manager a manufacturer's aircraft service change that installs a placard verifying aircraft is certified for SUN with a maximum takeoff weight of 95,000 lbs. Prior permission required for all aircraft with published wingspan exceeding 100' (30.48M).

Not recommended for night use or in marginal weather by unfamiliar pilots due to mountainous terrain.

Airfield surface conditions not monitored and ARFF not available between the hours of 0600 and 1400Z.

Birds in vicinity of airport.

Contact Airport Manager 208-788-4956 or 208-720-5186 for noise abatement procedures.

Taxiways B5 and B6 restricted to aircraft with wingspans of 79' or less (aircraft design group II) only.

All arriving aircraft from 0600Z to 1400Z required to announce on CTAF 125.6 when they are 20, 15, 10, and 5 miles out, and on short final. Equipment may be on runway.

Fuel available after dusk PPR 208-788-9511.

ARFF available from 0700-2300LT.

ARFF Index: Prior permission required for all scheduled air carrier operations between 2300-0600LT. Call Airport Manager 208-788-4956.

ATND SKD H24. Customs: O/R

Acraft with wingspan greater than 214' require 48 hours prior permission. Call 773-686-2255.

Birds on and in vicinity of apt, pyrotechnics and bird cannons in use.

East and West gates are manned 24 hours a day.

Airport nighttime noise abatement procedures are in effect from 0400-1300Z. Contact Airport Operations.

A380-800 Operational constraints exist on runways, taxiways, and ramps. Contact Airport Operations for information.

Diversion Air Carriers without a presence at ORD should contact Airport Operations prior to diverting to the extent practical and provide: Company, Flight Operations contact information, aircraft type, persons on board, international or domestic, any ground handler agreements in place.

BE ALERT: Twy S1 outbound or eastbound only, Twy S2 inbound or westbound only. Twys P1, P2, P3, P5, and P6 northbound only. Twy

ILLINOIS

E1, E2, E3 & E4 southbound only. Twy E3 westbound only from Rwy 09C/27C.

Aircraft are not permitted to stop on either Twy A or B Bridges.

B747-8, B747-400, B777-200LR(F), B777-300ER, A350-900, A350-1000, A340-500, A340-600 and A330-900 cannot pass on taxiway A and taxiway B due to insufficient wing tip clearance.

B747-8 operations not authorized on runways 9R/27L, 9L/27R and 10R/28L.

CAUTION: Be alert for fire equipment entering Twys E & Z.

Rwy Status Lights are in operation.

TWY YY between UAL main service center hanger south ramp and TWY C2 closed to wingspan more than 211FT.

Rwy 04L closed to arrivals; Rwy 22R closed to departures.

Line up and wait authorization in effect between sunset and sunrise at the following intersections: Rwy 28R at Twy GG, Twy EE, and Twy N5; Rwy 10L at Twy DD, Twy CC, and Twy BB. Rwy 27C at Twy TT. Rwy 09C at Twy FF. Rwy 27L at Twy TT. Rwy 09R at Twy BB and Twy FF. These runways will be used for departures only when exercising the provisions of this authorization.

Deicing fluid not available to transient aircraft.

Magnetic deviation possible intermittent west of Taxiway Y & Rwy 22L approach on Twy N.

Acraft at gates M1, M2, M3A, and M3 are to be pushed directly on to the centerline of Twy B. In addition, the push-out tractor and ground personnel should remain with the aircraft until such time as engines are started. Gates M1,2,3A and 3 must contact Gate Cont on 129.05 prior to requesting push back clearance from Grnd Cont 121.9. Aircraft arriving or departing M25 or M26 must contact Ramp Cont after clearing Twy D and prior to push back. Gates M4A thru

M26 are controlled by the International Gate Coordinator 0600-2200 LT, 129.05.

All Part 91 and unscheduled Part 125, 133 and 135 charter operators contact Signature Flight Support at 773-686-7000 regarding new security regulations prior to departure.

International Ramp Cont 129.05. Monitor Ground Cont simultaneously 0600-2200 LT.

Alert: Duplicate alpha-numeric taxiway designators and terminal gate designations involving the letters B, C, G, H, K, L and M.

Alert: Two taxi routes are available to access To/From N.E. Cargo Ramp.

ARFF frequency: 119.25 mhz.

Periodic fire training at north sector of airport.

Taxi lane BB2 closed to wingspan more than 118'.

ATCT is authorized to conduct simultaneous departures from Rwy 04L/04R, Rwy 22L/22R, Rwy 09R with Rwy 09L or Rwy 10L, Rwy 09C with Rwy 09L or Rwy 10L, Rwy 10C with Rwy 09R or Rwy 09C, Rwy 27L with Rwy 27R or Rwy 28R, Rwy 27C with Rwy 27R or Rwy 28R, Rwy 28C with Rwy 27L or Rwy 27C with course divergence beginning no later than 4 miles from runway end.

No run-ups permitted on the Rwy 14R and 14L pads.

ASDE-X IN USE. Operate transponders with altitude reporting mode and ADS-B (if equipped) enabled on all airport surfaces.

Be Alert: The northeast/southwest portion of Twy YY is not visible from the Center ATCT.

Dual VHF communications required for simultaneous close parallel ILS PRM approaches. Rwy 10C monitor 119.625, Rwy 10R monitor 128.05.

Primary run up location ground run up enclosure; Secondary run up location available upon request - contact city operations 773-686-2255.

aviation aircraft Mon-Sat, 1600-0700Z; Sun,
1600-2000Z and 0100-0700Z.

Aircraft departing Rwy 19R use minimum power
until passing the runway threshold. Rwy 19R
threshold has standard runway markings and is
780' S of the blast pad.

Aircraft operating near the intersection of Twys
S, D, G and the N end of Twy Z, should be alert

NEVADA

as there are closely aligned Twy centerlines and radius turns.

Aircraft taxiing westbound on Twy B near Twy E use care not to enter the Rwy on Twy Y. Aircraft taxiing westbound on Twy W near Twy E use care not to enter the runway on Twy U.

Aircraft that depart full length of Rwy 01L and 08L must hold at the same hold line as there is no room to hold between the Rwy ends and such aircraft should verify that they are on the correct runway.

Aircraft with a wingspan greater than 135', prior permission required from the Dept of Aviation to use Twy H.

Aircraft using full length departure on Rwy 08L use minimum power until passing the power-up point on Rwy. Power-up point is 348' E of blast pad and marked with sign and standard markings for beginning of Rwy.

All non-standard runway operations, prior permission required from Department of Aviation.

GA Customs Boarder Patrol reservations are required to be submitted a minimum of 12 hrs in advance (other conditions apply). Reservations must be made online at www.mccarran.com/GACBP. Questions can be directed to CBP559@mccarran.com.

GACustoms and Immigration located W side of airfield between FBO's.

Large numbers of birds and bats in vicinity of Apt between SS and SR.

Runway Status Lights are in operation.

Turbojet departures not permitted on Rwy 1R/19L or Rwy 1L/19R 0400-1600Z. Exceptions for Wx or operational necessity.

When special event parking prior permission required program NOTAM is active, transient aircraft operators not permanently based need to obtain a prior permission required number from FBO for each landing. Prior permission required approval & confirmation numbers can be obtained from the select FBO at

702-261-7775. Prior permission required confirmation numbers should be entered in the remarks section of each flight plan.

All Acft contact Ramp Control on 124.400 for Ops at A, B, and C Gates. Contact Ramp Control on 127.900 for Ops at D, E Gates and Cargo Ramp prior to entering Ramp or pushing back from Gate or Parking Spot. Ramp Control operating hours 1330-0900Z. Contact ATC from 0900-1330Z for ramp operations.

Extensive glider/soaring Ops weekends and holidays; SR-SS; LAS R187/020; altitudes up to but not including FL180. Gliders remain clear of the TCA but otherwise operate within the entire southwest quadrant of the TCA veil.

CAUTION: Parachute jumping activities in the vicinity of the Airport.

ASDE-X IN USE. Operate transponders with altitude reporting mode and ADS-B (if equipped) enabled on all airport surfaces.

Lighted golf range 1400' S of Rwy 1L/19R and 1R/19L.

Tie down fee.

Numerous Copter Ops on West side of Apt.

Practice Low Approaches authorized between 1000Z and 1400Z.

First 1000ft of Runway 16R is concrete.

ATND SKD 1500-0400Z. Lndg Rights.

Airfield conditions not monitored between 0800-1430Z.

Avoid intersection departures from Rwy 16L/34R.

Avoid low level overflight of Boeing ramp; NE corner of airport due to Jet Blast.

Be alert to converging traffic on base to final legs Rwy 16R/34L 0500-1500Z.

Flocks of large and small birds in vicinity of airport.

For noise abatement from 0500-1500Z if aircraft performance/wind allows, use Rwy 16R for arrivals and Rwy 34L for departures.

It is requested that pilots adhere to the following noise abatement procedures unless otherwise instructed by ATCT, itinerant arrival and low approach of small aircraft over 250 horsepower authorized on Rwy 16L and 34R.

Itinerant departure of small aircraft over 250 hp on Rwy 34R.

Personnel and equipment has facility constraints that limit its ability to accommodate diverted flight and maintain the airport's safe operations during irregular operations. Aircraft operators should contact the on-duty airport operations personnel to coordinate diverted flights except in the case of a declared in-flight emergency.

Prior permission required for access on Boeing ramp. Contact Boeing Flight Dispatch for approval. Prior to taxi onto Boeing ramp contact Boeing Radio Tower 123.475 or call 425-342-5900.

Rwy 16L/34R closed between 0500-1500Z.

Rwys 16L/34R limited to helicopter 8,000 lbs or less.

Takeoff clearance Rwy 16R full length; Enter runway via Twy A1 unless Twy AA specified.

Twy A2 restricted to 30,000 lbs.

Twy E restricted to aircraft with a wingspan of 171'. Aircraft wingspan of 171' or greater in taxi-lane E, tug operations only. East 500' of taxi-lane E restricted to wingspan less than 49'.

Twy C between terminal ramp and central ramp restricted to wingspan of 68' or less. Twys D, F, G and L restricted to wingspan less than 49'.

Twys A4, A5, K7, and B restricted to wingspan less than 118'. Taxi-lane H restricted to wingspan less than 49'.

Twy K1 closed to aircraft under 30,000 lbs.

Large aircraft fly west passing over water; small aircraft fly east passing over airport.

Use caution for 80' AGL light poles SW edge of bravo ramp.

Rwy 16R/34 TGL prohibited Mon-Fri 1500-1700Z.

Airport closed to unscheduled air carrier operations with more than 30 passenger seats 0500-1500Z except PPR contact airport operations.

WASHINGTON

Rwy 16L/34R - Large aircraft fly west pattern over water; small aircraft fly east pattern over airport.

100LL self service available 24 hours with credit card. Helicopters are prohibited at the self service fueling island. For Jet and and helicopter fuel afterhours call Ground Services Provider.

Terminal Procedures - North America

CANADA

ALTERNATE MINIMA

Authorized weather minima for alternate airports are to be determined utilizing the information presented in the tables below. The minima derived for an alternate airport shall be consistent with aircraft performance, navigation equipment limitations, functioning navigation aids (conventional and satellite-based), type of weather forecast, runway to be used and compliance with subsection 605.18(j) of the Canadian Aviation Regulations.

In addition to the Alternate Weather Minima Requirements tables below, the following must be considered by the pilot-in-command for satellite-based approaches at an alternate airport. Credit may be taken for satellite-based approaches provided that:

- a. Predicted satellite outages have been taken into account. The pilot-in-command verifies that approach-level RAIM or WAAS integrity is expected to be available at the proposed ETA for any airport;
- b. For GPS TSO C129/C129a avionics, periodically during the flight, and at least once before the mid-point of the flight to the destination, the pilot-in-command verifies that approach-level RAIM is expected to be available at the planned destination and/or alternate ETA; and,
- c. Where a satellite-based approach is planned at both the destination and alternate, the airports are separated by a minimum of:
 1. 75 NM where both airports are in either Nunavut, or north of 56 degrees North latitude in Quebec and Labrador;
 2. 100 NM where either or both airports are located anywhere else in Canada;
- d. For RNP Approach navigation specifications [procedure identification RNAV (GNSS) RWY XX]:
 1. No credit may be taken for LPV or LP lines of minima;
 2. Credit may be taken for LNAV/VNAV lines of minima when the aircraft is certified for barometric LNAV/VNAV; and,
 3. Credit may be taken for LNAV lines of minima.
- e. For RNP AR Approach navigation specifications [procedure identification RNAV (RNP) RWY XX]:
 1. No credit may be taken by General Aviation operators;
 2. Credit may be taken by Private and Commercial operators provided they have a valid operator authorization in accordance with their Private Operator Registration Document (PORD) or Aircraft Operating Certificate (AOC); and,
 3. Credit may be taken for RNP 0.30 lines of minima only.

CANADA
ALTERNATE WEATHER MINIMA REQUIREMENTS

FACILITIES AVAILABLE AT SUITABLE ALTERNATE	WEATHER REQUIREMENTS
TWO OR MORE USABLE PRECISION APPROACHES – each providing straight-in minima to separate suitable runways	400-1 or 200-1/2 above lowest usable HAT and visibility, whichever is greater.
ONE USABLE PRECISION APPROACH	600-2* or 300-1 above the lowest usable HAT and visibility, whichever is greater.
NON-PRECISION ONLY AVAILABLE	800-2* or 300-1 above the lowest usable HAT/HAA and visibility, whichever is greater.
NO IFR APPROACH AVAILABLE	Forecast weather must be no lower than 500 ft above a minimum IFR altitude that will permit a VFR approach and landing.
FOR HELICOPTERS, where instrument approach procedures are available	Ceiling 200 ft above the minima for the approach to be flown and visibility at least 1 SM, but never less than the minimum visibility for the approach to be flown
* 600-2 and 800-2 , as appropriate, are considered to be STANDARD ALTERNATE MINIMA. Should the selected alternate weather requirements meet the standard minima, then the following minima are also authorized:	

STANDARD ALTERNATE MINIMA		IF STANDARD IS APPLICABLE, THEN THE FOLLOWING MINIMA ARE ALSO AUTHORIZED	
CEILING	VISIBILITY	CEILING	VISIBILITY
600	2	700	1 1/2
		800	1
800	2	900	1 1/2
		1000	1

NOTE:

- These requirements are predicated upon the airport having an AERODROME FORECAST (TAF) available.*
- Airports served with an AERODROME ADVISORY forecast may qualify as an alternate provided the forecast weather is no lower than 500 ft above the lowest usable HAT/HAA and the visibility is not less than 3 miles.*
- Airports served with a GRAPHIC AREA FORECAST (GFA) may qualify as an alternate provided the forecast weather contains:*

CANADA

1. no cloud lower than 1000 ft above the lowest usable HAT/HAA;
 2. no cumulonimbus; and
 3. a visibility not less than 3 miles
- d. Ceiling minima are calculated by reference to the procedure HAA or HAT. Ceiling values in aviation forecasts are established in 100 ft increments. Up to 20 ft, use the lower 100 ft increment; above 20 ft, use the next higher 100 ft increment:

Examples:

HAA 620 ft = ceiling value of 600 ft;
HAA 621 ft = ceiling value of 700 ft;
HAT 420 ft = ceiling value of 400 ft.; and
HAT 421 ft = ceiling value of 500 ft.

- e. Calculated visibilities should not exceed 3 miles.

CAUTION: All heights specified in a GFA are ASL, unless otherwise indicated.

The emphasis of the above criteria is placed upon the availability of the lowest usable landing HAT/HAA and visibility for an airport. In determining the lowest usable landing HAT/HAA and visibility, the pilot should consider:

- a. the operational availability of the ground navigational equipment by consulting NOTAM;
- b. the compatibility of the aircraft equipment with the ground navigational equipment;
- c. the forecast surface wind conditions could dictate the landing runway and associated approach minima;
- d. the operational applicability of terms BECMG, TEMPO, and PROB within the forecast (see ATC, Requirements for Alternate Airport – IFR Flight);
- e. all heights mentioned within a GFA are ASL heights, unless otherwise indicated, and the terrain elevation must be applied in order to determine the lowest forecast ceiling at a particular location; and
- f. alternate minima values determined from a previous flight operation may not be applicable to a subsequent flight operation.

Aerodrome forecasts (TAF) that contain the terms BECMG, TEMPO or PROB may be used to determine the weather suitability of an airport as an alternate, provided that:

- a. where conditions are forecast to improve, the forecast BECMG condition shall be considered to be applicable as of the end of the BECMG time period, and these conditions shall not be below the published alternate minima requirements for that airport;
- b. where conditions are forecast to deteriorate, the forecast BECMG condition shall be considered to be applicable as of the start of the BECMG time period, and these conditions shall not be below the published alternate minima requirements for that airport;

- c. the forecast TEMPO condition shall not be below the published alternate minima requirements for that airport; and
- d. the forecast PROB condition shall not be below the appropriate landing minima for that airport.

CANADA

COLD TEMPERATURE CORRECTIONS

Pressure altimeters are calibrated to indicate true altitude under International Standard Atmosphere (ISA) conditions. Any deviation from ISA will result in an erroneous reading on the altimeter. In a case when the temperature is higher than ISA, the true altitude will be higher than the figure indicated by the altimeter, and the true altitude will be lower when the temperature is lower than ISA. The altimeter error may be significant and becomes extremely important when considering obstacle clearances in very cold temperatures.

In conditions of extreme cold weather, pilots should add the values derived from the Altitude Correction Chart to the published procedure altitudes, including minimum sector altitudes and DME arcs, to ensure adequate obstacle clearance. Unless otherwise specified, the destination aerodrome elevation is used as the elevation of the altimeter source.

With respect to altitude corrections, the following procedures apply:

- IFR assigned altitudes may be either accepted or refused. Refusal in this case is based upon the pilot's assessment of temperature effect on obstruction clearance.
- IFR assigned altitudes accepted by a pilot shall not be adjusted to compensate for cold temperatures, i.e., if a pilot accepts "maintain 3000 feet" an altitude correction shall not be applied to 3000 feet.
- Radar vectoring altitudes assigned by ATC are temperature compensated and require no corrective action by pilots.
- When altitude corrections are applied to a published final approach fix crossing altitude, procedure turn or missed approach altitude, pilots should advise ATC how much of a correction is to be applied.

Altitude Correction Chart

A/D TEMP °C	HEIGHT ABOVE THE ELEVATION OF THE ALTIMETER SOURCE (feet)													
	200	300	400	500	600	700	800	900	1000	1500	2000	3000	4000	5000
0	20	20	30	30	40	40	50	50	60	90	120	170	230	290
-10	20	30	40	50	60	70	80	90	100	150	200	290	390	490
-20	30	50	60	70	90	100	120	130	140	210	280	430	570	710
-30	40	60	80	100	120	130	150	170	190	280	380	570	760	950
-40	50	80	100	120	150	170	190	220	240	360	480	720	970	1210
-50	60	90	120	150	180	210	240	270	300	450	600	890	1190	1500

NOTE:

- The corrections have been rounded up to the next 10-ft increment.
- Values should be added to published minimum IFR altitudes.

CANADA

c. *Temperature values from the reporting station (normally the aerodrome) nearest to the position of the aircraft should be used.*

EXAMPLE: Aerodrome Elevation 2262 feet

Aerodrome Temperature -50° C

	ALTITUDE	HAA	CORRECTION	INDICATED ALTITUDE
Procedure Turn	4000 ft	1738 ft	+521.4 ft ¹	4600 ft ²
FAF	3300 ft	1038 ft	+311.4 ft	3700 ft
MDA Straight-in	2840 ft	578 ft	+173.4 ft	3020 ft
Circling MDA	2840 ft	578 ft	+173.4 ft	3020 ft

¹ CORRECTION derived as follows:

(2000 ft at -50° error) 600 - (1500 ft at -50° error) 450	= 150
Altitude difference of above (2000 - 1500)	= 500
Error per foot difference (150/500)	= .3
HAA	= 1738
Error at 1738 = (1738 - 1500) x 0.3 = 71.4 + 450 (error -50° at 1500)	= 521.4

² INDICATED ALTITUDE derived as follows:

Calculated error at 1738 from above	= 521.4
Procedure-turn altitude (4000) + error (521.4)	= 4521.4
INDICATED ALTITUDE rounded next higher 100-ft increment	= 4600
