- (c) Pilots of aircraft transiting the area and in radar contact/communication with approach control will receive traffic information on a controller workload permitting basis. Pilots of such aircraft should give their position, altitude, aircraft call sign, aircraft type, radar beacon code (if transponder equipped), destination, and/or route of flight.

b. TRSA Service (Radar Sequencing and Separation Service for VFR Aircraft in a TRSA).

1. This service has been implemented at certain terminal locations. The service is advertised in the Chart Supplement U.S. The purpose of this service is to provide separation

US 4-1

SECTION 1. SERVICES AVAILABLE TO PILOTS

between all participating VFR aircraft and all IFR aircraft operating within the airspace defined as the Terminal Radar Service Area (TRSA). Pilot participation is urged but is not mandatory.

2. If any aircraft does not want the service, the pilot should state "NEGATIVE TRSA SERVICE" or make a similar comment, on initial contact with approach control or ground control, as appropriate.
3. TRSAs are depicted on sectional aeronautical charts and listed in the Chart Supplement U.S.
4. While operating within a TRSA, pilots are provided TRSA service and separation as prescribed in this paragraph. In the event of a radar outage, separation and sequencing of VFR aircraft will be suspended as this service is dependent on radar. The pilot will be advised that the service is not available and issued wind, runway information, and the time or place to contact the tower. Traffic information will be provided on a workload permitting basis.
5. Visual separation is used when prevailing conditions permit and it will be applied as follows:
 - (a) When a VFR flight is positioned behind a preceding aircraft and the pilot reports having that aircraft in sight, the pilot will be instructed by ATC to follow the preceding aircraft. Radar service will be continued to the runway. THE ATC INSTRUCTION TO FOLLOW THE PRECEDING AIRCRAFT DOES NOT AUTHORIZE THE PILOT TO COMPLY WITH ANY ATC CLEARANCE OR INSTRUCTION ISSUED TO THE PRECEDING AIRCRAFT.
 - (b) If other "nonparticipating" or "local" aircraft are in the traffic pattern, the tower will issue a landing sequence.
 - (c) Departing VFR aircraft may be asked if they can visually follow a preceding departure out of the TRSA. The pilot will be instructed to follow the other aircraft provided that the pilot can maintain visual contact with that aircraft.
6. Participating VFR aircraft will be separated from IFR and other participating VFR aircraft by one of the following:
 - (a) 500 feet vertical separation.
 - (b) Visual separation.
 - (c) Target resolution (a process to ensure that correlated radar targets do not touch).
7. Participating pilots operating VFR in a TRSA:
 - (a) Must maintain an altitude when assigned by ATC unless the altitude assignment is to maintain at or below a specified altitude. ATC may assign altitudes for separation that do not conform to 14 CFR Section 91.159. When the altitude assignment is no longer needed for separation or when leaving the TRSA, the instruction will be broadcast, "RESUME APPROPRIATE VFR ALTITUDES." Pilots must then

US 4-1

SECTION 1. SERVICES AVAILABLE TO PILOTS

return to an altitude that conforms to 14 CFR Section 91.159 as soon as practicable.

- (b) When not assigned an altitude, the pilot should coordinate with ATC prior to any altitude change.
- 8. Within the TRSA, traffic information on observed but unidentified targets will, to the extent possible, be provided to all IFR and participating VFR aircraft. The pilot will be vectored upon request to avoid the observed traffic, provided the aircraft to be vectored is within the airspace under the jurisdiction of the controller.
- 9. Departing aircraft should inform ATC of their intended destination and/or route of flight and proposed cruising altitude.
- 10. ATC will normally advise participating VFR aircraft when leaving the geographical limits of the TRSA. Radar service is not automatically terminated with this advisory unless specifically stated by the controller.
- c. **Class C Service.** This service provides, in addition to basic radar service, approved separation between IFR and VFR aircraft, and sequencing of VFR arrivals to the primary airport.
- d. **Class B Service.** This service provides, in addition to basic radar service, approved separation of aircraft based on IFR, VFR, and/or weight, and sequencing of VFR arrivals to the primary airport(s).
- e. **PILOT RESPONSIBILITY.** THESE SERVICES ARE NOT TO BE INTERPRETED AS RELIEVING PILOTS OF THEIR RESPONSIBILITIES TO SEE AND AVOID OTHER TRAFFIC OPERATING IN BASIC VFR WEATHER CONDITIONS, TO ADJUST THEIR OPERATIONS AND FLIGHT PATH AS NECESSARY TO PRECLUDE SERIOUS WAKE ENCOUNTERS, TO MAINTAIN APPROPRIATE TERRAIN AND OBSTRUCTION CLEARANCE, OR TO REMAIN IN WEATHER CONDITIONS EQUAL TO OR BETTER THAN THE MINIMUMS REQUIRED BY 14 CFR SECTION 91.155. WHENEVER COMPLIANCE WITH AN ASSIGNED ROUTE, HEADING AND/OR ALTITUDE IS LIKELY TO COMPROMISE PILOT RESPONSIBILITY RESPECTING TERRAIN AND OBSTRUCTION CLEARANCE, VORTEX EXPOSURE, AND WEATHER MINIMUMS, APPROACH CONTROL SHOULD BE SO ADVISED AND A REVISED CLEARANCE OR INSTRUCTION OBTAINED.
- f. ATC services for VFR aircraft participating in terminal radar services are dependent on ATC radar. Services for VFR aircraft are not available during periods of a radar outage. The pilot will be advised when VFR services are limited or not available.

NOTE: *Class B and Class C airspace are areas of regulated airspace. The absence of ATC radar does not negate the requirement of an ATC clearance to enter Class B airspace or two way radio contact with ATC to enter Class C airspace.*

4-1-19 TOWER EN ROUTE CONTROL (TEC)

- a. TEC is an ATC program to provide a service to aircraft proceeding to and from metropolitan areas. It links designated Approach Control Areas by a network of identified routes made up of the existing airway structure of the National Airspace System. The FAA initiated an expan-

US 4-1

SECTION 1. SERVICES AVAILABLE TO PILOTS

ded TEC program to include as many facilities as possible. The program's intent is to provide an overflow resource in the low altitude system which would enhance ATC services. A few facilities have historically allowed turbojets to proceed between certain city pairs, such as Milwaukee and Chicago, via tower en route and these locations may continue this service. However, the expanded TEC program will be applied, generally, for nonturbojet aircraft operating at and below 10,000 feet. The program is entirely within the approach control airspace of multiple terminal facilities. Essentially, it is for relatively short flights. Participating pilots are encouraged to use TEC for flights of two hours duration or less. If longer flights are planned, extensive coordination may be required within the multiple complex which could result in unanticipated delays.

- b. Pilots requesting TEC are subject to the same delay factor at the destination airport as other aircraft in the ATC system. In addition, departure and en route delays may occur depending upon individual facility workload. When a major metropolitan airport is incurring significant delays, pilots in the TEC program may want to consider an alternative airport experiencing no delay.
- c. There are no unique requirements upon pilots to use the TEC program. Normal flight plan filing procedures will ensure proper flight plan processing. Pilots should include the acronym "TEC" in the remarks section of the flight plan when requesting tower en route control.
- d. All approach controls in the system may not operate up to the maximum TEC altitude of 10,000 feet. IFR flight may be planned to any satellite airport in proximity to the major primary airport via the same routing.

4-1-20 TRANSPONDER AND ADS-B OUT OPERATION

a. General

1. Pilots should be aware that proper application of transponder and ADS-B operating procedures will provide both VFR and IFR aircraft with a higher degree of safety while operating on the ground and airborne. Transponder/ADS-B panel designs differ; therefore, a pilot should be thoroughly familiar with the operation of their particular equipment to maximize its full potential. ADS-B Out, and transponders with altitude reporting mode turned ON (Mode C or S), substantially increase the capability of surveillance systems to see an aircraft. This provides air traffic controllers, as well as pilots of suitably equipped aircraft (TCAS and ADS-B In), increased situational awareness and the ability to identify potential traffic conflicts. Even VFR pilots who are not in contact with ATC will be afforded greater protection from IFR aircraft and VFR aircraft that are receiving traffic advisories. Nevertheless, pilots should never relax their visual scanning for other aircraft, and should include the ADS-B In display (if equipped) in their normal traffic scan.
2. Air Traffic Control Radar Beacon System (ATCRBS) is similar to and compatible with military coded radar beacon equipment. Civil Mode A is identical to military Mode 3.
3. **Transponder and ADS-B operations on the ground.** Civil and military aircraft should operate with the transponder in the altitude reporting mode (consult the aircraft's flight manual to determine the specific transponder position to enable altitude reporting) and

US 4-1

SECTION 1. SERVICES AVAILABLE TO PILOTS

ADS-B Out transmissions enabled at all airports, any time the aircraft is positioned on any portion of the airport movement area. This includes all defined taxiways and runways. Pilots must pay particular attention to ATIS and airport diagram notations, General Notes (included on airport charts), and comply with directions pertaining to transponder and ADS-B usage. Generally, these directions are:

- (a) **Departures.** Select the transponder mode which allows altitude reporting and enable ADS-B during pushback or taxi-out from parking spot. Select TA or TA/RA (if equipped with TCAS) when taking the active runway.
- (b) **Arrivals.** If TCAS equipped, deselect TA or TA/RA upon leaving the active runway, but continue transponder and ADS-B transmissions in the altitude reporting mode. Select STBY or OFF for transponder and ADS-B upon arriving at the aircraft's parking spot or gate.

4. Transponder and ADS-B Operations While Airborne.

- (a) Unless otherwise requested by ATC, aircraft equipped with an ATC transponder maintained in accordance with 14 CFR Section 91.413 MUST operate with this equipment on the appropriate Mode 3/A code, or other code as assigned by ATC, and with altitude reporting enabled whenever in controlled airspace. If practicable, aircraft SHOULD operate with the transponder enabled in uncontrolled airspace.
- (b) Aircraft equipped with ADS-B Out MUST operate with this equipment in the transmit mode at all times, unless otherwise requested by ATC.
- (c) When participating in a VFR formation flight that is not receiving ATC services, only the lead aircraft should operate their transponder and ADS-B Out. All other aircraft should disable transponder and ADS-B transmissions once established within the formation.

NOTE: *If the formation flight is receiving ATC services, pilots can expect ATC to direct all non-lead aircraft to STOP SQUAWK, and should not do so until instructed.*

- 5. A pilot on an IFR flight who elects to cancel the IFR flight plan prior to reaching their destination, should adjust the transponder/ADS-B according to VFR operations.
- 6. If entering a U.S. OFFSHORE AIRSPACE AREA from outside the U.S., the pilot should advise on first radio contact with a U.S. radar ATC facility that such equipment is available by adding "transponder" or "ADS-B" (if equipped) to the aircraft identification.
- 7. It should be noted by all users of ATC transponders and ADS-B Out systems that the surveillance coverage they can expect is limited to "line of sight" with ground radar and ADS-B radio sites. Low altitude or aircraft antenna shielding by the aircraft itself may result in reduced range or loss of aircraft contact. Though ADS-B often provides superior reception at low altitudes, poor coverage from any surveillance system can be improved by climbing to a higher altitude.

US 4-1

SECTION 1. SERVICES AVAILABLE TO PILOTS

NOTE: Pilots should refer to AIM, Paragraph 4-5-7, Automatic Dependent Surveillance-Broadcast (ADS-B) Services, for a complete description of operating limitations and procedures.

b. Transponder/ADS-B Code Designation

1. For ATC to utilize one of the 4096 discrete codes, a four-digit code designation will be used; for example, code 2102 will be expressed as "TWO ONE ZERO TWO."

NOTE: Circumstances may occasionally require ATC to assign a non-discrete code; i.e., a code ending in "00."

REFERENCE—FAA Order JO 7110.66, National Beacon Code Allocation Plan.

c. Automatic Altitude Reporting

1. Most transponders (Modes C and S) and all ADS-B Out systems are capable of automatic altitude reporting. This system converts aircraft altitude in 100-foot increments to coded digital information that is transmitted to the appropriate surveillance facility as well as to ADS-B In and TCAS systems.
2. Adjust the transponder/ADS-B to reply on the Mode 3/A code specified by ATC and with altitude reporting enabled, unless otherwise directed by ATC or unless the altitude reporting equipment has not been tested and calibrated as required by 14 CFR Section 91.217. If deactivation is required by ATC, turn off the altitude reporting feature of your transponder/ADS-B. An instruction by ATC to "STOP ALTITUDE SQUAWK, ALTITUDE DIFFERS BY (number of feet) FEET," may be an indication that the transmitted altitude information is incorrect, or that the aircraft's altimeter setting is incorrect. While an incorrect altimeter setting has no effect on the transmitted altitude information, it will cause the aircraft to fly at a true altitude different from the assigned altitude. When a controller indicates that an altitude readout is invalid, the pilot should verify that the aircraft altimeter is set correctly.

NOTE: Altitude encoders are preset at standard atmospheric pressure. Local altimeter correction is applied by the surveillance facility before the altitude information is presented to ATC.

3. Pilots should report exact altitude or flight level to the nearest hundred foot increment when establishing initial contact with an ATC facility. Exact altitude or flight level reports on initial contact provide ATC with information that is required prior to using automatically reported altitude information for separation purposes. This will significantly reduce altitude verification requests.

d. IDENT Feature

Transponder/ADS-B Out equipment must be operated only as specified by ATC. Activate the "IDENT" feature only when requested by ATC.

e. Code Changes

1. When making routine code changes, pilots should avoid inadvertent selection of Codes 7500, 7600 or 7700 thereby causing momentary false alarms at automated ground

US 4-1

SECTION 1. SERVICES AVAILABLE TO PILOTS

facilities. For example, when switching from Code 2700 to Code 7200, switch first to 2200 then to 7200, NOT to 7700 and then 7200. This procedure applies to nondiscrete Code 7500 and all discrete codes in the 7600 and 7700 series (i.e. 7600-7677, 7700-7777) which will trigger special indicators in automated facilities. Only nondiscrete Code 7500 will be decoded as the hijack code.

2. Under no circumstances should a pilot of a civil aircraft operate the transponder on Code 7777. This code is reserved for military interceptor operations.
3. Military pilots operating VFR or IFR within restricted/warning areas should adjust their transponders to Code 4000 unless another code has been assigned by ATC.

f. Mode C Transponder and ADS-B Out Requirements

1. Specific details concerning requirements to carry and operate Mode C transponders and ADS-B Out, as well as exceptions and ATC authorized deviations from those requirements, are found in 14 CFR Sections 91.215, 91.225, and 99.13.
2. In general, the CFRs require aircraft to be equipped with an operable Mode C transponder and ADS-B Out when operating:
 - (a) In Class A, Class B, or Class C airspace areas;
 - (b) Above the ceiling and within the lateral boundaries of Class B or Class C airspace up to 10,000 feet MSL;
 - (c) Class E airspace at and above 10,000 feet MSL within the 48 contiguous states and the District of Columbia, excluding the airspace at and below 2,500 feet AGL;
 - (d) Within 30 miles of a Class B airspace primary airport, below 10,000 feet MSL (commonly referred to as the "Mode C Veil");
 - (e) For ADS-B Out: Class E airspace at and above 3,000 feet MSL over the Gulf of Mexico from the coastline of the United States out to 12 nautical miles.

NOTE: *The airspace described in (e) above is specified in 14 CFR §91.225 for ADS-B Out requirements. However, 14 CFR §91.215 does not include this airspace for ATC transponder requirements.*

- (f) Transponder and ADS-B Out requirements do not apply to any aircraft that was not originally certificated with an electrical system, or that has not subsequently been certified with such a system installed, including balloons and gliders. These aircraft may conduct operations without a transponder or ADS-B Out when operating:
 - (1) Outside any Class B or Class C airspace area; and
 - (2) Below the altitude of the ceiling of a Class B or Class C airspace area designated for an airport, or 10,000 feet MSL, whichever is lower.
3. 14 CFR Section 99.13 requires all aircraft flying into, within, or across the contiguous U.S. ADIZ be equipped with a Mode C or Mode S transponder. Balloons, gliders and aircraft not equipped with an engine-driven electrical system are excepted from this requirement.

US 4-1

SECTION 1. SERVICES AVAILABLE TO PILOTS

REFERENCE—AIM, Chapter 5, Section 6, National Security and Interception Procedures.

4. Pilots must ensure that their aircraft transponder/ADS-B is operating on an appropriate ATC-assigned VFR/IFR code with altitude reporting enabled when operating in such airspace. If in doubt about the operational status of either feature of your transponder while airborne, contact the nearest ATC facility or FSS and they will advise you what facility you should contact for determining the status of your equipment.
5. In-flight requests for “immediate” deviation from the transponder requirements may be approved by controllers only for failed equipment, and only when the flight will continue IFR or when weather conditions prevent VFR descent and continued VFR flight in airspace not affected by the CFRs. All other requests for deviation should be made at least 1 hour before the proposed operation by contacting the nearest Flight Service or Air Traffic facility in person or by telephone. The nearest ARTCC will normally be the controlling agency and is responsible for coordinating requests involving deviations in other ARTCC areas.
6. In-flight requests for “immediate” deviation from the ADS-B Out requirements may be approved by ATC only for failed equipment, and may be accommodated based on workload, alternate surveillance availability, or other factors. All other requests for deviation must be made at least 1 hour before the proposed operation, following the procedures contained in Advisory Circular (AC) 90-114, Automatic Dependent Surveillance-Broadcast Operations.

g. Transponder/ADS-B Operation Under Visual Flight Rules (VFR)

1. Unless otherwise instructed by an ATC facility, adjust transponder/ADS-B to reply on Mode 3/A Code 1200 regardless of altitude.

NOTE 1: *Firefighting aircraft not in contact with ATC may squawk 1255 in lieu of 1200 while en route to, from, or within the designated firefighting area(s).*

NOTE 2: *VFR aircraft flying authorized SAR missions for the USAF or USCG may be advised to squawk 1277 in lieu of 1200 while en route to, from, or within the designated search area.*

NOTE 3: *VFR gliders should squawk 1202 in lieu of 1200.*

REFERENCE—FAA Order JO 7110.66, National Beacon Code Allocation Plan.

2. When required to operate their transponder/ADS-B, pilots must always operate that equipment with altitude reporting enabled, unless otherwise instructed by ATC or unless the installed equipment has not been tested and calibrated as required by 14 CFR Section 91.217. If deactivation is required, turn off altitude reporting.
3. When participating in a VFR formation flight that is not receiving ATC services, only the lead aircraft should operate their transponder and ADS-B Out. All other aircraft should disable transponder and ADS-B transmissions once established within the formation.

US 4-1

SECTION 1. SERVICES AVAILABLE TO PILOTS

NOTE: If the formation flight is receiving ATC services, pilots can expect ATC to direct all non-lead aircraft to STOP SQUAWK, and should not do so until instructed.

h. Cooperative Surveillance Phraseology

Air traffic controllers, both civil and military, will use the following phraseology when referring to operation of cooperative ATC surveillance equipment. Except as noted, the following ATC instructions do not apply to military transponders operating in other than Mode 3/A/C/S.

1. **SQUAWK (number).** Operate radar beacon transponder/ADS-B on designated code with altitude reporting enabled.
2. **IDENT.** Engage the "IDENT" feature (military I/P) of the transponder/ADS-B.
3. **SQUAWK (number) and IDENT.** Operate transponder/ADS-B on specified code with altitude reporting enabled, and engage the "IDENT" (military I/P) feature.
4. **SQUAWK STANDBY.** Switch transponder/ADS-B to standby position.
5. **SQUAWK NORMAL.** Resume normal transponder/ADS-B operation on previously assigned code. (Used after "SQUAWK STANDBY," or by military after specific transponder tests).
6. **SQUAWK ALTITUDE.** Activate Mode C with automatic altitude reporting.
7. **STOP ALTITUDE SQUAWK.** Turn off automatic altitude reporting.
8. **STOP SQUAWK (Mode in use).** Stop transponder and ADS-B Out transmissions, or switch off only specified mode of the aircraft transponder (military).
9. **SQUAWK MAYDAY.** Operate transponder/ADS-B in the emergency position (Mode A Code 7700 for civil transponder. Mode 3 Code 7700 and emergency feature for military transponder.)
10. **SQUAWK VFR.** Operate radar beacon transponder/ADS-B on Code 1200 in the Mode A/3, or other appropriate VFR code, with altitude reporting enabled.

4-1-21 AIRPORT RESERVATION OPERATIONS AND SPECIAL TRAFFIC MANAGEMENT PROGRAMS

This section describes procedures for obtaining required airport reservations at airports designated by the FAA and for airports operating under Special Traffic Management Programs.

a. Slot Controlled Airports.

1. The FAA may adopt rules to require advance operations for unscheduled operations at certain airports. In addition to the information in the rules adopted by the FAA, a listing of the airports and relevant information will be maintained on the FAA website listed below.
2. The FAA has established an Airport Reservation Office (ARO) to receive and process reservations for unscheduled flights at the slot controlled airports. The ARO uses the Enhanced Computer Voice Reservation System (e-CVRS) to allocate reservations. Reservations will be available beginning 72 hours in advance of the operation at the slot

US 4-1
SECTION 1. SERVICES AVAILABLE TO PILOTS

controlled airport. Standby lists are not maintained. Flights with declared emergencies do not require reservations. Refer to the website or touch-tone phone interface for the current listing of slot controlled airports, limitations, and reservation procedures.

NOTE: *The web interface/telephone numbers to obtain a reservation for unscheduled operations at a slot controlled airport are:*

1. *http://www.fly.faa.gov/ecvrs.*
 2. *Touch-tone: 1-800-875-9694*
 3. *Trouble number: 540-422-4246.*
3. For more detailed information on operations and reservation procedures at a Slot Controlled Airport, please see 14 CFR Part 93, Subpart K — High Density Traffic Airports.

b. Special Traffic Management Programs (STMP).

1. Special procedures may be established when a location requires special traffic handling to accommodate above normal traffic demand (for example, the Indianapolis 500, Super Bowl etc.) or reduced airport capacity (for example, airport runway/taxiway closures for airport construction). The special procedures may remain in effect until the problem has been resolved or until local traffic management procedures can handle the situation and a need for special handling no longer exists.
2. There will be two methods available for obtaining slot reservations through the ATCSCC: the web interface and the touch-tone interface. If these methods are used, a NOTAM will be issued relaying the website address and toll-free telephone number. Be sure to check current NOTAMs to determine: what airports are included in the STMP, the dates and times reservations are required; the time limits for reservation requests; the point of contact for reservations; and any other instructions.

NOTE: *The telephone numbers/web address to obtain a STMP slot are:*

1. *Touch-tone interface: 1-800-875-9755.*
 2. *Web interface: www.fly.faa.gov.*
 3. *Trouble number: 540-422-4246.*
- c. Users may contact the ARO at (540) 422-4246 if they have a problem making a reservation or have a question concerning the slot controlled airport/STMP regulations or procedures.

d. Making Reservations.

1. **Internet Users.** Detailed information and User Instruction Guides for using the Web Interface to the reservation systems are available on the websites for the slot controlled airports (e-CVRS), <http://www.fly.faa.gov/ecvrs>; and STMPs (e-STMP), <http://www.fly.faa.gov/estmp>.
2. **Telephone users.** When using the telephone to make a reservation, you are prompted for input of information about what you wish to do. All input is accomplished using the keypad on the telephone. The only problem with a telephone is that most keys have a

US 4-1
SECTION 1. SERVICES AVAILABLE TO PILOTS

letter and number associated with them. When the system asks for a date or time, it is expecting an input of numbers. A problem arises when entering an aircraft call sign or tail number. The system does not detect if you are entering a letter (alpha character) or a number. Therefore, when entering an aircraft call sign or tail number two keys are used to represent each letter or number. When entering a number, precede the number you wish by the number 0 (zero) i.e. 01, 02, 03, 04,... If you wish to enter a letter, first press the key on which the letter appears and then press 1, 2, or 3, depending upon whether the letter you desire is the first, second, or third letter on that key. For example, to enter the letter "N" first press the "6" key because "N" is on that key, then press the "2" key because the letter "N" is the second letter on the "6" key. Since there are no keys for the letters "Q" and "Z" e-CVRS pretends they are on the number "1" key. Therefore, to enter the letter "Q", press 11, and to enter the letter "Z" press 12.

NOTE: Users are reminded to enter the "N" character with their tail numbers. (See TBL 4-1-4.)

3. For additional helpful key entries, see TBL 4-1-5.)

TABLE 4-1-4 Codes for Call Sign/Tail Number Input

Codes for Call Sign/Tail Number Input Only			
A-21	J-51	S-73	1-01
B-22	K-52	T-81	2-02
C-23	L-53	U-82	3-03

TABLE 4-1-5 Helpful Key Entries

#	After entering a call sign/tail number, depressing the "pound key" (#) twice will indicate the end of the entry.
*2	Will take the user back to the start of the process.
*3	Will repeat the call sign/tail number used in a previous reservation.
*5	Will repeat the previous question.

US 4-1
SECTION 1. SERVICES AVAILABLE TO PILOTS
TABLE 4-1-5 Helpful Key Entries (continued)

*8	Tutorial Mode: In the tutorial mode each prompt for input includes a more detailed description of what is expected as input. *8 is a toggle on/off switch. If you are in tutorial mode and enter *8, you will return to the normal mode.
*0	Expert Mode: In the expert mode each prompt for input is brief with little or no explanation. Expert mode is also on/off toggle.

4-1-22 REQUESTS FOR WAIVERS AND AUTHORIZATIONS FROM TITLE 14, CODE OF FEDERAL REGULATIONS (14 CFR)

- a. Requests for a Certificate of Waiver or Authorization (FAA Form 7711-2), or requests for renewal of a waiver or authorization, may be accepted by any FAA facility and will be forwarded, if necessary, to the appropriate office having waiver authority.
- b. The grant of a Certificate of Waiver or Authorization from 14 CFR constitutes relief from specific regulations, to the degree and for the period of time specified in the certificate, and does not waive any state law or local ordinance. Should the proposed operations conflict with any state law or local ordinance, or require permission of local authorities or property owners, it is the applicant's responsibility to resolve the matter. The holder of a waiver is responsible for compliance with the terms of the waiver and its provisions.
- c. A waiver may be canceled at any time by the Administrator, the person authorized to grant the waiver, or the representative designated to monitor a specific operation. In such case either written notice of cancellation, or written confirmation of a verbal cancellation will be provided to the holder.

4-1-23 WEATHER SYSTEMS PROCESSOR

The Weather Systems Processor (WSP) was developed for use in the National Airspace System to provide weather processor enhancements to selected Airport Surveillance Radar (ASR)-9 facilities. The WSP provides Air Traffic with warnings of hazardous wind shear and microbursts. The WSP also provides users with terminal area 6-level weather, storm cell locations and movement, as well as the location and predicted future position and intensity of wind shifts that may affect airport operations.

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

4-2-1 GENERAL

- a. Radio communications are a critical link in the ATC system. The link can be a strong bond between pilot and controller or it can be broken with surprising speed and disastrous results. Discussion herein provides basic procedures for new pilots and also highlights safe operating concepts for all pilots.
- b. The single, most important thought in pilot-controller communications is understanding. It is essential, therefore, that pilots acknowledge each radio communication with ATC by using the appropriate aircraft call sign. Brevity is important, and contacts should be kept as brief as possible, but controllers must know what you want to do before they can properly carry out their control duties. And you, the pilot, must know exactly what the controller wants you to do. Since concise phraseology may not always be adequate, use whatever words are necessary to get your message across. Pilots are to maintain vigilance in monitoring air traffic control radio communications frequencies for potential traffic conflicts with their aircraft especially when operating on an active runway and/or when conducting a final approach to landing.
- c. All pilots will find the Pilot/Controller Glossary very helpful in learning what certain words or phrases mean. Good phraseology enhances safety and is the mark of a professional pilot. Jargon, chatter, and "CB" slang have no place in ATC communications. The Pilot/Controller Glossary is the same glossary used in FAA Order JO 7110.65, Air Traffic Control. We recommend that it be studied and reviewed from time to time to sharpen your communication skills.

4-2-2 RADIO TECHNIQUE

- a. **Listen** before you transmit. Many times you can get the information you want through ATIS or by monitoring the frequency. Except for a few situations where some frequency overlap occurs, if you hear someone else talking, the keying of your transmitter will be futile and you will probably jam their receivers causing them to repeat their call. If you have just changed frequencies, pause, listen, and make sure the frequency is clear.
- b. **Think** before keying your transmitter. Know what you want to say and if it is lengthy; e.g., a flight plan or IFR position report, jot it down.
- c. The microphone should be very close to your lips and after pressing the mike button, a slight pause may be necessary to be sure the first word is transmitted. Speak in a normal, conversational tone.
- d. When you release the button, wait a few seconds before calling again. The controller or FSS specialist may be jotting down your number, looking for your flight plan, transmitting on a different frequency, or selecting the transmitter for your frequency.
- e. Be alert to the sounds *or the lack of sounds* in your receiver. Check your volume, recheck your frequency, and *make sure that your microphone is not stuck* in the transmit position. Frequency blockage can, and has, occurred for extended periods of time due to unintentional transmitter operation. This type of interference is commonly referred to as a "stuck mike," and controllers may refer to it in this manner when attempting to assign an alternate frequency. If the assigned frequency is completely blocked by this type of interference, use

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

the procedures described for en route IFR radio frequency outage to establish or reestablish communications with ATC.

- f. Be sure that you are within the performance range of your radio equipment and the ground station equipment. Remote radio sites do not always transmit and receive on all of a facility's available frequencies, particularly with regard to VOR sites where you can hear but not reach a ground station's receiver. Remember that higher altitudes increase the range of VHF "line of sight" communications.

4-2-3 CONTACT PROCEDURES

a. Initial Contact.

1. The terms *initial contact* or *initial callup* means the first radio call you make to a given facility or the first call to a different controller or FSS specialist within a facility. Use the following format:
 - (a) Name of the facility being called;
 - (b) Your *full* aircraft identification as filed in the flight plan or as discussed in paragraph 4-2-4, Aircraft Call Signs;
 - (c) When operating on an airport surface, state your position.
 - (d) The type of message to follow or your request if it is short; and
 - (e) The word "Over" if required.

EXAMPLE:

1. "New York Radio, Mooney Three One One Echo."
 2. "Columbia Ground, Cessna Three One Six Zero Foxtrot, south ramp, I-F-R Memphis."
 3. "Miami Center, Baron Five Six Three Hotel, request V-F-R traffic advisories."
2. Many FSSs are equipped with Remote Communications Outlets (RCOs) and can transmit on the same frequency at more than one location. The frequencies available at specific locations are indicated on charts above FSS communications boxes. To enable the specialist to utilize the correct transmitter, advise the location and the frequency on which you expect a reply.

EXAMPLE: St. Louis FSS can transmit on frequency 122.3 at either Farmington, Missouri, or Decatur, Illinois, if you are in the vicinity of Decatur, your callup should be "Saint Louis radio, Piper Six Niner Six Yankee, receiving Decatur One Two Two Point Three."

3. If radio reception is reasonably assured, inclusion of your request, your position or altitude, and the phrase " (ATIS) Information Charlie received" in the initial contact helps decrease radio frequency congestion. Use discretion; do not overload the controller with information unneeded or superfluous. If you do not get a response from the ground station, recheck your radios or use another transmitter, but keep the next contact short.

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

EXAMPLE: “Atlanta Center, Duke Four One Romeo, request V-F-R traffic advisories, Twenty Northwest Rome, seven thousand five hundred, over.”

b. Initial Contact When Your Transmitting and Receiving Frequencies are Different.

1. If you are attempting to establish contact with a ground station and you are receiving on a different frequency than that transmitted, indicate the VOR name or the frequency on which you expect a reply. Most FSSs and control facilities can transmit on several VOR stations in the area. Use the appropriate FSS call sign as indicated on charts.

EXAMPLE: New York FSS transmits on the Kennedy, the Hampton, and the Calverton VORTACs. If you are in the Calverton area, your callup should be “New York radio, Cessna Three One Six Zero Foxtrot, receiving Calverton V-O-R, over.”

2. If the chart indicates FSS frequencies above the VORTAC or in the FSS communications boxes, transmit or receive on those frequencies nearest your location.
3. When unable to establish contact and you wish to call *any* ground station, use the phrase “ANY RADIO (tower) (station), GIVE CESSNA THREE ONE SIX ZERO FOX-TROT A CALL ON (frequency) OR (V-O-R).” If an emergency exists or you need assistance, so state.

c. Subsequent Contacts and Responses to Call-up from a Ground Facility.

Use the same format as used for the initial contact except you should state your message or request with the callup in one transmission. The ground station name and the word “Over” may be omitted if the message requires an obvious reply and there is no possibility for misunderstandings. *You should acknowledge all callups or clearances* unless the controller or FSS specialist advises otherwise. There are some occasions when controllers must issue time-critical instructions to other aircraft, and they may be in a position to observe your response, either visually or on radar. If the situation demands your response, take appropriate action or immediately advise the facility of any problem. Acknowledge with your aircraft identification, either at the beginning or at the end of your transmission, and one of the words “Wilco,” “Roger,” “Affirmative,” “Negative,” or other appropriate remarks; e.g., “PIPER TWO ONE FOUR LIMA, ROGER.” If you have been receiving services; e.g., VFR traffic advisories and you are leaving the area or changing frequencies, advise the ATC facility and terminate contact.

d. Acknowledgement of Frequency Changes.

1. When advised by ATC to change frequencies, acknowledge the instruction. If you select the new frequency without an acknowledgement, the controller's workload is increased because there is no way of knowing whether you received the instruction or have had radio communications failure.
2. At times, a controller/specialist may be working a sector with multiple frequency assignments. In order to eliminate unnecessary verbiage and to free the controller/specialist for higher priority transmissions, the controller/specialist may request the pilot “(Identification), change to my frequency 134.5.” This phrase should alert the pilot that the con-

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

troller/specialist is only changing frequencies, not controller/specialist, and that initial callup phraseology may be abbreviated.

EXAMPLE: “United Two Twenty-Two on one three four point five” or “one three four point five, United Two Twenty-Two.”

e. **Compliance with Frequency Changes.**

When instructed by ATC to change frequencies, select the new frequency as soon as possible unless instructed to make the change at a specific time, fix, or altitude. A delay in making the change could result in an untimely receipt of important information. If you are instructed to make the frequency change at a specific time, fix, or altitude, monitor the frequency you are on until reaching the specified time, fix, or altitudes unless instructed otherwise by ATC.

REFERENCE—AIM, Paragraph 5-3-1, ARTCC Communications.

4-2-4 AIRCRAFT CALL SIGNS

a. **Precautions in the Use of Call Signs.**

1. Improper use of call signs can result in pilots executing a clearance intended for another aircraft. Call signs should *never be abbreviated on an initial contact or at any time when other aircraft call signs have similar numbers/sounds or identical letters/number*; e.g., Cessna 6132F, Cessna 1622F, Baron 123F, Cherokee 7732F, etc.

EXAMPLE: Assume that a controller issues an approach clearance to an aircraft at the bottom of a holding stack and an aircraft with a similar call sign (at the top of the stack) acknowledges the clearance with the last two or three numbers of the aircraft's call sign. If the aircraft at the bottom of the stack did not hear the clearance and intervene, flight safety would be affected, and there would be no reason for either the controller or pilot to suspect that anything is wrong. This kind of “human factors” error can strike swiftly and is extremely difficult to rectify.

2. Pilots, therefore, must be certain that aircraft identification is complete and clearly identified before taking action on an ATC clearance. ATC specialists will not abbreviate call signs of air carrier or other civil aircraft having authorized call signs. ATC specialists may initiate abbreviated call signs of other aircraft by using the *prefix and the last three digits/letters* of the aircraft identification after communications are established. The pilot may use the abbreviated call sign in subsequent contacts with the ATC specialist. When aware of similar/identical call signs, ATC specialists will take action to minimize errors by emphasizing certain numbers/letters, by repeating the entire call sign, by repeating the prefix, or by asking pilots to use a different call sign temporarily. Pilots should use the phrase “VERIFY CLEARANCE FOR (your complete call sign)” if doubt exists concerning proper identity.
3. Civil aircraft pilots should state the aircraft type, model or manufacturer's name, followed by the digits/letters of the registration number. When the aircraft manufacturer's name or model is stated, the prefix “N” is dropped; e.g., Aztec Two Four Six Four Alpha.

EXAMPLE:

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

1. Bonanza Six Five Five Golf.
2. Breezy Six One Three Romeo Experimental (omit "Experimental" after initial contact).
4. Air Taxi or other commercial operators *not* having FAA authorized call signs should prefix their normal identification with the phonetic word "Tango."

EXAMPLE: Tango Aztec Two Four Six Four Alpha.

5. Air carriers and commuter air carriers having FAA authorized call signs should identify themselves by stating the complete call sign (using group form for the numbers) and the word "super" or "heavy" if appropriate.

EXAMPLE:

1. United Twenty-Five Heavy.
2. Midwest Commuter Seven Eleven.
6. Military aircraft use a variety of systems including serial numbers, word call signs, and combinations of letters/numbers. Examples include Army Copter 48931; Air Force 61782; REACH 31792; Pat 157; Air Evac 17652; Navy Golf Alfa Kilo 21; Marine 4 Charlie 36, etc.

b. Air Ambulance Flights.

Because of the priority afforded air ambulance flights in the ATC system, extreme discretion is necessary when using the term "MEDEVAC." It is only intended for those missions of an urgent medical nature and to be utilized only for that portion of the flight requiring priority handling. It is important for ATC to be aware of a flight's MEDEVAC status, and it is the pilot's responsibility to ensure that this information is provided to ATC.

1. To receive priority handling from ATC, the pilot must verbally identify the flight in radio transmissions by stating "MEDEVAC" followed by the FAA authorized call sign (ICAO 3LD, US Special, or local) or the aircraft civil "N" registration numbers/letters.

EXAMPLE: If the aircraft identification of the flight indicates DAL51, the pilot states "MEDEVAC Delta Fifty One."

If the aircraft identification of the flight indicates MDSTR1, the pilot states "MEDEVAC Medstar One."

If the aircraft identification of the flight indicates N123G or LN123G, the pilot states "MEDEVAC One Two Three Golf".

2. If requested by the pilot, ATC will provide additional assistance (e.g., landline notifications) to expedite ground handling of patients, vital organs, or urgently needed medical materials. When possible make these requests to ATC via methods other than through ATC radio frequencies.
3. MEDEVAC flights may include:

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

- (a) Civilian air ambulance flights responding to medical emergencies (e.g., first call to an accident scene, carrying patients, organ donors, organs, or other urgently needed lifesaving medical material).
 - (b) Air carrier and air taxi flights responding to medical emergencies. The nature of these medical emergency flights usually concerns the transportation of urgently needed lifesaving medical materials or vital organs, but can include inflight medical emergencies. It is imperative that the company/pilot determine, by the nature/urgency of the specific medical cargo, if priority ATC assistance is required.
4. When filing a flight plan, pilots may include “L” for MEDEVAC with the aircraft registration letters/digits and/or include “MEDEVAC” in Item 11 (Remarks) of the flight plan or Item 18 (Other Information) of an international flight plan. However, ATC will only use these flight plan entries for informational purposes or as a visual indicator. ATC will only provide priority handling when the pilot verbally identifies the “MEDEVAC” status of the flight as described in subparagraph b1 above.

NOTE: *Civilian air ambulance aircraft operating VFR and without a filed flight plan are eligible for priority handling in accordance with subparagraph b1 above.*

5. ATC will also provide priority handling to HOSP and AIR EVAC flights when verbally requested. These aircraft may file “HOSP” or “AIR EVAC” in either Item 11 (Remarks) of the flight plan or Item 18 of an international flight plan. For aircraft identification in radio transmissions, civilian pilots will use normal call signs when filing “HOSP” and military pilots will use the “EVAC” call sign.

c. Student Pilots Radio Identification.

1. The FAA desires to help student pilots in acquiring sufficient practical experience in the environment in which they will be required to operate. To receive additional assistance while operating in areas of concentrated air traffic, student pilots need only identify themselves as a student pilot during their initial call to an FAA radio facility.

EXAMPLE: Dayton tower, Fleetwing One Two Three Four, student pilot.

2. This special identification will alert FAA ATC personnel and enable them to provide student pilots with such extra assistance and consideration as they may need. It is recommended that student pilots identify themselves as such, on initial contact with each clearance delivery prior to taxiing, ground control, tower, approach and departure control frequency, or FSS contact.

4-2-5 DESCRIPTION OF INTERCHANGE OR LEASED AIRCRAFT

- a. Controllers issue traffic information based on familiarity with airline equipment and color/markings. When an air carrier dispatches a flight using another company's equipment and the pilot does not advise the terminal ATC facility, the possible confusion in aircraft identification can compromise safety.
- b. Pilots flying an “interchange” or “leased” aircraft not bearing the colors/markings of the company operating the aircraft should inform the terminal ATC facility on first contact the name of

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

the operating company and trip number, followed by the company name as displayed on the aircraft, and aircraft type.

EXAMPLE: Air Cal Three Eleven, United (interchange/lease), Boeing Seven Two Seven.

4-2-6 GROUND STATION CALL SIGNS

Pilots, when calling a ground station, should begin with the name of the facility being called followed by the type of the facility being called as indicated in TBL 4-2-1.

TABLE 4-2-1 Calling a Ground Station

Facility	Call Sign
Airport UNICOM	"Shannon UNICOM"
FAA Flight Service Station	"Chicago Radio"
Airport Traffic Control Tower	"Augusta Tower"
Clearance Delivery Position (IFR)	"Dallas Clearance Delivery"
Ground Control Position in Tower	"Miami Ground"
Radar or Nonradar Approach Control Position	"Oklahoma City Approach"
Radar Departure Control Position	"St. Louis Departure"
FAA Air Route Traffic Control Center	"Washington Center"

4-2-7 PHONETIC ALPHABET

The International Civil Aviation Organization (ICAO) phonetic alphabet is used by FAA personnel when communications conditions are such that the information cannot be readily received without their use. ATC facilities may also request pilots to use phonetic letter equivalents when aircraft with similar sounding identifications are receiving communications on the same frequency. Pilots should use the phonetic alphabet when identifying their aircraft during initial contact with air traffic control facilities. Additionally, use the phonetic equivalents for single letters and to spell out groups of letters or difficult words during adverse communications conditions. (See TBL 4-2-2.)

TABLE 4-2-2 Phonetic Alphabet/Morse Code

Character	Morse Code	Telephony	Phonic (Pronunciation)
A	• –	Alfa	(AL-FAH)

0	— — — — —	Zero	(ZEE-RO)

4-2-8 FIGURES

- a. Figures indicating hundreds and thousands in round number, as for ceiling heights, and upper wind levels up to 9,900 must be spoken in accordance with the following.

EXAMPLE:

1. 500 – five hundred
2. 4,500 – four thousand five hundred

- b. Numbers above 9,900 must be spoken by separating the digits preceding the word “thousand.”

EXAMPLE:

1. 10,000 – one zero thousand
2. 13,500 – one three thousand five hundred

- c. Transmit airway or jet route numbers as follows.

EXAMPLE:

1. V12 – Victor Twelve
2. J533 – J Five Thirty-Three

- d. All other numbers must be transmitted by pronouncing each digit.

EXAMPLE: 10 – one zero

- e. When a radio frequency contains a decimal point, the decimal point is spoken as “POINT.”

EXAMPLE: 122.1 – one two two point one

NOTE: ICAO procedures require the decimal point be spoken as “DECIMAL.” The FAA will honor such usage by military aircraft and all other aircraft required to use ICAO procedures.

4-2-9 ALTITUDES AND FLIGHT LEVELS

- a. Up to but not including 18,000 feet MSL, state the separate digits of the thousands plus the hundreds if appropriate.

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

EXAMPLE:

1. 12,000 – one two thousand
 2. 12,500 – one two thousand five hundred
- b. At and above 18,000 feet MSL (FL 180), state the words “flight level” followed by the separate digits of the flight level.

EXAMPLE:

1. 190 – Flight Level One Niner Zero
2. 275 – Flight Level Two Seven Five

4-2-10 DIRECTIONS

The three digits of bearing, course, heading, or wind direction should always be magnetic. The word “true” must be added when it applies.

EXAMPLE:

1. (Magnetic course) 005 – zero zero five
2. (True course) 050 – zero five zero true
3. (Magnetic bearing) 360 – three six zero
4. (Magnetic heading) 100 – heading one zero zero
5. (Wind direction) 220 – wind two two zero

4-2-11 SPEEDS

The separate digits of the speed followed by the word “KNOTS.” Except, controllers may omit the word “KNOTS” when using speed adjustment procedures; e.g., “REDUCE/INCREASE SPEED TO TWO FIVE ZERO.”

EXAMPLE: (Speed) 250 – two five zero knots

(Speed) 190 – one niner zero knots

The separate digits of the Mach Number preceded by “Mach.”

EXAMPLE: (Mach number) 1.5 – Mach one point five

(Mach number) 0.64 – Mach point six four

(Mach number) 0.7 – Mach point seven

4-2-12 TIME

- a. FAA uses Coordinated Universal Time (UTC) for all operations. The word “local” or the time zone equivalent must be used to denote local when local time is given during radio and telephone communications. The term “Zulu” may be used to denote UTC.

EXAMPLE: 0920 UTC – zero niner two zero,

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

zero one two zero pacific or local,
or one twenty AM

- b. To convert from Standard Time to Coordinated Universal Time:

TABLE 4-2-3 Standard Time to Coordinated Universal Time

Eastern Standard Time	Add 5 hours
Central Standard Time	Add 6 hours
Mountain Standard Time	Add 7 hours
Pacific Standard Time	Add 8 hours
Alaska Standard Time	Add 9 hours
Hawaii Standard Time	Add 10 hours

NOTE: For daylight time, subtract 1 hour.

- c. A reference may be made to local daylight or standard time utilizing the 24-hour clock system. The hour is indicated by the first two figures and the minutes by the last two figures.

EXAMPLE: 0000 – zero zero zero zero

0920 – zero niner two zero

- d. Time may be stated in minutes only (two figures) in radiotelephone communications when no misunderstanding is likely to occur.
- e. Current time in use at a station is stated in the nearest quarter minute in order that pilots may use this information for time checks. Fractions of a quarter minute less than 8 seconds are stated as the preceding quarter minute; fractions of a quarter minute of 8 seconds or more are stated as the succeeding quarter minute.

EXAMPLE: 0929:05 – time, zero niner two niner

0929:10 – time, zero niner two niner and one-quarter

4-2-13 COMMUNICATIONS WITH TOWER WHEN AIRCRAFT TRANSMITTER OR RECEIVER OR BOTH ARE INOPERATIVE

- a. **Arriving Aircraft.**

1. Receiver inoperative.

- (a) If you have reason to believe your receiver is inoperative, remain outside or above the Class D surface area until the direction and flow of traffic has been determined; then, advise the tower of your type aircraft, position, altitude, intention to land, and request that you be controlled with light signals.

REFERENCE—AIM, Paragraph 4-3-13, Traffic Control Light Signals.

US 4-2

SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES

- (b) When you are approximately 3 to 5 miles from the airport, advise the tower of your position and join the airport traffic pattern. From this point on, watch the tower for light signals. Thereafter, if a complete pattern is made, transmit your position downwind and/or turning base leg.
2. **Transmitter inoperative.** Remain outside or above the Class D surface area until the direction and flow of traffic has been determined; then, join the airport traffic pattern. Monitor the primary local control frequency as depicted on Sectional Charts for landing or traffic information, and look for a light signal which may be addressed to your aircraft. [Also see applicable Jeppesen charts and publications.] During hours of daylight, acknowledge tower transmissions or light signals by rocking your wings. At night, acknowledge by blinking the landing or navigation lights. To acknowledge tower transmissions during daylight hours, hovering helicopters will turn in the direction of the controlling facility and flash the landing light. While in flight, helicopters should show their acknowledgement of receiving a transmission by making shallow banks in opposite directions. At night, helicopters will acknowledge receipt of transmissions by flashing either the landing or the search light.
3. **Transmitter and receiver inoperative.** Remain outside or above the Class D surface area until the direction and flow of traffic has been determined; then, join the airport traffic pattern and maintain visual contact with the tower to receive light signals. Acknowledge light signals as noted above.
- b. **Departing Aircraft.** If you experience radio failure prior to leaving the parking area, make every effort to have the equipment repaired. If you are unable to have the malfunction repaired, call the tower by telephone and request authorization to depart without two-way radio communications. If tower authorization is granted, you will be given departure information and requested to monitor the tower frequency or watch for light signals as appropriate. During daylight hours, acknowledge tower transmissions or light signals by moving the ailerons or rudder. At night, acknowledge by blinking the landing or navigation lights. If radio malfunction occurs after departing the parking area, watch the tower for light signals or monitor tower frequency.

REFERENCE—14 CFR Section 91.125 and 14 CFR Section 91.129.

4-2-14 COMMUNICATIONS FOR VFR FLIGHTS

- a. FSSs and Supplemental Weather Service Locations (SWSL) are allocated frequencies for different functions; for example, in Alaska, certain FSSs provide Local Airport Advisory on 123.6 MHz or other frequencies which can be found in the Chart Supplement U.S. [Also see Jeppesen Low Altitude Enroute Charts and applicable Approach and Airport Charts.] If you are in doubt as to what frequency to use, 122.2 MHz is assigned to the majority of FSSs as a common en route simplex frequency.

NOTE: In order to expedite communications, state the frequency being used and the aircraft location during initial callup.

US 4-2**SECTION 2. RADIO COMMUNICATIONS PHRASEOLOGY AND TECHNIQUES**

EXAMPLE: Dayton radio, November One Two Three Four Five on one two two point two, over Springfield V-O-R, over.

- b. Certain VOR voice channels are being utilized for recorded broadcasts; for example, ATIS. These services and appropriate frequencies are listed in the Chart Supplement U.S. [Also see Jeppesen Low Altitude Enroute Charts and applicable Approach and Airport Charts.] On VFR flights, pilots are urged to monitor these frequencies. When in contact with a control facility, notify the controller if you plan to leave the frequency to monitor these broadcasts.

US 4-3

SECTION 3. AIRPORT OPERATIONS

4-3-1 GENERAL

Increased traffic congestion, aircraft in climb and descent attitudes, and pilot preoccupation with cockpit duties are some factors that increase the hazardous accident potential near the airport. The situation is further compounded when the weather is marginal, that is, just meeting VFR requirements. Pilots must be particularly alert when operating in the vicinity of an airport. This section defines some rules, practices, and procedures that pilots should be familiar with and adhere to for safe airport operations.

4-3-2 AIRPORTS WITH AN OPERATING CONTROL TOWER

- a. When operating at an airport where traffic control is being exercised by a control tower, pilots are required to maintain two-way radio contact with the tower while operating within the Class B, Class C, and Class D surface area unless the tower authorizes otherwise. Initial callup should be made about 15 miles from the airport. Unless there is a good reason to leave the tower frequency before exiting the Class B, Class C, and Class D surface areas, it is a good operating practice to remain on the tower frequency for the purpose of receiving traffic information. In the interest of reducing tower frequency congestion, pilots are reminded that it is not necessary to request permission to leave the tower frequency once outside of Class B, Class C, and Class D surface areas. Not all airports with an operating control tower will have Class D airspace. These airports do not have weather reporting which is a requirement for surface based controlled airspace, previously known as a control zone. The controlled airspace over these airports will normally begin at 700 feet or 1,200 feet above ground level and can be determined from the visual aeronautical charts. Pilots are expected to use good operating practices and communicate with the control tower as described in this section.
- b. When necessary, the tower controller will issue clearances or other information for aircraft to generally follow the desired flight path (traffic patterns) when flying in Class B, Class C, and Class D surface areas and the proper taxi routes when operating on the ground. If not otherwise authorized or directed by the tower, pilots of fixed-wing aircraft approaching to land must circle the airport to the left. Pilots approaching to land in a helicopter must avoid the flow of fixed-wing traffic. However, in all instances, an appropriate clearance must be received from the tower before landing.

US 4-3

SECTION 3. AIRPORT OPERATIONS

FIGURE 4-3-1

Components of a Traffic Pattern

NOTE: This diagram is intended only to illustrate terminology used in identifying various components of a traffic pattern. It should not be used as a reference or guide on how to enter a traffic pattern.

- c. The following terminology for the various components of a traffic pattern has been adopted as standard for use by control towers and pilots (See FIG 4-3-1):
1. **Upwind leg.** A flight path parallel to the landing runway in the direction of landing.
 2. **Crosswind leg.** A flight path at right angles to the landing runway off its takeoff end.
 3. **Downwind leg.** A flight path parallel to the landing runway in the opposite direction of landing.
 4. **Base leg.** A flight path at right angles to the landing runway off its approach end and extending from the downwind leg to the intersection of the extended runway centerline.
 5. **Final approach.** A flight path in the direction of landing along the extended runway centerline from the base leg to the runway.
 6. **Departure.** The flight path which begins after takeoff and continues straight ahead along the extended runway centerline. The departure climb continues until reaching a point at least $\frac{1}{2}$ mile beyond the departure end of the runway and within 300 feet of the traffic pattern altitude.
- d. Many towers are equipped with a tower radar display. The radar uses are intended to enhance the effectiveness and efficiency of the local control, or tower, position. They are not intended to provide radar services or benefits to pilots except as they may accrue through a more efficient tower operation. The four basic uses are:

US 4-3

SECTION 3. AIRPORT OPERATIONS

1. **To determine an aircraft's exact location.** This is accomplished by radar identifying the VFR aircraft through any of the techniques available to a radar position, such as having the aircraft *squawk ident*. Once identified, the aircraft's position and spatial relationship to other aircraft can be quickly determined, and standard instructions regarding VFR operation in Class B, Class C, and Class D surface areas will be issued. Once initial radar identification of a VFR aircraft has been established and the appropriate instructions have been issued, radar monitoring may be discontinued; the reason being that the local controller's primary means of surveillance in VFR conditions is visually scanning the airport and local area.
2. **To provide radar traffic advisories.** Radar traffic advisories may be provided to the extent that the local controller is able to monitor the radar display. Local control has primary control responsibilities to the aircraft operating on the runways, which will normally supersede radar monitoring duties.
3. **To provide a direction or suggested heading.** The local controller may provide pilots flying VFR with generalized instructions which will facilitate operations; e.g., "PROCEED SOUTHWESTBOUND, ENTER A RIGHT DOWNWIND RUNWAY THREE ZERO," or provide a suggested heading to establish radar identification or as an advisory aid to navigation; e.g., "SUGGESTED HEADING TWO TWO ZERO, FOR RADAR IDENTIFICATION." In both cases, the instructions are advisory aids to the pilot flying VFR and are not radar vectors.

NOTE: Pilots have complete discretion regarding acceptance of the suggested headings or directions and have sole responsibility for seeing and avoiding other aircraft.

4. **To provide information and instructions to aircraft operating within Class B, Class C, and Class D surface areas.** In an example of this situation, the local controller would use the radar to advise a pilot on an extended downwind when to turn base leg.

NOTE: The above tower radar applications are intended to augment the standard functions of the local control position. There is no controller requirement to maintain constant radar identification. In fact, such a requirement could compromise the local controller's ability to visually scan the airport and local area to meet FAA responsibilities to the aircraft operating on the runways and within the Class B, Class C, and Class D surface areas. Normally, pilots will not be advised of being in radar contact since that continued status cannot be guaranteed and since the purpose of the radar identification is not to establish a link for the provision of radar services.

- e. A few of the radar equipped towers are authorized to use the radar to ensure separation between aircraft in specific situations, while still others may function as limited radar approach controls. The various radar uses are strictly a function of FAA operational need. The facilities may be indistinguishable to pilots since they are all referred to as tower and no publication lists the degree of radar use. **Therefore, when in communication with a tower controller who may have radar available, do not assume that constant radar monitoring and complete ATC radar services are being provided.**

US 4-3

SECTION 3. AIRPORT OPERATIONS

4-3-3 TRAFFIC PATTERNS

- a. It is recommended that aircraft enter the airport traffic pattern at one of the following altitudes listed below. These altitudes should be maintained unless another traffic pattern altitude is published in the Chart Supplement U.S. or unless otherwise required by the applicable distance from cloud criteria (14 CFR Section 91.155). (See FIG 4-3-2 and FIG 4-3-3):
1. Propeller-driven aircraft enter the traffic pattern at 1,000 feet above ground level (AGL).
 2. Large and turbine-powered aircraft enter the traffic pattern at an altitude of not less than 1,500 feet AGL or 500 feet above the established pattern altitude.
 3. Helicopters operating in the traffic pattern may fly a pattern similar to the fixed-wing aircraft pattern, but at a lower altitude (500 AGL) and closer to the runway. This pattern may be on the opposite side of the runway from fixed-wing traffic when airspeed requires or for practice power-off landings (autorotation) and if local policy permits. Landings not to the runway must avoid the flow of fixed wing traffic.
- b. A pilot may vary the size of the traffic pattern depending on the aircraft's performance characteristics. Pilots of en route aircraft should be constantly alert for aircraft in traffic patterns and avoid these areas whenever possible.
- c. Unless otherwise indicated, all turns in the traffic pattern must be made to the left, except for helicopters, as applicable.
- d. On Sectional, Aeronautical, and VFR Terminal Area Charts, right traffic patterns are indicated at public-use and joint-use airports with the abbreviation "RP" (for Right Pattern), followed by the appropriate runway number(s) at the bottom of the airport data block.

EXAMPLE: *RP 9, 18, 22R*

NOTE:

1. *Pilots are encouraged to use the standard traffic pattern. However, those pilots who choose to execute a straight-in approach, maneuvering for and execution of the approach should not disrupt the flow of arriving and departing traffic. Likewise, pilots operating in the traffic pattern should be alert at all times for aircraft executing straight-in approaches.*

REFERENCE—AC 90-66B, *Non-Towered Airport Flight Operations*.

2. **RP indicates special conditions exist and refers pilots to the Chart Supplement U.S.*
 3. *Right traffic patterns are not shown at airports with full-time control towers.*
- e. Wind conditions affect all airplanes in varying degrees. Figure 4-3-4 is an example of a chart used to determine the headwind, crosswind, and tailwind components based on wind direction and velocity relative to the runway. Pilots should refer to similar information provided by the aircraft manufacturer when determining these wind components.

US 4-3

SECTION 3. AIRPORT OPERATIONS

FIGURE 4-3-2

Traffic Pattern Operations — Single Runway

**EXAMPLE: Key to traffic pattern operations**

1. Enter pattern in level flight, abeam the midpoint of the runway, at pattern altitude.
2. Maintain pattern altitude until abeam approach end of the landing runway on downwind leg.
3. Complete turn to final at least $\frac{1}{4}$ mile from the runway.
4. Continue straight ahead until beyond departure end of runway.
5. If remaining in the traffic pattern, commence turn to crosswind leg beyond the departure end of the runway within 300 feet of pattern altitude.
6. If departing the traffic pattern, continue straight out, or exit with a 45 degree turn (to the left when in a left-hand traffic pattern; to the right when in a right-hand traffic pattern) beyond the departure end of the runway, after reaching pattern altitude.

US 4-3

SECTION 3. AIRPORT OPERATIONS

FIGURE 4-3-3

Traffic Pattern Operations — Parallel Runways

EXAMPLE: Key to traffic pattern operations

1. Enter pattern in level flight, abeam the midpoint of the runway, at pattern altitude.
2. Maintain pattern altitude until abeam approach end of the landing runway on downwind leg.
3. Complete turn to final at least $\frac{1}{4}$ mile from the runway.
4. Continue straight ahead until beyond departure end of runway.
5. If remaining in the traffic pattern, commence turn to crosswind leg beyond the departure end of the runway within 300 feet of pattern altitude.

US 4-3

SECTION 3. AIRPORT OPERATIONS

6. If departing the traffic pattern, continue straight out, or exit with a 45 degree turn (to the left when in a left-hand traffic pattern; to the right when in a right-hand traffic pattern) beyond the departure end of the runway, after reaching pattern altitude.
7. Do not overshoot final or continue on a track which will penetrate the final approach of the parallel runway.
8. Do not continue on a track which will penetrate the departure path of the parallel runway.

FIGURE 4-3-4

Headwind/Tailwind/Crosswind Component Calculator

US 4-3

SECTION 3. AIRPORT OPERATIONS

4-3-4 VISUAL INDICATORS AT AIRPORTS WITHOUT AN OPERATING CONTROL TOWER

- a. At those airports *without an operating control tower*, a segmented circle visual indicator system, if installed, is designed to provide traffic pattern information.

REFERENCE—AIM, Paragraph 4-1-9, *Traffic Advisory Practices at Airports Without Operating Control Towers*.

- b. The segmented circle system consists of the following components:

1. **The segmented circle.** Located in a position affording maximum visibility to pilots in the air and on the ground and providing a centralized location for other elements of the system.
2. **The wind direction indicator.** A wind cone, wind sock, or wind tee installed near the operational runway to indicate wind direction. The large end of the wind cone/wind sock points into the wind as does the large end (cross bar) of the wind tee. In lieu of a tetrahedron and where a wind sock or wind cone is collocated with a wind tee, the wind tee may be manually aligned with the runway in use to indicate landing direction. These signaling devices may be located in the center of the segmented circle and may be lighted for night use. Pilots are cautioned against using a tetrahedron to indicate wind direction.
3. **The landing direction indicator.** A tetrahedron is installed when conditions at the airport warrant its use. It may be used to indicate the direction of landings and takeoffs. A tetrahedron may be located at the center of a segmented circle and may be lighted for night operations. The small end of the tetrahedron points in the direction of landing. Pilots are cautioned against using a tetrahedron for any purpose other than as an indicator of landing direction. Further, pilots should use extreme caution when making runway selection by use of a tetrahedron in very light or calm wind conditions as the tetrahedron may not be aligned with the designated calm-wind runway. At airports with control towers, the tetrahedron should only be referenced when the control tower is not in operation. Tower instructions supersede tetrahedron indications.
4. **Landing strip indicators.** Installed in pairs as shown in the segmented circle diagram and used to show the alignment of landing strips.
5. **Traffic pattern indicators.** Arranged in pairs in conjunction with landing strip indicators and used to indicate the direction of turns when there is a variation from the normal left traffic pattern. (If there is no segmented circle installed at the airport, traffic pattern indicators may be installed on or near the end of the runway.)

- c. Preparatory to landing at an airport without a control tower, or when the control tower is not in operation, pilots should concern themselves with the indicator for the approach end of the runway to be used. When approaching for landing, all turns must be made to the left unless a traffic pattern indicator indicates that turns should be made to the right. If the pilot will mentally enlarge the indicator for the runway to be used, the base and final approach legs of the traffic pattern to be flown immediately become apparent. Similar treatment of the indicator at the departure end of the runway will clearly indicate the direction of turn after takeoff.

US 4-3

SECTION 3. AIRPORT OPERATIONS

- d. When two or more aircraft are approaching an airport for the purpose of landing, the pilot of the aircraft at the lower altitude has the right-of-way over the pilot of the aircraft at the higher altitude. However, the pilot operating at the lower altitude should not take advantage of another aircraft, which is on final approach to land, by cutting in front of, or overtaking that aircraft.

4-3-5 UNEXPECTED MANEUVERS IN THE AIRPORT TRAFFIC PATTERN

There have been several incidents in the vicinity of controlled airports that were caused primarily by aircraft executing unexpected maneuvers. ATC service is based upon observed or known traffic and airport conditions. Controllers establish the sequence of arriving and departing aircraft by requiring them to adjust flight as necessary to achieve proper spacing. These adjustments can only be based on observed traffic, accurate pilot reports, and anticipated aircraft maneuvers. Pilots are expected to cooperate so as to preclude disrupting traffic flows or creating conflicting patterns. The pilot-in-command of an aircraft is directly responsible for and is the final authority as to the operation of the aircraft. On occasion it may be necessary for pilots to maneuver their aircraft to maintain spacing with the traffic they have been sequenced to follow. The controller can anticipate minor maneuvering such as shallow "S" turns. The controller cannot, however, anticipate a major maneuver such as a 360 degree turn. If a pilot makes a 360 degree turn after obtaining a landing sequence, the result is usually a gap in the landing interval and, more importantly, it causes a chain reaction which may result in a conflict with following traffic and an interruption of the sequence established by the tower or approach controller. Should a pilot decide to make maneuvering turns to maintain spacing behind a preceding aircraft, the pilot should always advise the controller if at all possible. Except when requested by the controller or in emergency situations, a 360 degree turn should never be executed in the traffic pattern or when receiving radar service without first advising the controller.

4-3-6 USE OF RUNWAYS/DECLARED DISTANCES

- a. Runways are identified by numbers which indicate the nearest 10-degree increment of the azimuth of the runway centerline. For example, where the magnetic azimuth is 183 degrees, the runway designation would be 18; for a magnetic azimuth of 87 degrees, the runway designation would be 9. For a magnetic azimuth ending in the number 5, such as 185, the runway designation could be either 18 or 19. Wind direction issued by the tower is also magnetic and wind velocity is in knots.
- b. Airport proprietors are responsible for taking the lead in local aviation noise control. Accordingly, they may propose specific noise abatement plans to the FAA. If approved, these plans are applied in the form of Formal or Informal Runway Use Programs for noise abatement purposes.

REFERENCE—*Pilot/Controller Glossary Term — Runway Use Program.*

1. At airports where no runway use program is established, ATC clearances may specify:
 - (a) The runway most nearly aligned with the wind when it is 5 knots or more;
 - (b) The "calm wind" runway when wind is less than 5 knots; or

US 4-3

SECTION 3. AIRPORT OPERATIONS

- (c) Another runway if operationally advantageous.

NOTE: *It is not necessary for a controller to specifically inquire if the pilot will use a specific runway or to offer a choice of runways. If a pilot prefers to use a different runway from that specified, or the one most nearly aligned with the wind, the pilot is expected to inform ATC accordingly.*

2. At airports where a runway use program is established, ATC will assign runways deemed to have the least noise impact. If in the interest of safety a runway different from that specified is preferred, the pilot is expected to advise ATC accordingly. ATC will honor such requests and advise pilots when the requested runway is noise sensitive. When use of a runway other than the one assigned is requested, pilot cooperation is encouraged to preclude disruption of traffic flows or the creation of conflicting patterns.

c. Declared Distances

1. Declared distances for a runway represent the maximum distances available and suitable for meeting takeoff and landing distance performance requirements. These distances are determined in accordance with FAA runway design standards by adding to the physical length of paved runway any clearway or stopway and subtracting from that sum any lengths necessary to obtain the standard runway safety areas, runway object free areas, or runway protection zones. As a result of these additions and subtractions, the declared distances for a runway may be more or less than the physical length of the runway as depicted on aeronautical charts and related publications, or available in electronic navigation databases provided by either the U.S. Government or commercial companies.
2. All 14 CFR Part 139 airports report declared distances for each runway. Other airports may also report declared distances for a runway if necessary to meet runway design standards or to indicate the presence of a clearway or stopway. Where reported, declared distances for each runway end are published in the Chart Supplement U.S. For runways without published declared distances, the declared distances may be assumed to be equal to the physical length of the runway unless there is a displaced landing threshold, in which case the Landing Distance Available (LDA) is shortened by the amount of the threshold displacement.

NOTE: A symbol  is shown on U.S. Government charts to indicate that runway declared distance information is available (See appropriate Chart Supplement U.S., Chart Supplement Alaska, or Pacific).

- (a) The FAA uses the following definitions for runway declared distances (See FIG 4-3-5):

REFERENCE—*Pilot/Controller Glossary Terms: “Accelerate-Stop Distance Available,” “Landing Distance Available,” “Takeoff Distance Available,” “Takeoff Run Available,” “Stopway,” and “Clearway.”*

US 4-3

SECTION 3. AIRPORT OPERATIONS

- (1) Takeoff Run Available (TORA) – The runway length declared available and suitable for the ground run of an airplane taking off.

The TORA is typically the physical length of the runway, but it may be shorter than the runway length if necessary to satisfy runway design standards. For example, the TORA may be shorter than the runway length if a portion of the runway must be used to satisfy runway protection zone requirements.

- (2) Takeoff Distance Available (TODA) – The takeoff run available plus the length of any remaining runway or clearway beyond the far end of the takeoff run available.

The TODA is the distance declared available for satisfying takeoff distance requirements for airplanes where the certification and operating rules and available performance data allow for the consideration of a clearway in takeoff performance computations.

NOTE: *The length of any available clearway will be included in the TODA published in the entry for that runway end within the Chart Supplement U.S.*

- (3) Accelerate-Stop Distance Available (ASDA) – The runway plus stopway length declared available and suitable for the acceleration and deceleration of an airplane aborting a takeoff.

The ASDA may be longer than the physical length of the runway when a stopway has been designated available by the airport operator, or it may be shorter than the physical length of the runway if necessary to use a portion of the runway to satisfy runway design standards; for example, where the airport operator uses a portion of the runway to achieve the runway safety area requirement. ASDA is the distance used to satisfy the airplane accelerate-stop distance performance requirements where the certification and operating rules require accelerate-stop distance computations.

NOTE: *The length of any available stopway will be included in the ASDA published in the entry for that runway end within the Chart Supplement U.S.*

- (4) Landing Distance Available (LDA) - The runway length declared available and suitable for a landing airplane.

The LDA may be less than the physical length of the runway or the length of the runway remaining beyond a displaced threshold if necessary to satisfy runway design standards; for example, where the airport operator uses a portion of the runway to achieve the runway safety area requirement.

Although some runway elements (such as stopway length and clearway length) may be available information, pilots must use the declared distances determined by the airport operator and not attempt to independently calculate declared distances by adding those elements to the reported physical length of the runway.

US 4-3

SECTION 3. AIRPORT OPERATIONS

- (b) The airplane operating rules and/or the airplane operating limitations establish minimum distance requirements for takeoff and landing and are based on performance data supplied in the Airplane Flight Manual or Pilot's Operating Handbook. The minimum distances required for takeoff and landing obtained either in planning prior to takeoff or in performance assessments conducted at the time of landing must fall **within** the applicable declared distances before the pilot can accept that runway for takeoff or landing.
- (c) Runway design standards may impose restrictions on the amount of runway available for use in takeoff and landing that are not apparent from the reported physical length of the runway or from runway markings and lighting. The runway elements of Runway Safety Area (RSA), Runway Object Free Area (ROFA), and Runway Protection Zone (RPZ) may reduce a runway's declared distances to less than the physical length of the runway at geographically constrained airports (See FIG 4-3-6). When considering the amount of runway available for use in takeoff or landing performance calculations, the declared distances published for a runway must always be used in lieu of the runway's physical length.

REFERENCE—AC 150/5300-13, *Airport Design*.

- (d) While some runway elements associated with declared distances may be identifiable through runway markings or lighting (for example, a displaced threshold or a stopway), the individual declared distance limits are not marked or otherwise identified on the runway. An aircraft is **not prohibited** from operating beyond a declared distance limit during the takeoff, landing, or taxi operation provided the runway surface is appropriately marked as usable runway (See FIG 4-3-6). The following examples clarify the intent of this paragraph.

REFERENCE—

AIM, Paragraph 2-3-3, Runway Markings.

AC 150/5340-1, Standards for Airport Markings.

EXAMPLE:

1. The declared LDA for runway 9 must be used when showing compliance with the landing distance requirements of the applicable airplane operating rules and/or airplane operating limitations or when making a before landing performance assessment. The LDA is less than the physical runway length, not only because of the displaced threshold, but also because of the subtractions necessary to meet the RSA beyond the far end of the runway. However, during the actual landing operation, it is permissible for the airplane to roll beyond the unmarked end of the LDA.
2. The declared ASDA for runway 9 must be used when showing compliance with the accelerate-stop distance requirements of the applicable airplane operating rules and/or airplane operating limitations. The ASDA is less than the physical length of the runway due to subtractions necessary to achieve the full RSA requirement. However, in the event of an aborted

US 4-3

SECTION 3. AIRPORT OPERATIONS

takeoff, it is permissible for the airplane to roll beyond the unmarked end of the ASDA as it is brought to a full-stop on the remaining usable runway.

FIGURE 4-3-5

Declared Distances with Full-Standard Runway Safety Areas, Runway Object Free Areas, and Runway Protection Zones

US 4-3
SECTION 3. AIRPORT OPERATIONS

FIGURE 4-3-6

Effects of a Geographical Constraint on a Runway's Declared Distances

Runway 27 operations: Runway 27 threshold displaced to provide the required RSA at the approach end of the runway. As a result, the LDA is reduced 200 ft.

Runway 9 operations: The ASDA is reduced by 600 ft to achieve the required RSA at the roll-out end of the runway. The LDA is reduced by 900 ft because, 1) the 300 ft displaced threshold located at the approach end of the runway (due to an approach obstacle), and 2) as result of the 600 ft of runway needed to achieve the required RSA at the roll-out end of the runway.

Runway	Length (feet)	TORA	TODA	ASDA	LDA
9	8000	8000	8000	7400	7100
27		8000	8000	8000	7800

NOTE: A runway's RSA begins a set distance prior to the threshold and will extend a set distance beyond the end of the runway depending on the runway's design criteria. If these required lengths cannot be achieved, the ASDA and/or LDA will be reduced as necessary to obtain the required lengths to the extent practicable.

US 4-3

SECTION 3. AIRPORT OPERATIONS

4-3-7 LOW LEVEL WIND SHEAR/MICROBURST DETECTION SYSTEMS

Low Level Wind Shear Alert System (LLWAS), Terminal Doppler Weather Radar (TDWR), Weather Systems Processor (WSP), and Integrated Terminal Weather System (ITWS) display information on hazardous wind shear and microburst activity in the vicinity of an airport to air traffic controllers who relay this information to pilots.

- a. LLWAS provides wind shear alert and gust front information but does not provide microburst alerts. The LLWAS is designed to detect low level wind shear conditions around the periphery of an airport. It does not detect wind shear beyond that limitation. Controllers will provide this information to pilots by giving the pilot the airport wind followed by the boundary wind.

EXAMPLE: Wind shear alert, airport wind 230 at 8, south boundary wind 170 at 20.

- b. LLWAS “network expansion,” (LLWAS NE) and LLWAS Relocation/Sustainment (LLWAS-RS) are systems integrated with TDWR. These systems provide the capability of detecting microburst alerts and wind shear alerts. Controllers will issue the appropriate wind shear alerts or microburst alerts. In some of these systems controllers also have the ability to issue wind information oriented to the threshold or departure end of the runway.

EXAMPLE: Runway 17 arrival microburst alert, 40 knot loss 3 mile final.

REFERENCE—AIM, Para 7-1-24, *Microbursts*.

- c. More advanced systems are in the field or being developed such as ITWS. ITWS provides alerts for microbursts, wind shear, and significant thunderstorm activity. ITWS displays wind information oriented to the threshold or departure end of the runway.
- d. The WSP provides weather processor enhancements to selected Airport Surveillance Radar (ASR)-9 facilities. The WSP provides Air Traffic with detection and alerting of hazardous weather such as wind shear, microbursts, and significant thunderstorm activity. The WSP displays terminal area 6 level weather, storm cell locations and movement, as well as the location and predicted future position and intensity of wind shifts that may affect airport operations. Controllers will receive and issue alerts based on Areas Noted for Attention (ARENA). An ARENA extends on the runway center line from a 3 mile final to the runway to a 2 mile departure.
- e. An airport equipped with the LLWAS, ITWS, or WSP is so indicated in the Chart Supplement U.S. under Weather Data Sources for that particular airport. [Jeppesen Airport Directory, Jepp Guide, and Airport Charts also indicate airports so equipped.]

4-3-8 BRAKING ACTION REPORTS AND ADVISORIES

- a. When available, ATC furnishes pilots the quality of braking action received from pilots. The quality of braking action is described by the terms “good,” “good to medium,” “medium,” “medium to poor,” “poor,” and “nil.” When pilots report the quality of braking action by using the terms noted above, they should use descriptive terms that are easily understood, such as, “braking action poor the first/last half of the runway,” together with the particular type of aircraft.

US 4-3

SECTION 3. AIRPORT OPERATIONS

- b. FICON NOTAMs will provide contaminant measurements for paved runways; however, a FICON NOTAM for braking action will only be used for non-paved runway surfaces, taxiways, and aprons. These NOTAMs are classified according to the most critical term ("good to medium," "medium," "medium to poor," and "poor").
 - 1. FICON NOTAM reporting of a braking condition for paved runway surfaces is not permissible by Federally Obligated Airports or those airports certificated under 14 CFR Part 139.
 - 2. A "NIL" braking condition at these airports must be mitigated by closure of the affected surface. Do not include the type of vehicle in the FICON NOTAM.
- c. When tower controllers receive runway braking action reports which include the terms medium, poor, or nil, or whenever weather conditions are conducive to deteriorating or rapidly changing runway braking conditions, the tower will include on the ATIS broadcast the statement, "*BRAKING ACTION ADVISORIES ARE IN EFFECT.*"
- d. During the time that braking action advisories are in effect, ATC will issue the most recent braking action report for the runway in use to each arriving and departing aircraft. Pilots should be prepared for deteriorating braking conditions and should request current runway condition information if not issued by controllers. Pilots should also be prepared to provide a descriptive runway condition report to controllers after landing.

4-3-9 RUNWAY CONDITION REPORTS

- a. Aircraft braking coefficient is dependent upon the surface friction between the tires on the aircraft wheels and the pavement surface. Less friction means less aircraft braking coefficient and less aircraft braking response.
- b. Runway condition code (RwyCC) values range from 1 (poor) to 6 (dry). For frozen contaminants on runway surfaces, a runway condition code reading of 4 indicates the level when braking deceleration or directional control is between good and medium.

NOTE: A RwyCC of "0" is used to delineate a braking action report of NIL and is prohibited from being reported in a FICON NOTAM.

- c. Airport management should conduct runway condition assessments on wet runways or runways covered with compacted snow and/or ice.
 - 1. Numerical readings may be obtained by using the Runway Condition Assessment Matrix (RCAM). The RCAM provides the airport operator with data to complete the report that includes the following:
 - (a) Runway(s) in use
 - (b) Time of the assessment
 - (c) Runway condition codes for each zone (touchdown, mid-point, roll-out)
 - (d) Pilot-reported braking action report (if available)
 - (e) The contaminant (for example, wet snow, dry snow, slush, ice, etc.)

US 4-3

SECTION 3. AIRPORT OPERATIONS

2. Assessments for each zone (see 4-3-9c1(c)) will be issued in the direction of takeoff and landing on the runway, ranging from “1” to “6” to describe contaminated surfaces.

NOTE: A *RwyCC* of “0” is used to delineate a braking action report of NIL and is prohibited from being reported in a FICON NOTAM.

3. When any 1 or more runway condition codes are reported as less than 6, airport management must notify ATC for dissemination to pilots.
4. Controllers will not issue runway condition codes when all 3 segments of a runway are reporting values of 6.
- d. When runway condition code reports are provided by airport management, the ATC facility providing approach control or local airport advisory must provide the report to all pilots.
- e. Pilots should use runway condition code information with other knowledge including aircraft performance characteristics, type, and weight, previous experience, wind conditions, and aircraft tire type (such as bias ply vs. radial constructed) to determine runway suitability.
- f. The Runway Condition Assessment Matrix identifies the descriptive terms “good,” “good to medium,” “medium,” “medium to poor,” “poor,” and “nil” used in braking action reports.

REFERENCE—Advisory Circular AC 91-79A (Revision 1), *Mitigating the Risks of a Runway Overrun Upon Landing*, Appendix 1.

FIGURE 4-3-7 Runway Condition Assessment Matrix (RCAM)

Assessment Criteria		Control/Braking Assessment Criteria	
Runway Condition Description	RwyC C	Deceleration or Directional Control Observation	Pilot Reported Braking Action
– Dry	6	—	—
– Frost – Wet (Includes damp and 1/8 inch depth or less of water) 1/8 inch (3mm) depth or less of: – Slush – Dry Snow – Wet Snow	5	Braking deceleration is normal for the wheel braking effort applied AND directional control is normal.	Good
-15°C and Colder outside air temperature: – Compacted Snow	4	Braking deceleration OR directional control is between Good and Medium.	Good to Medium

US 4-3

SECTION 3. AIRPORT OPERATIONS

FIGURE 4-3-7 Runway Condition Assessment Matrix (RCAM) (continued)

Assessment Criteria		Control/Braking Assessment Criteria	
Runway Condition Description	RwyC C	Deceleration or Directional Control Observation	Pilot Reported Braking Action
- Slippery When Wet (wet runway) - Dry Snow or Wet Snow (any depth) over Compacted Snow Greater than 1/8 inch (3mm) depth of: - Dry Snow - Wet Snow Warmer than -15°C outside air temperature: - Compacted Snow	3	Braking deceleration is noticeably reduced for the wheel braking effort applied OR directional control is noticeably reduced.	Medium
Greater than 1/8 inch(3 mm) depth of: - Water - Slush	2	Braking deceleration OR directional control is between Medium and Poor.	Medium to Poor
Ice	1	Braking deceleration is significantly reduced for the wheel braking effort applied OR directional control is significantly reduced.	Poor
- Wet Ice - Slush over Ice - Water over Compacted Snow - Dry Snow or Wet Snow over Ice	0	Braking deceleration is minimal to non-existent for the wheel braking effort applied OR directional control is uncertain.	Nil

4-3-10 INTERSECTION TAKEOFFS

- In order to enhance airport capacities, reduce taxiing distances, minimize departure delays, and provide for more efficient movement of air traffic, controllers may initiate intersection takeoffs as well as approve them when the pilot requests. If for ANY reason a pilot prefers to use a different intersection or the full length of the runway or desires to obtain the distance between the intersection and the runway end, THE PILOT IS EXPECTED TO INFORM ATC ACCORDINGLY.

US 4-3

SECTION 3. AIRPORT OPERATIONS

- b. Pilots are expected to assess the suitability of an intersection for use at takeoff during their preflight planning. They must consider the resultant length reduction to the published runway length and to the published declared distances from the intersection intended to be used for takeoff. The minimum runway required for takeoff must fall within the reduced runway length and the reduced declared distances before the intersection can be accepted for takeoff.

REFERENCE—AIM, *Paragraph 4-3-6, Use of Runways/Declared Distances.*

- c. Controllers will issue the measured distance from the intersection to the runway end rounded “down” to the nearest 50 feet to any pilot who requests and to all military aircraft, unless use of the intersection is covered in appropriate directives. Controllers, however, will not be able to inform pilots of the distance from the intersection to the end of any of the published declared distances.

REFERENCE—FAA Order JO 7110.65, *Paragraph 3-7-1, Ground Traffic Movement*

- d. An aircraft is expected to taxi to (but not onto) the end of the assigned runway unless prior approval for an intersection departure is received from ground control.
- e. Pilots should state their position on the airport when calling the tower for takeoff from a runway intersection.

EXAMPLE: Cleveland Tower, Apache Three Seven Two Two Papa, at the intersection of taxiway Oscar and runway two three right, ready for departure.

- f. Controllers are required to separate small aircraft that are departing from an intersection on the same runway (same or opposite direction) behind a large nonheavy aircraft (except B757), by ensuring that at least a 3-minute interval exists between the time the preceding large aircraft has taken off and the succeeding small aircraft begins takeoff roll. The 3-minute separation requirement will also be applied to small aircraft with a maximum certificated takeoff weight of 12,500 pounds or less departing behind a small aircraft with a maximum certificated takeoff weight of more than 12,500 pounds. To inform the pilot of the required 3-minute hold, the controller will state, “Hold for wake turbulence.” If after considering wake turbulence hazards, the pilot feels that a lesser time interval is appropriate, the pilot may request a waiver to the 3-minute interval. To initiate such a request, simply say “Request waiver to 3-minute interval” or a similar statement. Controllers may then issue a takeoff clearance if other traffic permits, since the pilot has accepted the responsibility for wake turbulence separation.
- g. The 3-minute interval is not required when the intersection is 500 feet or less from the departure point of the preceding aircraft and both aircraft are taking off in the same direction. Controllers may permit the small aircraft to alter course after takeoff to avoid the flight path of the preceding departure.
- h. A 4-minute interval is mandatory for small, large, and heavy aircraft behind a super aircraft. The 3-minute interval is mandatory behind a heavy aircraft in all cases, and for small aircraft behind a B757.

US 4-3

SECTION 3. AIRPORT OPERATIONS

4-3-11 PILOT RESPONSIBILITIES WHEN CONDUCTING LAND AND HOLD SHORT OPERATIONS (LAHSO)

- a. LAHSO is an acronym for “Land and Hold Short Operations.” These operations include landing and holding short of an **intersecting runway**, an **intersecting taxiway**, or some other designated **point on a runway** other than an intersecting runway or taxiway. (See FIG 4-3-8, FIG 4-3-9, FIG 4-3-10.)
- b. **Pilot Responsibilities and Basic Procedures.**
 1. LAHSO is an air traffic control procedure that requires pilot participation to balance the needs for increased airport capacity and system efficiency, consistent with safety. This procedure can be done safely **provided** pilots and controllers are knowledgeable and understand their responsibilities. The following paragraphs outline specific pilot/operator responsibilities when conducting LAHSO.
 2. At controlled airports, air traffic may clear a pilot to land and hold short. Pilots may accept such a clearance provided that the pilot-in-command determines that the aircraft can safely land and stop within the Available Landing Distance (ALD). ALD data are published in the special notices section of the Chart Supplement U.S. and in the U.S. Terminal Procedures Publications. Controllers will also provide ALD data upon request. Student pilots or pilots not familiar with LAHSO should **not** participate in the program.
 3. **The pilot-in-command has the final authority to accept or decline any land and hold short clearance. The safety and operation of the aircraft remain the responsibility of the pilot. Pilots are expected to decline a LAHSO clearance if they determine it will compromise safety.**
 4. To conduct LAHSO, pilots should become familiar with all available information concerning LAHSO at their destination airport. Pilots should have, *readily available*, the **published ALD** and runway **slope information** for **all** LAHSO runway combinations at **each** airport of intended landing. Additionally, knowledge about landing performance data permits the pilot to *readily* determine that the ALD for the assigned runway is sufficient for safe LAHSO. As part of a pilot's preflight planning process, pilots should determine if their destination airport has LAHSO. If so, their preflight planning process should include an assessment of which LAHSO combinations would work for them given their aircraft's required landing distance. Good pilot decision making is knowing in advance whether one can accept a LAHSO clearance if offered.

Land and Hold Short of a Designated Point on a Runway Other Than an Intersecting Runway or Taxiway

5. If, for any reason, such as difficulty in discerning the location of a LAHSO intersection, wind conditions, aircraft condition, etc., the pilot elects to request to land on the full length of the runway, to land on another runway, or to decline LAHSO, a pilot is expected to promptly inform air traffic, ideally even before the clearance is issued. **A LAHSO clearance, once accepted, must be adhered to, just as any other ATC clearance, unless an amended clearance is obtained or an emergency occurs. A LAHSO clearance does not preclude a rejected landing.**
6. A pilot who accepts a LAHSO clearance should land and exit the runway at the first convenient taxiway (unless directed otherwise) before reaching the hold short point. Otherwise, the pilot must stop and hold at the hold short point. **If a rejected landing becomes necessary after accepting a LAHSO clearance, the pilot should maintain safe separation from other aircraft or vehicles, and should promptly notify the controller.**
7. Controllers need a full read back of all LAHSO clearances. Pilots should read back their LAHSO clearance and include the words, "HOLD SHORT OF (RUNWAY/TAXIWAY/OR POINT)" in their acknowledgment of **all** LAHSO clearances. In order to reduce frequency congestion, pilots are encouraged to read back the LAHSO clearance without prompting. Don't make the controller have to ask for a read back!

c. **LAHSO Situational Awareness**

1. Situational awareness is **vital** to the success of LAHSO. Situational awareness starts with having current airport information in the cockpit, readily accessible to the pilot. (An airport diagram assists pilots in identifying their location on the airport, thus reducing requests for "progressive taxi instructions" from controllers.)

US 4-3

SECTION 3. AIRPORT OPERATIONS

2. Situational awareness includes effective pilot-controller radio communication. ATC expects pilots to specifically acknowledge and read back all LAHSO clearances as follows:

EXAMPLE: ATC: “(Aircraft ID) cleared to land runway six right, hold short of taxiway bravo for crossing traffic (type aircraft).”

Aircraft: “(Aircraft ID), wilco, cleared to land runway six right to hold short of taxiway bravo.”

ATC: “(Aircraft ID) cross runway six right at taxiway bravo, landing aircraft will hold short.”

Aircraft: “(Aircraft ID), wilco, cross runway six right at bravo, landing traffic (type aircraft) to hold.”

3. For those airplanes flown with two crewmembers, effective **intra-cockpit** communication between cockpit crewmembers is also critical. There have been several instances where the pilot working the radios accepted a LAHSO clearance but then simply forgot to tell the pilot flying the aircraft.
4. Situational awareness also includes a thorough understanding of the airport markings, signage, and lighting associated with LAHSO. These visual aids consist of a three-part system of **yellow hold-short markings, red and white signage** and, in certain cases, **in-pavement lighting**. Visual aids assist the pilot in determining where to hold short. FIG 4-3-8, FIG 4-3-9, FIG 4-3-10 depict how these markings, signage, and lighting combinations will appear once installed. Pilots are cautioned that not all airports conducting LAHSO have installed any or all of the above markings, signage, or lighting.
5. Pilots should only receive a LAHSO clearance when there is a minimum ceiling of 1,000 feet and 3 statute miles visibility. The intent of having “basic” VFR weather conditions is to allow pilots to maintain visual contact with other aircraft and ground vehicle operations. Pilots should consider the effects of prevailing inflight visibility (such as landing into the sun) and how it may affect overall situational awareness. Additionally, surface vehicles and aircraft being taxied by maintenance personnel may also be participating in LAHSO, especially in those operations that involve crossing an active runway.

4-3-12 LOW APPROACH

- a. A low approach (sometimes referred to as a low pass) is the go-around maneuver following an approach. Instead of landing or making a touch-and-go, a pilot may wish to go around (low approach) in order to expedite a particular operation (a series of practice instrument approaches is an example of such an operation). Unless otherwise authorized by ATC, the low approach should be made straight ahead, with no turns or climb made until the pilot has made a thorough visual check for other aircraft in the area.
- b. When operating within a Class B, Class C, and Class D surface area, a pilot intending to make a low approach should contact the tower for approval. This request should be made prior to starting the final approach.

US 4-3

SECTION 3. AIRPORT OPERATIONS

- c. When operating to an airport, not within a Class B, Class C, and Class D surface area, a pilot intending to make a low approach should, prior to leaving the final approach fix inbound (nonprecision approach) or the outer marker or fix used in lieu of the outer marker inbound (precision approach), so advise the FSS, UNICOM, or make a broadcast as appropriate.

REFERENCE—AIM, Paragraph 4-1-9, *Traffic Advisory Practices at Airports Without Operating Control Towers*.

4-3-13 TRAFFIC CONTROL LIGHT SIGNALS

- a. The following procedures are used by ATCTs in the control of aircraft, ground vehicles, equipment, and personnel not equipped with radio. These same procedures will be used to control aircraft, ground vehicles, equipment, and personnel equipped with radio if radio contact cannot be established. ATC personnel use a directive traffic control signal which emits an intense narrow light beam of a selected color (either red, white, or green) when controlling traffic by light signals.
- b. Although the traffic signal light offers the advantage that some control may be exercised over nonradio equipped aircraft, pilots should be cognizant of the disadvantages which are:
1. Pilots may not be looking at the control tower at the time a signal is directed toward their aircraft.
 2. The directions transmitted by a light signal are very limited since only approval or disapproval of a pilot's anticipated actions may be transmitted. No supplement or explanatory information may be transmitted except by the use of the "General Warning Signal" which advises the pilot to be on the alert.
- c. Between sunset and sunrise, a pilot wishing to attract the attention of the control tower should turn on a landing light and taxi the aircraft into a position, clear of the active runway, so that light is visible to the tower. The landing light should remain on until appropriate signals are received from the tower.
- d. Airport Traffic Control Tower Light Gun Signals. (See TBL 4-3-1.)
- e. During daylight hours, acknowledge tower transmissions or light signals by moving the ailerons or rudder. At night, acknowledge by blinking the landing or navigation lights. If radio malfunction occurs after departing the parking area, watch the tower for light signals or monitor tower frequency.

US 4-3

SECTION 3. AIRPORT OPERATIONS

TABLE 4-3-1 AIRPORT TRAFFIC CONTROL TOWER LIGHT GUN SIGNALS

Meaning			
Color and Type of Signal	Movement of Vehicles, Equipment and Personnel	Aircraft on the Ground	Aircraft in Flight
Steady green	Cleared to cross, proceed or go	Cleared for takeoff	Cleared to land
Flashing green	Not applicable	Cleared for taxi	Return for landing (to be followed by steady green at the proper time)
Steady red	STOP	STOP	Give way to other aircraft and continue circling
Flashing red	Clear the taxiway/runway	Taxi clear of the runway in use	Airport unsafe, do not land
Flashing white	Return to starting point on airport	Return to starting point on airport	Not applicable
Alternating red and green	Exercise extreme caution	Exercise extreme caution	Exercise extreme caution

4-3-14 COMMUNICATIONS

- Pilots of departing aircraft should communicate with the control tower on the appropriate ground control/clearance delivery frequency prior to starting engines to receive engine start time, taxi and/or clearance information. Unless otherwise advised by the tower, remain on that frequency during taxiing and runup, then change to local control frequency when ready to request takeoff clearance.

NOTE: *Pilots are encouraged to monitor the local tower frequency as soon as practical consistent with other ATC requirements.*

REFERENCE—AIM, Paragraph 4-1-13, Automatic Terminal Information Service (ATIS).

- The tower controller will consider that pilots of turbine-powered aircraft are ready for takeoff when they reach the runway or warm-up block unless advised otherwise.
- The majority of ground control frequencies are in the 121.6-121.9 MHz bandwidth. Ground control frequencies are provided to eliminate frequency congestion on the tower (local control) frequency and are limited to communications between the tower and aircraft on the ground and between the tower and utility vehicles on the airport, provide a clear VHF channel for arriving and departing aircraft. They are used for issuance of taxi information, clearances, and other necessary contacts between the tower and aircraft or other vehicles operated

US 4-3

SECTION 3. AIRPORT OPERATIONS

on the airport. A pilot who has just landed should not change from the tower frequency to the ground control frequency until directed to do so by the controller. Normally, only one ground control frequency is assigned at an airport; however, at locations where the amount of traffic so warrants, a second ground control frequency and/or another frequency designated as a clearance delivery frequency, may be assigned.

- d. A controller may omit the ground or local control frequency if the controller believes the pilot knows which frequency is in use. If the ground control frequency is in the 121 MHz bandwidth the controller may omit the numbers preceding the decimal point; e.g., 121.7, "CONTACT GROUND POINT SEVEN." However, if any doubt exists as to what frequency is in use, the pilot should promptly request the controller to provide that information.
- e. Controllers will normally avoid issuing a radio frequency change to helicopters, known to be single-piloted, which are hovering, air taxiing, or flying near the ground. At times, it may be necessary for pilots to alert ATC regarding single pilot operations to minimize delay of essential ATC communications. Whenever possible, ATC instructions will be relayed through the frequency being monitored until a frequency change can be accomplished. You must promptly advise ATC if you are unable to comply with a frequency change. Also, you should advise ATC if you must land to accomplish the frequency change unless it is clear the landing will have no impact on other air traffic; e.g., on a taxiway or in a helicopter operating area.

4-3-15 GATE HOLDING DUE TO DEPARTURE DELAYS

- a. Pilots should contact ground control or clearance delivery prior to starting engines as gate hold procedures will be in effect whenever departure delays exceed or are anticipated to exceed 15 minutes. The sequence for departure will be maintained in accordance with initial call up unless modified by flow control restrictions. Pilots should monitor the ground control or clearance delivery frequency for engine startup advisories or new proposed start time if the delay changes.
- b. The tower controller will consider that pilots of turbine-powered aircraft are ready for takeoff when they reach the runway or warm-up block unless advised otherwise.

4-3-16 VFR FLIGHTS IN TERMINAL AREAS

Use reasonable restraint in exercising the prerogative of VFR flight, especially in terminal areas. The weather minimums and distances from clouds are minimums. Giving yourself a greater margin in specific instances is just good judgment.

- a. **Approach Area.** Conducting a VFR operation in a Class B, Class C, Class D, and Class E surface area when the official visibility is 3 or 4 miles is not prohibited, but good judgment would dictate that you keep out of the approach area.
- b. **Reduced Visibility.** It has always been recognized that precipitation reduces forward visibility. Consequently, although again it may be perfectly legal to cancel your IFR flight plan at any time you can proceed VFR, it is good practice, when precipitation is occurring, to continue IFR operation into a terminal area until you are reasonably close to your destination.

US 4-3

SECTION 3. AIRPORT OPERATIONS

- c. **Simulated Instrument Flights.** In conducting simulated instrument flights, be sure that the weather is good enough to compensate for the restricted visibility of the safety pilot and your greater concentration on your flight instruments. Give yourself a little greater margin when your flight plan lies in or near a busy airway or close to an airport.

4-3-17 VFR HELICOPTER OPERATIONS AT CONTROLLED AIRPORTS

a. **General.**

1. The following ATC procedures and phraseologies recognize the unique capabilities of helicopters and were developed to improve service to all users. Helicopter design characteristics and user needs often require operations from movement areas and non-movement areas within the airport boundary. In order for ATC to properly apply these procedures, it is essential that pilots familiarize themselves with the local operations and make it known to controllers when additional instructions are necessary.
 2. Insofar as possible, helicopter operations will be instructed to avoid the flow of fixed-wing aircraft to minimize overall delays; however, there will be many situations where faster/larger helicopters may be integrated with fixed-wing aircraft for the benefit of all concerned. Examples would include IFR flights, avoidance of noise sensitive areas, or use of runways/taxiways to minimize the hazardous effects of rotor downwash in congested areas.
 3. Because helicopter pilots are intimately familiar with the effects of rotor downwash, they are best qualified to determine if a given operation can be conducted safely. Accordingly, the pilot has the final authority with respect to the specific airspeed/altitude combinations. ATC clearances are in no way intended to place the helicopter in a hazardous position. It is expected that pilots will advise ATC if a specific clearance will cause undue hazards to persons or property.
- b. Controllers normally limit ATC ground service and instruction to *movement* areas; therefore, operations from *nonmovement* areas are conducted at pilot discretion and should be based on local policies, procedures, or letters of agreement. In order to maximize the flexibility of helicopter operations, it is necessary to rely heavily on sound pilot judgment. For example, hazards such as debris, obstructions, vehicles, or personnel must be recognized by the pilot, and action should be taken as necessary to avoid such hazards. Taxi, hover taxi, and air taxi operations are considered to be ground movements. Helicopters conducting such operations are expected to adhere to the same conditions, requirements, and practices as apply to other ground taxiing and ATC procedures in the AIM. [Also see Jeppesen Air Traffic Control Section.]
1. The phraseology *taxi* is used when it is intended or expected that the helicopter will taxi on the airport surface, either via taxiways or other prescribed routes. *Taxi* is used primarily for helicopters equipped with wheels or in response to a pilot request. Preference should be given to this procedure whenever it is necessary to minimize effects of rotor downwash.

US 4-3

SECTION 3. AIRPORT OPERATIONS

2. Pilots may request a *hover taxi* when slow forward movement is desired or when it may be appropriate to move very short distances. Pilots should avoid this procedure if rotor downwash is likely to cause damage to parked aircraft or if blowing dust/snow could obscure visibility. If it is necessary to operate above 25 feet AGL when hover taxiing, the pilot should initiate a request to ATC.
3. *Air taxi* is the preferred method for helicopter ground movements on airports provided ground operations and conditions permit. Unless otherwise requested or instructed, pilots are expected to remain below 100 feet AGL. However, if a higher than normal airspeed or altitude is desired, the request should be made prior to lift-off. The pilot is solely responsible for selecting a safe airspeed for the altitude/operation being conducted. Use of *air taxi* enables the pilot to proceed at an optimum airspeed/altitude, minimize downwash effect, conserve fuel, and expedite movement from one point to another. Helicopters should avoid overflight of other aircraft, vehicles, and personnel during air-taxi operations. Caution must be exercised concerning active runways and pilots must be certain that air taxi instructions are understood. Special precautions may be necessary at unfamiliar airports or airports with multiple/intersecting active runways. The taxi procedures given in paragraph 4-3-18, Taxiing, paragraph 4-3-19, Taxi During Low Visibility, and paragraph 4-3-20, Exiting the Runway After Landing, also apply.

REFERENCE—

Pilot/Controller Glossary Term — Taxi.

Pilot/Controller Glossary Term — Hover Taxi.

Pilot/Controller Glossary Term — Air Taxi.

c. Takeoff and Landing Procedures.

1. Helicopter operations may be conducted from a runway, taxiway, portion of a landing strip, or any clear area which could be used as a landing site such as the scene of an accident, a construction site, or the roof of a building. The terms used to describe designated areas from which helicopters operate are: movement area, landing/takeoff area, apron/ramp, heliport and helipad (See Pilot/Controller Glossary). These areas may be improved or unimproved and may be separate from or located on an airport/heliport. ATC will issue takeoff clearances from *movement* areas other than active runways, or in diverse directions from active runways, with additional instructions as necessary. Whenever possible, takeoff clearance will be issued in lieu of extended hover/air taxi operations. Phraseology will be "CLEARED FOR TAKEOFF FROM (taxiway, helipad, runway number, etc.), MAKE RIGHT/LEFT TURN FOR (direction, heading, NAVAID radial) DEPARTURE/DEPARTURE ROUTE (number, name, etc.)." Unless requested by the pilot, downwind takeoffs will not be issued if the tailwind exceeds 5 knots.
2. Pilots should be alert to wind information as well as to wind indications in the vicinity of the helicopter. ATC should be advised of the intended method of departing. A pilot request to takeoff in a given direction indicates that the pilot is willing to accept the wind condition and controllers will honor the request if traffic permits. Departure points could

US 4-3

SECTION 3. AIRPORT OPERATIONS

be a significant distance from the control tower and it may be difficult or impossible for the controller to determine the helicopter's relative position to the wind.

3. If takeoff is requested from *nonmovement* areas, an area not authorized for helicopter use, an area not visible from the tower, an unlighted area at night, or an area off the airport, the phraseology "DEPARTURE FROM (requested location) WILL BE AT YOUR OWN RISK (additional instructions, as necessary). USE CAUTION (if applicable)." The pilot is responsible for operating in a safe manner and should exercise due caution.
4. Similar phraseology is used for helicopter landing operations. Every effort will be made to permit helicopters to proceed direct and land as near as possible to their final destination on the airport. Traffic density, the need for detailed taxiing instructions, frequency congestion, or other factors may affect the extent to which service can be expedited. As with ground movement operations, a high degree of pilot/controller cooperation and communication is necessary to achieve safe and efficient operations.

4-3-18 TAXIING

- a. **General.** Approval must be obtained prior to moving an aircraft or vehicle onto the movement area during the hours an Airport Traffic Control Tower is in operation.
 1. Always state your position on the airport when calling the tower for taxi instructions.
 2. The movement area is normally described in local bulletins issued by the airport manager or control tower. These bulletins may be found in FSSs, fixed base operators offices, air carrier offices, and operations offices.
 3. The control tower also issues bulletins describing areas where they cannot provide ATC service due to nonvisibility or other reasons.
 4. A clearance must be obtained prior to taxiing on a runway, taking off, or landing during the hours an Airport Traffic Control Tower is in operation.
 5. A clearance must be obtained prior to crossing any runway. ATC will issue an explicit clearance for all runway crossings.
 6. When assigned a takeoff runway, ATC will first specify the runway, issue taxi instructions, and state any hold short instructions or runway crossing clearances if the taxi route will cross a runway. This does not authorize the aircraft to "enter" or "cross" the assigned departure runway at any point. In order to preclude misunderstandings in radio communications, ATC will not use the word "cleared" in conjunction with authorization for aircraft to taxi.
 7. When issuing taxi instructions to any point other than an assigned takeoff runway, ATC will specify the point to taxi to, issue taxi instructions, and state any hold short instructions or runway crossing clearances if the taxi route will cross a runway.

NOTE: ATC is required to obtain a readback from the pilot of all runway hold short instructions.

US 4-3

SECTION 3. AIRPORT OPERATIONS

8. If a pilot is expected to hold short of a runway approach/departure (*Runway XX APPCH/Runway XX DEP*) hold area or ILS holding position (see FIG 2-3-15, Taxiways Located in Runway Approach Area), ATC will issue instructions.
 9. When taxi instructions are received from the controller, pilots should always read back:
 - (a) The runway assignment.
 - (b) Any clearance to enter a specific runway.
 - (c) Any instruction to hold short of a specific runway or line up and wait.
 10. Controllers are required to request a readback of runway hold short assignment when it is not received from the pilot/vehicle.
- b. ATC clearances or instructions pertaining to taxiing are predicated on known traffic and known physical airport conditions. Therefore, it is important that pilots clearly understand the clearance or instruction. Although an ATC clearance is issued for taxiing purposes, when operating in accordance with the CFRs, it is the responsibility of the pilot to avoid collision with other aircraft. Since "the pilot-in-command of an aircraft is directly responsible for, and is the final authority as to, the operation of that aircraft" the pilot should obtain clarification of any clearance or instruction which is not understood.
1. Good operating practice dictates that pilots acknowledge all runway crossing, hold short, or takeoff clearances unless there is some misunderstanding, at which time the pilot should query the controller until the clearance is understood.
- NOTE:** *Air traffic controllers are required to obtain from the pilot a readback of all runway hold short instructions.*
2. Pilots operating a single pilot aircraft should monitor only assigned ATC communications after being cleared onto the active runway for departure. Single pilot aircraft should not monitor other than ATC communications until flight from Class B, Class C, or Class D surface area is completed. This same procedure should be practiced from after receipt of the clearance for landing until the landing and taxi activities are complete. Proper effective scanning for other aircraft, surface vehicles, or other objects should be continuously exercised in all cases.
 3. If the pilot is unfamiliar with the airport or for any reason confusion exists as to the correct taxi routing, a request may be made for progressive taxi instructions which include step-by-step routing directions. Progressive instructions may also be issued if the controller deems it necessary due to traffic or field conditions (for example, construction or closed taxiways).
- c. At those airports where the U.S. Government operates the control tower and ATC has authorized noncompliance with the requirement for two-way radio communications while operating within the Class B, Class C, or Class D surface area, or at those airports where the U.S. Government does not operate the control tower and radio communications cannot be established, pilots must obtain a clearance by visual light signal prior to taxiing on a runway and prior to takeoff and landing.

US 4-3

SECTION 3. AIRPORT OPERATIONS

- d. The following phraseologies and procedures are used in radiotelephone communications with aeronautical ground stations.

1. **Request for taxi instructions prior to departure.** State your aircraft identification, location, type of operation planned (VFR or IFR), and the point of first intended landing.

EXAMPLE: Aircraft: "Washington ground, Beechcraft One Three One Five Niner at hangar eight, ready to taxi, I-F-R to Chicago."

Tower: "Beechcraft one three one five niner, Washington ground, runway two seven, taxi via taxiways Charlie and Delta, hold short of runway three three left."

Aircraft: "Beechcraft One Three One Five Niner, runway two seven, hold short of runway three three left."

2. **Receipt of ATC clearance.** ARTCC clearances are relayed to pilots by airport traffic controllers in the following manner.

EXAMPLE: Tower: "Beechcraft One Three One Five Niner, cleared to the Chicago Midway Airport via Victor Eight, maintain eight thousand."

Aircraft: "Beechcraft One Three One Five Niner, cleared to the Chicago Midway Airport via Victor Eight, maintain eight thousand."

NOTE: Normally, an ATC IFR clearance is relayed to a pilot by the ground controller. At busy locations, however, pilots may be instructed by the ground controller to "contact clearance delivery" on a frequency designated for this purpose. No surveillance or control over the movement of traffic is exercised by this position of operation.

3. **Request for taxi instructions after landing.** State your aircraft identification, location, and that you request taxi instructions.

EXAMPLE: Aircraft: "Dulles ground, Beechcraft One Four Two Six One clearing runway one right on taxiway echo three, request clearance to Page."

Tower: "Beechcraft One Four Two Six One, Dulles ground, taxi to Page via taxiways echo three, echo one, and echo niner."

or

Aircraft: "Orlando ground, Beechcraft One Four Two Six One clearing runway one eight left at taxiway bravo three, request clearance to Page."

Tower: "Beechcraft One Four Two Six One, Orlando ground, hold short of runway one eight right."

Aircraft: "Beechcraft One Four Two Six One, hold short of runway one eight right."

- e. During ground operations, jet blast, prop wash, and rotor wash can cause damage and upsets if encountered at close range. Pilots should consider the effects of jet blast, prop wash, and rotor wash on aircraft, vehicles, and maintenance equipment during ground operations.

US 4-3

SECTION 3. AIRPORT OPERATIONS

4-3-19 TAXI DURING LOW VISIBILITY

- a. Pilots and aircraft operators should be constantly aware that during certain low visibility conditions the movement of aircraft and vehicles on airports may not be visible to the tower controller. This may prevent visual confirmation of an aircraft's adherence to taxi instructions.
- b. Of vital importance is the need for pilots to notify the controller when difficulties are encountered or at the first indication of becoming disoriented. Pilots should proceed with extreme caution when taxiing toward the sun. When vision difficulties are encountered pilots should immediately inform the controller.
- c. Advisory Circular 120-57, Low Visibility Operations Surface Movement Guidance and Control System, commonly known as LVOSMGCS (pronounced "LVO SMIGS") describes an adequate example of a low visibility taxi plan for any airport which has takeoff or landing operations in less than 1,200 feet runway visual range (RVR) visibility conditions. These plans, which affect aircrew and vehicle operators, may incorporate additional lighting, markings, and procedures to control airport surface traffic. They will be addressed at two levels; operations less than 1,200 feet RVR to 500 feet RVR and operations less than 500 feet RVR.

NOTE: *Specific lighting systems and surface markings may be found in paragraph 2-1-10, Taxiway Lights, and paragraph 2-3-4, Taxiway Markings.*

- d. When low visibility conditions exist, pilots should focus their entire attention on the safe operation of the aircraft while it is moving. Checklists and nonessential communication should be withheld until the aircraft is stopped and the brakes set.

4-3-20 EXITING THE RUNWAY AFTER LANDING

The following procedures must be followed after landing and reaching taxi speed.

- a. Exit the runway without delay at the first available taxiway or on a taxiway as instructed by ATC. Pilots must not exit the landing runway onto another runway unless authorized by ATC. At airports with an operating control tower, pilots should not stop or reverse course on the runway without first obtaining ATC approval.
- b. Taxi clear of the runway unless otherwise directed by ATC. An aircraft is considered clear of the runway when all parts of the aircraft are past the runway edge and there are no restrictions to its continued movement beyond the runway holding position markings. In the absence of ATC instructions, the pilot is expected to taxi clear of the landing runway by taxiing beyond the runway holding position markings associated with the landing runway, even if that requires the aircraft to protrude into or cross another taxiway or ramp area. Once all parts of the aircraft have crossed the runway holding position markings, the pilot must hold unless further instructions have been issued by ATC.

NOTE:

1. *The tower will issue the pilot instructions which will permit the aircraft to enter another taxiway, runway, or ramp area when required.*
2. *Guidance contained in subparagraphs a and b above is considered an integral part of the landing clearance and satisfies the requirement of 14 CFR Section 91.129.*

US 4-3
SECTION 3. AIRPORT OPERATIONS

- c. Immediately change to ground control frequency when advised by the tower and obtain a taxi clearance.

NOTE:

1. *The tower will issue instructions required to resolve any potential conflicts with other ground traffic prior to advising the pilot to contact ground control.*
2. *Ground control will issue taxi clearance to parking. That clearance does not authorize the aircraft to "enter" or "cross" any runways. Pilots not familiar with the taxi route should request specific taxi instructions from ATC.*

4-3-21 PRACTICE INSTRUMENT APPROACHES

- a. Various air traffic incidents have indicated the necessity for adoption of measures to achieve more organized and controlled operations where practice instrument approaches are conducted. Practice instrument approaches are considered to be instrument approaches made by either a VFR aircraft not on an IFR flight plan or an aircraft on an IFR flight plan. To achieve this and thereby enhance air safety, it is Air Traffic's policy to provide for separation of such operations at locations where approach control facilities are located and, as resources permit, at certain other locations served by ARTCCs or parent approach control facilities. Pilot requests to practice instrument approaches may be approved by ATC subject to traffic and workload conditions. Pilots should anticipate that in some instances the controller may find it necessary to deny approval or withdraw previous approval when traffic conditions warrant. It must be clearly understood, however, that even though the controller may be providing separation, pilots on VFR flight plans are required to comply with basic VFR weather minimums (14 CFR Section 91.155). Application of ATC procedures or any action taken by the controller to avoid traffic conflicts does not relieve IFR and VFR pilots of their responsibility to see-and-avoid other traffic while operating in VFR conditions (14 CFR Section 91.113). In addition to the normal IFR separation minimums (which includes visual separation) during VFR conditions, 500 feet vertical separation may be applied between VFR aircraft and between a VFR aircraft and the IFR aircraft. Pilots not on IFR flight plans desiring practice instrument approaches should always state 'practice' when making requests to ATC. Controllers will instruct VFR aircraft requesting an instrument approach to maintain VFR. This is to preclude misunderstandings between the pilot and controller as to the status of the aircraft. If pilots wish to proceed in accordance with instrument flight rules, they must specifically request and obtain, an IFR clearance.
- b. Before practicing an instrument approach, pilots should inform the approach control facility or the tower of the type of practice approach they desire to make and how they intend to terminate it, i.e., full-stop landing, touch-and-go, or missed or low approach maneuver. This information may be furnished progressively when conducting a series of approaches. Pilots on an IFR flight plan, who have made a series of instrument approaches to full stop landings should inform ATC when they make their final landing. The controller will control flights practicing instrument approaches so as to ensure that they do not disrupt the flow of arriving and departing itinerant IFR or VFR aircraft. The priority afforded itinerant aircraft over practice instrument approaches is not intended to be so rigidly applied that it causes grossly ineffi-

US 4-3

SECTION 3. AIRPORT OPERATIONS

cient application of services. A minimum delay to itinerant traffic may be appropriate to allow an aircraft practicing an approach to complete that approach.

NOTE: *A clearance to land means that appropriate separation on the landing runway will be ensured. A landing clearance does not relieve the pilot from compliance with any previously issued restriction.*

- c. At airports without a tower, pilots wishing to make practice instrument approaches should notify the facility having control jurisdiction of the desired approach as indicated on the approach chart. All approach control facilities and ARTCCs are required to publish a Letter to Airmen depicting those airports where they provide standard separation to both VFR and IFR aircraft conducting practice instrument approaches.
- d. The controller will provide approved separation between both VFR and IFR aircraft when authorization is granted to make practice approaches to airports where an approach control facility is located and to certain other airports served by approach control or an ARTCC. Controller responsibility for separation of VFR aircraft begins at the point where the approach clearance becomes effective, or when the aircraft enters Class B or Class C airspace, or a TRSA, whichever comes first.
- e. VFR aircraft practicing instrument approaches are not automatically authorized to execute the missed approach procedure. This authorization must be specifically requested by the pilot and approved by the controller. Where ATC procedures require application of IFR separation to VFR aircraft practicing instrument approaches, separation will be provided throughout the procedure including the missed approach. Where no separation services are provided during the practice approach, no separation services will be provided during the missed approach.
- f. Except in an emergency, aircraft cleared to practice instrument approaches must not deviate from the approved procedure until cleared to do so by the controller.
- g. At radar approach control locations when a full approach procedure (procedure turn, etc.,) cannot be approved, pilots should expect to be vectored to a final approach course for a practice instrument approach which is compatible with the general direction of traffic at that airport.
- h. When granting approval for a practice instrument approach, the controller will usually ask the pilot to report to the tower prior to or over the final approach fix inbound (nonprecision approaches) or over the outer marker or fix used in lieu of the outer marker inbound (precision approaches).
- i. When authorization is granted to conduct practice instrument approaches to an airport with a tower, but where approved standard separation is not provided to aircraft conducting practice instrument approaches, the tower will approve the practice approach, instruct the aircraft to maintain VFR and issue traffic information, as required.
- j. When an aircraft notifies a FSS providing Local Airport Advisory to the airport concerned of the intent to conduct a practice instrument approach and whether or not separation is to be provided, the pilot will be instructed to contact the appropriate facility on a specified fre-

US 4-3

SECTION 3. AIRPORT OPERATIONS

quency prior to initiating the approach. At airports where separation is not provided, the FSS will acknowledge the message and issue known traffic information but will neither approve or disapprove the approach.

- k. Pilots conducting practice instrument approaches should be particularly alert for other aircraft operating in the local traffic pattern or in proximity to the airport.

4-3-22 OPTION APPROACH

The "Cleared for the Option" procedure will permit an instructor, flight examiner or pilot the option to make a touch-and-go, low approach, missed approach, stop-and-go, or full stop landing. This procedure can be very beneficial in a training situation in that neither the student pilot nor examinee would know what maneuver would be accomplished. The pilot should make a request for this procedure passing the final approach fix inbound on an instrument approach or entering downwind for a VFR traffic pattern. After ATC approval of the option, the pilot should inform ATC as soon as possible of any delay on the runway during their stop-and-go or full stop landing. The advantages of this procedure as a training aid are that it enables an instructor or examiner to obtain the reaction of a trainee or examinee under changing conditions, the pilot would not have to discontinue an approach in the middle of the procedure due to student error or pilot proficiency requirements, and finally it allows more flexibility and economy in training programs. This procedure will only be used at those locations with an operational control tower and will be subject to ATC approval.

4-3-23 USE OF AIRCRAFT LIGHTS

- a. Aircraft position lights are required to be lighted on aircraft operated on the surface and in flight from sunset to sunrise. In addition, aircraft equipped with an anti-collision light system are required to operate that light system during all types of operations (day and night). However, during any adverse meteorological conditions, the pilot-in-command may determine that the anti-collision lights should be turned off when their light output would constitute a hazard to safety (14 CFR Section 91.209). Supplementary strobe lights should be turned off on the ground when they adversely affect ground personnel or other pilots, and in flight when there are adverse reflection from clouds.
- b. An aircraft anti-collision light system can use one or more rotating beacons and/or strobe lights, be colored either red or white, and have different (higher than minimum) intensities when compared to other aircraft. Many aircraft have both a rotating beacon and a strobe light system.
- c. The FAA has a voluntary pilot safety program, Operation Lights On, to enhance the *see-and-avoid* concept. Pilots are encouraged to turn on their landing lights during takeoff; i.e., either after takeoff clearance has been received or when beginning takeoff roll. Pilots are further encouraged to turn on their landing lights when operating below 10,000 feet, day or night, especially when operating within 10 miles of any airport, or in conditions of reduced visibility and in areas where flocks of birds may be expected, i.e., coastal areas, lake areas, around refuse dumps, etc. Although turning on aircraft lights does enhance the *see-and-avoid* concept, pilots should not become complacent about keeping a sharp lookout for other aircraft.

US 4-3

SECTION 3. AIRPORT OPERATIONS

Not all aircraft are equipped with lights and some pilots may not have their lights turned on. Aircraft manufacturer's recommendations for operation of landing lights and electrical systems should be observed.

- d. Prop and jet blast forces generated by large aircraft have overturned or damaged several smaller aircraft taxiing behind them. To avoid similar results, and in the interest of preventing upsets and injuries to ground personnel from such forces, the FAA recommends that air carriers and commercial operators turn on their rotating beacons anytime their aircraft engines are in operation. General aviation pilots using rotating beacon equipped aircraft are also encouraged to participate in this program which is designed to alert others to the potential hazard. Since this is a voluntary program, exercise caution and do not rely solely on the rotating beacon as an indication that aircraft engines are in operation.
- e. Prior to commencing taxi, it is recommended to turn on navigation, position, anti-collision, and logo lights (if equipped). To signal intent to other pilots, consider turning in on the taxi light when the aircraft is moving or intending to move on the ground, and turning it off when stopped or yielding to other ground traffic. Strobe lights should not be illuminated during taxi if they will adversely affect the vision of pilots or ground personnel.
- f. At the discretion of the pilot-in-command, all exterior lights should be illuminated when taxiing on or across any runway. This increases the conspicuousness of the aircraft to controllers and other pilots approaching to land, taxiing, or crossing the runway. Pilots should comply with any equipment operating limitations and consider the effects of landing and strobe lights on other aircraft in their vicinity.
- g. When entering the departure runway for takeoff or to "line up and wait," all lights, except for landing lights, should be illuminated to make the aircraft conspicuous to ATC and other aircraft on approach. Landing lights should be turned on when takeoff clearance is received or when commencing takeoff roll at an airport without an operating control tower.

4-3-24 FLIGHT INSPECTION/'FLIGHT CHECK' AIRCRAFT IN TERMINAL AREAS

- a. *Flight check* is a call sign used to alert pilots and air traffic controllers when a FAA aircraft is engaged in flight inspection/certification of NAVAIDs and flight procedures. Flight check aircraft fly preplanned high/low altitude flight patterns such as grids, orbits, DME arcs, and tracks, including low passes along the full length of the runway to verify NAVAID performance.
- b. Pilots should be especially watchful and avoid the flight paths of any aircraft using the call sign "Flight Check". These flights will normally receive special handling from ATC. Pilot patience and cooperation in allowing uninterrupted recordings can significantly help expedite flight inspections, minimize costly, repetitive runs, and reduce the burden on the U.S. taxpayer.

US 4-3

SECTION 3. AIRPORT OPERATIONS

**4-3-26 OPERATIONS AT UNCONTROLLED AIRPORTS WITH
AUTOMATED SURFACE OBSERVING SYSTEM (ASOS)/
AUTOMATED WEATHER OBSERVING SYSTEM (AWOS)**

- a. Many airports throughout the National Airspace System are equipped with either ASOS or AWOS. At most airports with an operating control tower or human observer, the weather will be available to you in an Aviation Routine Weather Report (METAR) hourly or special observation format on the Automatic Terminal Information Service (ATIS) or directly transmitted from the controller/observer.
- b. At uncontrolled airports that are equipped with ASOS/AWOS with ground-to-air broadcast capability, the one-minute updated airport weather should be available to you within approximately 25 NM of the airport below 10,000 feet. The frequency for the weather broadcast will be published on sectional charts and in the Chart Supplement U.S. [Frequencies on ASOS/AWOS also may be found on Jeppesen Enroute and Airport Charts.] Some part-time towered airports may also broadcast the automated weather on their ATIS frequency during the hours that the tower is closed.
- c. Controllers issue SVFR or IFR clearances based on pilot request, known traffic and reported weather, i.e., METAR/Nonroutine (Special) Aviation Weather Report (SPECI) observations, when they are available. Pilots have access to more current weather at uncontrolled ASOS/AWOS airports than do the controllers who may be located several miles away. Controllers will rely on the pilot to determine the current airport weather from the ASOS/AWOS. All aircraft arriving or departing an ASOS/AWOS equipped uncontrolled airport should monitor the airport weather frequency to ascertain the status of the airspace. Pilots in Class E airspace must be alert for changing weather conditions which may affect the status of the airspace from IFR/VFR. If ATC service is required for IFR/SVFR approach/departure or requested for VFR service, the pilot should advise the controller that he/she has received the one-minute weather and state his/her intentions.

EXAMPLE: "I have the (airport) one-minute weather, request an ILS Runway 14 approach."

REFERENCE—AIM, Para 7-1-10, *Weather Observing Programs*

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

4-4-1 CLEARANCE

- a. A clearance issued by ATC is predicated on known traffic and known physical airport conditions. An ATC clearance means an authorization by ATC, for the purpose of preventing collision between known aircraft, for an aircraft to proceed under specified conditions within controlled airspace. IT IS NOT AUTHORIZATION FOR A PILOT TO DEVIATE FROM ANY RULE, REGULATION, OR MINIMUM ALTITUDE NOR TO CONDUCT UNSAFE OPERATION OF THE AIRCRAFT.
- b. 14 CFR Section 91.3(a) states: "The pilot-in-command of an aircraft is directly responsible for, and is the final authority as to, the operation of that aircraft." If ATC issues a clearance that would cause a pilot to deviate from a rule or regulation, or in the pilot's opinion, would place the aircraft in jeopardy, IT IS THE PILOT'S RESPONSIBILITY TO REQUEST AN AMENDED CLEARANCE. Similarly, if a pilot prefers to follow a different course of action, such as make a 360 degree turn for spacing to follow traffic when established in a landing or approach sequence, land on a different runway, takeoff from a different intersection, takeoff from the threshold instead of an intersection, or delay operation, THE PILOT IS EXPECTED TO INFORM ATC ACCORDINGLY. When the pilot requests a different course of action, however, the pilot is expected to cooperate so as to preclude disruption of traffic flow or creation of conflicting patterns. The pilot is also expected to use the appropriate aircraft call sign to acknowledge all ATC clearances, frequency changes, or advisory information.
- c. Each pilot who deviates from an ATC clearance in response to a Traffic Alert and Collision Avoidance System resolution advisory must notify ATC of that deviation as soon as possible.

REFERENCE—*Pilot/Controller Glossary Term — Traffic Alert and Collision Avoidance System.*

- d. When weather conditions permit, during the time an IFR flight is operating, it is the direct responsibility of the pilot to avoid other aircraft since VFR flights may be operating in the same area without the knowledge of ATC. Traffic clearances provide standard separation only between IFR flights.

4-4-2 CLEARANCE PREFIX

A clearance, control information, or a response to a request for information originated by an ATC facility and relayed to the pilot through an air-to-ground communication station will be prefixed by "ATC clears," "ATC advises," or "ATC requests."

4-4-3 CLEARANCE ITEMS

ATC clearances normally contain the following:

- a. **Clearance Limit.** The traffic clearance issued prior to departure will normally authorize flight to the airport of intended landing. Many airports and associated NAVAIDs are collocated with the same name and/or identifier, so care should be exercised to ensure a clear understanding of the clearance limit. When the clearance limit is the airport of intended landing, the clearance should contain the airport name followed by the word "airport." Under certain conditions, a clearance limit may be a NAVAID or other fix. When the clearance limit is a

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

NAVAID, intersection, or waypoint and the type is known, the clearance should contain type. Under certain conditions, at some locations a short-range clearance procedure is utilized whereby a clearance is issued to a fix within or just outside of the terminal area and pilots are advised of the frequency on which they will receive the long-range clearance direct from the center controller.

- b. **Departure Procedure.** Headings to fly and altitude restrictions may be issued to separate a departure from other air traffic in the terminal area. Where the volume of traffic warrants, DPs have been developed.

REFERENCE—

AIM, Paragraph 5-2-6, Abbreviated IFR Departure Clearance (Cleared...as Filed) Procedures.

AIM, Paragraph 5-2-9, Instrument Departure Procedures (DP) — Obstacle Departure Procedures (ODP) and Standard Instrument Departures (SID).

c. **Route of Flight.**

1. Clearances are normally issued for the altitude or flight level and route filed by the pilot. However, due to traffic conditions, it is frequently necessary for ATC to specify an altitude or flight level or route different from that requested by the pilot. In addition, flow patterns have been established in certain congested areas or between congested areas whereby traffic capacity is increased by routing all traffic on preferred routes. Information on these flow patterns is available in offices where preflight briefing is furnished or where flight plans are accepted.
2. When required, air traffic clearances include data to assist pilots in identifying radio reporting points. It is the responsibility of pilots to notify ATC immediately if their radio equipment cannot receive the type of signals they must utilize to comply with their clearance.

d. **Altitude Data.**

1. The altitude or flight level instructions in an ATC clearance normally require that a pilot "MAINTAIN" the altitude or flight level at which the flight will operate when in controlled airspace. Altitude or flight level changes while en route should be requested prior to the time the change is desired.
2. When possible, if the altitude assigned is different from the altitude requested by the pilot, ATC will inform the pilot when to expect climb or descent clearance or to request altitude change from another facility. If this has not been received prior to crossing the boundary of the ATC facility's area and assignment at a different altitude is still desired, the pilot should reinitiate the request with the next facility.
3. The term "cruise" may be used instead of "MAINTAIN" to assign a block of airspace to a pilot from the minimum IFR altitude up to and including the altitude specified in the cruise clearance. The pilot may level off at any intermediate altitude within this block of airspace. Climb/descent within the block is to be made at the discretion of the pilot.

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

However, once the pilot starts descent and verbally reports leaving an altitude in the block, the pilot may not return to that altitude without additional ATC clearance.

REFERENCE—*Pilot/Controller Glossary Term — Cruise.*

e. Holding Instructions.

1. Whenever an aircraft has been cleared to a fix other than the destination airport and delay is expected, it is the responsibility of the ATC controller to issue complete holding instructions (unless the pattern is charted), an EFC time, and a best estimate of any additional en route/terminal delay.
2. If the holding pattern is charted and the controller doesn't issue complete holding instructions, the pilot is expected to hold as depicted on the appropriate chart. When the pattern is charted, the controller may omit all holding instructions except the charted holding direction and the statement *AS PUBLISHED*, e.g., "*HOLD EAST AS PUBLISHED.*" Controllers must always issue complete holding instructions when pilots request them.

NOTE: *Only those holding patterns depicted on U.S. government or commercially produced charts which meet FAA requirements should be used.*

3. If no holding pattern is charted and holding instructions have not been issued, the pilot should ask ATC for holding instructions prior to reaching the fix. This procedure will eliminate the possibility of an aircraft entering a holding pattern other than that desired by ATC. If unable to obtain holding instructions prior to reaching the fix (due to frequency congestion, stuck microphone, etc.), hold in a standard pattern on the course on which you approached the fix and request further clearance as soon as possible. In this event, the altitude/flight level of the aircraft at the clearance limit will be protected so that separation will be provided as required.
4. When an aircraft is 3 minutes or less from a clearance limit and a clearance beyond the fix has not been received, the pilot is expected to start a speed reduction so that the aircraft will cross the fix, initially, at or below the maximum holding airspeed.
5. When no delay is expected, the controller should issue a clearance beyond the fix as soon as possible and, whenever possible, at least 5 minutes before the aircraft reaches the clearance limit.
6. Pilots should report to ATC the time and altitude/flight level at which the aircraft reaches the clearance limit and report leaving the clearance limit.

NOTE: *In the event of two-way communications failure, pilots are required to comply with 14 CFR Section 91.185.*

4-4-4 AMENDED CLEARANCES

- a. Amendments to the initial clearance will be issued at any time an air traffic controller deems such action necessary to avoid possible confliction between aircraft. Clearances will require that a flight "hold" or change altitude prior to reaching the point where standard separation from other IFR traffic would no longer exist.

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

NOTE: *Some pilots have questioned this action and requested “traffic information” and were at a loss when the reply indicated “no traffic report.” In such cases the controller has taken action to prevent a traffic conflict which would have occurred at a distant point.*

- b. A pilot may wish an explanation of the handling of the flight at the time of occurrence; however, controllers are not able to take time from their immediate control duties nor can they afford to overload the ATC communications channels to furnish explanations. Pilots may obtain an explanation by directing a letter or telephone call to the chief controller of the facility involved.
- c. Pilots have the privilege of requesting a different clearance from that which has been issued by ATC if they feel that they have information which would make another course of action more practicable or if aircraft equipment limitations or company procedures forbid compliance with the clearance issued.

4-4-5 CODED DEPARTURE ROUTE (CDR)

- a. CDRs provide air traffic control a rapid means to reroute departing aircraft when the filed route is constrained by either weather or congestion.
- b. CDRs consist of an eight-character designator that represents a route of flight. The first three alphanumeric characters represent the departure airport, characters four through six represent the arrival airport, and the last two characters are chosen by the overlying ARTCC. For example, PITORDN1 is an alternate route from Pittsburgh to Chicago. Participating aircrews may then be re-cleared by air traffic control via the CDR abbreviated clearance, PITORDN1.
- c. CDRs are updated on the 56 day charting cycle. Participating aircrews must ensure that their CDR is current.
- d. Traditionally, CDRs have been used by air transport companies that have signed a Memorandum of Agreement with the local air traffic control facility. General aviation customers who wish to participate in the program may now enter “CDR Capable” in the remarks section of their flight plan.
- e. When “CDR Capable” is entered into the remarks section of the flight plan the general aviation customer communicates to ATC the ability to decode the current CDR into a flight plan route and the willingness to fly a different route than that which was filed.

4-4-6 SPECIAL VFR CLEARANCES

- a. An ATC clearance must be obtained *prior* to operating within a Class B, Class C, Class D, or Class E surface area when the weather is less than that required for VFR flight. A VFR pilot may request and be given a clearance to enter, leave, or operate within most Class D and Class E surface areas and some Class B and Class C surface areas in special VFR conditions, traffic permitting, and providing such flight will not delay IFR operations. All special VFR flights must remain clear of clouds. The visibility requirements for special VFR aircraft (other than helicopters) are:
 - 1. At least 1 statute mile flight visibility for operations within Class B, Class C, Class D, and Class E surface areas.

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

2. At least 1 statute mile ground visibility if taking off or landing. If ground visibility is not reported at that airport, the flight visibility must be at least 1 statute mile.
 3. The restrictions in subparagraphs 1 and 2 do not apply to helicopters. Helicopters must remain clear of clouds and may operate in Class B, Class C, Class D, and Class E surface areas with less than 1 statute mile visibility.
- b. When a control tower is located within the Class B, Class C, or Class D surface area, requests for clearances should be to the tower. In a Class E surface area, a clearance may be obtained from the nearest tower, FSS, or center.
 - c. It is not necessary to file a complete flight plan with the request for clearance, but pilots should state their intentions in sufficient detail to permit ATC to fit their flight into the traffic flow. The clearance will not contain a specific altitude as the pilot must remain clear of clouds. The controller may require the pilot to fly at or below a certain altitude due to other traffic, but the altitude specified will permit flight at or above the minimum safe altitude. In addition, at radar locations, flights may be vectored if necessary for control purposes or on pilot request.

NOTE: *The pilot is responsible for obstacle or terrain clearance.*

REFERENCE—14 CFR Section 91.119, *Minimum safe altitudes: General.*

- d. Special VFR clearances are effective within Class B, Class C, Class D, and Class E surface areas only. ATC does not provide separation after an aircraft leaves the Class B, Class C, Class D, or Class E surface area on a special VFR clearance.
- e. Special VFR operations by fixed-wing aircraft are prohibited in some Class B and Class C surface areas due to the volume of IFR traffic. A list of these Class B and Class C surface areas is contained in 14 CFR Part 91, Appendix D, Section 3. They are also depicted on sectional aeronautical charts.
- f. ATC provides separation between Special VFR flights and between these flights and other IFR flights.
- g. Special VFR operations by fixed-wing aircraft are prohibited between sunset and sunrise unless the pilot is instrument rated and the aircraft is equipped for IFR flight.
- h. Pilots arriving or departing an uncontrolled airport that has automated weather broadcast capability (ASOS/AWOS) should monitor the broadcast frequency, advise the controller that they have the “one-minute weather” and state intentions prior to operating within the Class B, Class C, Class D, or Class E surface areas.

REFERENCE—*Pilot/Controller Glossary Term — One-minute Weather.*

4-4-7 PILOT RESPONSIBILITY UPON CLEARANCE ISSUANCE

- a. **Record ATC clearance.** When conducting an IFR operation, make a written record of your clearance. The specified conditions which are a part of your air traffic clearance may be somewhat different from those included in your flight plan. Additionally, ATC may find it necessary to ADD conditions, such as particular departure route. The very fact that ATC speci-

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

fies different or additional conditions means that other aircraft are involved in the traffic situation.

- b. **ATC Clearance/Instruction Readback.** Pilots of airborne aircraft should read back *those parts* of ATC clearances and instructions containing altitude assignments, vectors or runway assignments as a means of mutual verification. The read back of the “numbers” serves as a double check between pilots and controllers and reduces the kinds of communications errors that occur when a number is either “misheard” or is incorrect.
 - 1. Include the aircraft identification in all readbacks and acknowledgments. This aids controllers in determining that the correct aircraft received the clearance or instruction. The requirement to include aircraft identification in all readbacks and acknowledgments becomes more important as frequency congestion increases and when aircraft with similar call signs are on the same frequency.
 - EXAMPLE:** “Climbing to Flight Level three three zero, United Twelve” or “November Five Charlie Tango, roger, cleared to land runway nine left.”
 - 2. Read back altitudes, altitude restrictions, and vectors in the same sequence as they are given in the clearance or instruction.
 - 3. Altitudes contained in charted procedures, such as DPs, instrument approaches, etc., should not be read back unless they are specifically stated by the controller.
 - 4. Initial read back of a taxi, departure or landing clearance should include the runway assignment, including left, right, center, etc. if applicable.
- c. It is the responsibility of the pilot to accept or refuse the clearance issued.

4-4-8 IFR CLEARANCE VFR-ON-TOP

- a. A pilot on an IFR flight plan operating in VFR weather conditions, may request VFR-on-top in lieu of an assigned altitude. This permits a pilot to select an altitude or flight level of their choice (subject to any ATC restrictions.)
- b. Pilots desiring to climb through a cloud, haze, smoke, or other meteorological formation and then either cancel their IFR flight plan or operate VFR-on-top may request a climb to VFR-on-top. The ATC authorization must contain either a top report or a statement that no top report is available, and a request to report reaching VFR-on-top. Additionally, the ATC authorization may contain a clearance limit, routing and an alternative clearance if VFR-on-top is not reached by a specified altitude.
- c. A pilot on an IFR flight plan, operating in VFR conditions, may request to climb/descend in VFR conditions.
- d. ATC may not authorize VFR-on-top/VFR conditions operations unless the pilot requests the VFR operation or a clearance to operate in VFR conditions will result in noise abatement benefits where part of the IFR departure route does not conform to an FAA approved noise abatement route or altitude.

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

e. When operating in VFR conditions with an ATC authorization to “maintain VFR-on-top/main-tain VFR conditions” pilots on IFR flight plans must:

1. Fly at the appropriate VFR altitude as prescribed in 14 CFR Section 91.159.
2. Comply with the VFR visibility and distance from cloud criteria in 14 CFR Section 91.155 (Basic VFR Weather Minimums).
3. Comply with instrument flight rules that are applicable to this flight; i.e., minimum IFR altitudes, position reporting, radio communications, course to be flown, adherence to ATC clearance, etc.

NOTE: *Pilots should advise ATC prior to any altitude change to ensure the exchange of accurate traffic information.*

f. ATC authorization to “maintain VFR-on-top” is not intended to restrict pilots so that they must operate only *above* an obscuring meteorological formation (layer). Instead, it permits operation above, below, between layers, or in areas where there is no meteorological obscuration. It is imperative, however, that pilots understand that clearance to operate “VFR-on-top/VFR conditions” does not imply cancellation of the IFR flight plan.

g. Pilots operating VFR-on-top/VFR conditions may receive traffic information from ATC on other pertinent IFR or VFR aircraft. However, aircraft operating in Class B airspace/TRSAs must be separated as required by FAA Order JO 7110.65, Air Traffic Control.

NOTE: *When operating in VFR weather conditions, it is the pilot’s responsibility to be vigilant so as to see-and-avoid other aircraft.*

h. ATC will not authorize VFR or VFR-on-top operations in Class A airspace.

REFERENCE—AIM, Paragraph 3-2-2, Class A Airspace.

4-4-9 VFR/IFR FLIGHTS

A pilot departing VFR, either intending to or needing to obtain an IFR clearance en route, must be aware of the position of the aircraft and the relative terrain/obstructions. When accepting a clearance below the MEA/MIA/MVA/OROCA, pilots are responsible for their own terrain/obstruction clearance until reaching the MEA/MIA/MVA/OROCA. If pilots are unable to maintain terrain/obstruction clearance, the controller should be advised and pilots should state their intentions.

NOTE: *OROCA is a published altitude which provides 1,000 feet of terrain and obstruction clearance in the US (2,000 feet of clearance in designated mountainous areas). These altitudes are not assessed for NAVAID signal coverage, air traffic control surveillance, or communications coverage, and are published for general situational awareness, flight planning and in-flight contingency use.*

4-4-10 ADHERENCE TO CLEARANCE

a. When air traffic clearance has been obtained under either visual or instrument flight rules, the pilot-in-command of the aircraft must not deviate from the provisions thereof unless an amended clearance is obtained. When ATC issues a clearance or instruction, pilots are

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

expected to execute its provisions upon receipt. ATC, in certain situations, will include the word “IMMEDIATELY” in a clearance or instruction to impress urgency of an imminent situation and expeditious compliance by the pilot is expected and necessary for safety. The addition of a VFR or other restriction; i.e., climb or descent point or time, crossing altitude, etc., does not authorize a pilot to deviate from the route of flight or any other provision of the ATC clearance.

- b. When a heading is assigned or a turn is requested by ATC, pilots are expected to promptly initiate the turn, to complete the turn, and maintain the new heading unless issued additional instructions.
- c. The term “AT PILOT’S DISCRETION” included in the altitude information of an ATC clearance means that ATC has offered the pilot the option to start climb or descent when the pilot wishes, is authorized to conduct the climb or descent at any rate, and to temporarily level off at any intermediate altitude as desired. However, once the aircraft has vacated an altitude, it may not return to that altitude.
- d. When ATC has not used the term “AT PILOT’S DISCRETION” nor imposed any climb or descent restrictions, pilots should initiate climb or descent promptly on acknowledgement of the clearance. Descend or climb at an optimum rate consistent with the operating characteristics of the aircraft to 1,000 feet above or below the assigned altitude, and then attempt to descend or climb at a rate of between 500 and 1,500 fpm until the assigned altitude is reached. If at anytime the pilot is unable to climb or descend at a rate of at least 500 feet a minute, advise ATC. If it is necessary to level off at an intermediate altitude during climb or descent, advise ATC, except when leveling off at 10,000 feet MSL on descent, or 2,500 feet above airport elevation (prior to entering a Class C or Class D surface area), when required for speed reduction.

REFERENCE—14 CFR Section 91.117.

NOTE: *Leveling off at 10,000 feet MSL on descent or 2,500 feet above airport elevation (prior to entering a Class C or Class D surface area) to comply with 14 CFR Section 91.117 airspeed restrictions is commonplace. Controllers anticipate this action and plan accordingly. Leveling off at any other time on climb or descent may seriously affect air traffic handling by ATC. Consequently, it is imperative that pilots make every effort to fulfill the above expected actions to aid ATC in safely handling and expediting traffic.*

- e. If the altitude information of an ATC DESCENT clearance includes a provision to “CROSS (fix) AT” or “AT OR ABOVE/BELOW (altitude),” the manner in which the descent is executed to comply with the crossing altitude is at the pilot’s discretion. This authorization to descend at pilot’s discretion is only applicable to that portion of the flight to which the crossing altitude restriction applies, and the pilot is expected to comply with the crossing altitude as a provision of the clearance. Any other clearance in which pilot execution is optional will so state “AT PILOT’S DISCRETION.”

EXAMPLE:

1. “United Four Seventeen, descend and maintain six thousand.”

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

NOTE:

1. *The pilot is expected to commence descent upon receipt of the clearance and to descend at the suggested rates until reaching the assigned altitude of 6,000 feet.*

EXAMPLE:

2. "United Four Seventeen, descend at pilot's discretion, maintain six thousand."

NOTE:

2. *The pilot is authorized to conduct descent within the context of the term at pilot's discretion as described above.*

EXAMPLE:

3. "United Four Seventeen, cross Lakeview V-O-R at or above Flight Level two zero zero, descend and maintain six thousand."

NOTE:

3. *The pilot is authorized to conduct descent at pilot's discretion until reaching Lakeview VOR and must comply with the clearance provision to cross the Lakeview VOR at or above FL 200. After passing Lakeview VOR, the pilot is expected to descend at the suggested rates until reaching the assigned altitude of 6,000 feet.*

EXAMPLE:

4. "United Four Seventeen, cross Lakeview V-O-R at six thousand, maintain six thousand."

NOTE:

4. *The pilot is authorized to conduct descent at pilot's discretion, however, must comply with the clearance provision to cross the Lakeview VOR at 6,000 feet.*

EXAMPLE:

5. "United Four Seventeen, descend now to Flight Level two seven zero, cross Lakeview V-O-R at or below one zero thousand, descend and maintain six thousand."

NOTE:

5. *The pilot is expected to promptly execute and complete descent to FL 270 upon receipt of the clearance. After reaching FL 270 the pilot is authorized to descend "at pilot's discretion" until reaching Lakeview VOR. The pilot must comply with the clearance provision to cross Lakeview VOR at or below 10,000 feet. After Lakeview VOR the pilot is expected to descend at the suggested rates until reaching 6,000 feet.*

EXAMPLE:

6. "United Three Ten, descend now and maintain Flight Level two four zero, pilot's discretion after reaching Flight Level two eight zero."

NOTE:

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

6. *The pilot is expected to commence descent upon receipt of the clearance and to descend at the suggested rates until reaching FL 280. At that point, the pilot is authorized to continue descent to FL 240 within the context of the term "at pilot's discretion" as described above.*
- f. In case emergency authority is used to deviate from provisions of an ATC clearance, the pilot-in-command must notify ATC as soon as possible and obtain an amended clearance. In an emergency situation which does not result in a deviation from the rules prescribed in 14 CFR Part 91 but which requires ATC to give priority to an aircraft, the pilot of such aircraft must, when requested by ATC, make a report within 48 hours of such emergency situation to the manager of that ATC facility.
- g. The guiding principle is that the last ATC clearance has precedence over the previous ATC clearance. When the route or altitude in a previously issued clearance is amended, the controller will restate applicable altitude restrictions. If altitude to maintain is changed or restated, whether prior to departure or while airborne, and previously issued altitude restrictions are omitted, those altitude restrictions are canceled, including departure procedures and STAR altitude restrictions.

EXAMPLE:

1. A departure flight receives a clearance to destination airport to maintain FL 290. The clearance incorporates a DP which has certain altitude crossing restrictions. Shortly after takeoff, the flight receives a new clearance changing the maintaining FL from 290 to 250. If the altitude restrictions are still applicable, the controller restates them.
2. A departing aircraft is cleared to cross Fluky Intersection at or above 3,000 feet, Gordonville VOR at or above 12,000 feet, maintain FL 200. Shortly after departure, the altitude to be maintained is changed to FL 240. If the altitude restrictions are still applicable, the controller issues an amended clearance as follows: "cross Fluky Intersection at or above three thousand, cross Gordonville V-O-R at or above one two thousand, maintain Flight Level two four zero."
3. An arriving aircraft is cleared to the destination airport via V45 Delta VOR direct; the aircraft is cleared to cross Delta VOR at 10,000 feet, and then to maintain 6,000 feet. Prior to Delta VOR, the controller issues an amended clearance as follows: "turn right heading one eight zero for vector to runway three six I-L-S approach, maintain six thousand."

NOTE: *Because the altitude restriction "cross Delta V-O-R at 10,000 feet" was omitted from the amended clearance, it is no longer in effect.*

- h. Pilots of turbojet aircraft equipped with afterburner engines should advise ATC prior to takeoff if they intend to use afterburning during their climb to the en route altitude. Often, the controller may be able to plan traffic to accommodate a high performance climb and allow the aircraft to climb to the planned altitude without restriction.
- i. If an "expedite" climb or descent clearance is issued by ATC, and the altitude to maintain is subsequently changed or restated without an expedite instruction, the expedite instruction is canceled. Expedite climb/descent normally indicates to the pilot that the approximate best

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

rate of climb/descent should be used without requiring an exceptional change in aircraft handling characteristics. Normally controllers will inform pilots of the reason for an instruction to expedite.

4-4-11 IFR SEPARATION STANDARDS

- a. ATC effects separation of aircraft vertically by assigning different altitudes; longitudinally by providing an interval expressed in time or distance between aircraft on the same, converging, or crossing courses, and laterally by assigning different flight paths.
- b. Separation will be provided between all aircraft operating on IFR flight plans except during that part of the flight (outside Class B airspace or a TRSA) being conducted on a VFR-on-top/VFR conditions clearance. Under these conditions, ATC may issue traffic advisories, but it is the sole responsibility of the pilot to be vigilant so as to see and avoid other aircraft.
- c. When radar is employed in the separation of aircraft at the same altitude, a minimum of 3 miles separation is provided between aircraft operating within 40 miles of the radar antenna site, and 5 miles between aircraft operating beyond 40 miles from the antenna site. These minima may be increased or decreased in certain specific situations.

NOTE: *Certain separation standards may be increased in the terminal environment due to radar outages or other technical reasons.*

4-4-12 SPEED ADJUSTMENTS

- a. ATC will issue speed adjustments to pilots of radar-controlled aircraft to achieve or maintain appropriate spacing. If necessary, ATC will assign a speed when approving deviations or radar vectoring off procedures that include published speed restrictions. If no speed is assigned, speed becomes pilot's discretion. However, when the aircraft reaches the end of the STAR, the last published speed on the STAR must be maintained until ATC deletes it, assigns a new speed, issues a vector, assigns a direct route, or issues an approach clearance.
- b. ATC will express all speed adjustments in terms of knots based on indicated airspeed (IAS) in 5 or 10 knot increments except that at or above FL 240 speeds may be expressed in terms of Mach numbers in 0.01 increments. The use of Mach numbers is restricted to turbo-jet aircraft with Mach meters.
- c. Pilots complying with speed adjustments (published or assigned) are expected to maintain a speed within plus or minus 10 knots or 0.02 Mach number of the specified speed.
- d. When ATC assigns speed adjustments, it will be in accordance with the following recommended minimums:
 1. To aircraft operating between FL 280 and 10,000 feet, a speed not less than 250 knots or the equivalent Mach number.

NOTE 1: *On a standard day the Mach numbers equivalent to 250 knots CAS (subject to minor variations) are:*

FL 240-0.6

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

FL 250-0.61

FL 260-0.62

FL 270-0.64

FL 280-0.65

FL 290-0.66.

NOTE 2: *When an operational advantage will be realized, speeds lower than the recommended minima may be applied.*

2. To arriving turbojet aircraft operating below 10,000 feet:
 - (a) A speed not less than 210 knots, except;
 - (b) Within 20 flying miles of the airport of intended landing, a speed not less than 170 knots.
3. To arriving reciprocating engine or turboprop aircraft within 20 flying miles of the runway threshold of the airport of intended landing, a speed not less than 150 knots.
4. To departing aircraft:
 - (a) Turbojet aircraft, a speed not less than 230 knots.
 - (b) Reciprocating engine aircraft, a speed not less than 150 knots.
- e. When ATC combines a speed adjustment with a descent clearance, the sequence of delivery, with the word “then” between, indicates the expected order of execution.

EXAMPLE:

1. Descend and maintain (altitude); then, reduce speed to (speed).
2. Reduce speed to (speed); then, descend and maintain (altitude).

NOTE: *The maximum speeds below 10,000 feet as established in 14 CFR Section 91.117 still apply. If there is any doubt concerning the manner in which such a clearance is to be executed, request clarification from ATC.*

- f. If ATC determines (before an approach clearance is issued) that it is no longer necessary to apply speed adjustment procedures, they will:
 1. Advise the pilot to “resume normal speed.” Normal speed is used to terminate ATC assigned speed adjustments on segments where no published speed restrictions apply. It does not cancel published restrictions on upcoming procedures. This does not relieve the pilot of those speed restrictions which are applicable to 14 CFR Section 91.117.

EXAMPLE: (An aircraft is flying a SID with no published speed restrictions. ATC issues a speed adjustment and instructs the aircraft where the adjustment ends): “Maintain two two zero knots until BALTR then resume normal speed.”

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

NOTE: *The ATC assigned speed assignment of two two zero knots would apply until BALTR. The aircraft would then resume a normal operating speed while remaining in compliance with 14 CFR Section 91.117.*

2. Instruct pilots to “comply with speed restrictions” when the aircraft is joining or resuming a charted procedure or route with published speed restrictions.

EXAMPLE: (ATC vectors an aircraft off of a SID to rejoin the procedure at a subsequent waypoint. When instructing the aircraft to resume the procedure, ATC also wants the aircraft to comply with the published procedure speed restrictions): “Resume the SALT ONE departure. Comply with speed restrictions.”

CAUTION: *The phraseology “Descend via/Climb via SID” requires compliance with all altitude and/or speed restrictions depicted on the procedure.*

3. Instruct the pilot to “resume published speed.” Resume published speed is issued to terminate a speed adjustment where speed restrictions are published on a charted procedure.

NOTE: *When instructed to “comply with speed restrictions” or to “resume published speed,” ATC anticipates pilots will begin adjusting speed the minimum distance necessary prior to a published speed restriction so as to cross the waypoint/fix at the published speed. Once at the published speed, ATC expects pilots will maintain the published speed until additional adjustment is required to comply with further published or ATC assigned speed restrictions or as required to ensure compliance with 14 CFR Section 91.117.*

EXAMPLE: (An aircraft is flying a SID/STAR with published speed restrictions. ATC issues a speed adjustment and instructs the aircraft where the adjustment ends): “Maintain two two zero knots until BALTR then resume published speed.”

NOTE: *The ATC assigned speed assignment of two two zero knots would apply until BALTR. The aircraft would then comply with the published speed restrictions.*

4. Advise the pilot to “delete speed restrictions” when either ATC assigned or published speed restrictions on a charted procedure are no longer required.

EXAMPLE: (An aircraft is flying a SID with published speed restrictions designed to prevent aircraft overtake on departure. ATC determines there is no conflicting traffic and deletes the speed restriction): “Delete speed restrictions.”

NOTE: *When deleting published restrictions, ATC must ensure obstacle clearance until aircraft are established on a route where no published restrictions apply. This does not relieve the pilot of those speed restrictions which are applicable to 14 CFR Section 91.117.*

5. Instruct the pilot to “climb via” or “descend via.” A climb via or descend via clearance cancels any previously issued speed restrictions and, once established on the depicted departure or arrival, to climb or descend, and to meet all published or assigned altitude and/or speed restrictions.

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

EXAMPLE:

1. (An aircraft is flying a SID with published speed restrictions. ATC has issued a speed restriction of 250 knots for spacing. ATC determines that spacing between aircraft is adequate and desires the aircraft to comply with published restrictions): "United 436, Climb via SID."
2. (An aircraft is established on a STAR. ATC must slow an aircraft for the purposes of spacing and assigns it a speed of 280 knots. When spacing is adequate, ATC deletes the speed restriction and desires that the aircraft comply with all published restrictions on the STAR): "Gulfstream two three papa echo, descend via the TYLER One arrival."

NOTE:

1. *In example 1, when ATC issues a "Climb via SID" clearance, it deletes any previously issued speed and/or altitude restrictions. The pilot should then vertically navigate to comply with all speed and/or altitude restrictions published on the SID.*
2. *In example 2, when ATC issues a "Descend via <STAR name> arrival," ATC has canceled any previously issued speed and/or altitude restrictions. The pilot should vertically navigate to comply with all speed and/or altitude restrictions published on the STAR.*

CAUTION: *When descending on a STAR, pilots should not speed up excessively beyond the previously issued speed. Otherwise, adequate spacing between aircraft descending on the STAR that was established by ATC with the previous restriction may be lost.*

- a. Approach clearances supersede any prior speed adjustment assignments, and pilots are expected to make their own speed adjustments as necessary to complete the approach. However, under certain circumstances, it may be necessary for ATC to issue further speed adjustments after approach clearance is issued to maintain separation between successive arrivals. Under such circumstances, previously issued speed adjustments will be restated if that speed is to be maintained or additional speed adjustments are requested. Speed adjustments should not be assigned inside the final approach fix on final or a point 5 miles from the runway, whichever is closer to the runway.
- b. The pilots retain the prerogative of rejecting the application of speed adjustment by ATC if the minimum safe airspeed for any particular operation is greater than the speed adjustment.

NOTE: *In such cases, pilots are expected to advise ATC of the speed that will be used.*

- i. Pilots are reminded that they are responsible for rejecting the application of speed adjustment by ATC if, in their opinion, it will cause them to exceed the maximum indicated airspeed prescribed by 14 CFR Section 91.117(a), (c) and (d). **IN SUCH CASES, THE PILOT IS EXPECTED TO SO INFORM ATC.** Pilots operating at or above 10,000 feet MSL who are issued speed adjustments which exceed 250 knots IAS and are subsequently cleared below 10,000 feet MSL are expected to comply with 14 CFR Section 91.117(a).

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

- j. Speed restrictions of 250 knots do not apply to U.S. registered aircraft operating beyond 12 nautical miles from the coastline within the U.S. Flight Information Region, in Class E airspace below 10,000 feet MSL. However, in airspace underlying a Class B airspace area designated for an airport, or in a VFR corridor designated through such as a Class B airspace area, pilots are expected to comply with the 200 knot speed limit specified in 14 CFR Section 91.117(c).
- k. For operations in a Class C and Class D surface area, ATC is authorized to request or approve a speed greater than the maximum indicated airspeeds prescribed for operation within that airspace (14 CFR Section 91.117(b)).

NOTE: *Pilots are expected to comply with the maximum speed of 200 knots when operating beneath Class B airspace or in a Class B VFR corridor (14 CFR Section 91.117(c) and (d)).*

- l. When in communications with the ARTCC or approach control facility, pilots should, as a good operating practice, state any ATC assigned speed restriction on initial radio contact associated with an ATC communications frequency change.

4-4-13 RUNWAY SEPARATION

Tower controllers establish the sequence of arriving and departing aircraft by requiring them to adjust flight or ground operation as necessary to achieve proper spacing. They may “HOLD” an aircraft short of the runway to achieve spacing between it and an arriving aircraft; the controller may instruct a pilot to “EXTEND DOWNWIND” in order to establish spacing from an arriving or departing aircraft. At times a clearance may include the word “IMMEDIATE.” For example: “CLEARED FOR IMMEDIATE TAKEOFF.” In such cases “IMMEDIATE” is used for purposes of *air traffic separation*. It is up to the pilot to refuse the clearance if, in the pilot’s opinion, compliance would adversely affect the operation.

REFERENCE—AIM, Paragraph 4-3-15, *Gate Holding due to Departure Delays.*

4-4-14 VISUAL SEPARATION

- a. Visual separation is a means employed by ATC to separate aircraft in terminal areas and en route airspace in the NAS. There are two methods employed to effect this separation:
 - 1. The tower controller sees the aircraft involved and issues instructions, as necessary, to ensure that the aircraft avoid each other.
 - 2. A pilot sees the other aircraft involved and upon instructions from the controller provides separation by maneuvering the aircraft to avoid it. When pilots accept responsibility to maintain visual separation, they must maintain constant visual surveillance and not pass the other aircraft until it is no longer a factor.

NOTE: *Traffic is no longer a factor when during approach phase the other aircraft is in the landing phase of flight or executes a missed approach; and during departure or en route, when the other aircraft turns away or is on a diverging course.*

- b. A pilot’s acceptance of instructions to follow another aircraft or provide visual separation from it is an acknowledgment that the pilot will maneuver the aircraft as necessary to avoid the

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

other aircraft or to maintain in-trail separation. In operations conducted behind heavy aircraft, or a small aircraft behind a B757 or other large aircraft, it is also an acknowledgment that the pilot accepts the responsibility for wake turbulence separation. Visual separation is prohibited behind super aircraft.

NOTE: *When a pilot has been told to follow another aircraft or to provide visual separation from it, the pilot should promptly notify the controller if visual contact with the other aircraft is lost or cannot be maintained or if the pilot cannot accept the responsibility for the separation for any reason.*

- c. Scanning the sky for other aircraft is a key factor in collision avoidance. Pilots and copilots (or the right seat passenger) should continuously scan to cover all areas of the sky visible from the cockpit. Pilots must develop an effective scanning technique which maximizes one's visual capabilities. Spotting a potential collision threat increases directly as more time is spent looking outside the aircraft. One must use timesharing techniques to effectively scan the surrounding airspace while monitoring instruments as well.
- d. Since the eye can focus only on a narrow viewing area, effective scanning is accomplished with a series of short, regularly spaced eye movements that bring successive areas of the sky into the central visual field. Each movement should not exceed ten degrees, and each area should be observed for at least one second to enable collision detection. Although many pilots seem to prefer the method of horizontal back-and-forth scanning every pilot should develop a scanning pattern that is not only comfortable but assures optimum effectiveness. Pilots should remember, however, that they have a regulatory responsibility (14 CFR Section 91.113(a)) to see and avoid other aircraft when weather conditions permit.

4-4-15 USE OF VISUAL CLEARING PROCEDURES AND SCANNING TECHNIQUES

- a. **Before Takeoff.** Prior to taxiing onto a runway or landing area in preparation for takeoff, pilots should scan the approach areas for possible landing traffic and execute the appropriate clearing maneuvers to provide them a clear view of the approach areas.
- b. **Climbs and Descents.** During climbs and descents in flight conditions which permit visual detection of other traffic, pilots should execute gentle banks, left and right at a frequency which permits continuous visual scanning of the airspace about them.
- c. **Straight and Level.** Sustained periods of straight and level flight in conditions which permit visual detection of other traffic should be broken at intervals with appropriate clearing procedures to provide effective visual scanning.
- d. **Traffic Pattern.** Entries into traffic patterns while descending create specific collision hazards and should be avoided.
- e. **Traffic at VOR Sites.** All operators should emphasize the need for sustained vigilance in the vicinity of VORs and airway intersections due to the convergence of traffic.
- f. **Training Operations.** Operators of pilot training programs are urged to adopt the following practices:

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

1. Pilots undergoing flight instruction at all levels should be requested to verbalize clearing procedures (call out “clear” left, right, above, or below) to instill and sustain the habit of vigilance during maneuvering.
2. **High-wing airplane.** Momentarily raise the wing in the direction of the intended turn and look.
3. **Low-wing airplane.** Momentarily lower the wing in the direction of the intended turn and look.
4. Appropriate clearing procedures should precede the execution of all turns including chandelles, lazy eights, stalls, slow flight, climbs, straight and level, spins, and other combination maneuvers.

g. Scanning Techniques for Traffic Avoidance.

1. Pilots must be aware of the limitations inherent in the visual scanning process. These limitations may include:
 - (a) Reduced scan frequency due to concentration on flight instruments or tablets and distraction with passengers.
 - (b) Blind spots related to high-wing and low-wing aircraft in addition to windshield posts and sun visors.
 - (c) Prevailing weather conditions including reduced visibility and the position of the sun.
 - (d) The attitude of the aircraft will create additional blind spots.
 - (e) The physical limitations of the human eye, including the time required to (re)focus on near and far objects, from the instruments to the horizon for example; empty field myopia, narrow field of vision and atmospheric lighting all affect our ability to detect another aircraft.
2. Best practices to see and avoid:
 - (a) ADS-B In is an effective system to help pilots see and avoid other aircraft. If your aircraft is equipped with ADS-B In, it is important to understand its features and how to use it properly. Many units provide visual and/or audio alerts to supplement the system’s traffic display. Pilots should incorporate the traffic display in their normal traffic scan to provide awareness of nearby aircraft. Prior to taxiing onto an airport movement area, ADS-B In can provide advance indication of arriving aircraft and aircraft in the traffic pattern. Systems that incorporate a traffic-alerting feature can help minimize the pilot’s inclination to fixate on the display. Refer to 4-5-7e, ADS-B Limitations.
 - (b) Understand the limitations of ADS-B In. In certain airspace, not all aircraft will be equipped with ADS-B Out or transponders and will not be visible on your ADS-B In display.
 - (c) Limit the amount of time that you focus on flight instruments or tablets.

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

- (d) Develop a strategic approach to scanning for traffic. Scan the entire sky and try not to focus straight ahead.

4-4-16 TRAFFIC ALERT AND COLLISION AVOIDANCE SYSTEM (TCAS I & II)

- a. **TCAS I** provides proximity warning only, to assist the pilot in the visual acquisition of intruder aircraft. No recommended avoidance maneuvers are provided nor authorized as a direct result of a TCAS I warning. It is intended for use by smaller commuter aircraft holding 10 to 30 passenger seats, and general aviation aircraft.
- b. **TCAS II** provides traffic advisories (TA) and resolution advisories (RA). Resolution advisories provide recommended maneuvers in a vertical direction (climb or descend only) to avoid conflicting traffic. Transport category aircraft, and larger commuter and business aircraft holding 31 passenger seats or more, are required to be TCAS II equipped.
 1. When a TA occurs, attempt to establish visual contact with the traffic but do not deviate from an assigned clearance based only on TA information.
 2. When an RA occurs, pilots should respond immediately to the RA displays and maneuver as indicated unless doing so would jeopardize the safe operation of the flight, or the flight crew can ensure separation with the help of definitive visual acquisition of the aircraft causing the RA.
 3. Each pilot who deviates from an ATC clearance in response to an RA must notify ATC of that deviation as soon as practicable, and notify ATC when clear of conflict and returning to their previously assigned clearance.
- c. Deviations from rules, policies, or clearances should be kept to the minimum necessary to satisfy an RA. Most RA maneuvering requires minimum excursion from assigned altitude.
- d. The serving IFR air traffic facility is not responsible to provide approved standard IFR separation to an IFR aircraft, from other aircraft, terrain, or obstructions after an RA maneuver until one of the following conditions exists:
 1. The aircraft has returned to its assigned altitude and course.
 2. Alternate ATC instructions have been issued.
 3. A crew member informs ATC that the TCAS maneuver has been completed.

NOTE: TCAS does not alter or diminish the pilot's basic authority and responsibility to ensure safe flight. Since TCAS does not respond to aircraft which are not transponder equipped or aircraft with a transponder failure, TCAS alone does not ensure safe separation in every case. At this time, no air traffic service nor handling is predicated on the availability of TCAS equipment in the aircraft.

4-4-17 TRAFFIC INFORMATION SERVICE (TIS)

- a. TIS provides proximity warning only, to assist the pilot in the visual acquisition of intruder aircraft. No recommended avoidance maneuvers are provided nor authorized as a direct result

US 4-4

SECTION 4. ATC CLEARANCES AND AIRCRAFT SEPARATION

of a TIS intruder display or TIS alert. It is intended for use by aircraft in which TCAS is not required.

- b. TIS does not alter or diminish the pilot's basic authority and responsibility to ensure safe flight. Since TIS does not respond to aircraft which are not transponder equipped, aircraft with a transponder failure, or aircraft out of radar coverage, TIS alone does not ensure safe separation in every case.
- c. At this time, no air traffic service nor handling is predicated on the availability of TIS equipment in the aircraft.
- d. Presently, no air traffic services or handling is predicated on the availability of an ADS-B cockpit display. A "traffic-in-sight" reply to ATC must be based on seeing an aircraft out-the-window, NOT on the cockpit display.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

4-5-1 RADAR**a. Capabilities**

1. Radar is a method whereby radio waves are transmitted into the air and are then received when they have been reflected by an object in the path of the beam. Range is determined by measuring the time it takes (at the speed of light) for the radio wave to go out to the object and then return to the receiving antenna. The direction of a detected object from a radar site is determined by the position of the rotating antenna when the reflected portion of the radio wave is received.
2. More reliable maintenance and improved equipment have reduced radar system failures to a negligible factor. Most facilities actually have some components duplicated, one operating and another which immediately takes over when a malfunction occurs to the primary component.

b. Limitations

1. It is very important for the aviation community to recognize the fact that there are limitations to radar service and that ATC controllers may not always be able to issue traffic advisories concerning aircraft which are not under ATC control and cannot be seen on radar. (See FIG 4-5-1.)

FIGURE 4-5-1

Limitations to Radar Service

Precipitation Attenuation

The nearby target absorbs and scatters so much of the out-going and returning energy that the radar does not detect the distant target.

- (a) The characteristics of radio waves are such that they normally travel in a continuous straight line unless they are:
 - (1) "Bent" by abnormal atmospheric phenomena such as temperature inversions;

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

- (2) Reflected or attenuated by dense objects such as heavy clouds, precipitation, ground obstacles, mountains, etc.; or
 - (3) Screened by high terrain features.
- (b) The bending of radar pulses, often called anomalous propagation or ducting, may cause many extraneous blips to appear on the radar operator's display if the beam has been bent toward the ground or may decrease the detection range if the wave is bent upward. It is difficult to solve the effects of anomalous propagation, but using beacon radar and electronically eliminating stationary and slow moving targets by a method called moving target indicator (MTI) usually negate the problem.
- (c) Radar energy that strikes dense objects will be reflected and displayed on the operator's scope thereby blocking out aircraft at the same range and greatly weakening or completely eliminating the display of targets at a greater range. Again, radar beacon and MTI are very effectively used to combat ground clutter and weather phenomena, and a method of circularly polarizing the radar beam will eliminate some weather returns. A negative characteristic of MTI is that an aircraft flying a speed that coincides with the canceling signal of the MTI (tangential or "blind" speed) may not be displayed to the radar controller.
- (d) Relatively low altitude aircraft will not be seen if they are screened by mountains or are below the radar beam due to earth curvature. The historical solution to screening has been the installation of strategically placed multiple radars, which has been done in some areas, but ADS-B now provides ATC surveillance in some areas with challenging terrain where multiple radar installations would be impractical.
- (e) There are several other factors which affect radar control. The amount of reflective surface of an aircraft will determine the size of the radar return. Therefore, a small light airplane or a sleek jet fighter will be more difficult to see on primary radar than a large commercial jet or military bomber. Here again, the use of transponder or ADS-B equipment is invaluable. In addition, all FAA ATC facilities display automatically reported altitude information to the controller from appropriately equipped aircraft.
- (f) At some locations within the ATC en route environment, secondary-radar-only (no primary radar) gap filler radar systems are used to give lower altitude radar coverage between two larger radar systems, each of which provides both primary and secondary radar coverage. ADS-B serves this same role, supplementing both primary and secondary radar. In those geographical areas served by secondary radar only or ADS-B, aircraft without either transponders or ADS-B equipment cannot be provided with radar service. Additionally, transponder or ADS-B equipped aircraft cannot be provided with radar advisories concerning primary targets and ATC radar-derived weather.

REFERENCE—*Pilot/Controller Glossary Term — Radar.*

- (g) With regard to air traffic radar reception, wind turbines generally do not affect the quality of air traffic surveillance radar returns for transponder and ADS-B Out

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

equipped aircraft. Air traffic interference issues apply to the search radar and Non-Transponder/Non-ADS-B Out equipped aircraft.

NOTE: Generally, one or two wind turbines don't present a significant radar reception loss. A rule of thumb is three (3) or more turbines constitute a wind turbine farm and thus negatively affect the search radar product.

- (1) Detection loss in the area of a wind turbine farm is substantial. In extreme circumstances, this can extend for more than 1.0 nautical mile (NM) horizontally around the nearest turbine and at all altitudes above the wind turbine farm. (See FIG 4-5-2.)

FIGURE 4-5-2

Wind Turbine Farm Area of Potential Interference

NOTE: All aircraft should comply with 14 CFR §91.119(c) "...aircraft may not be operated closer than 500 feet to any person, vessel, vehicle, or structure."

- (2) To avoid interference Non-Transponder/Non-ADS-B Out equipped aircraft should avoid flight within 1.0 NM horizontally, at all altitudes, from the wind turbine farms.
- (3) Because detection loss near and above wind turbine farms for search-only targets causes dropped tracks, erroneous tracks, and can result in loss of separation, it is imperative that Non-Transponder/Non-ADS-B Out equipped

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

aircraft operate at the proper VFR altitudes per hemispheric rule and utilize see-and-avoid techniques.

- (4) Pilots should be aware that air traffic controllers cannot provide separation from Non-Transponder/Non-ADS-B Out equipped aircraft in the vicinity of wind turbine farms. See-and-avoid is the pilot's responsibility, as these non-equipped aircraft may not appear on radar and will not appear on the Traffic Information Services-Broadcast (TIS-B).

- (h) The controller's ability to advise a pilot flying on instruments or in visual conditions of the aircraft's proximity to another aircraft will be limited if the unknown aircraft is not observed on radar, if no flight plan information is available, or if the volume of traffic and workload prevent issuing traffic information. The controller's first priority is given to establishing vertical, lateral, or longitudinal separation between aircraft flying IFR under the control of ATC.

- c. FAA radar units operate continuously at the locations shown in the Chart Supplement U.S., and their services are available to all pilots, both civil and military. Contact the associated FAA control tower or ARTCC on any frequency guarded for initial instructions, or in an emergency, any FAA facility for information on the nearest radar service.

4-5-2 AIR TRAFFIC CONTROL RADAR BEACON SYSTEM (ATCRBS)

- a. The ATCRBS, sometimes referred to as secondary surveillance radar, consists of three main components:
 - 1. **Interrogator.** Primary radar relies on a signal being transmitted from the radar antenna site and for this signal to be reflected or "bounced back" from an object (such as an aircraft). This reflected signal is then displayed as a "target" on the controller's radarscope. In the ATCRBS, the Interrogator, a ground based radar beacon transmitter-receiver, scans in synchronism with the primary radar and transmits discrete radio signals which repetitiously request all transponders, on the mode being used, to reply. The replies received are then mixed with the primary returns and both are displayed on the same radarscope.
 - 2. **Transponder.** This airborne radar beacon transmitter-receiver automatically receives the signals from the interrogator and selectively replies with a specific pulse group (code) only to those interrogations being received on the mode to which it is set. These replies are independent of, and much stronger than a primary radar return.
 - 3. **Radarscope.** The radarscope used by the controller displays returns from both the primary radar system and the ATCRBS. These returns, called targets, are what the controller refers to in the control and separation of traffic.
- b. The job of identifying and maintaining identification of primary radar targets is a long and tedious task for the controller. Some of the advantages of ATCRBS over primary radar are:
 - 1. Reinforcement of radar targets.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

2. Rapid target identification.
 3. Unique display of selected codes.
- c. A part of the ATCRBS ground equipment is the decoder. This equipment enables a controller to assign discrete transponder codes to each aircraft under his/her control. Normally only one code will be assigned for the entire flight. Assignments are made by the ARTCC computer on the basis of the National Beacon Code Allocation Plan. The equipment is also designed to receive Mode C altitude information from the aircraft.

NOTE: Refer to figures with explanatory legends for an illustration of the target symbology depicted on radar scopes in the NAS Stage A (en route), the ARTS III (terminal) Systems, and other nonautomated (broadband) radar systems. (See FIG 4-5-3 and FIG 4-5-4.)

- d. It should be emphasized that aircraft transponders greatly improve the effectiveness of radar systems.

REFERENCE—AIM, Paragraph 4-1-20, Transponder and ADS-B Out Operation.

5. Radar limit line for control
6. Obstruction (video map)
7. Primary radar returns of obstacles or terrain (can be removed by MTI)
8. Satellite airports
9. Runway centerlines (marks and spaces indicate miles)
10. Primary airport with parallel runways
11. Approach gates
12. Tracked target (primary and beacon target)
13. Control position symbol
14. Untracked target select code (monitored) with Mode C readout of 5,000'
15. Untracked target without Mode C
16. Primary target
17. Beacon target only (secondary radar) (transponder)
18. Primary and beacon target
19. Leader line
20. Altitude Mode C readout is 6,000'

NOTE: *Readouts may not be displayed because of nonreceipt of beacon information, garbled beacon signals, and flight plan data which is displayed alternately with the altitude readout.*

21. Ground speed readout is 240 knots

NOTE: *Readouts may not be displayed because of a loss of beacon signal, a controller alert that a pilot was squawking emergency, radio failure, etc.*

22. Aircraft ID

23. Asterisk indicates a controller entry in Mode C block. In this case 5,000' is entered and "05" would alternate with Mode C readout.

24. Indicates heavy

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

25. "Low ALT" flashes to indicate when an aircraft's predicted descent places the aircraft in an unsafe proximity to terrain.

NOTE: *This feature does not function if the aircraft is not squawking Mode C. When a helicopter or aircraft is known to be operating below the lower safe limit, the "low ALT" can be changed to "inhibit" and flashing ceases.*

26. NAVAIDs

27. Airways

28. Primary target only

29. Nonmonitored. No Mode C (an asterisk would indicate nonmonitored with Mode C)

30. Beacon target only (secondary radar based on aircraft transponder)

31. Tracked target (primary and beacon target) control position A

32. Aircraft is squawking emergency Code 7700 and is nonmonitored, untracked, Mode C

33. Controller assigned runway 36 right alternates with Mode C readout

NOTE: *A three letter identifier could also indicate the arrival is at specific airport.*

34. Ident flashes

35. Identifying target blossoms

36. Untracked target identifying on a selected code

37. Range marks (10 and 15 miles) (can be changed/offset)

38. Aircraft controlled by center

39. Targets in suspend status

40. Coast/suspend list (aircraft holding, temporary loss of beacon/target, etc.)

41. Radio failure (emergency information)

42. Select beacon codes (being monitored)

 2. Correlated primary radar target [X]
- See note below.
3. Uncorrelated beacon target [/]
 4. Correlated beacon target [\]
 5. Indenting beacon target [≡]

NOTE: In Number 2 correlated means the association of radar data with the computer projected track of an identified aircraft.

Position symbols:

6. Free track (no flight plan tracking) [Δ]
7. Flat track (flight plan tracking) [◇]
8. Coast (beacon target lost) [#]
9. Present position hold [X̄]

Data block information:

10. Aircraft ident
- See note below.
11. Assigned altitude FL280, Mode C altitude same or within $\pm 200'$ of assigned altitude.
- See note below.
12. Computer ID #191, handoff is to sector 33 (0-33 would mean handoff accepted) See note below.
 13. Assigned altitude 17,000', aircraft is climbing, Mode C readout was 14,300 when last beacon interrogation was received.
 14. Leader line connecting target symbol and data block
 15. Track velocity and direction vector line (projected ahead of target)
 16. Assigned altitude 7,000, aircraft is descending, last Mode C readout (or last reported altitude) was 100' above FL230
 17. Transponder code shows in full data block only when different than assigned code
 18. Aircraft is 300' above assigned altitude
 19. Reported altitude (no Mode C readout) same as assigned. (An "n" would indicate no reported altitude.)

US 4-5
SECTION 5. SURVEILLANCE SYSTEMS

- 20. Transponder set on emergency Code 7700 (EMRG flashes to attract attention)
- 21. Transponder Code 1200 (VFR) with no Mode C
- 22. Code 1200 (VFR) with Mode C and last altitude readout
- 23. Transponder set on radio failure Code 7600 (RDOF flashes)
- 24. Computer ID #228, CST indicates target is in coast status
- 25. Assigned altitude FL290, transponder code (these two items constitute a "limited data block")

NOTE: Numbers 10, 11, and 12 constitute a "full data block"

Other symbols:

- 26. Navigational aid
- 27. Airway or jet route
- 28. Outline of weather returns based on primary radar. "H" represents areas of high density precipitation which might be thunderstorms. Radial lines indicated lower density precipitation.
- 29. Obstruction
- 30. Airports

Small: ▢

4-5-3 SURVEILLANCE RADAR

- a. Surveillance radars are divided into two general categories: Airport Surveillance Radar (ASR) and Air Route Surveillance Radar (ARSR).
 - 1. ASR is designed to provide relatively short-range coverage in the general vicinity of an airport and to serve as an expeditious means of handling terminal area traffic through observation of precise aircraft locations on a radarscope. The ASR can also be used as an instrument approach aid.
 - 2. ARSR is a long-range radar system designed primarily to provide a display of aircraft locations over large areas.
- b. Surveillance radars scan through 360 degrees of azimuth and present target information on a radar display located in a tower or center. This information is used independently or in conjunction with other navigational aids in the control of air traffic.

4-5-4 PRECISION APPROACH RADAR (PAR)

- a. PAR is designed for use as a landing aid rather than an aid for sequencing and spacing aircraft. PAR equipment may be used as a primary landing aid (See Chapter 5, Air Traffic Procedures, for additional information), or it may be used to monitor other types of approaches. It is designed to display range, azimuth, and elevation information.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

- b. Two antennas are used in the PAR array, one scanning a vertical plane, and the other scanning horizontally. Since the range is limited to 10 miles, azimuth to 20 degrees, and elevation to 7 degrees, only the final approach area is covered. Each scope is divided into two parts. The upper half presents altitude and distance information, and the lower half presents azimuth and distance.

4-5-5 AIRPORT SURFACE DETECTION EQUIPMENT (ASDE-X)/ AIRPORT SURFACE SURVEILLANCE CAPABILITY (ASSC)

- a. ASDE-X/ASSC is a multi-sensor surface surveillance system the FAA is acquiring for airports in the United States. This system provides high resolution, short-range, clutter free surveillance information about aircraft and vehicles, both moving and fixed, located on or near the surface of the airport's runways and taxiways under all weather and visibility conditions. The system consists of:
 1. **A Primary Radar System.** ASDE-X/ASSC system coverage includes the airport surface and the airspace up to 200 feet above the surface. Typically located on the control tower or other strategic location on the airport, the Primary Radar antenna is able to detect and display aircraft that are not equipped with or have malfunctioning transponders or ADS-B.
 2. **Interfaces.** ASDE-X/ASSC contains an automation interface for flight identification via all automation platforms and interfaces with the terminal radar for position information.
 3. **Automation.** A Multi-sensor Data Processor (MSDP) combines all sensor reports into a single target which is displayed to the air traffic controller.
 4. **Air Traffic Control Tower Display.** A high resolution, color monitor in the control tower cab provides controllers with a seamless picture of airport operations on the airport surface.
- b. The combination of data collected from the multiple sensors ensures that the most accurate information about aircraft location is received in the tower, thereby increasing surface safety and efficiency.
- c. The following facilities are operational with ASDE-X:

4-5-6 TRAFFIC INFORMATION SERVICE (TIS)

a. Introduction.

The Traffic Information Service (TIS) provides information to the cockpit via data link, that is similar to VFR radar traffic advisories normally received over voice radio. Among the first FAA-provided data services, TIS is intended to improve the safety and efficiency of “see and avoid” flight through an automatic display that informs the pilot of nearby traffic and potential conflict situations. This traffic display is intended to assist the pilot in visual acquisition of these aircraft. TIS employs an enhanced capability of the terminal Mode S radar system, which contains the surveillance data, as well as the data link required to “uplink” this information to suitably-equipped aircraft (known as a TIS “client”). TIS provides estimated position, altitude, altitude trend, and ground track information for up to 8 intruder aircraft within 7 NM horizontally, +3,500 and -3,000 feet vertically of the client aircraft (see FIG 4-5-5, TIS Proximity Coverage Volume). The range of a target reported at a distance greater than 7 NM only indicates that this target will be a threat within 34 seconds and does not display a precise distance. TIS will alert the pilot to aircraft (under surveillance of the Mode S radar) that are estimated to be within 34 seconds of potential collision, regardless of distance or altitude. TIS surveillance data is derived from the same radar used by ATC; this data is uplinked to the client aircraft on each radar scan (nominally every 5 seconds).

b. Requirements.

1. In order to use TIS, the client and any intruder aircraft must be equipped with the appropriate cockpit equipment and fly within the radar coverage of a Mode S radar capable of providing TIS. Typically, this will be within 55 NM of the sites depicted in FIG 4-5-6, Terminal Mode S Radar Sites. ATC communication is not a requirement to receive TIS, although it may be required by the particular airspace or flight operations in which TIS is being used.

US 4-5
SECTION 5. SURVEILLANCE SYSTEMS

(APPROXIMATE LOCATIONS)

US 4-5
SECTION 5. SURVEILLANCE SYSTEMS

FIGURE 4-5-7

Traffic Information Service (TIS)
Avionics Block Diagram

2. The cockpit equipment functionality required by a TIS client aircraft to receive the service consists of the following (refer to FIG 4-5-7):

- (a) Mode S data link transponder with altitude encoder.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

- (b) Data link applications processor with TIS software installed.
- (c) Control-display unit.
- (d) Optional equipment includes a digital heading source to correct display errors caused by “crab angle” and turning maneuvers.

NOTE: *Some of the above functions will likely be combined into single pieces of avionics, such as (a) and (b).*

3. To be visible to the TIS client, the intruder aircraft must, at a minimum, have an operating transponder (Mode A, C or S). All altitude information provided by TIS from intruder aircraft is derived from Mode C reports, if appropriately equipped.
4. TIS will initially be provided by the terminal Mode S systems that are paired with ASR-9 digital primary radars. These systems are in locations with the greatest traffic densities, thus will provide the greatest initial benefit. The remaining terminal Mode S sensors, which are paired with ASR-7 or ASR-8 analog primary radars, will provide TIS pending modification or relocation of these sites. See FIG 4-5-6, Terminal Mode S Radar Sites, for site locations. There is no mechanism in place, such as NOTAMs, to provide status update on individual radar sites since TIS is a nonessential, supplemental information service.

The FAA also operates en route Mode S radars (not illustrated) that rotate once every 12 seconds. These sites will require additional development of TIS before any possible implementation. There are no plans to implement TIS in the en route Mode S radars at the present time.

c. Capabilities.

1. TIS provides ground-based surveillance information over the Mode S data link to properly equipped client aircraft to aid in visual acquisition of proximate air traffic. The actual avionics capability of each installation will vary and the supplemental handbook material must be consulted prior to using TIS. A maximum of eight (8) intruder aircraft may be displayed; if more than eight aircraft match intruder parameters, the eight “most significant” intruders are uplinked. These “most significant” intruders are usually the ones in closest proximity and/or the greatest threat to the TIS client.
2. TIS, through the Mode S ground sensor, provides the following data on each intruder aircraft:
 - (a) Relative bearing information in 6-degree increments.
 - (b) Relative range information in 1/8 NM to 1 NM increments (depending on range).
 - (c) Relative altitude in 100-foot increments (within 1,000 feet) or 500-foot increments (from 1,000-3,500 feet) if the intruder aircraft has operating altitude reporting capability.
 - (d) Estimated intruder ground track in 45-degree increments.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

- (e) Altitude trend data (level within 500 fpm or climbing/descending >500 fpm) if the intruder aircraft has operating altitude reporting capability.
 - (f) Intruder priority as either an “traffic advisory” or “proximate” intruder.
3. When flying from surveillance coverage of one Mode S sensor to another, the transfer of TIS is an automatic function of the avionics system and requires no action from the pilot.
4. There are a variety of status messages that are provided by either the airborne system or ground equipment to alert the pilot of high priority intruders and data link system status. These messages include the following:
- (a) **Alert.** Identifies a potential collision hazard within 34 seconds. This alert may be visual and/or audible, such as a flashing display symbol or a headset tone. A target is a threat if the time to the closest approach in vertical and horizontal coordinates is less than 30 seconds and the closest approach is expected to be within 500 feet vertically and 0.5 nautical miles laterally.
 - (b) **TIS Traffic.** TIS traffic data is displayed.
 - (c) **Coasting.** The TIS display is more than 6 seconds old. This indicates a missing uplink from the ground system. When the TIS display information is more than 12 seconds old, the “No Traffic” status will be indicated.
 - (d) **No Traffic.** No intruders meet proximate or alert criteria. This condition may exist when the TIS system is fully functional or may indicate “coasting” between 12 and 59 seconds old (see (c) above).
 - (e) **TIS Unavailable.** The pilot has requested TIS, but no ground system is available. This condition will also be displayed when TIS uplinks are missing for 60 seconds or more.
 - (f) **TIS Disabled.** The pilot has not requested TIS or has disconnected from TIS.
 - (g) **Good-bye.** The client aircraft has flown outside of TIS coverage.
- NOTE:** Depending on the avionics manufacturer implementation, it is possible that some of these messages will not be directly available to the pilot.*
5. Depending on avionics system design, TIS may be presented to the pilot in a variety of different displays, including text and/or graphics. Voice annunciation may also be used, either alone or in combination with a visual display. FIG 4-5-7, Traffic Information Service (TIS), Avionics Block Diagram, shows an example of a TIS display using symbology similar to the Traffic Alert and Collision Avoidance System (TCAS) installed on most passenger air carrier/commuter aircraft in the U.S. The small symbol in the center represents the client aircraft and the display is oriented “track up,” with the 12 o'clock position at the top. The range rings indicate 2 and 5 NM. Each intruder is depicted by a symbol positioned at the approximate relative bearing and range from the client aircraft. The circular symbol near the center indicates an “alert” intruder and the diamond symbols indicate “proximate” intruders.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

6. The inset in the lower right corner of FIG 4-5-7, Traffic Information Service (TIS), Avionics Block Diagram, shows a possible TIS data block display. The following information is contained in this data block:
- (a) The intruder, located approximately four o'clock, three miles, is a "proximate" aircraft and currently not a collision threat to the client aircraft. This is indicated by the diamond symbol used in this example.
 - (b) The intruder ground track diverges to the right of the client aircraft, indicated by the small arrow.
 - (c) The intruder altitude is 700 feet less than or below the client aircraft, indicated by the "-07" located under the symbol.
 - (d) The intruder is descending >500 fpm, indicated by the downward arrow next to the "-07" relative altitude information. The absence of this arrow when an altitude tag is present indicates level flight or a climb/descent rate less than 500 fpm.

NOTE: *If the intruder did not have an operating altitude encoder (Mode C), the altitude and altitude trend "tags" would have been omitted.*

d. **Limitations.**

1. TIS is **NOT** intended to be used as a collision avoidance system and does not relieve the pilot's responsibility to "see and avoid" other aircraft (see Paragraph 5-5-8, See and Avoid). TIS must not be used for avoidance maneuvers during IMC or other times when there is no visual contact with the intruder aircraft. TIS is intended only to assist in visual acquisition of other aircraft in VMC. Avoidance maneuvers are neither provided nor authorized as a direct result of a TIS intruder display or TIS alert.
2. While TIS is a useful aid to visual traffic avoidance, it has some system limitations that must be fully understood to ensure proper use. Many of these limitations are inherent in secondary radar surveillance. In other words, the information provided by TIS will be no better than that provided to ATC. Other limitations and anomalies are associated with the TIS predictive algorithm.
 - (a) **Intruder Display Limitations.** TIS will only display aircraft with operating transponders installed. TIS relies on surveillance of the Mode S radar, which is a "secondary surveillance" radar similar to the ATCRBS described in paragraph 4-5-2.
 - (b) **TIS Client Altitude Reporting Requirement.** Altitude reporting is required by the TIS client aircraft in order to receive TIS. If the altitude encoder is inoperative or disabled, TIS will be unavailable, as TIS requests will not be honored by the ground system. As such, TIS requires altitude reporting to determine the Proximity Coverage Volume as indicated in FIG 4-5-5. TIS users must be alert to altitude encoder malfunctions, as TIS has no mechanism to determine if client altitude reporting is correct. A failure of this nature will cause erroneous and possibly unpredictable TIS operation. If this malfunction is suspected, confirmation of altitude reporting with ATC is suggested.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

- (c) **Intruder Altitude Reporting.** Intruders without altitude reporting capability will be displayed without the accompanying altitude tag. Additionally, nonaltitude reporting intruders are assumed to be at the same altitude as the TIS client for alert computations. This helps to ensure that the pilot will be alerted to all traffic under radar coverage, but the actual altitude difference may be substantial. Therefore, visual acquisition may be difficult in this instance.
- (d) **Coverage Limitations.** Since TIS is provided by ground-based, secondary surveillance radar, it is subject to all limitations of that radar. **If an aircraft is not detected by the radar, it cannot be displayed on TIS.** Examples of these limitations are as follows:
- (1) TIS will typically be provided within 55 NM of the radars depicted in FIG 4-5-6, Terminal Mode S Radar Sites. This maximum range can vary by radar site and is always subject to “line of sight” limitations; the radar and data link signals will be blocked by obstructions, terrain, and curvature of the earth.
 - (2) TIS will be unavailable at low altitudes in many areas of the country, particularly in mountainous regions. Also, when flying near the “floor” of radar coverage in a particular area, intruders below the client aircraft may not be detected by TIS.
 - (3) TIS will be temporarily disrupted when flying directly over the radar site providing coverage if no adjacent site assumes the service. A ground-based radar, similar to a VOR or NDB, has a zenith cone, sometimes referred to as the cone of confusion or cone of silence. This is the area of ambiguity directly above the station where bearing information is unreliable. The zenith cone setting for TIS is 34 degrees: Any aircraft above that angle with respect to the radar horizon will lose TIS coverage from that radar until it is below this 34 degree angle. The aircraft may not actually lose service in areas of multiple radar coverage since an adjacent radar will provide TIS. If no other TIS-capable radar is available, the “Good-bye” message will be received and TIS terminated until coverage is resumed.
- (e) **Intermittent Operations.** TIS operation may be intermittent during turns or other maneuvering, particularly if the transponder system does not include antenna diversity (antenna mounted on the top and bottom of the aircraft). As in (d) above, TIS is dependent on two-way, “line of sight” communications between the aircraft and the Mode S radar. Whenever the structure of the client aircraft comes between the transponder antenna (usually located on the underside of the aircraft) and the ground-based radar antenna, the signal may be temporarily interrupted.
- (f) **TIS Predictive Algorithm.** TIS information is collected one radar scan prior to the scan during which the uplink occurs. Therefore, the surveillance information is approximately 5 seconds old. In order to present the intruders in a “real time” position, TIS uses a “predictive algorithm” in its tracking software. This algorithm uses track history data to extrapolate intruders to their expected positions consistent

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

with the time of display in the cockpit. Occasionally, aircraft maneuvering will cause this algorithm to induce errors in the TIS display. These errors primarily affect relative bearing information; intruder distance and altitude will remain relatively accurate and may be used to assist in “see and avoid.” Some of the more common examples of these errors are as follows:

- (1) When client or intruder aircraft maneuver excessively or abruptly, the tracking algorithm will report incorrect horizontal position until the maneuvering aircraft stabilizes.
- (2) When a rapidly closing intruder is on a course that crosses the client at a shallow angle (either overtaking or head on) and either aircraft abruptly changes course within $1/4$ NM, TIS will display the intruder on the opposite side of the client than it actually is.

These are relatively rare occurrences and will be corrected in a few radar scans once the course has stabilized.

- (g) **Heading/Course Reference.** Not all TIS aircraft installations will have onboard heading reference information. In these installations, aircraft course reference to the TIS display is provided by the Mode S radar. The radar only determines ground track information and has no indication of the client aircraft heading. In these installations, all intruder bearing information is referenced to ground track and does not account for wind correction. Additionally, since ground-based radar will require several scans to determine aircraft course following a course change, a lag in TIS display orientation (intruder aircraft bearing) will occur. As in (f) above, intruder distance and altitude are still usable.
- (h) **Closely-Spaced Intruder Errors.** When operating more than 30 NM from the Mode S sensor, TIS forces any intruder within $3/8$ NM of the TIS client to appear at the same horizontal position as the client aircraft. Without this feature, TIS could display intruders in a manner confusing to the pilot in critical situations (for example, a closely-spaced intruder that is actually to the right of the client may appear on the TIS display to the left). At longer distances from the radar, TIS cannot accurately determine relative bearing/distance information on intruder aircraft that are in close proximity to the client.

Because TIS uses a ground-based, rotating radar for surveillance information, the accuracy of TIS data is dependent on the distance from the sensor (radar) providing the service. This is much the same phenomenon as experienced with ground-based navigational aids, such as a VOR. As distance from the radar increases, the accuracy of surveillance decreases. Since TIS does not inform the pilot of distance from the Mode S radar, the pilot must assume that any intruder appearing at the same position as the client aircraft may actually be up to $3/8$ NM away in any direction. Consistent with the operation of TIS, an alert on the display (regardless of distance from the radar) should stimulate an outside visual scan, intruder acquisition, and traffic avoidance based on outside reference.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

e. Reports of TIS Malfunctions.

1. Users of TIS can render valuable assistance in the early correction of malfunctions by reporting their observations of undesirable performance. Reporters should identify the time of observation, location, type and identity of aircraft, and describe the condition observed; the type of transponder processor, and software in use can also be useful information. Since TIS performance is monitored by maintenance personnel rather than ATC, it is suggested that malfunctions be reported by radio or telephone to the nearest Flight Service Station (FSS) facility.

NOTE: TIS operates at only those terminal Mode S radar sites depicted in FIG 4-5-6. Though similar in some ways, TIS is not related to TIS-B (Traffic Information Service — Broadcast).

4-5-7 AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST (ADS-B) SERVICES

a. Introduction.

1. Automatic Dependent Surveillance-Broadcast (ADS-B) is a surveillance technology deployed throughout the NAS (see FIG 4-5-8). The ADS-B system is composed of aircraft avionics and a ground infrastructure. Onboard avionics determine the position of the aircraft by using the GNSS and transmit its position along with additional information about the aircraft to ground stations for use by ATC and other ADS-B services. This information is transmitted at a rate of approximately once per second. (See FIG 4-5-9 and FIG 4-5-10.)

US 4-5
SECTION 5. SURVEILLANCE SYSTEMS

FIGURE 4-5-8

ADS-B, TIS-B, AND FIS-B:
Broadcast Services Architecture

2. In the United States, ADS-B equipped aircraft exchange information on one of two frequencies: 978 or 1090 MHz. The 1090 MHz frequency is also associated with Mode A, C, and S transponder operations. 1090 MHz transponders with integrated ADS-B functionality extend the transponder message sets with additional ADS-B information. This additional information is known as an “extended squitter” message and is referred to as 1090ES. ADS-B equipment operating on 978 MHz is known as the Universal Access Transceiver (UAT).
3. ADS-B avionics can have the ability to both transmit and receive information. The transmission of ADS-B information from an aircraft is known as ADS-B Out. The receipt of ADS-B information by an aircraft is known as ADS-B In. All aircraft operating within the airspace defined in 14 CFR §91.225 are required to transmit the information defined in §91.227 using ADS-B Out avionics.
4. In general, operators flying at 18,000 feet and above (Class A airspace) are required to have 1090ES equipment. Those that do not fly above 18,000 may use either UAT or 1090ES equipment. (Refer to 14 CFR §§91.225 and 91.227.) While the regulations do

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

not require it, operators equipped with ADS-B In will realize additional benefits from ADS-B broadcast services: Traffic Information Service-Broadcast (TIS-B) (Paragraph 4-5-8) and Flight Information Service-Broadcast (FIS-B) (Paragraph 4-5-9).

b. ADS-B Certification and Performance Requirements.

ADS-B equipment may be certified as a surveillance source for air traffic separation services using ADS-B Out. ADS-B equipment may also be certified for use with ADS-B In advisory services that enable appropriately equipped aircraft to display traffic and flight information. Refer to the aircraft's flight manual supplement or Pilot Operating Handbook for the capabilities of a specific aircraft installation.

c. ADS-B Capabilities and Procedures.

1. ADS-B enables improved surveillance services, both air-to-air and air-to-ground, especially in areas where radar is ineffective due to terrain or where it is impractical or cost prohibitive. Initial NAS applications of air-to-air ADS-B are for "advisory" use only, enhancing a pilot's visual acquisition of other nearby equipped aircraft either when airborne or on the airport surface. Additionally, ADS-B will enable ATC and fleet operators to monitor aircraft throughout the available ground station coverage area.

FIGURE 4-5-9

En Route — ADS-B/ADS-R/TIS-B/FIS-B Service Ceilings/Floors

US 4-5
SECTION 5. SURVEILLANCE SYSTEMS

FIGURE 4-5-10

Terminal — ADS-B/ADS-R/TIS-B/FIS-B Service Ceilings/Floors

- One of the data elements transmitted by ADS-B is the aircraft's Flight Identification (FLT ID). The FLT ID is comprised of a maximum of seven alphanumeric characters and must correspond to the aircraft identification filed in the flight plan. For airline and commuter aircraft, the FLT ID is usually the company name and flight number (for example, AAL3432), and is typically entered into the avionics by the flight crew during preflight. For general aviation (GA), if aircraft avionics allow dynamic modification of the FLT ID, the pilot can enter it prior to flight. However, some ADS-B avionics require the FLT ID to be set to the aircraft registration number (for example, N1234Q) by the installer and cannot be changed by the pilot from the cockpit. In both cases, the FLT ID must correspond to the aircraft identification filed in its flight plan.

ATC automation systems use the transmitted ADS-B FLT ID to uniquely identify each aircraft within a given airspace, and to correlate it to its filed flight plan for the purpose of providing surveillance and separation services. If the FLT ID and the filed aircraft identification are not identical, a Call Sign Mis-Match (CSMM) is generated and ATC automation systems may not associate the aircraft with its filed flight plan. In this case, air traffic services may be delayed or unavailable until the CSMM is corrected. Consequently, it is imperative that flight crews and GA pilots ensure the FLT ID entry correctly matches the aircraft identification filed in their flight plan.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

3. Each ADS-B aircraft is assigned a unique ICAO address (also known as a 24-bit address) that is broadcast by the ADS-B transmitter. This ICAO address is programmed at installation. Should multiple aircraft broadcast the same ICAO address while transiting the same ADS-B Only Service Volume, the ADS-B network may be unable to track the targets correctly. If radar reinforcement is available, tracking will continue. If radar is unavailable, the controller may lose target tracking entirely on one or both targets. Consequently, it is imperative that the ICAO address entry is correct.
4. Aircraft that are equipped with ADS-B avionics on the UAT datalink have a feature that allows them to broadcast an anonymous 24-bit ICAO address. In this mode, the UAT system creates a randomized address that does not match the actual ICAO address assigned to the aircraft. The UAT anonymous 24-bit address feature may only be used when the operator has not filed an IFR flight plan and is not requesting ATC services. In the anonymity mode, the aircraft's beacon code must be set to 1200 and, depending on the manufacturer's implementation, the aircraft FLT ID might not be transmitted. Pilots should be aware that while in UAT anonymity mode, they will not be eligible to receive ATC separation and flight following services, and may not benefit from enhanced ADS-B search and rescue capabilities.
5. ADS-B systems integrated with the transponder will automatically set the applicable emergency status when 7500, 7600, or 7700 are entered into the transponder. ADS-B systems not integrated with the transponder, or systems with optional emergency codes, will require that the appropriate emergency code is entered through a pilot interface. ADS-B is intended for inflight and airport surface use. Unless otherwise directed by ATC, transponder/ADS-B systems should be turned "on" and remain "on" whenever operating in the air or on the airport surface movement area.

d. ATC Surveillance Services using ADS-B — Procedures and Recommended Phraseology

Radar procedures, with the exceptions found in this paragraph, are identical to those procedures prescribed for radar in AIM Chapter 4 and Chapter 5.

1. Preflight:

If ATC services are anticipated when either a VFR or IFR flight plan is filed, the aircraft identification (as entered in the flight plan) must be entered as the FLT ID in the ADS-B avionics.

2. Inflight:

When requesting surveillance services while airborne, pilots must disable the anonymous feature, if so equipped, prior to contacting ATC. Pilots must also ensure that their transmitted ADS-B FLT ID matches the aircraft identification as entered in their flight plan.

3. Aircraft with an Inoperative/Malfunctioning ADS-B Transmitter:

- (a) ATC will inform the flight crew when the aircraft's ADS-B transmitter appears to be inoperative or malfunctioning:

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

PHRASEOLOGY:

YOUR ADS-B TRANSMITTER APPEARS TO BE INOPERATIVE/MALFUNCTIONING. STOP ADS-B TRANSMISSIONS.

- (b) ATC will inform the flight crew if it becomes necessary to turn off the aircraft's ADS-B transmitter.

PHRASEOLOGY:

STOP ADS-B TRANSMISSIONS.

- (c) Other malfunctions and considerations:

Loss of automatic altitude reporting capabilities (encoder failure) will result in loss of ATC altitude advisory services.

4. Procedures for Accommodation of Non-ADS-B Equipped Aircraft:

- (a) Pilots of aircraft not equipped with ADS-B may only operate outside airspace designated as ADS-B airspace in 14 CFR §91.225. Pilots of unequipped aircraft wishing to fly any portion of a flight in ADS-B airspace may seek a deviation from the regulation to conduct operations without the required equipment. Direction for obtaining this deviation are available in Advisory Circular 90-114.
- (b) While air traffic controllers can identify which aircraft are ADS-B equipped and which are not, there is no indication if a non-equipped pilot has obtained a preflight authorization to enter ADS-B airspace. Situations may occur when the pilot of a non-equipped aircraft, without an authorization to operate in ADS-B airspace receives an ATC-initiated in-flight clearance to fly a heading, route, or altitude that would penetrate ADS-B airspace. Such clearances may be for traffic, weather, or simply to shorten the aircraft's route of flight. When this occurs, the pilot should acknowledge and execute the clearance, but must advise the controller that they are not ADS-B equipped and have not received prior authorization to operate in ADS-B airspace. The controller, at their discretion, will either acknowledge and proceed with the new clearance, or modify the clearance to avoid ADS-B airspace. In either case, the FAA will normally not take enforcement action for non-equipage in these circumstances.

NOTE: *Pilots operating without ADS-B equipment must not request route or altitude changes that will result in an incursion into ADS-B airspace except for safety of flight; for example, weather avoidance. Unequipped aircraft that have not received a pre-flight deviation authorization will only be considered in compliance with regulation if the amendment to flight is initiated by ATC.*

EXAMPLE 1: ATC: *"November Two Three Quebec, turn fifteen degrees left, proceed direct Bradford when able, rest of route unchanged."*

Aircraft: *"November Two Three Quebec, turning fifteen degrees left, direct Bradford when able, rest of route unchanged. Be advised, we are negative ADS-B equipment and have not received authorization to operate in ADS-B airspace."*

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

ATC: *“November Two Three Quebec, roger”*

or

“November Two Three Quebec, roger, turn twenty degrees right, rejoin Victor Ten, rest of route unchanged.”

EXAMPLE 2: ATC: *“November Four Alpha Tango, climb and maintain one zero thousand for traffic.”*

Aircraft: *“November Four Alpha Tango, leaving eight thousand for one zero thousand. Be advised, we are negative ADS-B equipment and have not received authorization to operate in ADS-B airspace.”*

ATC: *“November Four Alpha Tango, roger”*

or

“November Four Alpha Tango, roger, cancel climb clearance, maintain eight thousand.”

REFERENCE—Federal Register Notice, Volume 84, Number 62, dated April 1, 2019.

e. ADS-B Limitations.

The ADS-B cockpit display of traffic is NOT intended to be used as a collision avoidance system and does not relieve the pilot's responsibility to “see and avoid” other aircraft. (See Paragraph 5-5-8, See and Avoid). ADS-B must not be used for avoidance maneuvers during IMC or other times when there is no visual contact with the intruder aircraft. ADS-B is intended only to assist in visual acquisition of other aircraft. No avoidance maneuvers are provided or authorized, as a direct result of an ADS-B target being displayed in the cockpit.

f. Reports of ADS-B Malfunctions.

Users of ADS-B can provide valuable assistance in the correction of malfunctions by reporting instances of undesirable system performance. Since ADS-B performance is monitored by maintenance personnel rather than ATC, report malfunctions to the nearest Flight Service Station (FSS) facility by radio or telephone, or by sending an email to the ADS-B help desk at adsb@faa.gov. Reports should include:

1. Condition observed;
2. Date and time of observation;
3. Altitude and location of observation;
4. Type and call sign of the aircraft; and
5. Type and software version of avionics system.

4-5-8 TRAFFIC INFORMATION SERVICE-BROADCAST (TIS-B)

a. Introduction.

TIS-B is the broadcast of ATC derived traffic information to ADS-B equipped (1090ES or UAT) aircraft from ground radio stations. The source of this traffic information is derived from

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

ground-based air traffic surveillance sensors. TIS-B service will be available throughout the NAS where there are both adequate surveillance coverage from ground sensors and adequate broadcast coverage from ADS-B ground radio stations. The quality level of traffic information provided by TIS-B is dependent upon the number and type of ground sensors available as TIS-B sources and the timeliness of the reported data. (See FIG 4-5-9 and FIG 4-5-10.)

b. TIS-B Requirements.

In order to receive TIS-B service, the following conditions must exist:

1. Aircraft must be equipped with an ADS-B transmitter/receiver or transceiver, and a cockpit display of traffic information (CDTI).
2. Aircraft must fly within the coverage volume of a compatible ground radio station that is configured for TIS-B uplinks. (Not all ground radio stations provide TIS-B due to a lack of radar coverage or because a radar feed is not available).
3. Aircraft must be within the coverage of and detected by at least one ATC radar serving the ground radio station in use.

c. TIS-B Capabilities.

1. TIS-B is intended to provide ADS-B equipped aircraft with a more complete traffic picture in situations where not all nearby aircraft are equipped with ADS-B Out. This advisory-only application is intended to enhance a pilot's visual acquisition of other traffic.
2. Only transponder-equipped targets (i.e., Mode A/C or Mode S transponders) are transmitted through the ATC ground system architecture. Current radar siting may result in limited radar surveillance coverage at lower altitudes near some airports, with subsequently limited TIS-B service volume coverage. If there is no radar coverage in a given area, then there will be no TIS-B coverage in that area.

d. TIS-B Limitations.

1. TIS-B is **NOT** intended to be used as a collision avoidance system and does not relieve the pilot's responsibility to "see and avoid" other aircraft, in accordance with 14CFR §91.113b. TIS-B must not be used for avoidance maneuvers during times when there is no visual contact with the intruder aircraft. TIS-B is intended only to assist in the visual acquisition of other aircraft.

NOTE: No aircraft avoidance maneuvers are authorized as a direct result of a TIS-B target being displayed in the cockpit.

2. While TIS-B is a useful aid to visual traffic avoidance, its inherent system limitations must be understood to ensure proper use.
 - (a) A pilot may receive an intermittent TIS-B target of themselves, typically when maneuvering (e.g., climbing turns) due to the radar not tracking the aircraft as quickly as ADS-B.

US 4-5

SECTION 5. SURVEILLANCE SYSTEMS

- (b) The ADS-B-to-radar association process within the ground system may at times have difficulty correlating an ADS-B report with corresponding radar returns from the same aircraft. When this happens the pilot may see duplicate traffic symbols (i.e., "TIS-B shadows") on the cockpit display.
 - (c) Updates of TIS-B traffic reports will occur less often than ADS-B traffic updates. TIS-B position updates will occur approximately once every 3-13 seconds depending on the type of radar system in use within the coverage area. In comparison, the update rate for ADS-B is nominally once per second.
 - (d) The TIS-B system only uplinks data pertaining to transponder-equipped aircraft. Aircraft without a transponder will not be displayed as TIS-B traffic.
 - (e) There is no indication provided when any aircraft is operating inside or outside the TIS-B service volume, therefore it is difficult to know if one is receiving uplinked TIS-B traffic information.
3. Pilots and operators are reminded that the airborne equipment that displays TIS-B targets is for pilot situational awareness only and is not approved as a collision avoidance tool. Unless there is an imminent emergency requiring immediate action, any deviation from an air traffic control clearance in response to perceived converging traffic appearing on a TIS-B display must be approved by the controlling ATC facility before commencing the maneuver, except as permitted under certain conditions in 14CFR §91.123. Uncoordinated deviations may place an aircraft in close proximity to other aircraft under ATC control not seen on the airborne equipment and may result in a pilot deviation or other incident.

e. Reports of TIS-B Malfunctions.

Users of TIS-B can provide valuable assistance in the correction of malfunctions by reporting instances of undesirable system performance. Since TIS-B performance is monitored by maintenance personnel rather than ATC, report malfunctions to the nearest Flight Service Station (FSS) facility by radio or telephone, or by sending an email to the ADS-B help desk at adsb@faa.gov. Reports should include:

1. Condition observed;
2. Date and time of observation;
3. Altitude and location of observation;
4. Type and call sign of the aircraft; and
5. Type and software version of avionics system.

4-5-9 FLIGHT INFORMATION SERVICE-BROADCAST (FIS-B)**a. Introduction.**

FIS-B is a ground broadcast service provided through the ADS-B Services network over the 978 MHz UAT data link. The FAA FIS-B system provides pilots and flight crews of properly equipped aircraft with a cockpit display of certain aviation weather and aeronautical informa-

US 4-5
SECTION 5. SURVEILLANCE SYSTEMS

tion. FIS-B reception is line-of-sight within the service volume of the ground infrastructure. (See FIG 4-5-9 and FIG 4-5-10.)

b. Weather Products.

FIS-B does not replace a preflight weather briefing from a source listed in paragraph 7-1-2, FAA Weather Services, or inflight updates from an FSS or ATC. FIS-B information may be used by the pilot for the safe conduct of flight and aircraft movement; however, the information should not be the only source of weather or aeronautical information. A pilot should be particularly alert and understand the limitations and quality assurance issues associated with individual products. This includes graphical representation of next generation weather radar (NEXRAD) imagery and Notices to Air Missions (NOTAMs)/temporary flight restrictions (TFR).

REFERENCE—

AIM, Para 7-1-9, Flight Information Services (FIS).

Advisory Circular (AC) 00-63, “Use of Cockpit Displays of Digital Weather and Aeronautical Information.”

c. Reports of FIS-B Malfunctions.

Users of FIS-B can provide valuable assistance in the correction of malfunctions by reporting instances of undesirable system performance. Since FIS-B performance is monitored by maintenance personnel rather than ATC, report malfunctions to the nearest Flight Service Station (FSS) facility by radio or telephone, or by sending an email to the ADS-B help desk at adsb@faa.gov. Reports should include:

1. Condition observed;
2. Date and time of observation;
3. Altitude and location of observation;
4. Type and call sign of the aircraft; and
5. Type and software version of avionics system.

Product	Update Interval ¹	Transmission Interval (95%) ²	Basic Product
Temporary Restricted Areas (TRA)	As Available	10 minutes	Yes
Temporary Military Operations Areas (TMOA)	As Available	10 minutes	Yes

- ¹ The Update Interval is the rate at which the product data is available from the source.
- ² The Transmission Interval is the amount of time within which a new or updated product transmission must be completed (95%) and the rate or repetition interval at which the product is rebroadcast (95%).
- ³ The transmission and update intervals for the expanded set of basic meteorological products may be adjusted based on FAA and vendor agreement on the final product formats and performance requirements.

NOTE 1: Details concerning the content, format, and symbols of the various data link products provided should be obtained from the specific avionics manufacturer.

NOTE 2: NOTAM-D and NOTAM-FDC products broadcast via FIS-B are limited to those issued or effective within the past 30 days.

4-5-10 AUTOMATIC DEPENDENT SURVEILLANCE-REBROADCAST (ADS-R)

a. Introduction.

ADS-R is a datalink translation function of the ADS-B ground system required to accommodate the two separate operating frequencies (978 MHz and 1090 ES). The ADS-B system receives the ADS-B messages transmitted on one frequency and ADS-R translates and reformats the information for rebroadcast and use on the other frequency. This allows ADS-B In equipped aircraft to see nearby ADS-B Out traffic regardless of the operating link of the other aircraft. Aircraft operating on the same ADS-B frequency exchange information directly and do not require the ADS-R translation function. (See FIG 4-5-9 and FIG 4-5-10.)

b. Reports of ADS-R Malfunctions.

Users of ADS-R can provide valuable assistance in the correction of malfunctions by reporting instances of undesirable system performance. Since ADS-R performance is monitored by maintenance personnel rather than ATC, report malfunctions to the nearest Flight Service Station (FSS) facility by radio or telephone, or by sending an email to the ADS-B help desk at adsb@faa.gov. Reports should include:

1. Condition observed;
2. Date and time of observation;

US 4-5**SECTION 5. SURVEILLANCE SYSTEMS**

3. Altitude and location of observation;
4. Type and call sign of the aircraft; and
5. Type and software version of avionics system.

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION
MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR**4-6-1 APPLICABILITY AND RVSM MANDATE (DATE/TIME AND AREA)**

- a. **Applicability.** The policies, guidance and direction in this section apply to RVSM operations in the airspace over the lower 48 states, Alaska, Atlantic and Gulf of Mexico High Offshore Airspace and airspace in the San Juan FIR where VHF or UHF voice direct controller-pilot communication (DCPC) is normally available. Policies, guidance and direction for RVSM operations in oceanic airspace where VHF or UHF voice DCPC is not available and the airspace of other countries can be found in the Aeronautical Information Publication (AIP), Part II—En Route, ENR 1. General Rules and Procedures, and ENR 7.Oceanic Operations.
- b. **Requirement.** The FAA implemented RVSM between flight level (FL) 290–410 (inclusive) in the following airspace: the airspace of the lower 48 states of the United States, Alaska, Atlantic and Gulf of Mexico High Offshore Airspace and the San Juan FIR. RVSM has been implemented worldwide and may be applied in all ICAO Flight Information Regions (FIR).
- c. **RVSM Authorization.** In accordance with 14 CFR Section 91.180, with only limited exceptions, prior to operating in RVSM airspace, operators must comply with the standards of Part 91, Appendix G, and be authorized by the Administrator. If either the operator or the operator's aircraft have not met the applicable RVSM standards, the aircraft will be referred to as a "non-RVSM" aircraft. Paragraph 4-6-10 discusses ATC policies for accommodation of non-RVSM aircraft flown by the Department of Defense, Air Ambulance (MEDEVAC) operators, foreign State governments and aircraft flown for certification and development. Paragraph 4-6-11, Non-RVSM Aircraft Requesting Climb to and Descent from Flight Levels Above RVSM Airspace Without Intermediate Level Off, contains policies for non-RVSM aircraft climbing and descending through RVSM airspace to/from flight levels above RVSM airspace.
- d. **Benefits.** RVSM enhances ATC flexibility, mitigates conflict points, enhances sector throughput, reduces controller workload and enables crossing traffic. Operators gain fuel savings and operating efficiency benefits by flying at more fuel efficient flight levels and on more user preferred routings.

4-6-2 FLIGHT LEVEL ORIENTATION SCHEME

Altitude assignments for direction of flight follow a scheme of odd altitude assignment for magnetic courses 000-179 degrees and even altitudes for magnetic courses 180-359 degrees for flights up to and including FL 410, as indicated in FIG 4-6-1.

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

FIGURE 4-6-1

Flight Level Orientation Scheme

NOTE: Odd Flight Levels: Magnetic Course 000 – 179 Degrees Even Flight Levels: Magnetic Course 180 – 359 Degrees.

4-6-3 AIRCRAFT AND OPERATOR APPROVAL POLICY/PROCEDURES, RVSM MONITORING AND DATABASES FOR AIRCRAFT AND OPERATOR APPROVAL

- RVSM Authority.** 14 CFR Section 91.180 applies to RVSM operations within the U.S. 14 CFR Section 91.706 applies to RVSM operations outside the U.S. Both sections require that the operator be authorized prior to operating in RVSM airspace. For Domestic RVSM operations, an operator may choose to operate under the provisions of Part 91, Appendix G, Section 9; or if intending to operate outside U.S. airspace, hold a specific approval (OpSpec/MSpec/LOA) under the provisions of Section 3 of Part 91, Appendix G.
- Sources of Information.** Advisory Circular (AC) 91-85, *Authorization of Aircraft and Operators for Flight in Reduced Vertical Separation Minimum (RVSM) Airspace*, and the FAA RVSM website.
- TCAS Equipage.** TCAS equipage requirements are contained in 14 CFR Sections 121.356, 125.224, 129.18 and 135.189. Part 91, Appendix G, does not contain TCAS equipage requirements specific to RVSM, however, Appendix G does require that aircraft equipped with TCAS II and flown in RVSM airspace be modified to incorporate TCAS II Version 7.0 or a later version.
- Aircraft Monitoring.** Operators are required to participate in the RVSM altitude-keeping performance monitoring program that is appropriate for the type of operation being conducted. The monitoring programs are described in AC 91-85. Monitoring is a quality control program

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

that enables the FAA and other civil aviation authorities to assess the in-service altitude-keeping performance of aircraft and operators.

- e. **Purpose of RVSM Approvals Databases.** All RVSM designated airspace is monitored airspace. ATC does not use RVSM approvals databases to determine whether or not a clearance can be issued into RVSM airspace. RVSM program managers do regularly review the operators and aircraft that operate in RVSM airspace to identify and investigate those aircraft and operators flying in RVSM airspace, but not listed on the RVSM approvals databases.
- f. **Registration of U.S. Operators.** When U.S. operators and aircraft are granted specific RVSM authority, the Separation Standards Group at the FAA Technical Center obtains PTRS operator and aircraft information to update the FAA maintained U.S. Operator/Aircraft RVSM Approvals database. Basic database operator and aircraft information can be viewed on the RVSM Documentation web page in the “RVSM Approvals” section.

4-6-4 FLIGHT PLANNING INTO RVSM AIRSPACE

- a. Operators that do not file the correct aircraft equipment suffix on the FAA or ICAO Flight Plan may be denied clearance into RVSM airspace. Policies for the FAA Flight Plan are detailed in subparagraph c below. Policies for the ICAO Flight Plan are detailed in subparagraph d.
- b. The operator will annotate the equipment block of the FAA or ICAO Flight Plan with an aircraft equipment suffix indicating RVSM capability only after determining that both the operator is authorized and its aircraft are RVSM-compliant.
 - 1. An operator may operate in RVSM airspace under the provisions of Part 91, Appendix G, Section 9, without specific authorization and should file “/w” in accordance with paragraph d.
 - 2. An operator must get an OpSpec/MSpec/ LOA when intending to operate RVSM outside U.S. airspace. Once issued, that operator can file “/w” in accordance with paragraph d.
 - 3. An operator should not file “/w” when intending to operate in RVSM airspace outside of the U.S., if they do not hold a valid OpSpec/MSpec/ LOA.
- c. General Policies for FAA Flight Plan Equipment Suffix. Appendix 4, TBL 4-2, allows operators to indicate that the aircraft has both RVSM and Advanced Area Navigation (RNAV) capabilities or has only RVSM capability.
 - 1. The operator will annotate the equipment block of the FAA Flight Plan with the appropriate aircraft equipment suffix from Appendix 4, TBL 4-2 and/or TBL 4-3.
 - 2. Operators can only file one equipment suffix in block 3 of the FAA Flight Plan. Only this equipment suffix is displayed directly to the controller.
 - 3. Aircraft with RNAV Capability. For flight in RVSM airspace, aircraft with RNAV capability, but not Advanced RNAV capability, will file “/W”. Filing “/W” will not preclude such aircraft from filing and flying direct routes in en route airspace.
- d. Policy for ICAO Flight Plan Equipment Suffixes.

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

1. Operators/aircraft that are RVSM-compliant and that file ICAO flight plans will file “/W” in block 10 (Equipment) to indicate RVSM authorization and will also file the appropriate ICAO Flight Plan suffixes to indicate navigation and communication capabilities.
 2. Operators/aircraft that file ICAO flight plans that include flight in domestic U.S. RVSM airspace must file “/W” in block 10 to indicate RVSM authorization.
- e. Importance of Flight Plan Equipment Suffixes. Military users, and civilians who file stereo route flight plans, must file the appropriate equipment suffix in the equipment block of the FAA Form 7233-1, Flight Plan, or DD Form 175, Military Flight Plan, or FAA Form 7233-4, International Flight Plan, or DD Form 1801, DOD International Flight Plan. All other users must file the appropriate equipment suffix in the equipment block of FAA Form 7233-4, International Flight Plan. The equipment suffix informs ATC:
1. Whether or not the operator and aircraft are authorized to fly in RVSM airspace.
 2. The navigation and/or transponder capability of the aircraft (e.g., advanced RNAV, transponder with Mode C).
- f. Significant ATC uses of the flight plan equipment suffix information are:
1. To issue or deny clearance into RVSM airspace.
 2. To apply a 2,000 foot vertical separation minimum in RVSM airspace to aircraft that are not authorized for RVSM, but are in one of the limited categories that the FAA has agreed to accommodate. (See paragraphs 4-6-10, Procedures for Accommodation of Non-RVSM Aircraft, and 4-6-11, Non-RVSM Aircraft Requesting Climb to and Descent from Flight Levels Above RVSM Airspace Without Intermediate Level Off, for policy on limited operation of unapproved aircraft in RVSM airspace).
 3. To determine if the aircraft has “Advanced RNAV” capabilities and can be cleared to fly procedures for which that capability is required.
- g. Improperly changing an aircraft equipment suffix and/or adding “NON-RVSM” in the NOTES or REMARKS section (Field 18) while not removing the “W” from Field 10, will not provide air traffic control with the proper visual indicator necessary to detect Non-RVSM aircraft. To ensure information processes correctly for Non-RVSM aircraft, the “W” in Field 10 must be removed. Entry of information in the NOTES or REMARKS section (Field 18) will not affect the determination of RVSM capability and must not be used to indicate a flight is Non-RVSM.

4-6-5 PILOT RVSM OPERATING PRACTICES AND PROCEDURES

- a. **RVSM Mandate.** If either the operator is not authorized for RVSM operations or the aircraft is not RVSM-compliant, the pilot will neither request nor accept a clearance into RVSM airspace unless:
1. The flight is conducted by a non-RVSM DOD, MEDEVAC, certification/development or foreign State (government) aircraft in accordance with paragraph 4-6-10, Procedures for Accommodation of Non-RVSM Aircraft.

US 4-6

**SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION
MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR**

2. The pilot intends to climb to or descend from FL 430 or above in accordance with paragraph 4-6-11, Non-RVSM Aircraft Requesting Climb to and Descent from Flight Levels Above RVSM Airspace Without Intermediate Level Off.
3. An emergency situation exists.
- b. **Basic RVSM Operating Practices and Procedures.** AC 91-85 contains pilot practices and procedures for RVSM. Operators must incorporate applicable practices and procedures, as supplemented by the applicable paragraphs of this section, into operator training or pilot knowledge programs and operator documents containing RVSM operational policies.
- c. AC 91-85 contains practices and procedures for flight planning, preflight procedures at the aircraft, procedures prior to RVSM airspace entry, inflight (en route) procedures, contingency procedures and post flight.
- d. The following paragraphs either clarify or supplement AC 91-85 practices and procedures.

**4-6-6 GUIDANCE ON SEVERE TURBULENCE AND MOUNTAIN
WAVE ACTIVITY (MWA)****a. Introduction/Explanation**

1. The information and practices in this paragraph are provided to emphasize to pilots and controllers the importance of taking appropriate action in RVSM airspace when aircraft experience severe turbulence and/or MWA that is of sufficient magnitude to significantly affect altitude-keeping.
2. **Severe Turbulence.** Severe turbulence causes large, abrupt changes in altitude and/or attitude usually accompanied by large variations in indicated airspeed. Aircraft may be momentarily out of control. Encounters with severe turbulence must be remedied immediately in any phase of flight. Severe turbulence may be associated with MWA.

3. Mountain Wave Activity (MWA)

- (a) Significant MWA occurs both below and above the floor of RVSM airspace, FL 290. MWA often occurs in western states in the vicinity of mountain ranges. It may occur when strong winds blow perpendicular to mountain ranges resulting in up and down or wave motions in the atmosphere. Wave action can produce altitude excursions and airspeed fluctuations accompanied by only light turbulence. With sufficient amplitude, however, wave action can induce altitude and airspeed fluctuations accompanied by severe turbulence. MWA is difficult to forecast and can be highly localized and short lived.
- (b) Wave activity is not necessarily limited to the vicinity of mountain ranges. Pilots experiencing wave activity anywhere that significantly affects altitude-keeping can follow the guidance provided below.
- (c) Inflight MWA Indicators (Including Turbulence). Indicators that the aircraft is being subjected to MWA are:

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

- (1) Altitude excursions and/or airspeed fluctuations with or without associated turbulence.
- (2) Pitch and trim changes required to maintain altitude with accompanying airspeed fluctuations.
- (3) Light to severe turbulence depending on the magnitude of the MWA.

4. Priority for Controller Application of Merging Target Procedures

- (a) **Explanation of Merging Target Procedures.** As described in subparagraph c3 below, ATC will use “merging target procedures” to mitigate the effects of both severe turbulence and MWA. The procedures in subparagraph c3 have been adapted from existing procedures published in FAA Order JO 7110.65, Air Traffic Control, paragraph 5-1-4, Merging Target Procedures. paragraph 5-1-4 calls for en route controllers to advise pilots of potential traffic that they perceive may fly directly above or below his/her aircraft at minimum vertical separation. In response, pilots are given the option of requesting a radar vector to ensure their radar target will not merge or overlap with the traffic's radar target.
 - (b) The provision of “merging target procedures” to mitigate the effects of severe turbulence and/or MWA is not optional for the controller, but rather is a priority responsibility. Pilot requests for vectors for traffic avoidance when encountering MWA or pilot reports of “Unable RVSM due turbulence or MWA” are considered first priority aircraft separation and sequencing responsibilities. (FAA Order JO 7110.65, paragraph 2-1-2, Duty Priority, states that the controller's first priority is to separate aircraft and issue safety alerts).
 - (c) Explanation of the term “traffic permitting.” The contingency actions for MWA and severe turbulence detailed in paragraph 4-6-9, Contingency Actions: Weather Encounters and Aircraft System Failures that Occur After Entry into RVSM Airspace, state that the controller will “vector aircraft to avoid merging targets with traffic at adjacent flight levels, traffic permitting.” The term “traffic permitting” is not intended to imply that merging target procedures are not a priority duty. The term is intended to recognize that, as stated in FAA Order JO 7110.65, paragraph 2-1-2, Duty Priority, there are circumstances when the controller is required to perform more than one action and must “exercise their best judgment based on the facts and circumstances known to them” to prioritize their actions. Further direction given is: “That action which is most critical from a safety standpoint is performed first.”
- 5. TCAS Sensitivity.** For both MWA and severe turbulence encounters in RVSM airspace, an additional concern is the sensitivity of collision avoidance systems when one or both aircraft operating in close proximity receive TCAS advisories in response to disruptions in altitude hold capability.

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

b. **Pre-flight tools.** Sources of observed and forecast information that can help the pilot ascertain the possibility of MWA or severe turbulence are: Forecast Winds and Temperatures Aloft (FD), Area Forecast (FA), Graphical Turbulence Guidance (GTG), SIGMETs and PIREPs.

c. **Pilot Actions When Encountering Weather (e.g., Severe Turbulence or MWA)**

1. **Weather Encounters Inducing Altitude Deviations of Approximately 200 feet.**

When the pilot experiences weather induced altitude deviations of approximately 200 feet, the pilot will contact ATC and state "Unable RVSM Due (state reason)" (e.g., turbulence, mountain wave). See contingency actions in paragraph 4-6-9.

2. **Severe Turbulence (including that associated with MWA).** When pilots encounter severe turbulence, they should contact ATC and report the situation. Until the pilot reports clear of severe turbulence, the controller will apply merging target vectors to one or both passing aircraft to prevent their targets from merging:

EXAMPLE: "Yankee 123, FL 310, unable RVSM due severe turbulence."

"Yankee 123, fly heading 290; traffic twelve o'clock, 10 miles, opposite direction; east-bound MD-80 at FL 320" (or the controller may issue a vector to the MD-80 traffic to avoid Yankee 123).

3. **MWA.** When pilots encounter MWA, they should contact ATC and report the magnitude and location of the wave activity. When a controller makes a merging targets traffic call, the pilot may request a vector to avoid flying directly over or under the traffic. In situations where the pilot is experiencing altitude deviations of 200 feet or greater, the pilot will request a vector to avoid traffic. Until the pilot reports clear of MWA, the controller will apply merging target vectors to one or both passing aircraft to prevent their targets from merging:

EXAMPLE: "Yankee 123, FL 310, unable RVSM due mountain wave."

"Yankee 123, fly heading 290; traffic twelve o'clock, 10 miles, opposite direction; east-bound MD-80 at FL 320" (or the controller may issue a vector to the MD-80 traffic to avoid Yankee 123).

4. **FL Change or Re-route.** To leave airspace where MWA or severe turbulence is being encountered, the pilot may request a FL change and/or re-route, if necessary.

4-6-7 GUIDANCE ON WAKE TURBULENCE

a. Pilots should be aware of the potential for wake turbulence encounters in RVSM airspace. Experience gained since 1997 has shown that such encounters in RVSM airspace are generally moderate or less in magnitude.

b. Prior to DRVSM implementation, the FAA established provisions for pilots to report wake turbulence events in RVSM airspace using the NASA Aviation Safety Reporting System (ASRS). A "Safety Reporting" section established on the FAA RVSM Documentation web page provides contacts, forms, and reporting procedures.

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

- c. To date, wake turbulence has not been reported as a significant factor in DRVSM operations. European authorities also found that reports of wake turbulence encounters did not increase significantly after RVSM implementation (eight versus seven reports in a ten-month period). In addition, they found that reported wake turbulence was generally similar to moderate clear air turbulence.
- d. **Pilot Action to Mitigate Wake Turbulence Encounters**
 - 1. Pilots should be alert for wake turbulence when operating:
 - (a) In the vicinity of aircraft climbing or descending through their altitude.
 - (b) Approximately 10-30 miles after passing 1,000 feet below opposite-direction traffic.
 - (c) Approximately 10-30 miles behind and 1,000 feet below same-direction traffic.
 - 2. Pilots encountering or anticipating wake turbulence in DRVSM airspace have the option of requesting a vector, FL change or if capable, a lateral offset.

NOTE:

- 1. *Offsets of approximately a wing span upwind generally can move the aircraft out of the immediate vicinity of another aircraft's wake vortex.*
- 2. *In domestic U.S. airspace, pilots must request clearance to fly a lateral offset. Strategic lateral offsets flown in oceanic airspace do not apply.*

4-6-8 PILOT/CONTROLLER PHRASEOLOGY

TBL 4-6-1 shows standard phraseology that pilots and controllers will use to communicate in DRVSM operations.

TABLE 4-6-1 Pilot/Controller Phraseology

Message	Phraseology
For a controller to ascertain the RVSM approval status of an aircraft:	(call sign) confirm RVSM approved
Pilot indication that flight is RVSM approved	Affirm RVSM

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION
MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

TABLE 4-6-1 Pilot/Controller Phraseology (continued)

Pilot report lack of RVSM approval (non-RVSM status). Pilot will report non-RVSM status, as follows: - On the initial call on any frequency in the RVSM airspace and - In all requests for flight level changes pertaining to flight levels within the RVSM airspace and - In all read backs to flight level clearances pertaining to flight levels within the RVSM airspace and - In read back of flight level clearances involving climb and descent through RVSM airspace (FL 290-410).	Negative RVSM, (supplementary information, e.g., "Certification flight").
Pilot report of one of the following after entry into RVSM airspace: all primary altimeters, automatic altitude control systems or altitude alerters have failed. (See paragraph 4-6-9, Contingency Actions: Weather Encounters and Aircraft System Failures that Occur After Entry into RVSM Airspace.) NOTE: <i>This phrase is to be used to convey both the initial indication of RVSM aircraft system failure and on initial contact on all frequencies in RVSM airspace until the problem ceases to exist or the aircraft has exited RVSM airspace.</i>	Unable RVSM Due Equipment
ATC denial of clearance into RVSM airspace	Unable issue clearance into RVSM airspace, maintain FL
*Pilot reporting inability to maintain cleared flight level due to weather encounter. (See Paragraph 4-6-9, Contingency Actions: Weather Encounters and Aircraft System Failures that Occur After Entry into RVSM Airspace.).	*Unable RVSM due (state reason) (e.g., turbulence, mountain wave)

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

TABLE 4-6-1 Pilot/Controller Phraseology (continued)

ATC requesting pilot to confirm that an aircraft has regained RVSM-approved status or a pilot is ready to resume RVSM	Confirm able to resume RVSM
Pilot ready to resume RVSM after aircraft system or weather contingency	Ready to resume RVSM

4-6-9 **CONTINGENCY ACTIONS: WEATHER ENCOUNTERS AND AIRCRAFT SYSTEM FAILURES THAT OCCUR AFTER ENTRY INTO RVSM AIRSPACE**

TBL 4-6-2 provides pilot guidance on actions to take under certain conditions of aircraft system failure that occur after entry into RVSM airspace and weather encounters. It also describes the expected ATC controller actions in these situations. It is recognized that the pilot and controller will use judgment to determine the action most appropriate to any given situation.

TABLE 4-6-2 Contingency Actions: Weather Encounters and Aircraft System Failures that Occur After Entry into RVSM Airspace

Initial Pilot Actions in Contingency Situations
Initial pilot actions when unable to maintain flight level (FL) or unsure of aircraft altitude-keeping capability:
– Notify ATC and request assistance as detailed below. – Maintain cleared flight level, to the extent possible, while evaluating the situation. – Watch for conflicting traffic both visually and by reference to TCAS, if equipped. – Alert nearby aircraft by illuminating exterior lights (commensurate with aircraft limitations).

Severe Turbulence and/or Mountain Wave Activity (MWA) Induced Altitude Deviations of Approximately 200 feet	
Pilot will:	Controller will:

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

– When experiencing severe turbulence and/or MWA induced altitude deviations of approximately 200 feet or greater, pilot will contact ATC and state “Unable RVSM Due (state reason)” (e.g., turbulence, mountain wave) – If not issued by the controller, request vector clear of traffic at adjacent FLs – If desired, request FL change or re-route – Report location and magnitude of turbulence or MWA to ATC See Paragraph 4-6-6, Guidance on Severe Turbulence and Mountain Wave Activity (MWA) for detailed guidance.	– Vector aircraft to avoid merging target with traffic at adjacent flight levels, traffic permitting – Advise pilot of conflicting traffic – Issue FL change or re-route, traffic permitting – Issue PIREP to other aircraft Paragraph 4-6-6 explains “traffic permitting.”
--	---

Mountain Wave Activity (MWA) Encounters – General

Pilot actions:	Controller actions:
– Contact ATC and report experiencing MWA – If so desired, pilot may request a FL change or re-route – Report location and magnitude of MWA to ATC See paragraph 4-6-6 for guidance on MWA. NOTE: MWA encounters do not necessarily result in altitude deviations on the order of 200 feet. The guidance below is intended to address less significant MWA encounters.	– Advise pilot of conflicting traffic at adjacent FL – If pilot requests, vector aircraft to avoid merging target with traffic at adjacent RVSM flight levels, traffic permitting – Issue FL change or re-route, traffic permitting – Issue PIREP to other aircraft Paragraph 4-6-6 explains “traffic permitting.”

Wake Turbulence Encounters

Pilot should:	Controller should:
– Contact ATC and request vector, FL change or, if capable, a lateral offset See Paragraph 4-6-7, Guidance on Wake Turbulence.	– Issue vector, FL change or lateral offset clearance, traffic permitting Paragraph 4-6-6 explains “traffic permitting.”

US 4-6
SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR
“Unable RVSM Due Equipment”
Failure of Automatic Altitude Control System, Altitude Alerter or All Primary Altimeters
Pilot will:

- Contact ATC and state “Unable RVSM Due Equipment”
- Request clearance out of RVSM airspace unless operational situation dictates otherwise

Controller will:

- Provide 2,000 feet vertical separation or appropriate horizontal separation
- Clear aircraft out of RVSM airspace unless operational situation dictates otherwise

One Primary Altimeter Remains Operational
Pilot will:

- Cross check stand-by altimeter
- Notify ATC of operation with single primary altimeter
- If unable to confirm primary altimeter accuracy, follow actions for failure of all primary altimeters

Controller will:

- Acknowledge operation with single primary altimeter

Transponder Failure
Pilot will:

- Contact ATC and request authority to continue to operate at cleared flight level
- Comply with revised ATC clearance, if issued

NOTE: 14 CFR Section 91.215 (ATC transponder and altitude reporting equipment and use) regulates operation with the transponder inoperative.

Controller will:

- Consider request to continue to operate at cleared flight level
- Issue revised clearance, if necessary

4-6-10 PROCEDURES FOR ACCOMMODATION OF NON-RVSM AIRCRAFT

a. General Policies for Accommodation of Non-RVSM Aircraft

1. The RVSM mandate calls for only RVSM authorized aircraft/operators to fly in designated RVSM airspace with limited exceptions. The policies detailed below are intended exclusively for use by aircraft that the FAA has agreed to accommodate. They are not intended to provide other operators a means to circumvent the normal RVSM approval process.

US 4-6

SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR

2. If the operator is not authorized or the aircraft is not RVSM-compliant, the aircraft will be referred to as a “non-RVSM” aircraft. 14 CFR Section 91.180 and Part 91, Appendix G, enable the FAA to authorize a deviation to operate a non-RVSM aircraft in RVSM airspace.
3. Non-RVSM aircraft flights will be handled on a workload permitting basis. The vertical separation standard applied between aircraft not approved for RVSM and all other aircraft must be 2,000 feet.
4. **Required Pilot Calls.** The pilot of non-RVSM aircraft will inform the controller of the lack of RVSM approval in accordance with the direction provided in Paragraph 4-6-8, Pilot/Controller Phraseology.

b. Categories of Non-RVSM Aircraft that may be Accommodated

Subject to FAA approval and clearance, the following categories of non-RVSM aircraft may operate in domestic U.S. RVSM airspace provided they have an operational transponder.

1. Department of Defense (DOD) aircraft.
2. Flights conducted for aircraft certification and development purposes.
3. Active air ambulance flights utilizing a “MEDEVAC” call sign.
4. Aircraft climbing/descending through RVSM flight levels (without intermediate level off) to/from FLs above RVSM airspace (Policies for these flights are detailed in paragraph 4-6-11, Non-RVSM Aircraft Requesting Climb to and Descent from Flight Levels Above RVSM Airspace Without Intermediate Level Off.
5. Foreign State (government) aircraft.

c. Methods for operators of non-RVSM aircraft to request access to RVSM Airspace. Operators may:

1. **LOA/MOU.** Enter into a Letter of Agreement (LOA)/Memorandum of Understanding (MOU) with the RVSM facility (the Air Traffic facility that provides air traffic services in RVSM airspace). Operators must comply with LOA/MOU.
2. **File-and-Fly.** File a flight plan to notify the FAA of their intention to request access to RVSM airspace.

NOTE: Priority for access to RVSM airspace will be afforded to RVSM compliant aircraft, then File-and-Fly flights.

4-6-11 NON-RVSM AIRCRAFT REQUESTING CLIMB TO AND DESCENT FROM FLIGHT LEVELS ABOVE RVSM AIRSPACE WITHOUT INTERMEDIATE LEVEL OFF

- a. **File-and-Fly.** Operators of non-RVSM aircraft climbing to and descending from RVSM flight levels should just file a flight plan.

US 4-6

**SECTION 6. OPERATIONAL POLICY/PROCEDURES FOR REDUCED VERTICAL SEPARATION
MINIMUM (RVSM) IN THE DOMESTIC U.S., ALASKA, OFFSHORE AIRSPACE AND THE SAN JUAN FIR**

- b. Non-RVSM aircraft climbing to and descending from flight levels above RVSM airspace will be handled on a workload permitting basis. The vertical separation standard applied in RVSM airspace between non-RVSM aircraft and all other aircraft must be 2,000 feet.
- c. Non-RVSM aircraft climbing to/descending from RVSM airspace can only be considered for accommodation provided:
 - 1. Aircraft is capable of a continuous climb/descent and does not need to level off at an intermediate altitude for any operational considerations and
 - 2. Aircraft is capable of climb/descent at the normal rate for the aircraft.
- d. **Required Pilot Calls.** The pilot of non-RVSM aircraft will inform the controller of the lack of RVSM approval in accordance with the direction provided in paragraph 4-6-8, Pilot/Controller Phraseology.

US 5-1

SECTION 1. PREFLIGHT

5-1-1 PREFLIGHT PREPARATION

- a. Prior to every flight, pilots should gather all information vital to the nature of the flight, assess whether the flight would be safe, and then file a flight plan. Pilots can receive a regulatory compliant briefing without contacting Flight Service. Pilots are encouraged to use automated resources and review Advisory Circular AC 91-92, Pilot's Guide to a Preflight Briefing, for more information. Pilots who prefer to contact Flight Service are encouraged to conduct a self-brief prior to calling. Conducting a self-brief before contacting Flight Service provides familiarity of meteorological and aeronautical conditions applicable to the route of flight and promotes a better understanding of weather information. Pilots may access Flight Service through www.1800wxbrief.com or by calling 1-800-WX-BRIEF. Flight planning applications are also available for conducting a self-briefing and filing flight plans.

NOTE: *Alaska only: Pilots filing flight plans via "fast file" who desire to have their briefing recorded, should include a statement at the end of the recording as to the source of their weather briefing.*

- b. The information required by the FAA to process flight plans is obtained from FAA Form 7233-4, International Flight Plan. Only DOD users, and civilians who file stereo route flight plans, may use FAA Form 7233-1, Flight Plan.

NOTE: *FAA and DOD Flight Plan Forms are equivalent. Where the FAA specifies Form 7233-1, Flight Plan and FAA Form 7233-4, International Flight Plan, the DOD may substitute their Form DD 175, Military Flight Plan and Form DD-1801, DOD International Flight Plan as necessary. NAS automation systems process and convert data in the same manner, although for computer acceptance, input fields may be adjusted to follow FAA format.*

- c. FSSs are required to advise of pertinent NOTAMs if a *standard* briefing is requested, but if they are overlooked, do not hesitate to remind the specialist that you have not received NOTAM information. Additionally, FSS briefers do not provide FDC NOTAM information for special instrument approach procedures unless specifically asked. Pilots authorized by the FAA to use special instrument approach procedures must specifically request FDC NOTAM information for these procedures. Pilots who receive the information electronically will receive NOTAMs for special IAPs automatically.

NOTE: *Domestic Notices and International Notices are not provided during a briefing unless specifically requested by the pilot since the FSS specialist has no way of knowing whether the pilot has already checked the Federal NOTAM System (FNS) NOTAM Search website external links prior to calling. Airway NOTAMs, procedural NOTAMs, and NOTAMs that are general in nature and not tied to a specific airport/facility (for example, flight advisories and restrictions, open duration special security instructions, and special flight rules areas) are briefed solely by pilot request. Remember to ask for these notices if you have not already reviewed this information, and to request all pertinent NOTAMs specific to your flight.*

REFERENCE—AIM, Para 5-1-3, Notice to Air Missions (NOTAM) System.

- d. Pilots are urged to use only the latest issue of aeronautical charts in planning and conducting flight operations. Aeronautical charts are revised and reissued on a regular scheduled basis to ensure that depicted data are current and reliable. In the conterminous U.S., Sectional

**US 5-1
SECTION 1. PREFLIGHT**

Charts are updated every 6 months, IFR En Route Charts every 56 days, and amendments to civil IFR Approach Charts are accomplished on a 56-day cycle with a change notice volume issued on the 28-day midcycle. [Jeppesen IFR Enroute Charts are updated every 56 days, and amendments to Jeppesen IFR Approach Charts are accomplished every 14 days.] Charts that have been superseded by those of a more recent date may contain obsolete or incomplete flight information.

REFERENCE—*AIM, Paragraph 9-1-4, General Description of Each Chart Series.*

- e. When requesting a preflight briefing, identify yourself as a pilot and provide the following:
 1. **Type of flight planned; e.g., VFR or IFR.**
 2. **Aircraft's number or pilot's name.**
 3. **Aircraft type.**
 4. **Departure Airport.**
 5. **Route of flight.**
 6. **Destination.**
 7. **Flight altitude(s).**
 8. **ETD and ETE.**
- f. Prior to conducting a briefing, briefers are required to have the background information listed above so that they may tailor the briefing to the needs of the proposed flight. The objective is to communicate a “picture” of meteorological and aeronautical information necessary for the conduct of a safe and efficient flight. Briefers use all available weather and aeronautical information to summarize data applicable to the proposed flight. Pilots who have briefed themselves before calling Flight Service should advise the briefer what information has been obtained from other sources.

REFERENCE—*AIM, Paragraph 7-1-5, Preflight Briefings, contains those items of a weather briefing that should be expected or requested.*

- g. FAA by 14 CFR Part 93, Subpart K, has designated High Density Traffic Airports (HDTA) and has prescribed air traffic rules and requirements for operating aircraft (excluding helicopter operations) to and from these airports.

REFERENCE—

Chart Supplement U.S., Special Notices Section.

AIM, Paragraph 4-1-21, Airport Reservation Operations and Special Traffic Management Programs.

- h. In addition to the filing of a flight plan, if the flight will traverse or land in one or more foreign countries, it is particularly important that pilots leave a complete itinerary with someone directly concerned and keep that person advised of the flight's progress. If serious doubt arises as to the safety of the flight, that person should first contact the FSS.

US 5-1

SECTION 1. PREFLIGHT

REFERENCE—*AIM, Paragraph 5-1-11, Flights Outside the U.S. and U.S. Territories.*

- i. Pilots operating under provisions of 14 CFR Part 135 on a domestic flight without having an FAA assigned 3-letter designator, must prefix the normal registration (N) number with the letter "T" on flight plan filing; for example, TN1234B.

REFERENCE—

AIM, Paragraph 4-2-4, Aircraft Call Signs.

FAA Order JO 7110.65, Paragraph 2-3-5a, Aircraft Identity.

FAA Order JO 7110.10, Paragraph 6-2-1b1, Flight Plan Recording.

5-1-2 FOLLOW IFR PROCEDURES EVEN WHEN OPERATING VFR

- a. To maintain IFR proficiency, pilots are urged to practice IFR procedures whenever possible, even when operating VFR. Some suggested practices include:
 - 1. Obtain a complete preflight briefing and check NOTAMs. Prior to every flight, pilots should gather all information vital to the nature of the flight. Pilots can receive a regulatory compliant briefing without contacting Flight Service. Pilots are encouraged to use automated resources and review AC 91-92, Pilot's Guide to a Preflight Briefing, for more information. NOTAMs are available online from the Federal NOTAM System (FNS) NOTAM Search website (<https://notams.aim.faa.gov/notamSearch/>), private vendors, or on request from Flight Service.
 - 2. File a flight plan. This is an excellent low cost insurance policy. The cost is the time it takes to fill it out. The insurance includes the knowledge that someone will be looking for you if you become overdue at your destination. Pilots can file flight plans either by using a website or by calling Flight Service. Flight planning applications are also available to file, activate, and close VFR flight plans.
 - 3. Use current charts.
 - 4. Use the navigation aids. Practice maintaining a good course—keep the needle centered.
 - 5. Maintain a constant altitude which is appropriate for the direction of flight.
 - 6. Estimate en route position times.
 - 7. Make accurate and frequent position reports to the FSSs along your route of flight.
- b. Simulated IFR flight is recommended (under the hood); however, pilots are cautioned to review and adhere to the requirements specified in 14 CFR Section 91.109 before and during such flight.
- c. When flying VFR at night, in addition to the altitude appropriate for the direction of flight, pilots should maintain an altitude which is at or above the minimum en route altitude as shown on charts. This is especially true in mountainous terrain, where there is usually very little ground reference. Do not depend on your eyes alone to avoid rising unlighted terrain, or even lighted obstructions such as TV towers.

US 5-1
SECTION 1. PREFLIGHT

5-1-3 NOTICE TO AIR MISSIONS (NOTAM) SYSTEM

- a. **General.** The NOTAM system provides pilots with time critical aeronautical information that is temporary, or information to be published on aeronautical charts at a later date, or information from another operational publication. The NOTAM is cancelled when the information in the NOTAM is published on the chart or when the temporary condition is returned to normal status. NOTAMs may be disseminated up to 7 days before the start of activity. Pilots can access NOTAM information online via NOTAM Search at: <https://notams.aim.faa.gov/notamSearch/> or from an FSS.
- b. **Preflight.** 14 CFR §91.103, Preflight Action directs pilots to become familiar with all available information concerning a planned flight prior to departure, including NOTAMs. Pilots may change their flight plan based on available information. Current NOTAM information may affect:
1. Aerodromes.
 2. Runways, taxiways, and ramp restrictions.
 3. Obstructions.
 4. Communications.
 5. Airspace.
 6. Status of navigational aids or radar service availability.
 7. Other information essential to planned en route, terminal, or landing operations.
- c. **ARTCC NOTAMs.** Pilots should also review NOTAMs for the ARTCC area (for example, Washington Center (ZDC), Cleveland Center (ZOB), etc.) in which the flight will be operating. You can find the 3 letter code for each ARTCC on the FAA's NOTAM webpage. These NOTAMs may affect the planned flight. Some of the operations include Central Altitude Reservation Function (CARF), Special Use Airspace (SUA), Temporary Flight Restrictions (TFR), Global Positioning System (GPS), Flight Data Center (FDC) changes to routes, wind turbine, and Unmanned Aircraft System (UAS).
- NOTE:** NOTAM information is transmitted using ICAO contractions to reduce transmission time. See TBL 5-1-2 for a listing of the most commonly used contractions, or go online to the following URL: <https://www.notams.faa.gov/downloads/contractions.pdf>. For a complete listing of approved NOTAM Contractions, see FAA JO Order 7340.2, Contractions.
- d. **Destination Update.** Pilots should also contact ATC or FSS while en route to obtain updated airfield information for their destination. This is particularly important when flying to the airports without an operating control tower. Snow removal, fire and rescue activities, construction, and wildlife encroachment, may pose hazards to pilots. This information may not be available to pilots prior to arrival/departure.
- e. **NAVAID NOTAMs.** Pilots should check NOTAMs to ensure NAVAIDs required for the flight are in service. A NOTAM is published when a NAVAID is out of service or Unserviceable (U/S). Although a NAVAID is deemed U/S and planned for removal from service, it may be a long time before that NAVAID is officially decommissioned and removed from charts. A

US 5-1

SECTION 1. PREFLIGHT

NOTAM is the primary method of alerting pilots to its unavailability. It is recommended that pilots using VFR charts should regularly consult the Chart Update Bulletin. This bulletin identifies any updates to the chart that have not yet been accounted for.

- f. **GPS NOTAMS.** The FAA issues information on the status of GPS through the NOTAM system. Operators may find information on GPS satellite outages, GPS testing, and GPS anomalies by specifically searching for GPS NOTAMS prior to flight.

1. The NOTAM system uses the terms UNRELIABLE (UNREL), MAY NOT BE AVAILABLE (AVBL), and NOT AVAILABLE (AVBL) when describing the status of GPS. UNREL indicates the expected level of service of the GPS and/or WAAS may not be available. Pilots must then determine the adequacy of the signal for desired use. Aircraft should have additional navigation equipment for their intended route.

NOTE: Unless associated with a known testing NOTAM, pilots should report GPS anomalies, including degraded operation and/or loss of service, as soon as possible via radio or telephone, and via the GPS Anomaly Reporting Form. (See 1-1-13.)

2. GPS operations may also be NOTAMED for testing. This is indicated in the NOTAM language with the name of the test in parenthesis. When GPS testing NOTAMS are published and testing is actually occurring, ATC will advise pilots requesting or cleared for a GPS or RNAV (GPS) approach, that GPS may not be available and request the pilot's intentions. TBL 5-1-1 lists an example of a GPS testing NOTAM.

- g. **NOTAM Classification.** NOTAM information is classified as Domestic NOTAMS (NOTAM D), Flight Data Center (FDC) NOTAMS, International NOTAMS, or Military NOTAMS.

1. **NOTAM (D)** information is disseminated for all navigational facilities that are part of the National Airspace System (NAS), all public use aerodromes, seaplane bases, and heliports listed in the Chart Supplement. U.S. NOTAM (D) information includes taxiway closures, personnel and equipment near or crossing runways, and airport lighting aids that do not affect instrument approach criteria (i.e., VGSI). All NOTAM Ds must have one of the keywords listed in TBL 5-1-1, as the first part of the text after the location identifier. These keywords categorize NOTAM Ds by subject, for example, APRON (ramp), RWY (runway), SVC (Services), etc. There are several types of NOTAM Ds:

- (a) Aerodrome activity and conditions, to include field conditions.
- (b) Airspace to include CARF, SUA, and general airspace activity like UAS or pyrotechnics.
- (c) Visual and radio navigational aids.
- (d) Communication and services.
- (e) Pointer NOTAMS. NOTAMS issued to point to additional aeronautical information. When pointing to another NOTAM, the keyword in the pointer NOTAM must match the keyword in the original NOTAM. Pointer NOTAMS should be issued for, but are not limited to, TFRs, Airshows, Temporary SUA, major NAS system interruptions, etc.

US 5-1

SECTION 1. PREFLIGHT

2. FDC NOTAMs are issued when it is necessary to disseminate regulatory information. FDC NOTAMs include:
 - (a) Amendments to published IAPs and other current aeronautical charts.
 - (b) Temporary Flight Restrictions (TFR) restrict entrance to a certain airspace at a certain time, however, some TFRs provide relief if ATC permission is given to enter the area when requested. Online preflight resources for TFRs provide graphics and plain language interpretations.
 - (c) High barometric pressure warning.
 - (d) Laser light activity.
 - (e) ADS-B, TIS-B, and FIS-B service availability.
 - (f) Satellite-based systems such as WAAS or GPS.
 - (g) Special Notices.
3. International NOTAMs are published in ICAO format per Annex 15 and distributed to multiple countries.
 - (a) International NOTAMs issued by the U.S. NOTAM Office use Series A followed by 4 sequential numbers, a slant “/” and a 2-digit number representing the year the NOTAM was issued. International NOTAMs basically duplicate data found in a U.S. Domestic NOTAM.
 - (b) Not every topic of a U.S. Domestic NOTAM is issued as an International NOTAM by the U.S. The U.S. International NOTAM will be linked to the appropriate U.S. Domestic NOTAM when possible.
 - (c) International NOTAMs received by the FAA from other countries are stored in the U.S. NOTAM System.
 - (d) The International NOTAM format includes a “Q” Line that can be easily read/parsed by a computer and allows the NOTAM to be displayed digitally.
 - (1) Field A: ICAO location identifier or FIR affected by the NOTAM.
 - (2) Field B: Start of Validity.
 - (3) Field C: End of Validity (both in [Year] [Month] [Day] [Hour] [Minute] format).
 - (4) Field D: (when present) Schedule.
 - (5) Field E: Full NOTAM description.
 - (6) Field F: (when present) Lowest altitude, or “SFC.”
 - (7) Field G: (when present) Highest altitude, or “UNL.”
 - (e) For more on International format, please see Annex 15.
4. **Military NOTAMs** are NOTAMs originated by the U.S. Air Force, Army, Marine, or Navy, and pertaining to military or joint-use navigational aids/airports that are part of the

US 5-1
SECTION 1. PREFLIGHT

NAS. Military NOTAMs are published in the International NOTAM format and should be reviewed by users of a military or joint-use facility.

h. Security NOTAMS:

1. U.S. Domestic Security NOTAMS are FDC NOTAMS that inform pilots of certain U.S. security activities or requirements, such as Special Security Instructions for aircraft operations to, from, within, or transitioning U.S. territorial airspace. These NOTAMS are found on the Federal NOTAM System (FNS) NOTAM Search website under the location designator KZZZ.
2. United States International Flight Prohibitions, Potential Hostile Situations, and Foreign Notices are issued by the FAA and are found on the Federal NOTAM System (FNS) NOTAM Search website under the location designator KICZ.

5-1-4 OPERATIONAL INFORMATION SYSTEM (OIS)

- a. The FAA's Air Traffic Control System Command Center (ATCSCC) maintains a website with near real-time National Airspace System (NAS) status information. NAS operators are encouraged to access the website at <http://www.fly.faa.gov> prior to filing their flight plan.
- b. The website consolidates information from advisories. An advisory is a message that is disseminated electronically by the ATCSCC that contains information pertinent to the NAS.
 1. Advisories are normally issued for the following items:
 - (a) Ground Stops.
 - (b) Ground Delay Programs.
 - (c) Route Information.
 - (d) Plan of Operations.
 - (e) Facility Outages and Scheduled Facility Outages.
 - (f) Volcanic Ash Activity Bulletins.
 - (g) Special Traffic Management Programs.
 2. This list is not all-inclusive. Any time there is information that may be beneficial to a large number of people, an advisory may be sent. Additionally, there may be times when an advisory is not sent due to workload or the short length of time of the activity.

US 5-1

SECTION 1. PREFLIGHT

3. Route information is available on the website and in specific advisories. Some route information, subject to the 56-day publishing cycle, is located on the “OIS” under “Products,” Route Management Tool (RMT), and “What’s New” Playbook. The RMT and Playbook contain routings for use by Air Traffic and NAS operators when they are coordinated “real-time” and are then published in an ATCSCC advisory.
4. Route advisories are identified by the word “Route” in the header; the associated action is required (RQD), recommended (RMD), planned (PLN), or for your information (FYI). Operators are expected to file flight plans consistent with the Route RQD advisories.
5. Electronic System Impact Reports are on the intranet at <http://www.atccsc.faa.gov/ois/> under “System Impact Reports.” This page lists scheduled outages/events/projects that significantly impact the NAS; for example, runway closures, air shows, and construction projects. Information includes anticipated delays and traffic management initiatives (TMI) that may be implemented.

5-1-5 FLIGHT PLAN — VFR FLIGHTS

(See Appendix 4, FAA Form 7233-4 — International Flight Plan)

- a. The requirements for the filing and activation of VFR flight plans can vary depending in which airspace the flight is operating. Pilots are responsible for activating flight plans with a Flight Service Station. Control tower personnel do not automatically activate VFR flight plans.

1. Within the continental U.S., a VFR flight plan is not normally required.
2. VFR flights (except for DOD and law enforcement flights) into an Air Defense Identification Zone (ADIZ) are required to file DVFR flight plans.

NOTE: Detailed ADIZ procedures are found in Section 6, National Security and Interception Procedures, of this chapter. (See 14 CFR Part 99).

3. Flights within the Washington, DC Special Flight Rules Area have additional requirements that must be met. Visit <http://www.faasafety.gov> for the required Special Awareness Training that must be completed before flight within this area.
4. VFR flight to an international destination requires a filed and activated flight plan.

NOTE: ICAO flight plan guidance is published in ICAO Document 4444 PANS-ATM Appendix 2.

- b. It is strongly recommended that a VFR flight plan be filed with a Flight Service Station or equivalent flight plan filing service. When filing, pilots must use FAA Form 7233-4, International Flight Plan or DD Form 1801. Only DOD users, and civilians who file stereo route flight plans, may use FAA Form 7233-1, Flight Plan. Pilots may take advantage of advances in technology by filing their flight plans using any available electronic means. Activating the flight plan will ensure that you receive VFR Search and Rescue services.
- c. When a stopover flight is anticipated, it is recommended that a separate flight plan be filed for each leg of the flight.

US 5-1

SECTION 1. PREFLIGHT

- d. Pilots are encouraged to activate their VFR flight plans with Flight Service by the most expeditious means possible. This may be via radio or other electronic means. VFR flight plan proposals are normally retained for two hours following the proposed time of departure.
- e. Pilots may also activate a VFR flight plan by using an assumed departure time. This assumed departure time will cause the flight plan to become active at the designated time. This may negate the need for communication with a flight service station or flight plan filing service upon departure. It is the pilot's responsibility to revise his actual departure time, time en route, or ETA with flight service.

NOTE: *Pilots are strongly advised to remain mindful when using an assumed departure time. If not updated, search and rescue activities will be based on the assumed departure time.*

- f. U.S. air traffic control towers do not routinely activate VFR flight plans. Foreign pilots especially must be mindful of the need to communicate directly with a flight service station, or use an assumed departure time procedure clearly communicated with the flight plan filing service.
- g. Although position reports are not required for VFR flight plans, periodic reports to FSSs along the route are good practice. Such contacts permit significant information to be passed to the transiting aircraft and also serve to check the progress of the flight should it be necessary for any reason to locate the aircraft.
- h. Pilots flying VFR should fly an appropriate cruising altitude for their direction of flight.
- i. When filing a VFR Flight plan, indicate the appropriate aircraft equipment capability as prescribed for an IFR flight plan.

REFERENCE—AIM, Para 5-1-6, IFR Flights.

- j. ATC radar history data can be useful in finding a downed or missing aircraft; therefore, surveillance equipment should be listed in Item 18. Pilots using commercial GPS tracking services are encouraged to note the specific service in Item 19 N/ (survival equip remarks) of FAA Form 7233-4 or DD Form 1801.

5-1-6 FLIGHT PLAN — IFR FLIGHTS

(See Appendix 4, FAA Form 7233-4 — International Flight Plan)

a. General

- 1. Use of FAA Form 7233-4 or DD Form 1801 is mandatory for:
 - (a) Assignment of RNAV SIDs and STARs or other PBN routing,
 - (b) All civilian IFR flights that will depart U.S. domestic airspace, and
 - (c) Domestic IFR flights except military/ DOD and civilians who file stereo route flight plans.
 - (d) All military/DOD IFR flights that will depart U.S. controlled airspace.

**US 5-1
SECTION 1. PREFLIGHT**

2. Military/DOD flights using FAA Form 7233-1, or DD Form 175, may not be eligible for assignment of RNAV SIDs or STARs. Military flights desiring assignment of these procedures should file using FAA Form 7233-4 or DD 1801, as described in this section.
3. When filing an IFR flight plan using FAA Form 7233-4 or DD Form 1801, it is recommended that filers include all operable navigation, communication, and surveillance equipment capabilities by adding appropriate equipment qualifiers as shown in Appendix 4, FAA Form 7233-4, International Flight Plan.
4. ATC issues clearances based on aircraft capabilities filed in Items 10 and 18 of FAA Form 7233-4 or DD 1801. Operators should file all capabilities for which the aircraft and crew is certified, capable, and authorized. PBN/capability must be filed in Item 18, Other Information. When filing a capability, ATC expects filers to use that capability; for example, answer a SATVOICE call from ATC if code M1 or M3 is filed in Item 10a.
5. Prior to departure from within, or prior to entering controlled airspace, a pilot must submit a complete flight plan and receive an air traffic clearance, if weather conditions are below VFR minimums. IFR flight plans may be submitted to an FSS or flight plan filing service.
6. Pilots should file IFR flight plans at least 30 minutes prior to estimated time of departure to preclude possible delay in receiving a departure clearance from ATC.
7. In order to provide FAA traffic management units' strategic route planning capabilities, nonscheduled operators conducting IFR operations above FL230 are requested to voluntarily file IFR flight plans at least 4 hours prior to estimated time of departure (ETD).
8. To minimize your delay in entering Class B, Class C, Class D, and Class E surface areas at destination when IFR weather conditions exist or are forecast at that airport, an IFR flight plan should be filed before departure. Otherwise, a 30-minute delay is not unusual in receiving an ATC clearance because of time spent in processing flight plan data.
9. Traffic saturation frequently prevents control personnel from accepting flight plans by radio. In such cases, the pilot is advised to contact a flight plan filing service for the purpose of filing the flight plan.
10. When requesting an IFR clearance, it is highly recommended that the departure airport be identified by stating the city name and state and/or the airport location identifier in order to clarify to ATC the exact location of the intended airport of departure.
11. Multiple versions of flight plans for the same flight may lead to unsafe conditions and errors within the air traffic system. Pilots must not file more than one flight plan for the same flight without ensuring that the previous flight plan has been successfully removed.
12. When a pilot is aware that the possibility for multiple flight plans on the same aircraft may exist, ensuring receipt of a full route clearance will help mitigate chances of error.

REFERENCE—

US 5-1
SECTION 1. PREFLIGHT

AIM, Para 5-1-12, Change in Flight Plan.

AIM, Para 5-1-13, Change in Proposed Departure Time.

b. Airways and Jet Routes Depiction on Flight Plan

1. It is vitally important that the route of flight be accurately and completely described in the flight plan. To simplify definition of the proposed route, and to facilitate ATC, pilots are requested to file via airways or jet routes established for use at the altitude or flight level planned.
2. If flight is to be conducted via designated airways or jet routes, describe the route by indicating the type and number designators of the airway(s) or jet route(s) requested. If more than one airway or jet route is to be used, clearly indicate points of transition. If the transition is made at an unnamed intersection, show the next succeeding NAVAID or named intersection on the intended route and the complete route from that point. Reporting points may be identified by using authorized name/code as depicted on appropriate aeronautical charts. The following two examples illustrate the need to specify the transition point when two routes share more than one transition fix.

EXAMPLE 1: ALB J37 BUMPY J14 BHM Spelled out: from Albany, New York, via Jet Route 37 transitioning to Jet Route 14 at BUMPY intersection, thence via Jet Route 14 to Birmingham, Alabama.

EXAMPLE 2: ALB J37 ENO J14 BHM Spelled out: from Albany, New York, via Jet Route 37 transitioning to Jet Route 14 at Smyrna VORTAC (ENO) thence via Jet Route 14 to Birmingham, Alabama.

3. The route of flight may also be described by naming the reporting points or NAVAIDS over which the flight will pass, provided the points named are established for use at the altitude or flight level planned.

EXAMPLE: BWI V44 SWANN V433 DQO Spelled out: from Baltimore-Washington International, via Victor 44 to Swann intersection, transitioning to Victor 433 at Swann, thence via Victor 433 to Dupont.

4. When the route of flight is defined by named reporting points, whether alone or in combination with airways or jet routes, and the navigational aids (VOR, VORTAC, TACAN, NDB) to be used for the flight are a combination of different types of aids, enough information should be included to clearly indicate the route requested.

EXAMPLE: LAX J5 LKV J3 GEG YXC FL330 J500 VLR J515 YWG Spelled out: from Los Angeles International via Jet Route 5 Lakeview, Jet Route 3 Spokane, direct Cranbrook, British Columbia VOR/DME, Flight Level 330 Jet Route 500 to Langruth, Manitoba VORTAC, Jet Route 515 to Winnipeg, Manitoba.

5. When filing IFR, it is to the pilot's advantage to file a preferred route.

REFERENCE—Preferred IFR Routes are described and tabulated in the Chart Supplement U.S. Additionally available at U.S. http://www.fly.faa.gov/Products/Coded_Depar-

US 5-1
SECTION 1. PREFLIGHT

ture_Routes/NFDC_Preferred_Routes_Database/nfdc_preferred_routes_database.html.

6. ATC may issue a SID or a STAR, as appropriate.

REFERENCE—

AIM, Para 5-2-9, Instrument Departure Procedures (DP) — Obstacle Departure Procedures (ODP) and Standard Instrument Departures (SID), and Diverse Vector Areas (DVA).

AIM, Para 5-4-1, Standard Terminal Arrival (STAR) Procedures.

NOTE: *Pilots not desiring an RNAV SID or RNAV STAR should enter in Item #18, PBN code: NAV/RNV A0 and/or D0.*

c. Direct Flights

1. All or any portions of the route which will not be flown on the radials or courses of established airways or routes, such as direct route flights, must be defined by indicating the radio fixes over which the flight will pass. Fixes selected to define the route must be those over which the position of the aircraft can be accurately determined. Such fixes automatically become compulsory reporting points for the flight, unless advised otherwise by ATC. Only those navigational aids established for use in a particular structure; i.e., in the low or high structures, may be used to define the en route phase of a direct flight within that altitude structure.
2. The azimuth feature of VOR aids and the azimuth and distance (DME) features of VORTAC and TACAN aids are assigned certain frequency protected areas of airspace which are intended for application to established airway and route use, and to provide guidance for planning flights outside of established airways or routes. These areas of airspace are expressed in terms of cylindrical service volumes of specified dimensions called “class limits” or “categories.”

REFERENCE—*AIM, Para 1-1-8, Navigational Aid (NAVAID) Service Volumes.*

3. An operational service volume has been established for each class in which adequate signal coverage and frequency protection can be assured. To facilitate use of VOR, VORTAC, or TACAN aids, consistent with their operational service volume limits, pilot use of such aids for defining a direct route of flight in controlled airspace should not exceed the following:
 - (a) Operations above FL450 — Use aids not more than 200 NM apart. These aids are depicted on en route high altitude charts.
 - (b) Operation off established routes from 18,000 feet MSL to FL450 — Use aids not more than 260 NM apart. These aids are depicted on en route high altitude charts.
 - (c) Operation off established airways below 18,000 feet MSL — Use aids not more than 80 NM apart. These aids are depicted on en route low altitude charts.

US 5-1
SECTION 1. PREFLIGHT

- (d) Operation off established airways between 14,500 feet MSL and 17,999 feet MSL in the conterminous U.S. — (H) facilities not more than 200 NM apart may be used.
4. Increasing use of self-contained airborne navigational systems which do not rely on the VOR/VORTAC/TACAN system has resulted in pilot requests for direct routes which exceed NAVAID service volume limits.
 5. At times, ATC will initiate a direct route in a surveillance environment which exceeds NAVAID service volume limits. Pilots must adhere to the altitude specified in the clearance.
 6. Appropriate airway or jet route numbers may also be included to describe portions of the route to be flown.

EXAMPLE: MDW V262 BDF V10 BRL STJ SLN GCK Spelled out: from Chicago Midway Airport via Victor 262 to Bradford, Victor 10 to Burlington, Iowa, direct St. Joseph, Missouri, direct Salina, Kansas, direct Garden City, Kansas.

NOTE: When route of flight is described by radio fixes, the pilot will be expected to fly a direct course between the points named.

7. Pilots are reminded that they are responsible for adhering to obstruction clearance requirements on those segments of direct routes that are outside of controlled airspace and ATC surveillance capability. The MEAs and other altitudes shown on IFR en route charts pertain to those route segments within controlled airspace, and those altitudes may not meet obstruction clearance criteria when operating off those routes.

NOTE: Refer to 14 CFR 91.177 for pilot responsibility when flying random point to point routes.

d. Area Navigation (RNAV)/Global Navigation Satellite System (GNSS)

1. When not being radar monitored, GNSS-equipped RNAV aircraft on random RNAV routes must be cleared via or reported to be established on a point-to-point route.
 - (a) The points must be published NAVAIDs, waypoints, fixes or airports recallable from the aircraft's navigation database. The points must be displayed on controller video maps or depicted on the controller chart displayed at the control position. When applying non-radar separation the maximum distance between points must not exceed 500 miles.
 - (b) ATC will protect 4 miles either side of the route centerline.
 - (c) Assigned altitudes must be at or above the highest MIA along the projected route segment being flown, including the protected airspace of that route segment.
2. Pilots of aircraft equipped with approved area navigational equipment may file for RNAV routes throughout the National Airspace System in accordance with the following procedures:
 - (a) File airport-to-airport flight plans.

US 5-1

SECTION 1. PREFLIGHT

- (b) File the appropriate indication of RNAV and/or RNP capability in the flight plan.
- (c) Plan the random route portion of the flight plan to begin and end over appropriate arrival and departure transition fixes or appropriate navigation aids for the altitude stratum within which the flight will be conducted. The use of normal preferred departure and arrival routes (DP/STAR), where established, is recommended.
- (d) File route structure transitions to and from the random route portion of the flight.
- (e) Define the random route by waypoints. File route description waypoints by using degree distance fixes based on navigational aids which are appropriate for the altitude stratum.
- (f) File a minimum of one route description waypoint for each ARTCC through whose area the random route will be flown. These waypoints must be located within 200 NM of the preceding center's boundary.
- (g) File an additional route description waypoint for each turn point in the route.
- (h) Plan additional route description waypoints as required to ensure accurate navigation via the filed route of flight. Navigation is the pilot's responsibility unless ATC assistance is requested.
- (i) Plan the route of flight so as to avoid prohibited and restricted airspace by 3 NM unless permission has been obtained to operate in that airspace and the appropriate ATC facilities are advised.

NOTE: *To be approved for use in the National Airspace System, RNAV equipment must meet system availability, accuracy, and airworthiness standards. For additional information and guidance on RNAV equipment requirements see Advisory Circular (AC) 20-138 Airworthiness Approval of Positioning and Navigation Systems and AC 90-100 U.S. Terminal and En Route Area Navigation (RNAV) Operations.*

- 3. Pilots of aircraft equipped with latitude/longitude coordinate navigation capability, independent of VOR/TACAN references, may file for random RNAV using the following procedures:
 - (a) File airport-to-airport flight plans prior to departure.
 - (b) File the appropriate RNAV capability certification suffix in the flight plan.
 - (c) Plan the random route portion of the flight to begin and end over published departure/arrival transition fixes or appropriate navigation aids for airports without published transition procedures. The use of preferred departure and arrival routes, such as DP and STAR, where established, is recommended.
 - (d) Plan the route of flight so as to avoid prohibited and restricted airspace by 3 NM unless permission has been obtained to operate in that airspace and the appropriate ATC facility is advised.
 - (e) Define the route of flight after the departure fix, including each intermediate fix (turnpoint) and the arrival fix for the destination airport in terms of latitude/longitude

US 5-1
SECTION 1. PREFLIGHT

coordinates plotted to the nearest minute or in terms of Navigation Reference System (NRS) waypoints. For latitude/ longitude filing the arrival fix must be identified by both the latitude/longitude coordinates and a fix identifier.

EXAMPLE:

MIA¹ SRQ² 3407/10615³ 3407/11546 TNP⁴ LAX⁵

¹ Departure airport.

² Departure fix.

³ Intermediate fix (turning point).

⁴ Arrival fix.

⁵ Destination airport.

or

ORD¹ IOW² KP49G³ KD34U⁴ KL16O⁵ OAL⁶ MOD2⁷ SFO⁸

¹ Departure airport.

² Transition fix.

³ Minneapolis ARTCC waypoint.

⁴ Denver ARTCC Waypoint.

⁵ Los Angeles ARTCC waypoint.

⁶ Transition fix.

⁷ Arrival.

⁸ Destination airport.

- (f) Record latitude/longitude coordinates by two or four figures describing latitude in degrees followed by an N or S, followed by 3 or 5 digits longitude, followed by an E or W. Separate latitude and longitude with a solidus “/.” Use leading zeros if necessary.
- (g) File at FL390 or above for the random RNAV portion of the flight.
- (h) Fly all routes/route segments on Great Circle tracks.
- (i) Make any inflight requests for random RNAV clearances or route amendments to an en route ATC facility.

5-1-7 FLIGHT PLANS FOR MILITARY/DOD USE ONLY

(See Appendix 4, FAA Form 7233-1, Flight Plan)

US 5-1
SECTION 1. PREFLIGHT

Within U.S. controlled airspace, FAA Form 7233-1 or DD Form 175 may be used by DOD aircraft. However, use of the DD Form 1801 by DOD aircraft is recommended for IFR flights and is mandatory for:

- a. Any flight that will depart U.S. controlled airspace.
- b. Any flight requesting routing that requires Performance Based Navigation.
- c. Any flight requesting services that require filing of capabilities only supported in the international flight plan.

NOTE 1: *The order of flight plan elements in DD Form 175 is equivalent to that of FAA Form 7233-1.*

NOTE 2: *Civilians who file stereo route flight plans, may use FAA Form 7233-1, Flight Plan.*

5-1-8 FLIGHT PLAN — DEFENSE VFR (DVFR) FLIGHTS

VFR flights (except DOD or law enforcement flights) into an ADIZ are required to file DVFR flight plans for security purposes. Detailed ADIZ procedures are found in Section 6, National Security and Interception Procedures, of this chapter. [Reproduced on Jeppesen enroute pages.]

REFERENCE—*14 CFR Part 99, Security Control for Air Traffic.*

- a. DVFR flight plans must be filed using FAA Form 7233-4 or DD Form 1801.
- b. Enter the letter “D” in Item 8, Type of Flight, of FAA Form 7233-4 or DD Form 1801.
- c. DVFR flights where pilots decline search and rescue coverage must clearly indicate “NORIV” in Item 18 following the indicator “RMK/.” This flight plan must still be activated in order to properly notify NORAD, however no flight plan cancellation will be expected.

EXAMPLE: RMK/NORIV

5-1-9 SINGLE FLIGHTS CONDUCTED WITH BOTH VFR AND IFR FLIGHT PLANS

- a. Flight plans which combine VFR operation on an active VFR flight plan for one portion of a flight, and IFR for another portion, sometimes known as a composite flight plan, cannot be accepted or processed by current en route automation systems.
- b. Pilots are free to operate VFR in VFR conditions prior to accepting an IFR clearance from the appropriate control facility, or may cancel an IFR clearance and proceed VFR as desired. However, if a pilot desires to be on an active VFR flight plan, with search and rescue provisions, for the portion of flight not conducted under an IFR clearance, a separate VFR flight plan must be filed, activated, and closed.
- c. If a pilot desires to be on an active VFR flight plan prior to or following the IFR portion of the flight, that flight plan must be filed and processed as a distinct and separate flight plan. The VFR flight plan must be opened and closed with either a Flight Service Station or other service provider having the capability to open and close VFR flight plans. Air Traffic Control does not have the ability to determine if an aircraft is operating on an active VFR flight plan and cannot process the activation or cancellation of a VFR flight plan.

US 5-1

SECTION 1. PREFLIGHT

- d. Pilots may propose to commence the IFR portion of flight at a defined airborne point. This airborne point, or fix, is entered as the departure point in Item 13 of FAA Form 7233-4 or DD Form 1801.
- e. Pilots may indicate in the IFR flight plan the intention to terminate the IFR portion of flight at any defined airborne point. The airborne point, or fix, is entered as the destination point in Item 16 of FAA Form 7233-4 or DD Form 1801.
- f. Prior to beginning the IFR portion of flight, a pilot must receive an IFR clearance from the appropriate control facility.
- g. If the pilot does not desire further clearance after reaching the clearance limit, he or she must advise ATC to cancel the IFR clearance.

5-1-10 IFR OPERATIONS TO HIGH ALTITUDE DESTINATIONS

- a. Pilots planning IFR flights to airports located in mountainous terrain are cautioned to consider the necessity for an alternate airport even when the forecast weather conditions would technically relieve them from the requirement to file one.

REFERENCE—

14 CFR Section 91.167.

AIM, Paragraph 4-1-19, Tower En Route Control (TEC).

- b. The FAA has identified three possible situations where the failure to plan for an alternate airport when flying IFR to such a destination airport could result in a critical situation if the weather is less than forecast and sufficient fuel is not available to proceed to a suitable airport.
 - 1. An IFR flight to an airport where the Minimum Descent Altitudes (MDAs) or landing visibility minimums for *all instrument approaches* are higher than the forecast weather minimums specified in 14 CFR Section 91.167(b). For example, there are 3 high altitude airports in the U.S. with approved instrument approach procedures where all of the MDAs are greater than 2,000 feet and/or the landing visibility minimums are greater than 3 miles (Bishop, California; South Lake Tahoe, California; and Aspen-Pitkin Co./Sardy Field, Colorado). In the case of these airports, it is possible for a pilot to elect, on the basis of forecasts, not to carry sufficient fuel to get to an alternate when the ceiling and/or visibility is actually lower than that necessary to complete the approach.
 - 2. A small number of other airports in mountainous terrain have MDAs which are slightly (100 to 300 feet) below 2,000 feet AGL. In situations where there is an option as to whether to plan for an alternate, pilots should bear in mind that just a slight worsening of the weather conditions from those forecast could place the airport below the published IFR landing minimums.
 - 3. An IFR flight to an airport which requires special equipment; i.e., DME, glide slope, etc., in order to make the available approaches to the lowest minimums. Pilots should be aware that all other minimums on the approach charts may require weather conditions better than those specified in 14 CFR Section 91.167(b). An inflight equipment malfunction

US 5-1

SECTION 1. PREFLIGHT

tion could result in the inability to comply with the published approach procedures or, again, in the position of having the airport below the published IFR landing minimums for all remaining instrument approach alternatives.

5-1-11 FLIGHTS OUTSIDE U.S. TERRITORIAL AIRSPACE

- a. When conducting flights, particularly extended flights, outside the U.S. and its territories, full account should be taken of the amount and quality of air navigation services available in the airspace to be traversed. Every effort should be made to secure information on the location and range of navigational aids, availability of communications and meteorological services, the provision of air traffic services, including alerting service, and the existence of search and rescue services.
- b. Pilots should remember that there is a need to continuously guard the VHF emergency frequency 121.5 MHz when on long over-water flights, except when communications on other VHF channels, equipment limitations, or cockpit duties prevent simultaneous guarding of two channels. Guarding of 121.5 MHz is particularly critical when operating in proximity to Flight Information Region (FIR) boundaries, for example, operations on Route R220 between Anchorage and Tokyo, since it serves to facilitate communications with regard to aircraft which may experience in-flight emergencies, communications, or navigational difficulties.

REFERENCE—ICAO Annex 10, Vol II, Paras 5.2.2.1.1.1 and 5.2.2.1.1.2.

- c. The filing of a flight plan, always good practice, takes on added significance for extended flights outside U.S. airspace and is, in fact, usually required by the laws of the countries being visited or overflown. It is also particularly important in the case of such flights that pilots leave a complete itinerary and schedule of the flight with someone directly concerned and keep that person advised of the flight's progress. If serious doubt arises as to the safety of the flight, that person should first contact the appropriate FSS. Round Robin Flight Plans to Canada and Mexico are not accepted.
- d. All pilots should review the foreign airspace and entry restrictions published in the appropriate Aeronautical Information Publication (AIP) during the flight planning process. Foreign airspace penetration without official authorization can involve both danger to the aircraft and the imposition of severe penalties and inconvenience to both passengers and crew. A flight plan on file with ATC authorities does not necessarily constitute the prior permission required by certain other authorities. The possibility of fatal consequences cannot be ignored in some areas of the world.
- e. Current NOTAMs for foreign locations must also be reviewed. International Notices regarding specific countries may be obtained through the Federal NOTAM System (FNS) NOTAM Search External Links or the Air Traffic Plans and Publications website. For additional flight information at foreign locations, pilots should also review the FAA's Prohibitions, Restrictions, and Notices website at https://www.faa.gov/air_traffic/publications/us_restrictions/.
- f. When customs notification to foreign locations is required, it is the responsibility of the pilot to arrange for customs notification in a timely manner.

US 5-1

SECTION 1. PREFLIGHT

- g. Aircraft arriving to locations in U.S. territorial airspace must meet the entry requirements as described in AIM Section 6, National Security and Interception Procedures.

5-1-12 CHANGE IN FLIGHT PLAN

- a. In addition to altitude or flight level, destination and/or route changes, increasing or decreasing the speed of an aircraft constitutes a change in a flight plan. Therefore, at any time the average true airspeed at cruising altitude between reporting points varies or is expected to vary from that given in the flight plan by *plus or minus 5 percent, or 10 knots, whichever is greater*, ATC should be advised.
- b. All changes to existing flight plans should be completed more than 46 minutes prior to the proposed departure time. Changes must be made with the initial flight plan service provider. If the initial flight plan's service provider is unavailable, filers may contact an ATC facility or FSS to make the necessary revisions. Any revision 46 minutes or less from the proposed departure time must be coordinated through an ATC facility or FSS.

5-1-13 CHANGE IN PROPOSED DEPARTURE TIME

- a. To prevent computer saturation in the en route environment, parameters have been established to delete proposed departure flight plans which have not been activated. Most centers have this parameter set so as to delete these flight plans a minimum of 2 hours after the proposed departure time or Expect Departure Clearance Time (EDCT). To ensure that a flight plan remains active, pilots whose actual departure time will be delayed 2 hours or more beyond their filed departure time, are requested to notify ATC of their new proposed departure time.
- b. Due to traffic saturation, ATC personnel frequently will be unable to accept these revisions via radio. It is recommended that you forward these revisions to a flight plan service provider or FSS.

5-1-14 CLOSING VFR/DVFR FLIGHT PLANS

A pilot is responsible for ensuring that his/her VFR or DVFR flight plan is canceled. You should close your flight plan with the nearest FSS, or if one is not available, you may request any ATC facility to relay your cancellation to the FSS. Control towers do not automatically close VFR or DVFR flight plans since they do not know if a particular VFR aircraft is on a flight plan. If you fail to report or cancel your flight plan within $\frac{1}{2}$ hour after your ETA, search and rescue procedures are started.

REFERENCE—

14 CFR Section 91.153.

14 CFR Section 91.169.

US 5-1

SECTION 1. PREFLIGHT

5-1-15 CANCELING IFR FLIGHT PLAN

- a. 14 CFR Sections 91.153 and 91.169 include the statement “When a flight plan has been activated, the pilot-in-command, upon canceling or completing the flight under the flight plan, must notify an FAA Flight Service Station or ATC facility.”
- b. An IFR flight plan may be canceled at any time the flight is operating in VFR conditions outside Class A airspace by pilots stating “CANCEL MY IFR FLIGHT PLAN” to the controller or air/ground station with which they are communicating. Immediately after canceling an IFR flight plan, a pilot should take the necessary action to change to the appropriate air/ground frequency, VFR radar beacon code and VFR altitude or flight level.
- c. ATC separation and information services will be discontinued, including radar services (where applicable). Consequently, if the canceling flight desires VFR radar advisory service, the pilot must specifically request it.

NOTE: *Pilots must be aware that other procedures may be applicable to a flight that cancels an IFR flight plan within an area where a special program, such as a designated TRSA, Class C airspace, or Class B airspace, has been established.*

- d. If a DVFR flight plan requirement exists, the pilot is responsible for filing this flight plan to replace the canceled IFR flight plan. If a subsequent IFR operation becomes necessary, a new IFR flight plan must be filed and an ATC clearance obtained before operating in IFR conditions.
- e. If operating on an IFR flight plan to an airport with a functioning control tower, the flight plan is automatically closed upon landing.
- f. If operating on an IFR flight plan to an airport where there is no functioning control tower, the pilot must initiate cancellation of the IFR flight plan. This can be done after landing if there is a functioning FSS or other means of direct communications with ATC. In the event there is no FSS and/or air/ground communications with ATC is not possible below a certain altitude, the pilot should, weather conditions permitting, cancel the IFR flight plan while still airborne and able to communicate with ATC by radio. This will not only save the time and expense of canceling the flight plan by telephone but will quickly release the airspace for use by other aircraft.

5-1-16 RNAV AND RNP OPERATIONS

- a. During the pre-flight planning phase the availability of the navigation infrastructure required for the intended operation, including any non-RNAV contingencies, must be confirmed for the period of intended operation. Availability of the onboard navigation equipment necessary for the route to be flown must be confirmed. Pilots are reminded that on composite VFR to IFR flight plan, or on an IFR clearance, while flying unpublished departures via RNAV into uncontrolled airspace, the PIC is responsible for terrain and obstruction clearance until reaching the MEA/MIA/MVA/OROCA.

NOTE: *OROCA is a published altitude which provides 1,000 feet of terrain and obstruction clearance in the U.S. (2,000 feet of clearance in designated mountainous areas). These alti-*

US 5-1

SECTION 1. PREFLIGHT

tudes are not assessed for NAVAID signal coverage, air traffic control surveillance, or communications coverage, and are published for general situational awareness, flight planning and in-flight contingency use.

- b. If a pilot determines a specified RNP level cannot be achieved, revise the route or delay the operation until appropriate RNP level can be ensured.
- c. The onboard navigation database must be current and appropriate for the region of intended operation and must include the navigation aids, waypoints, and coded terminal airspace procedures for the departure, arrival and alternate airfields.
- d. During system initialization, pilots of aircraft equipped with a Flight Management System or other RNAV-certified system, must confirm that the navigation database is current, and verify that the aircraft position has been entered correctly. Flight crews should crosscheck the cleared flight plan against charts or other applicable resources, as well as the navigation system textual display and the aircraft map display. This process includes confirmation of the waypoints sequence, reasonableness of track angles and distances, any altitude or speed constraints, and identification of fly-by or fly-over waypoints. A procedure must not be used if validity of the navigation database is in doubt.
- e. Prior to commencing takeoff, the flight crew must verify that the RNAV system is operating correctly and the correct airport and runway data have been loaded.
- f. During the pre-flight planning phase RAIM prediction must be performed if TSO-C129() equipment is used to solely satisfy the RNAV and RNP requirement. GPS RAIM availability must be confirmed for the intended route of flight (route and time) using current GPS satellite information. In the event of a predicted, continuous loss of RAIM of more than five (5) minutes for any part of the intended flight, the flight should be delayed, canceled, or re-routed where RAIM requirements can be met. Operators may satisfy the predictive RAIM requirement through any one of the following methods:
 - 1. Operators may monitor the status of each satellite in its plane/slot position, by accounting for the latest GPS constellation status (for example, NOTAMs or NANUs), and compute RAIM availability using model-specific RAIM prediction software;
 - 2. Operators may use the Service Availability Prediction Tool (SAPT) on the FAA en route and terminal RAIM prediction website;
 - 3. Operators may contact a Flight Service Station to obtain non-precision approach RAIM;
 - 4. Operators may use a third party interface, incorporating FAA/VOLPE RAIM prediction data without altering performance values, to predict RAIM outages for the aircraft's predicted flight path and times;
 - 5. Operators may use the receiver's installed RAIM prediction capability (for TSO-C129a/ Class A1/B1/C1 equipment) to provide non-precision approach RAIM, accounting for the latest GPS constellation status (for example, NOTAMs or NANUs). Receiver non-precision approach RAIM should be checked at airports spaced at intervals not to exceed 60 NM along the RNAV 1 procedure's flight track. "Terminal" or "Approach" RAIM must be available at the ETA over each airport checked; or,

US 5-1

SECTION 1. PREFLIGHT

6. Operators not using model-specific software or FAA/VOLPE RAIM data will need FAA operational approval.

NOTE: *If TSO-C145/C146 equipment is used to satisfy the RNAV and RNP requirement, the pilot/operator need not perform the prediction if WAAS coverage is confirmed to be available along the entire route of flight. Outside the U.S. or in areas where WAAS coverage is not available, operators using TSO-C145/C146 receivers are required to check GPS RAIM availability.*

5-1-17 COLD TEMPERATURE OPERATIONS

- a. Pilots should begin planning for cold temperature operations during the preflight planning phase. Cold temperatures produce barometric altimetry errors, which affect instrument flight procedures. Currently there are two temperature limitations that may be published in the notes box of the middle briefing strip on an instrument approach procedure (IAP). The two published temperature limitations are:
 1. A temperature range limitation associated with the use of baro-VNAV that may be published on an United States PBN IAP titled RNAV (GPS) or RNAV (RNP); and/or
 2. A Cold Temperature Airport (CTA) limitation designated by a snowflake ICON and temperature in Celsius (C) that is published on every IAP for the airfield. [Jeppesen supplies a note on the approach chart in substitution for the snowflake symbol.]
- b. Pilots should request the lowest forecast temperature +/- 1 hour for arrival and departure operations. If the temperature is forecast to be outside of the baro-VNAV or at or below the CTA temperature limitation, consider the following:
 1. When using baro-VNAV with an aircraft that does not have an automated temperature compensating function, pilots should plan to use the appropriate minima and/or IAP.
 - (a) The LNAV/VNAV line of minima on an RNAV (GPS) may not be used without an approved automated temperature compensating function if the temperature is outside of the baro-VNAV temperature range limitation. The LNAV minima may be used.
 - (b) The RNAV (RNP) procedure may not be accomplished without an approved automated temperature compensating function if the temperature is outside of the baro-VNAV temperature range limitation.
 2. If the temperature is forecast to be at or below the published CTA temperature, pilots should calculate a correction for the appropriate segment/s or a correction for all the segments if using the "All Segments Method."

Pilots should review the operating procedures for the aircraft's temperature compensating system when planning to use the system for any cold temperature corrections. Any planned altitude correction for the intermediate and/or missed approach holding segments must be coordinated with ATC. Pilots do not have to advise ATC of a correction in the final segment.

NOTE: *The charted baro-VNAV temperature range limitation does not apply to pilots operating aircraft with an airworthiness approval to conduct an RNAV (GPS) approach to LNAV/VNAV minima with the use of SBAS vertical guidance.*

US 5-1
SECTION 1. PREFLIGHT

REFERENCE—AIM, Chapter 7, Section 3, Cold Temperature Barometric Altimeter Errors, Setting Procedures, and Cold Temperature Airports (CTA).

US 5-2

SECTION 2. DEPARTURE PROCEDURES

5-2-1 PRE-TAXI CLEARANCE PROCEDURES

- a. Certain airports have established pre-taxi clearance programs whereby pilots of departing instrument flight rules (IFR) aircraft may elect to receive their IFR clearances before they start taxiing for takeoff. The following provisions are included in such procedures:
1. Pilot participation is not mandatory.
 2. Participating pilots call clearance delivery or ground control not more than 10 minutes before proposed taxi time.
 3. IFR clearance (or delay information, if clearance cannot be obtained) is issued at the time of this initial call-up.
 4. When the IFR clearance is received on clearance delivery frequency, pilots call ground control when ready to taxi.
 5. Normally, pilots need not inform ground control that they have received IFR clearance on clearance delivery frequency. Certain locations may, however, require that the pilot inform ground control of a portion of the routing or that the IFR clearance has been received.
 6. If a pilot cannot establish contact on clearance delivery frequency or has not received an IFR clearance before ready to taxi, the pilot should contact ground control and inform the controller accordingly.
- b. Locations where these procedures are in effect are indicated in the Chart Supplement U.S. [Also published on Jeppesen charts by the abbreviation "Cpt."]

5-2-2 AUTOMATED PRE-DEPARTURE CLEARANCE PROCEDURES

- a. Many airports in the National Airspace System are equipped with the Terminal Data Link System (TDLS) that includes the Pre-Departure Clearance (PDC) and Controller Pilot Data Link Communication-Departure Clearance (CPDLC-DCL) functions. Both the PDC and CPDLC-DCL functions automate the Clearance Delivery operations in the ATCT for participating users. Both functions display IFR clearances from the ARTCC to the ATCT. The Clearance Delivery controller in the ATCT can append local departure information and transmit the clearance via data link to participating airline/service provider computers for PDC. The airline/service provider will then deliver the clearance via the Aircraft Communications Addressing and Reporting System (ACARS) or a similar data link system, or for non-data link equipped aircraft, via a printer located at the departure gate. For CPDLC-DCL, the departure clearance is uplinked from the ATCT via the Future Air Navigation System (FANS) to the aircraft avionics and requires a response from the flight crew. Both PDC and CPDLC-DCL reduce frequency congestion, controller workload, and are intended to mitigate delivery/read back errors.
- b. Both services are available only to participating aircraft that have subscribed to the service through an approved service provider.

US 5-2

SECTION 2. DEPARTURE PROCEDURES

- c. In all situations, the pilot is encouraged to contact clearance delivery if a question or concern exists regarding an automated clearance. Due to technical reasons, the following limitations/differences exist between the two services:

1. PDC

- (a) Aircraft filing multiple flight plans are limited to one PDC clearance per departure airport within an 18-hour period. Additional clearances will be delivered verbally.
- (b) If the clearance is revised or modified prior to delivery, it will be rejected from PDC and the clearance will need to be delivered verbally.
- (c) No acknowledgment of receipt or read back is required for a PDC.

2. CPDLC-DCL

- (a) No limitation to the number of clearances received.
- (b) Allows delivery of revised flight data, including revised departure clearances.
- (c) A response from the flight crew is required.
- (d) Requires a logon to the FAA National Single Data Authority – KUSA – utilizing the ATC FANS application.
- (e) To be eligible, operators must have received CPDLC/FANS authorization from the responsible civil aviation authority, and file appropriate equipment information in ICAO field 10a and in the ICAO field 18 DAT (Other Data Applications) of the flight plan.

5-2-3 IFR CLEARANCES OFF UNCONTROLLED AIRPORTS

- a. Pilots departing on an IFR flight plan should consult the Chart Supplement U.S. to determine the frequency or telephone number to use to contact clearance delivery. On initial contact, pilots should advise that the flight is IFR and state the departure and destination airports.
- b. Air traffic facilities providing clearance delivery services via telephone will have their telephone number published in the Chart Supplement U.S. of that airport's entry. This same section may also contain a telephone number to use for cancellation of an IFR flight plan after landing.
- c. Except in Alaska, pilots of MEDEVAC flights may obtain a clearance by calling 1-877-543-4733.

5-2-4 TAXI CLEARANCE

Pilots on IFR flight plans should communicate with the control tower on the appropriate ground control or clearance delivery frequency prior to starting engines, to receive engine start time, taxi, and/or clearance information.

US 5-2

SECTION 2. DEPARTURE PROCEDURES

5-2-5 LINE UP AND WAIT (LUAW)

- a. Line up and wait is an air traffic control (ATC) procedure designed to position an aircraft onto the runway for an imminent departure. The ATC instruction “LINE UP AND WAIT” is used to instruct a pilot to taxi onto the departure runway and line up and wait.

EXAMPLE: Tower: “N234AR Runway 24L, line up and wait.”

- b. This ATC instruction is not an authorization to takeoff. In instances where the pilot has been instructed to line up and wait and has been advised of a reason/condition (wake turbulence, traffic on an intersecting runway, etc.) or the reason/condition is clearly visible (another aircraft that has landed on or is taking off on the same runway), and the reason/condition is satisfied, the pilot should expect an imminent takeoff clearance, unless advised of a delay. If you are uncertain about any ATC instruction or clearance, contact ATC immediately.
- c. If a takeoff clearance is not received within a reasonable amount of time after clearance to line up and wait, ATC should be contacted.

EXAMPLE: Aircraft: Cessna 234AR holding in position Runway 24L.

Aircraft: Cessna 234AR holding in position Runway 24L at Bravo.

NOTE: *FAA analysis of accidents and incidents involving aircraft holding in position indicate that two minutes or more elapsed between the time the instruction was issued to line up and wait and the resulting event (for example, land-over or go-around). Pilots should consider the length of time that they have been holding in position whenever they HAVE NOT been advised of any expected delay to determine when it is appropriate to query the controller.*

REFERENCE—*Advisory Circulars 91-73A, Part 91 and Part 135 Single-Pilot Procedures during Taxi Operations, and 120-74A, Parts 91, 121, 125, and 135 Flightcrew Procedures during Taxi Operations*

- d. Situational awareness during line up and wait operations is enhanced by monitoring ATC instructions/clearances issued to other aircraft. Pilots should listen carefully if another aircraft is on frequency that has a similar call sign and pay close attention to communications between ATC and other aircraft. If you are uncertain of an ATC instruction or clearance, query ATC immediately. Care should be taken to not inadvertently execute a clearance/instruction for another aircraft.
- e. Pilots should be especially vigilant when conducting line up and wait operations at night or during reduced visibility conditions. They should scan the full length of the runway and look for aircraft on final approach or landing roll out when taxiing onto a runway. ATC should be contacted anytime there is a concern about a potential conflict.
- f. When two or more runways are active, aircraft may be instructed to “LINE UP AND WAIT” on two or more runways. When multiple runway operations are being conducted, it is important to listen closely for your call sign and runway. Be alert for similar sounding call signs and acknowledge all instructions with your call sign. When you are holding in position and are not sure if the takeoff clearance was for you, ask ATC before you begin takeoff roll. ATC prefers

US 5-2

SECTION 2. DEPARTURE PROCEDURES

that you confirm a takeoff clearance rather than mistake another aircraft's clearance for your own.

- g. When ATC issues intersection "line up and wait" and takeoff clearances, the intersection designator will be used. If ATC omits the intersection designator, call ATC for clarification.

EXAMPLE: Aircraft: "Cherokee 234AR, Runway 24L at November 4, line up and wait."

- h. If landing traffic is a factor during line up and wait operations, ATC will inform the aircraft in position of the closest traffic within 6 flying miles requesting a full-stop, touch-and-go, stop-and-go, or an unrestricted low approach to the same runway. Pilots should take care to note the position of landing traffic. ATC will also advise the landing traffic when an aircraft is authorized to "line up and wait" on the same runway.

EXAMPLE: Tower: "Cessna 234AR, Runway 24L, line up and wait. Traffic a Boeing 737, six mile final."

Tower: "Delta 1011, continue, traffic a Cessna 210 holding in position Runway 24L."

NOTE: ATC will normally withhold landing clearance to arrival aircraft when another aircraft is in position and holding on the runway.

- i. Never land on a runway that is occupied by another aircraft, even if a landing clearance was issued. Do not hesitate to ask the controller about the traffic on the runway and be prepared to execute a go-around.

NOTE: Always clarify any misunderstanding or confusion concerning ATC instructions or clearances. ATC should be advised immediately if there is any uncertainty about the ability to comply with any of their instructions.

5-2-6 ABBREVIATED IFR DEPARTURE CLEARANCE (CLEARED . . . AS FILED) PROCEDURES

- a. ATC facilities will issue an abbreviated IFR departure clearance based on the ROUTE of flight filed in the IFR flight plan, provided the filed route can be approved with little or no revision. These abbreviated clearance procedures are based on the following conditions:
1. The aircraft is on the ground or it has departed visual flight rules (VFR) and the pilot is requesting IFR clearance while airborne.
 2. That a pilot will not accept an abbreviated clearance if the route or destination of a flight plan filed with ATC has been changed by the pilot or the company or the operations officer before departure.
 3. That it is the responsibility of the company or operations office to inform the pilot when they make a change to the filed flight plan.
 4. That it is the responsibility of the pilot to inform ATC in the initial call-up (for clearance) when the filed flight plan has been either:
 - (a) Amended, or
 - (b) Canceled and replaced with a new filed flight plan.

US 5-2

SECTION 2. DEPARTURE PROCEDURES

NOTE: *The facility issuing a clearance may not have received the revised route or the revised flight plan by the time a pilot requests clearance.*

- b. Controllers will issue a detailed clearance when they know that the original filed flight plan has been changed or when the pilot requests a full route clearance.
- c. The clearance as issued will include the destination airport filed in the flight plan.
- d. ATC procedures now require the controller to state the DP name, the current number and the DP transition name after the phrase “Cleared to (destination) airport” and prior to the phrase, “then as filed,” for ALL departure clearances when the DP or DP transition is to be flown. The procedures apply whether or not the DP is filed in the flight plan.
- e. STARs, when filed in a flight plan, are considered a part of the filed route of flight and will not normally be stated in an initial departure clearance. If the ARTCC’s jurisdictional airspace includes both the departure airport and the fix where a STAR or STAR transition begins, the STAR name, the current number and the STAR transition name MAY be stated in the initial clearance.
- f. “Cleared to (destination) airport as filed” does NOT include the en route altitude filed in a flight plan. An en route altitude will be stated in the clearance or the pilot will be advised to expect an assigned or filed altitude within a given time frame or at a certain point after departure. This may be done verbally in the departure instructions or stated in the DP.
- g. In both radar and nonradar environments, the controller will state “Cleared to (destination) airport as filed” or:
 - 1. If a DP or DP transition is to be flown, specify the DP name, the current DP number, the DP transition name, the assigned altitude/flight level, and any additional instructions (departure control frequency, beacon code assignment, etc.) necessary to clear a departing aircraft via the DP or DP transition and the route filed.

EXAMPLE: National Seven Twenty cleared to Miami Airport Intercontinental one departure, Lake Charles transition then as filed, maintain Flight Level two seven zero.

- 2. When there is no DP or when the pilot cannot accept a DP, the controller will specify the assigned altitude or flight level, and any additional instructions necessary to clear a departing aircraft via an appropriate departure routing and the route filed.

NOTE: *A detailed departure route description or a radar vector may be used to achieve the desired departure routing.*

- 3. If it is necessary to make a minor revision to the filed route, the controller will specify the assigned DP or DP transition (or departure routing), the revision to the filed route, the assigned altitude or flight level and any additional instructions necessary to clear a departing aircraft.

EXAMPLE: Jet Star One Four Two Four cleared to Atlanta Airport, South Boston two departure then as filed except change route to read South Boston Victor 20 Greensboro, maintain one seven thousand.

US 5-2

SECTION 2. DEPARTURE PROCEDURES

4. Additionally, in a nonradar environment, the controller will specify one or more fixes, as necessary, to identify the initial route of flight.

EXAMPLE: Cessna Three One Six Zero Foxtrot cleared to Charlotte Airport as filed via Brooke, maintain seven thousand.

- h. To ensure success of the program, pilots should:

1. Avoid making changes to a filed flight plan just prior to departure.
2. State the following information in the initial call-up to the facility when no change has been made to the filed flight plan: Aircraft call sign, location, type operation (IFR) and the name of the airport (or fix) to which you expect clearance.

EXAMPLE: "Washington clearance delivery (or ground control if appropriate) American Seventy Six at gate one, IFR Los Angeles."

3. If the flight plan has been changed, state the change and request a full route clearance.

EXAMPLE: "Washington clearance delivery, American Seventy Six at gate one. IFR San Francisco. My flight plan route has been amended (or destination changed). Request full route clearance."

4. Request verification or clarification from ATC if ANY portion of the clearance is not clearly understood.
5. When requesting clearance for the IFR portion of a VFR/IFR flight, request such clearance prior to the fix where IFR operation is proposed to commence in sufficient time to avoid delay. Use the following phraseology:

EXAMPLE: "Los Angeles center, Apache Six One Papa, VFR estimating Paso Robles VOR at three two, one thousand five hundred, request IFR to Bakersfield."

5-2-7 DEPARTURE RESTRICTIONS, CLEARANCE VOID TIMES, HOLD FOR RELEASE, AND RELEASE TIMES

- a. ATC may assign departure restrictions, clearance void times, hold for release, and release times, when necessary, to separate departures from other traffic or to restrict or regulate the departure flow. Departures from an airport without an operating control tower must be issued either a departure release (along with a release time and/or void time if applicable), or a hold for release.

REFERENCE—FAA Order JO 7110.65, Para 4-3-4, *Departure Release, Hold for Release, Release Times, Departure Restrictions, and Clearance Void Times*.

1. **Clearance Void Times.** A pilot may receive a clearance, when operating from an airport without a control tower, which contains a provision for the clearance to be void if not airborne by a specific time. A pilot who does not depart prior to the clearance void time must advise ATC as soon as possible of their intentions. ATC will normally advise the pilot of the time allotted to notify ATC that the aircraft did not depart prior to the clearance void time. This time cannot exceed 30 minutes. Failure of an aircraft to con-

US 5-2

SECTION 2. DEPARTURE PROCEDURES

tact ATC within 30 minutes after the clearance void time will result in the aircraft being considered overdue and search and rescue procedures initiated.

NOTE:

- 1. Other IFR traffic for the airport where the clearance is issued is suspended until the aircraft has contacted ATC or until 30 minutes after the clearance void time or 30 minutes after the clearance release time if no clearance void time is issued.*
- 2. If the clearance void time expires, it does not cancel the departure clearance or IFR flight plan. It withdraws the pilot's authority to depart IFR until a new departure release/release time has been issued by ATC and is acknowledged by the pilot.*
- 3. Pilots who depart at or after their clearance void time are not afforded IFR separation and may be in violation of 14 CFR Section 91.173 which requires that pilots receive an appropriate ATC clearance before operating IFR in controlled airspace.*
- 4. Pilots who choose to depart VFR after their clearance void time has expired should not depart using the previously assigned IFR transponder code.*

EXAMPLE: Clearance void if not off by (clearance void time) and, if required, if not off by (clearance void time) advise (facility) not later than (time) of intentions.

- 2. Hold for Release.** ATC may issue "hold for release" instructions in a clearance to delay an aircraft's departure for traffic management reasons (i.e., weather, traffic volume, etc.). When ATC states in the clearance, "hold for release," the pilot may not depart utilizing that IFR clearance until a release time or additional instructions are issued by ATC. In addition, ATC will include departure delay information in conjunction with "hold for release" instructions. The ATC instruction, "hold for release," applies to the IFR clearance and does not prevent the pilot from departing under VFR. However, prior to takeoff the pilot should cancel the IFR flight plan and operate the transponder/ADS-B on the appropriate VFR code. An IFR clearance may not be available after departure.

EXAMPLE: (Aircraft identification) cleared to (destination) airport as filed, maintain (altitude), and, if required (additional instructions or information), hold for release, expect (time in hours and/or minutes) departure delay.

- 3. Release Times.** A "release time" is a departure restriction issued to a pilot by ATC, specifying the earliest time an aircraft may depart. ATC will use "release times" in conjunction with traffic management procedures and/or to separate a departing aircraft from other traffic.

EXAMPLE: (Aircraft identification) released for departure at (time in hours and/or minutes).

- 4. Expect Departure Clearance Time (EDCT).** The EDCT is the runway release time assigned to an aircraft included in traffic management programs. Aircraft are expected to depart no earlier than 5 minutes before, and no later than 5 minutes after the EDCT.

US 5-2

SECTION 2. DEPARTURE PROCEDURES

- b. If practical, pilots departing uncontrolled airports should obtain IFR clearances prior to becoming airborne when two-way communications with the controlling ATC facility is available.

5-2-8 DEPARTURE CONTROL

- a. Departure Control is an approach control function responsible for ensuring separation between departures. So as to expedite the handling of departures, Departure Control may suggest a take off direction other than that which may normally have been used under VFR handling. Many times it is preferred to offer the pilot a runway that will require the fewest turns after take off to place the pilot on course or selected departure route as quickly as possible. At many locations particular attention is paid to the use of preferential runways for local noise abatement programs, and route departures away from congested areas.
- b. Departure Control utilizing radar will normally clear aircraft out of the terminal area using vectors, a diverse vector area (DVA), or published DPs.
 - 1. When a departure is to be vectored immediately following takeoff using vectors, a DVA, or published DPs that begins with an ATC assigned heading off the ground, the pilot will be advised prior to takeoff of the initial heading to be flown but may not be advised of the purpose of the heading. When ATC assigns an initial heading with the takeoff clearance that will take the aircraft off an assigned procedure (for example, an RNAV SID with a published lateral path to a waypoint and crossing restrictions from the departure end of runway), the controller will assign an altitude to maintain with the initial heading and, if necessary, a speed to maintain.
 - 2. At some airports when a departure will fly an RNAV SID that begins at the runway, ATC may advise aircraft of the initial fix/waypoint on the RNAV route. The purpose of the advisory is to remind pilots to verify the correct procedure is programmed in the FMS before takeoff. Pilots must immediately advise ATC if a different RNAV SID is entered in the aircraft's FMC. When this advisory is absent, pilots are still required to fly the assigned SID as published.

EXAMPLE: Delta 345 RNAV to MPASS, Runway26L, cleared for takeoff.

NOTE:

- 1. *The SID transition is not restated as it is contained in the ATC clearance.*
- 2. *Aircraft cleared via RNAV SIDs designed to begin with a vector to the initial waypoint are assigned a heading before departure.*
- 3. Pilots operating in a radar environment are expected to associate departure headings or an RNAV departure advisory with vectors or the flight path to their planned route or flight. When given a vector taking the aircraft off a previously assigned nonradar route, the pilot will be advised briefly what the vector is to achieve. Thereafter, radar service will be provided until the aircraft has been reestablished "on-course" using an appropriate navigation aid and the pilot has been advised of the aircraft's position or a handoff is made to another radar controller with further surveillance capabilities.

US 5-2

SECTION 2. DEPARTURE PROCEDURES

- c. Controllers will inform pilots of the departure control frequencies and, if appropriate, the transponder code before takeoff. Pilots must ensure their transponder/ADS-B is adjusted to the “on” or normal operating position as soon as practical and remain on during all operations unless otherwise requested to change to “standby” by ATC. Pilots should not change to the departure control frequency until requested. Controllers may omit the departure control frequency if a DP has or will be assigned and the departure control frequency is published on the DP.

5-2-9 INSTRUMENT DEPARTURE PROCEDURES (DP) — OBSTACLE DEPARTURE PROCEDURES (ODP), STANDARD INSTRUMENT DEPARTURES (SID), AND DIVERSE VECTOR AREAS (DVA)

- a. Instrument departure procedures are preplanned instrument flight rule (IFR) procedures which provide obstruction clearance from the terminal area to the appropriate en route structure. There are two types of DPs, Obstacle Departure Procedures (ODP), printed either textually or graphically, and Standard Instrument Departures (SID), always printed graphically. All DPs, either textual or graphic may be designed using either conventional or RNAV criteria. RNAV procedures will have RNAV printed in the title; for example, SHEAD TWO DEPARTURE (RNAV). ODPs provide obstruction clearance via the least onerous route from the terminal area to the appropriate en route structure. ODPs are recommended for obstruction clearance and may be flown without ATC clearance unless an alternate departure procedure (SID or radar vector) has been specifically assigned by ATC. Graphic ODPs will have (OBSTACLE) printed in the procedure title; for example, GEYSR THREE DEPARTURE (OBSTACLE), or, CROWN ONE DEPARTURE (RNAV) (OBSTACLE). Standard Instrument Departures are air traffic control (ATC) procedures printed for pilot/controller use in graphic form to provide obstruction clearance and a transition from the terminal area to the appropriate en route structure. SIDs are primarily designed for system enhancement and to reduce pilot/controller workload. ATC clearance must be received prior to flying a SID. All DPs provide the pilot with a way to depart the airport and transition to the en route structure safely.
- b. A Diverse Vector Area (DVA) is an area in which ATC may provide random radar vectors during an uninterrupted climb from the departure runway until above the MVA/MIA, established in accordance with the TERPS criteria for diverse departures. The DVA provides obstacle and terrain avoidance in lieu of taking off from the runway under IFR using an ODP or SID.
- c. Pilots operating under 14 CFR Part 91 are strongly encouraged to file and fly a DP at night, during marginal Visual Meteorological Conditions (VMC) and Instrument Meteorological Conditions (IMC), when one is available. The following paragraphs will provide an overview of the DP program, why DPs are developed, what criteria are used, where to find them, how they are to be flown, and finally pilot and ATC responsibilities.
- d. Why are DPs necessary? The primary reason is to provide obstacle clearance protection information to pilots. A secondary reason, at busier airports, is to increase efficiency and reduce communications and departure delays through the use of SIDs. When an instrument approach is initially developed for an airport, the need for DPs is assessed. The procedure

US 5-2

SECTION 2. DEPARTURE PROCEDURES

designer conducts an obstacle analysis to support departure operations. If an aircraft may turn in any direction from a runway within the limits of the assessment area (see paragraph 5-2-9e3) and remain clear of obstacles, that runway passes what is called a diverse departure assessment and no ODP will be published. A SID may be published if needed for air traffic control purposes. However, if an obstacle penetrates what is called the 40:1 obstacle identification surface, then the procedure designer chooses whether to:

1. Establish a steeper than normal climb gradient; or
 2. Establish a steeper than normal climb gradient with an alternative that increases takeoff minima to allow the pilot to visually remain clear of the obstacle(s); or
 3. Design and publish a specific departure route; or
 4. A combination or all of the above.
- e. What criteria is used to provide obstruction clearance during departure?
1. Unless specified otherwise, required obstacle clearance for all departures, including diverse, is based on the pilot crossing the departure end of the runway at least 35 feet above the departure end of runway elevation, climbing to 400 feet above the departure end of runway elevation before making the initial turn, and maintaining a minimum climb gradient of 200 feet per nautical mile (FPNM), unless required to level off by a crossing restriction, until the minimum IFR altitude. A greater climb gradient may be specified in the DP to clear obstacles or to achieve an ATC crossing restriction. If an initial turn higher than 400 feet above the departure end of runway elevation is specified in the DP, the turn should be commenced at the higher altitude. If a turn is specified at a fix, the turn must be made at that fix. Fixes may have minimum and/or maximum crossing altitudes that must be adhered to prior to passing the fix. In rare instances, obstacles that exist on the extended runway centerline may make an “early turn” more desirable than proceeding straight ahead. In these cases, the published departure instructions will include the language “turn left(right) as soon as practicable.” These departures will also include a ceiling and visibility minimum of at least 300 and 1. Pilots encountering one of these DPs should preplan the climb out to gain altitude and begin the turn as quickly as possible within the bounds of safe operating practices and operating limitations. This type of departure procedure is being phased out.
- NOTE:** “Practical” or “feasible” may exist in some existing departure text instead of “practicable.”
2. ODPs, SIDs, and DVAs assume normal aircraft performance, and that all engines are operating. Development of contingency procedures, required to cover the case of an engine failure or other emergency in flight that may occur after liftoff, is the responsibility of the operator. (More detailed information on this subject is available in Advisory Circular AC 120-91, Airport Obstacle Analysis, and in the “Departure Procedures” section of chapter 2 in the Instrument Procedures Handbook, FAA-H-8083-16.)
 3. The 40:1 obstacle identification surface (OIS) begins at the departure end of the runway (DER) and slopes upward at 152 FPNM until reaching the minimum IFR altitude or

US 5-2

SECTION 2. DEPARTURE PROCEDURES

entering the en route structure. This assessment area is limited to 25 NM from the airport in nonmountainous areas and 46 NM in designated mountainous areas. Beyond this distance, the pilot is responsible for obstacle clearance if not operating on a published route, if below (having not reached) the MEA or MOCA of a published route, or an ATC assigned altitude. See FIG 5-2-1. (Ref 14 CFR 91.177 for further information on en route altitudes.)

NOTE: ODPs are normally designed to terminate within these distance limitations, however, some ODPs will contain routes that may exceed 25/46 NM; these routes will ensure obstacle protection until reaching the end of the ODP.

FIGURE 5-2-1

Diverse Departure Obstacle Assessment to 25/46 NM

4. Obstacles that are located within 1 NM of the DER and penetrate the 40:1 OCS are referred to as “low, close-in obstacles.” The standard required obstacle clearance (ROC) of 48 feet per NM to clear these obstacles would require a climb gradient greater than 200 feet per NM for a very short distance, only until the aircraft was 200 feet above the DER. To eliminate publishing an excessive climb gradient, the obstacle AGL/MSL height and location relative to the DER is noted in the “Take-off Minimums and (OBSTACLE) Departure Procedures” section of a given Terminal Procedures Publication (TPP) booklet.
 - (a) Pilots must refer to the TPP booklet or the Graphic ODP for information on these obstacles. These obstacle notes will no longer be published on SIDs. Pilots assigned a SID for departure must refer to the airport entry in the TPP to obtain information on these obstacles.
 - (b) The purpose of noting obstacles in the “Take-off Minimums and (OBSTACLE) Departure Procedures” section of the TPP is to identify the obstacle(s) and alert

US 5-2

SECTION 2. DEPARTURE PROCEDURES

the pilot to the height and location of the obstacle(s) so they can be avoided. This can be accomplished in a variety of ways; for example, the pilot may be able to see the obstruction and maneuver around the obstacle(s) if necessary; early liftoff/climb performance may allow the aircraft to cross well above the obstacle(s); or if the obstacle(s) cannot be visually acquired during departure, preflight planning should take into account what turns or other maneuvers may be necessary immediately after takeoff to avoid the obstruction(s).

EXAMPLE: TAKEOFF OBSTACLE NOTES: Rwy 14, trees 2011' from DER, 29' left of centerline, 100' AGL/3829' MSL. Rwy 32, trees 1009' from DER, 697' left of centerline, 100' AGL/3839' MSL. Tower 4448' from DER, 1036' left of centerline, 165' AGL/3886' MSL.

NOTE: *Compliance with 14 CFR Part 121 or 135 one-engine-inoperative (OEI) departure performance requirements, or similar ICAO/State rules, cannot be assured by the sole use of "low, close-in" obstacle data as published in the TPP. Operators should refer to precise data sources (for example, GIS database, etc.) specifically intended for OEI departure planning for those operations.*

5. Climb gradients greater than 200 FPNM are specified when required to support procedure design constraints, obstacle clearance, and/or airspace restrictions. Compliance with a climb gradient for these purposes is mandatory when the procedure is part of the ATC clearance, unless increased takeoff minimums are provided and weather conditions allow compliance with these minimums.

NOTE: *Climb gradients for ATC purposes are being phased out on SIDs.*

EXAMPLE: "Cross ALPHA intersection at or below 4000; maintain 6000." The pilot climbs at least 200 FPNM to 6000. If 4000 is reached before ALPHA, the pilot levels off at 4000 until passing ALPHA; then immediately resumes at least 200 FPNM climb.

EXAMPLE: "TAKEOFF MINIMUMS: RWY 27, Standard with a minimum climb of 280' per NM to 2500." A climb of at least 280 FPNM is required to 2500 and is mandatory when the departure procedure is included in the ATC clearance.

NOTE: *Some SIDs still retain labeled "ATC" climb gradients published or have climb gradients that are established to meet a published altitude restriction that is not required for obstacle clearance or procedure design criteria. These procedures will be revised in the course of the normal procedure amendment process.*

6. Climb gradients may be specified only to an altitude/fix, above which the normal gradient applies.

An ATC-required altitude restriction published at a fix, will not have an associated climb gradient published with that restriction. Pilots are expected to determine if crossing altitudes can be met, based on the performance capability of the aircraft they are operating.

EXAMPLE: "Minimum climb 340 FPNM to ALPHA." The pilot climbs at least 340 FPNM to ALPHA, then at least 200 FPNM to MIA.

US 5-2

SECTION 2. DEPARTURE PROCEDURES

7. A Visual Climb Over Airport (VCOA) procedure is a departure option for an IFR aircraft, operating in visual meteorological conditions equal to or greater than the specified visibility and ceiling, to visually conduct climbing turns over the airport to the published "at or above" altitude. At this point, the pilot may proceed in instrument meteorological conditions to the first en route fix using a diverse departure, or to proceed via a published routing to a fix from where the aircraft may join the IFR en route structure, while maintaining a climb gradient of at least 200 feet per nautical mile. VCOA procedures are developed to avoid obstacles greater than 3 statute miles from the departure end of the runway as an alternative to complying with climb gradients greater than 200 feet per nautical mile. Pilots are responsible to advise ATC as early as possible of the intent to fly the VCOA option prior to departure. Pilots are expected to remain within the distance prescribed in the published visibility minimums during the climb over the airport until reaching the "at or above" altitude for the VCOA procedure. If no additional routing is published, then the pilot may proceed in accordance with their IFR clearance. If additional routing is published after the "at-or-above" altitude, the pilot must comply with the route to a fix that may include a climb-in-holding pattern to reach the MEA/MIA for the en route portion of their IFR flight. These textual procedures are published in the Take-Off Minimums and (Obstacle) Departure Procedures section of the Terminal Procedures Publications and/or appear as an option on a Graphic ODP.

EXAMPLE: TAKEOFF MINIMUMS: Rwy 32, standard with minimum climb of 410' per NM to 3000' or 1100-3 for VCOA. VCOA: Rwy 32, obtain ATC approval for VCOA when requesting IFR clearance. Climb in visual conditions to cross Broken Bow Muni/Keith Glaze Field at or above 3500' before proceeding on course.

- f. Who is responsible for obstacle clearance? DPs are designed so that adherence to the procedure by the pilot will ensure obstacle protection. Additionally:
1. Obstacle clearance responsibility also rests with the pilot when he/she chooses to climb in visual conditions in lieu of flying a DP and/or depart under increased takeoff minima rather than fly the climb gradient. Standard takeoff minima are one statute mile for aircraft having two engines or less and one-half statute mile for aircraft having more than two engines. Specified ceiling and visibility minima will allow visual avoidance of obstacles during the initial climb at the standard climb gradient. When departing using the VCOA, obstacle avoidance is not guaranteed if the pilot maneuvers farther from the airport than the published visibility minimum for the VCOA prior to reaching the published VCOA altitude. DPs may also contain what are called Low Close in Obstacles. These obstacles are less than 200 feet above the departure end of runway elevation and within one NM of the runway end and do not require increased takeoff minimums. These obstacles are identified on the SID chart or in the Take-off Minimums and (Obstacle) Departure Procedures section of the U. S. Terminal Procedure booklet. These obstacles are especially critical to aircraft that do not lift off until close to the departure end of the runway or which climb at the minimum rate. Pilots should also consider drift following lift-off to ensure sufficient clearance from these obstacles. That segment of the procedure that requires the pilot to see and avoid obstacles ends when the aircraft crosses the specified point at the required altitude. In all cases continued obsta-

US 5-2

SECTION 2. DEPARTURE PROCEDURES

clearance is based on having climbed a minimum of 200 feet per nautical mile to the specified point and then continuing to climb at least 200 foot per nautical mile during the departure until reaching the minimum en route altitude unless specified otherwise.

2. ATC may vector the aircraft beginning with an ATC-assigned heading issued with the initial or takeoff clearance followed by subsequent vectors, if required, until reaching the minimum vectoring altitude by using a published Diverse Vector Area (DVA).
3. The DVA may be established below the Minimum Vectoring Altitude (MVA) or Minimum IFR Altitude (MIA) in a radar environment at the request of Air Traffic. This type of DP meets the TERPS criteria for diverse departures, obstacles, and terrain avoidance in which vectors below the MVA/MIA may be issued to departing aircraft. The DVA has been assessed for departures which do not follow a specific ground track, but will remain within the specified area. Use of a DVA is valid only when aircraft are permitted to climb uninterrupted from the departure runway to the MVA/MIA (or higher). ATC will not assign an altitude below the MVA/MIA within a DVA. At locations that have a DVA, ATC is not permitted to utilize a SID and DVA concurrently.

- (a) The existence of a DVA will be noted in the Takeoff Minimums and Obstacle Departure Procedure section of the U.S. Terminal Procedures Publication (TPP). The Takeoff Departure procedure will be listed first, followed by any applicable DVA.

EXAMPLE: DIVERSE VECTOR AREA (RADAR VECTORS) AMDT 1 14289 (FAA)

Rwy 6R, headings as assigned by ATC; requires minimum climb of 290' per NM to 400.

Rwys 6L, 7L, 7R, 24R, 25R, headings as assigned by ATC.

- (b) Pilots should be aware that a published climb gradient greater than the standard 200 FPNM can exist within a DVA. Pilots should note that the DVA has been assessed for departures which do not follow a specific ground track.
- (c) ATC may also vector an aircraft off a previously assigned DP. If the aircraft is airborne and established on a SID or ODP and subsequently vectored off, ATC is responsible for terrain and obstruction clearance. In all cases, the minimum 200 FPNM climb gradient is assumed.

NOTE: *As is always the case, when used by the controller during departure, the term "radar contact" should not be interpreted as relieving pilots of their responsibility to maintain appropriate terrain and obstruction clearance, which may include flying the obstacle DP.*

4. Pilots must preplan to determine if the aircraft can meet the climb gradient (expressed in feet per nautical mile) required by the departure procedure or DVA, and be aware that flying at a higher than anticipated ground speed increases the climb rate requirement in feet per minute. Higher than standard climb gradients are specified by a note on the departure procedure chart for graphic DPs, or in the Take-Off Minimums and

US 5-2

SECTION 2. DEPARTURE PROCEDURES

(Obstacle) Departure Procedures section of the U.S. Terminal Procedures booklet for textual ODPs. The required climb gradient, or higher, must be maintained to the specified altitude or fix, then the standard climb gradient of 200 ft/NM can be resumed. A table for the conversion of climb gradient (feet per nautical mile) to climb rate (feet per minute), at a given ground speed, is included on the inside of the back cover of the U.S. Terminal Procedures booklets.

[Jeppesen charts and tables clearly present all of this information.]

- g. Where are DPs located? DPs and DVAs will be listed by airport in the IFR Takeoff Minimums and (Obstacle) Departure Procedures Section, Section L, of the Terminal Procedures Publications (TPP). If the DP is textual, it will be described in TPP Section L. SIDs and complex ODPs will be published graphically and named. The name will be listed by airport name and runway in Section L. Graphic ODPs will also have the term “(OBSTACLE)” printed in the charted procedure title, differentiating them from SIDs.

1. An ODP that has been developed solely for obstacle avoidance will be indicated with the symbol “T” on appropriate Instrument Approach Procedure (IAP) charts and DP charts for that airport. The “T” symbol will continue to refer users to TPP Section C. In the case of a graphic ODP, the TPP Section C will only contain the name of the ODP. Since there may be both a textual and a graphic DP, Section C should still be checked for additional information. The nonstandard takeoff minimums and minimum climb gradients found in TPP Section C also apply to charted DPs and radar vector departures unless different minimums are specified on the charted DP. Takeoff minimums and departure procedures apply to all runways unless otherwise specified. New graphic DPs will have all the information printed on the graphic depiction. As a general rule, ATC will only assign an ODP from a non-towered airport when compliance with the ODP is necessary for aircraft to aircraft separation. Pilots may use the ODP to help ensure separation from terrain and obstacles.

h. Responsibilities

1. Each pilot, prior to departing an airport on an IFR flight should:
 - (a) Consider the type of terrain and other obstacles on or in the vicinity of the departure airport;
 - (b) Determine whether an ODP is available;
 - (c) Determine if obstacle avoidance can be maintained visually or if the ODP should be flown; and
 - (d) Consider the effect of degraded climb performance and the actions to take in the event of an engine loss during the departure. Pilots should notify ATC as soon as possible of reduced climb capability in that circumstance.

NOTE: Guidance concerning contingency procedures that address an engine failure on takeoff after V_1 speed on a large or turbine-powered transport category airplane may be found in AC 120-91, Airport Obstacle Analysis.

US 5-2

SECTION 2. DEPARTURE PROCEDURES

- (e) Determine if a DVA is published and whether the aircraft is capable of meeting the published climb gradient. Advise ATC when requesting the IFR clearance, or as soon as possible, if unable to meet the DVA climb gradient.
 - (f) Check for Takeoff Obstacle Notes published in the TPP for the takeoff runway.
2. Pilots should not exceed a published speed restriction associated with a SID waypoint until passing that waypoint.
 3. After an aircraft is established on a SID and subsequently vectored or cleared to deviate off of the SID or SID transition, pilots must consider the SID canceled, unless the controller adds "expect to resume SID;" pilots should then be prepared to rejoin the SID at a subsequent fix or procedure leg. If the SID contains published altitude and/or speed restrictions, those restrictions are canceled and pilots will receive an altitude to maintain and, if necessary, a speed. ATC may also interrupt the vertical navigation of a SID and provide alternate altitude instructions while the aircraft remains established on the published lateral path. Aircraft may be vectored off of an ODP, or issued an altitude lower than a published altitude on an ODP, at which time the ODP is canceled. In these cases, ATC assumes responsibility for terrain and obstacle clearance. In all cases, the minimum 200 FPNM climb gradient is assumed.
 4. Aircraft instructed to resume a SID procedure such as a DP or SID which contains speed and/or altitude restrictions, must be:
 - (a) Issued/reissued all applicable restrictions, or
 - (b) Advised to "Climb via SID" or resume published speed.

EXAMPLE: "Resume the Solar One departure, Climb via SID."

"Proceed direct CIROS, resume the Solar One departure, Climb via SID."

5. A clearance for a SID which does not contain published crossing restrictions, and/or is a SID with a Radar Vector segment or a Radar Vector SID, will be issued using the phraseology "Maintain (*altitude*)."
6. A clearance for a SID which contains published altitude restrictions may be issued using the phraseology "climb via." Climb via is an abbreviated clearance that requires compliance with the procedure lateral path, associated speed and altitude restrictions along the cleared route or procedure. Clearance to "climb via" authorizes the pilot to:
 - (a) When used in the IFR departure clearance, in a PDC, DCL or when cleared to a waypoint depicted on a SID, to join the procedure after departure or to resume the procedure.
 - (b) When vertical navigation is interrupted and an altitude is assigned to maintain which is not contained on the published procedure, to climb from that previously-assigned altitude at pilot's discretion to the altitude depicted for the next waypoint.
 - (c) Once established on the depicted departure, to navigate laterally and climb to meet all published or assigned altitude and speed restrictions.

US 5-2

SECTION 2. DEPARTURE PROCEDURES

NOTE:

1. When otherwise cleared along a route or procedure that contains published speed restrictions, the pilot must comply with those speed restrictions independent of a climb via clearance.
2. ATC anticipates pilots will begin adjusting speed the minimum distance necessary prior to a published speed restriction so as to cross the waypoint/fix at the published speed. Once at the published speed ATC expects pilots will maintain the published speed until additional adjustment is required to comply with further published or ATC assigned speed restrictions or as required to ensure compliance with 14 CFR Section 91.117.
3. If ATC interrupts lateral/vertical navigation while an aircraft is flying a SID, ATC must ensure obstacle clearance. When issuing a "climb via" clearance to join or resume a procedure ATC must ensure obstacle clearance until the aircraft is established on the lateral and vertical path of the SID.
4. ATC will assign an altitude to cross if no altitude is depicted at a waypoint/fix or when otherwise necessary/required, for an aircraft on a direct route to a waypoint/fix where the SID will be joined or resumed.
5. SIDs will have a "top altitude;" the "top altitude" is the charted "maintain" altitude contained in the procedure description or assigned by ATC.

REFERENCE—

FAA Order JO 7110.65, Paragraph 5-6-2, Methods.

PCG, Climb Via, Top Altitude.

EXAMPLE:**1. Lateral route clearance:**

"Cleared Loop Six departure."

NOTE: The aircraft must comply with the SID lateral path, and any published speed restrictions

2. Routing with assigned altitude:

"Cleared Loop Six departure, climb and maintain four thousand."

NOTE: The aircraft must comply with the SID lateral path, and any published speed restriction while climbing unrestricted to four thousand.

3. (A pilot filed a flight plan to the Johnston Airport using the Scott One departure, Jonez transition, then Q-145. The pilot filed for FL350. The Scott One includes altitude restrictions, a top altitude and instructions to expect the filed altitude ten minutes after departure). Before departure ATC uses PDC, DCL or clearance delivery to issue the clearance:

US 5-2

SECTION 2. DEPARTURE PROCEDURES

“Cleared to Johnston Airport, Scott One departure, Jonez transition, Q-One Forty-five. Climb via SID.”

NOTE: *In Example 3, the aircraft must comply with the Scott One departure lateral path and any published speed and altitude restrictions while climbing to the SID top altitude.*

4. (Using the Example 3 flight plan, ATC determines the top altitude must be changed to FL180). The clearance will read:

“Cleared to Johnston Airport, Scott One departure, Jonez transition, Q-One Forty-five, Climb via SID except maintain flight level one eight zero.”

NOTE: *In Example 4, the aircraft must comply with the Scott One departure lateral path and any published speed and altitude restrictions while climbing to FL180. The aircraft must stop climb at FL180 until issued further clearance by ATC.*

5. (An aircraft was issued the Suzan Two departure, “climb via SID” in the IFR departure clearance. After departure ATC must change a waypoint crossing restriction). The clearance will be:

“Climb via SID except cross Mkala at or above seven thousand.”

NOTE: *In Example 5, the aircraft will comply with the Suzan Two departure lateral path and any published speed and altitude restrictions and climb so as to cross Mkala at or above 7,000; remainder of the departure must be flown as published.*

6. (An aircraft was issued the Teddd One departure, “climb via SID” in the IFR departure clearance. An interim altitude of 10,000 was issued instead of the published top altitude of FL230). After departure ATC is able to issue the published top altitude. The clearance will be:

“Climb via SID.”

NOTE: *In Example 6, the aircraft will track laterally and vertically on the Teddd One departure and initially climb to 10,000; Once re-issued the “climb via” clearance the interim altitude is canceled aircraft will continue climb to FL230 while complying with published restrictions.*

7. (An aircraft was issued the Bbear Two departure, “climb via SID” in the IFR departure clearance. An interim altitude of 16,000 was issued instead of the published top altitude of FL190). After departure, ATC is able to issue a top altitude of FL300 and still requires compliance with the published SID restrictions. The clearance will be:

“Climb via SID except maintain flight level three zero zero.”

NOTE: *In Example 7, the aircraft will track laterally and vertically on the Bbear Two departure and initially climb to 16,000; Once re-issued the “climb via” clearance the interim altitude is canceled and the aircraft will continue climb to FL300 while complying with published restrictions.*

US 5-2

SECTION 2. DEPARTURE PROCEDURES

8. (An aircraft was issued the Bizze Two departure, “climb via SID.” After departure, ATC vectors the aircraft off of the SID, and then issues a direct routing to rejoin the SID at Rockr waypoint which does not have a published altitude restriction. ATC wants the aircraft to cross at or above 10,000). The clearance will read:

“Proceed direct Rockr, cross Rockr at or above one-zero thousand, climb via the Bizze Two departure.”

NOTE: *In Example 8, the aircraft will join the Bizze Two SID at Rockr at or above 10,000 and then comply with the published lateral path and any published speed or altitude restrictions while climbing to the SID top altitude.*

9. (An aircraft was issued the Suzan Two departure, “climb via SID” in the IFR departure clearance. After departure ATC vectors the aircraft off of the SID, and then clears the aircraft to rejoin the SID at Dvine waypoint, which has a published crossing restriction). The clearance will read:

“Proceed direct Dvine, Climb via the Suzan Two departure.”

NOTE: *In Example 9, the aircraft will join the Suzan Two departure at Dvine, at the published altitude, and then comply with the published lateral path and any published speed or altitude restrictions.*

7. Pilots cleared for vertical navigation using the phraseology “climb via” must inform ATC, upon initial contact, of the altitude leaving and any assigned restrictions not published on the procedure.

EXAMPLE:

1. (Cactus 711 is cleared to climb via the Laura Two departure. The Laura Two has a top altitude of FL190): “Cactus Seven Eleven leaving two thousand, climbing via the Laura Two departure.”
 2. (Cactus 711 is cleared to climb via the Laura Two departure, but ATC changed the top altitude to 16,000): “Cactus Seven Eleven leaving two thousand for one-six thousand, climbing via the Laura Two departure.”
8. If prior to or after takeoff an altitude restriction is issued by ATC, all previously issued “ATC” altitude restrictions are canceled including those published on a SID. Pilots must still comply with all speed restrictions and lateral path requirements published on the SID unless canceled by ATC.

EXAMPLE: Prior to takeoff or after departure ATC issues an altitude change clearance to an aircraft cleared to climb via a SID but ATC no longer requires compliance with published altitude restrictions:

“Climb and maintain flight level two four zero.”

NOTE: *The published SID altitude restrictions are canceled; The aircraft should comply with the SID lateral path and begin an unrestricted climb to FL240. Compliance with published speed restrictions is still required unless specifically deleted by ATC.*

US 5-2

SECTION 2. DEPARTURE PROCEDURES

9. Altitude restrictions published on an ODP are necessary for obstacle clearance and/or design constraints. Crossing altitudes and speed restrictions on ODPs cannot be canceled or amended by ATC.
- i. PBN Departure Procedures
 1. All public PBN SIDs and graphic ODPs are normally designed using RNAV 1, RNP 1, or A-RNP NavSpecs. These procedures generally start with an initial track or heading leg near the departure end of runway (DER). In addition, these procedures require system performance currently met by GPS or DME/DME/IRU PBN systems that satisfy the criteria discussed in the latest AC 90-100, U.S. Terminal and En Route Area Navigation (RNAV) Operations. RNAV 1 and RNP 1 procedures must maintain a total system error of not more than 1 NM for 95 percent of the total flight time. Minimum values for A-RNP procedures will be charted in the PBN box (for example, 1.00 or 0.30).
 2. In the U.S., a specific procedure's PBN requirements will be prominently displayed in separate, standardized notes boxes. For procedures with PBN elements, the "PBN box" will contain the procedure's NavSpec(s); and, if required: specific sensors or infrastructure needed for the navigation solution, any additional or advanced functional requirements, the minimum RNP value, and any amplifying remarks. Items listed in this PBN box are REQUIRED for the procedure's PBN elements.

US 5-3

SECTION 3. EN ROUTE PROCEDURES

5-3-1 ARTCC COMMUNICATIONS**a. Direct Communications, Controllers and Pilots.**

1. ARTCCs are capable of direct communications with IFR air traffic on certain frequencies. Maximum communications coverage is possible through the use of Remote Center Air/Ground (RCAG) sites comprised of both VHF and UHF transmitters and receivers. These sites are located throughout the U.S. Although they may be several hundred miles away from the ARTCC, they are remoted to the various ARTCCs by land lines or microwave links. Since IFR operations are expedited through the use of direct communications, pilots are requested to use these frequencies strictly for communications pertinent to the control of IFR aircraft. Flight plan filing, en route weather, weather forecasts, and similar data should be requested through FSSs, company radio, or appropriate military facilities capable of performing these services.
2. An ARTCC is divided into sectors. Each sector is handled by one or a team of controllers and has its own sector discrete frequency. As a flight progresses from one sector to another, the pilot is requested to change to the appropriate sector discrete frequency.
3. Controller Pilot Data Link Communications (CPDLC) is a system that supplements air/ground voice communications. The CPDLC's principal operating criteria are:

- (a) Voice remains the primary and controlling air/ground communications means.
- (b) Participating aircraft will need to have the appropriate CPDLC avionics equipment in order to receive uplink or transmit downlink messages.
- (c) En Route CPDLC Initial Services offer the following services: Altimeter Setting (AS), Transfer of Communications (TOC), Initial Contact (IC), and limited route assignments, including airborne reroutes (ABRR), limited altitude assignments, and emergency messages.

- (1) Altimeter settings will be uplinked automatically when appropriate after a Monitor TOC. Altimeter settings will also be uplinked automatically when an aircraft receives an uplinked altitude assignment below FL 180. A controller may also manually send an altimeter setting message.

NOTE: When conducting instrument approach procedures, pilots are responsible to obtain and use the appropriate altimeter setting in accordance with 14 CFR Section 97.20. CPDLC issued altimeter settings are excluded for this purpose.

- (2) Initial contact is a safety validation transaction that compares a pilot's initiated altitude downlink message with an aircraft's stored altitude in the ATC automation system. When an IC mismatch or Confirm Assigned Altitude (CAA) downlink time-out indicator is displayed in the Full Data Block (FDB) and Aircraft List (ACL), the controller who has track control of the aircraft must use voice communication to verify the assigned altitude of the aircraft, and acknowledge the IC mismatch/time-out indicator.

US 5-3
SECTION 3. EN ROUTE PROCEDURES

- (3) Transfer of communications automatically establishes data link contact with a succeeding sector.
- (4) Menu text transmissions are scripted nontrajectory altering uplink messages.
- (5) The CPDLC Message Elements for the Initial Capabilities rollout are contained in TBL 5-3-1 through TBL 5-3-19, CPDLC Message Elements, below.

NOTE: *The FAA is not implementing ATN B1; the ATN B1 column in the tables is there for informational purposes only.*

b. ATC Frequency Change Procedures.

1. The following phraseology will be used by controllers to effect a frequency change:

EXAMPLE: (Aircraft identification) contact (facility name or location name and terminal function) (frequency) at (time, fix, or altitude).

NOTE: *Pilots are expected to maintain a listening watch on the transferring controller's frequency until the time, fix, or altitude specified. ATC will omit frequency change restrictions whenever pilot compliance is expected upon receipt.*

2. The following phraseology should be utilized by pilots for establishing contact with the designated facility:

- (a) When operating in a radar environment: On initial contact, the pilot should inform the controller of the aircraft's assigned altitude preceded by the words "level," or "climbing to," or "descending to," as appropriate; and the aircraft's present vacating altitude, if applicable.

EXAMPLE:

US 5-3

SECTION 3. EN ROUTE PROCEDURES

1. (Name) CENTER, (aircraft identification), LEVEL (altitude or flight level).
2. (Name) CENTER, (aircraft identification), LEAVING (exact altitude or flight level), CLIMBING TO OR DESCENDING TO (altitude of flight level).

NOTE: *Exact altitude or flight level means to the nearest 100 foot increment. Exact altitude or flight level reports on initial contact provide ATC with information required prior to using Mode C altitude information for separation purposes.*

(b) When operating in a nonradar environment:

- (1) On initial contact, the pilot should inform the controller of the aircraft's present position, altitude and time estimate for the next reporting point.

EXAMPLE: (Name) CENTER, (aircraft identification), (position), (altitude), ESTIMATING (reporting point) AT (time).

- (2) After initial contact, when a position report will be made, the pilot should give the controller a complete position report.

EXAMPLE: (Name) CENTER, (aircraft identification), (position), (time), (altitude), (type of flight plan), (ETA and name of next reporting point), (the name of the next succeeding reporting point), AND (remarks).

REFERENCE—AIM, Paragraph 5-3-2, *Position Reporting*.

3. At times controllers will ask pilots to verify that they are at a particular altitude. The phraseology used will be: "VERIFY AT (altitude)." In climbing or descending situations, controllers may ask pilots to "VERIFY ASSIGNED ALTITUDE AS (altitude)." Pilots should confirm that they are at the altitude stated by the controller or that the assigned altitude is correct as stated. If this is not the case, they should inform the controller of the actual altitude being maintained or the different assigned altitude.

CAUTION: *Pilots should not take action to change their actual altitude or different assigned altitude to the altitude stated in the controllers verification request unless the controller specifically authorizes a change.*

- c. **ARTCC Radio Frequency Outage.** ARTCCs normally have at least one back-up radio receiver and transmitter system for each frequency, which can usually be placed into service quickly with little or no disruption of ATC service. Occasionally, technical problems may cause a delay but switchover seldom takes more than 60 seconds. When it appears that the outage will not be quickly remedied, the ARTCC will usually request a nearby aircraft, if there is one, to switch to the affected frequency to broadcast communications instructions. It is important, therefore, that the pilot wait at least 1 minute before deciding that the ARTCC has actually experienced a radio frequency failure. When such an outage does occur, the pilot should, if workload and equipment capability permit, maintain a listening watch on the affected frequency while attempting to comply with the following recommended communications procedures:

US 5-3

SECTION 3. EN ROUTE PROCEDURES

1. If two-way communications cannot be established with the ARTCC after changing frequencies, a pilot should attempt to recontact the transferring controller for the assignment of an alternative frequency or other instructions.
2. When an ARTCC radio frequency failure occurs after two-way communications have been established, the pilot should attempt to reestablish contact with the center on any other known ARTCC frequency, preferably that of the next responsible sector when practicable, and ask for instructions. However, when the next normal frequency change along the route is known to involve another ATC facility, the pilot should contact that facility, if feasible, for instructions. If communications cannot be reestablished by either method, the pilot is expected to request communications instructions from the FSS appropriate to the route of flight.

NOTE: *The exchange of information between an aircraft and an ARTCC through an FSS is quicker than relay via company radio because the FSS has direct interphone lines to the responsible ARTCC sector. Accordingly, when circumstances dictate a choice between the two, during an ARTCC frequency outage, relay via FSS radio is recommended.*

- d. **Oakland Oceanic FIR.** The use of CPDLC and ADS-C in the Oakland Oceanic FIR (KZAK) is only permitted by Inmarsat and Iridium customers. All other forms of data link connectivity are not authorized. Users must ensure that the proper data link code is filed in Item 10a of the ICAO FPL in order to indicate which satellite medium(s) the aircraft is equipped with. The identifier for Inmarsat is J5 and the identifier for Iridium is J7. If J5 or J7 is not included in the ICAO FPL, then the LOGON will be rejected by KZAK and the aircraft will not be able to connect.
- e. **New York Oceanic FIR.** The use of CPDLC and ADS-C in the New York Oceanic FIR (KZNY) is only permitted by Inmarsat and Iridium customers. All other forms of data link connectivity are not authorized. Users must ensure that the proper data link code is filed in Item 10a of the ICAO FPL in order to indicate which satellite medium(s) the aircraft is equipped with. The identifier for Inmarsat is J5 and the identifier for Iridium is J7. If J5 or J7 is not included in the ICAO FPL, then the LOGON will be rejected by KZNY and the aircraft will not be able to connect.

5-3-2 POSITION REPORTING

The safety and effectiveness of traffic control depends to a large extent on accurate position reporting. In order to provide the proper separation and expedite aircraft movements, ATC must be able to make accurate estimates of the progress of every aircraft operating on an IFR flight plan.

a. Position Identification.

1. When a position report is to be made passing a VOR radio facility, the time reported should be the time at which the first complete reversal of the "to/from" indicator is accomplished.

US 5-3

SECTION 3. EN ROUTE PROCEDURES

2. When a position report is made passing a facility by means of an airborne ADF, the time reported should be the time at which the indicator makes a complete reversal.
 3. When an aural or a light panel indication is used to determine the time passing a reporting point, such as a fan marker, Z marker, cone of silence or intersection of range courses, the time should be noted when the signal is first received and again when it ceases. The mean of these two times should then be taken as the actual time over the fix.
 4. If a position is given with respect to distance and direction from a reporting point, the distance and direction should be computed as accurately as possible.
 5. Except for terminal area transition purposes, position reports or navigation with reference to aids not established for use in the structure in which flight is being conducted will not normally be required by ATC.
- b. **Position Reporting Points.** CFRs require pilots to maintain a listening watch on the appropriate frequency and, unless operating under the provisions of subparagraph c, to furnish position reports passing certain reporting points. Reporting points are indicated by symbols on en route charts. The designated compulsory reporting point symbol is a solid triangle  and the "on request" reporting point symbol is the open triangle . Reports passing an "on request" reporting point are only necessary when requested by ATC.
- c. **Position Reporting Requirements.**
1. **Flights Along Airways or Routes.** A position report is required by all flights regardless of altitude, including those operating in accordance with an ATC clearance specifying "VFR-on-top," over each designated compulsory reporting point along the route being flown.
 2. **Flights Along a Direct Route.** Regardless of the altitude or flight level being flown, including flights operating in accordance with an ATC clearance specifying "VFR-on-top," pilots must report over each reporting point used in the flight plan to define the route of flight.
 3. **Flights in a Radar Environment.** When informed by ATC that their aircraft are in "Radar Contact," pilots should discontinue position reports over designated reporting points. They should resume normal position reporting when ATC advises "RADAR CONTACT LOST" or "RADAR SERVICE TERMINATED."
 4. **Flights in an Oceanic (Non-radar) Environment.** Pilots must report over each point used in the flight plan to define the route of flight, even if the point is depicted on aeronautical charts as an "on request" (non-compulsory) reporting point. For aircraft providing automatic position reporting via an Automatic Dependent Surveillance-Contract (ADS-C) logon, pilots should discontinue voice position reports.

NOTE: ATC will inform pilots that they are in "radar contact":

(a) when their aircraft is initially identified in the ATC system; and

US 5-3

SECTION 3. EN ROUTE PROCEDURES

- (b) *when radar identification is reestablished after radar service has been terminated or radar contact lost.*

Subsequent to being advised that the controller has established radar contact, this fact will not be repeated to the pilot when handed off to another controller. At times, the aircraft identity will be confirmed by the receiving controller; however, this should not be construed to mean that radar contact has been lost. The identity of transponder equipped aircraft will be confirmed by asking the pilot to "ident," "squawk standby," or to change codes. Aircraft without transponders will be advised of their position to confirm identity. In this case, the pilot is expected to advise the controller if in disagreement with the position given. Any pilot who cannot confirm the accuracy of the position given because of not being tuned to the NAVAID referenced by the controller, should ask for another radar position relative to the tuned in NAVAID.

d. Position Report Items:

1. Position reports should include the following items:

- (a) Identification;
- (b) Position;
- (c) Time;
- (d) Altitude or flight level (include actual altitude or flight level when operating on a clearance specifying VFR-on-top);
- (e) Type of flight plan (not required in IFR position reports made directly to ARTCCs or approach control);
- (f) ETA and name of next reporting point;
- (g) The name only of the next succeeding reporting point along the route of flight; and
- (h) Pertinent remarks.

5-3-3 ADDITIONAL REPORTS

a. The following reports should be made to ATC or FSS facilities without a specific ATC request:

1. *At all times.*

- (a) When vacating any previously assigned altitude or flight level for a newly assigned altitude or flight level.
- (b) When an altitude change will be made if operating on a clearance specifying VFR-on-top.
- (c) When *unable* to climb/descend at a rate of a least 500 feet per minute.
- (d) When approach has been missed. (Request clearance for specific action; i.e., to alternative airport, another approach, etc.)

US 5-3

SECTION 3. EN ROUTE PROCEDURES

- (e) Change in the average true airspeed (at cruising altitude) when it varies by 5 percent or 10 knots (whichever is greater) from that filed in the flight plan.
- (f) The time and altitude or flight level upon reaching a holding fix or point to which cleared.
- (g) When leaving any assigned holding fix or point.

NOTE: *The reports in subparagraphs (f) and (g) may be omitted by pilots of aircraft involved in instrument training at military terminal area facilities when radar service is being provided.*

- (h) Any loss, in controlled airspace, of VOR, TACAN, ADF, low frequency navigation receiver capability, GPS anomalies while using installed IFR-certified GPS/GNSS receivers, complete or partial loss of ILS receiver capability or impairment of air/ground communications capability. Reports should include aircraft identification, equipment affected, degree to which the capability to operate under IFR in the ATC system is impaired, and the nature and extent of assistance desired from ATC.

NOTE:

1. *Other equipment installed in an aircraft may effectively impair safety and/or the ability to operate under IFR. If such equipment (e.g., airborne weather radar) malfunctions and in the pilot's judgment either safety or IFR capabilities are affected, reports should be made as above.*
2. *When reporting GPS anomalies, include the location and altitude of the anomaly. Be specific when describing the location and include duration of the anomaly if necessary.*

- (i) Any information relating to the safety of flight.

2. When not in radar contact.

- (a) When leaving final approach fix inbound on final approach (nonprecision approach) or when leaving the outer marker or fix used in lieu of the outer marker inbound on final approach (precision approach).
 - (b) A corrected estimate at anytime it becomes apparent that an estimate as previously submitted is in error in excess of 2 minutes. For flights in the North Atlantic (NAT), a revised estimate is required if the error is 3 minutes or more.
- b. Pilots encountering weather conditions which have not been forecast, or hazardous conditions which have been forecast, are expected to forward a report of such weather to ATC.

REFERENCE—

AIM, Para 7-1-18, *Pilot Weather Reports (PIREPs)*.

14 CFR Section 91.183(B) and (C).

US 5-3

SECTION 3. EN ROUTE PROCEDURES

5-3-4 AIRWAYS AND ROUTE SYSTEMS

a. Three fixed route systems are established for air navigation purposes. They are the Federal airway system (consisting of VOR and L/MF routes), the jet route system, and the RNAV route system. To the extent possible, these route systems are aligned in an overlying manner to facilitate transition between each.

1. The VOR and L/MF (nondirectional radio beacons) Airway System consists of airways designated from 1,200 feet above the surface (or in some instances higher) up to but not including 18,000 feet MSL. These airways are depicted on IFR Enroute Low Altitude Charts.

NOTE: *The altitude limits of a victor airway should not be exceeded except to effect transition within or between route structures.*

- (a) Except in Alaska, the VOR airways are: predicated solely on VOR or VORTAC navigation aids; depicted in black on aeronautical charts; and identified by a "V" (Victor) followed by the airway number (for example, V12).

NOTE: *Segments of VOR airways in Alaska are based on L/MF navigation aids and charted in brown instead of black on en route charts. [Jeppesen does not distinguish these routes on Enroute Charts.]*

- (1) A segment of an airway which is common to two or more routes carries the numbers of all the airways which coincide for that segment. When such is the case, pilots filing a flight plan need to indicate only that airway number for the route filed.

NOTE: *A pilot who intends to make an airway flight, using VOR facilities, will simply specify the appropriate "victor" airway(s) in the flight plan. For example, if a flight is to be made from Chicago to New Orleans at 8,000 feet, using omniranges only, the route may be indicated as "departing from Chicago-Midway, cruising 8,000 feet via Victor 9 to Moisant International." If flight is to be conducted in part by means of L/MF navigation aids and in part on omniranges, specifications of the appropriate airways in the flight plan will indicate which types of facilities will be used along the described routes, and, for IFR flight, permit ATC to issue a traffic clearance accordingly. A route may also be described by specifying the station over which the flight will pass, but in this case since many VORs and L/MF aids have the same name, the pilot must be careful to indicate which aid will be used at a particular location. This will be indicated in the route of flight portion of the flight plan by specifying the type of facility to be used after the location name in the following manner: Newark L/MF, Allentown VOR.*

- (2) With respect to position reporting, reporting points are designated for VOR Airway Systems. Flights using Victor Airways will report over these points unless advised otherwise by ATC.

US 5-3

SECTION 3. EN ROUTE PROCEDURES

- (b) The L/MF airways (colored airways) are predicated solely on L/MF navigation aids and are depicted in brown on aeronautical charts and are identified by color name and number (e.g., Amber One). [L/MF airways are depicted in blue on Jeppesen Low Altitude Enroute Charts.] Green and Red airways are plotted east and west. Amber and Blue airways are plotted north and south.

NOTE: *Except for G13 in North Carolina, the colored airway system exists only in the state of Alaska. All other such airways formerly so designated in the conterminous U.S. have been rescinded.*

- (c) The use of TSO-C145 (as revised) or TSO-C146 (as revised) GPS/WAAS navigation systems is allowed in Alaska as the only means of navigation on published air traffic service (ATS) routes, including those Victor, T-Routes, and colored airway segments designated with a second minimum en route altitude (MEA) depicted in blue and followed by the letter G at those lower altitudes. [US Government charts only] The altitudes so depicted are below the minimum reception altitude (MRA) of the land-based navigation facility defining the route segment, and guarantee standard en route obstacle clearance and two-way communications. Air carrier operators requiring operations specifications are authorized to conduct operations on those routes in accordance with FAA operations specifications.
2. The jet route system consists of jet routes established from 18,000 feet MSL to FL 450 inclusive.
- (a) These routes are depicted on Enroute High Altitude Charts. Jet routes are depicted in black on aeronautical charts and are identified by a "J" (Jet) followed by the airway number (e.g., J12). Jet routes, as VOR airways, are predicated solely on VOR or VORTAC navigation facilities (except in Alaska).

NOTE: *Segments of jet routes in Alaska are based on L/MF navigation aids and are charted in brown color instead of black on en route charts. [Jeppesen does not distinguish these routes on Enroute Charts.]*

- (b) With respect to position reporting, reporting points are designated for jet route systems. Flights using jet routes will report over these points unless otherwise advised by ATC.

3. Area Navigation (RNAV) Routes.

- (a) Published RNAV routes, including Q-Routes and T-Routes, can be flight planned for use by aircraft with RNAV capability, subject to any limitations or requirements noted on en route charts, in applicable Advisory Circulars, or by NOTAM. RNAV routes are depicted in blue on aeronautical charts and are identified by the letter "Q" or "T" followed by the airway number (for example, Q-13, T-205). Published RNAV routes are RNAV-2 except when specifically charted as RNAV-1. These routes require system performance currently met by GPS, GPS/WAAS, or DME/DME/IRU RNAV systems that satisfy the criteria discussed in AC 90-100A, U.S. Terminal and En Route Area Navigation (RNAV) Operations.

US 5-3

SECTION 3. EN ROUTE PROCEDURES

NOTE: AC 90-100A does not apply to over water RNAV routes (reference 14 CFR 91.511, including the Q-routes in the Gulf of Mexico and the Atlantic routes) or Alaska VOR/DME RNAV routes ("JxxxR"). The AC does not apply to off-route RNAV operations, Alaska GPS routes or Caribbean routes.

- (1) Q-routes are available for use by RNAV equipped aircraft between 18,000 feet MSL and FL 450 inclusive. Q-routes are depicted on Enroute High Altitude Charts.

NOTE: Aircraft in Alaska may only operate on GNSS Q-routes with GPS (TSO-C129 (as revised) or TSO-C196 (as revised)) equipment while the aircraft remains in Air Traffic Control (ATC) radar surveillance or with GPS/WAAS which does not require ATC radar surveillance.

- (2) T-routes are available for use by GPS or GPS/WAAS equipped aircraft from 1,200 feet above the surface (or in some instances higher) up to but not including 18,000 feet MSL. T-routes are depicted on Enroute Low Altitude Charts.

NOTE: Aircraft in Alaska may only operate on GNSS T-routes with GPS/WAAS (TSO-C145 (as revised) or TSO-C146 (as revised)) equipment.

- (b) Unpublished RNAV routes are direct routes, based on area navigation capability, between waypoints defined in terms of latitude/longitude coordinates, degree-distance fixes, or offsets from established routes/airways at a specified distance and direction. Radar monitoring by ATC is required on all unpublished RNAV routes, except for GNSS-equipped aircraft cleared via filed published waypoints recallable from the aircraft's navigation database.
- (c) Magnetic Reference Bearing (MRB) is the published bearing between two waypoints on an RNAV/GPS/GNSS route. The MRB is calculated by applying magnetic variation at the waypoint to the calculated true course between two waypoints. The MRB enhances situational awareness by indicating a reference bearing (no-wind heading) that a pilot should see on the compass/HSI/RMI etc., when turning prior to/over a waypoint en route to another waypoint. Pilots should use this bearing as a reference only, because their RNAV/GPS/GNSS navigation system will fly the true course between the waypoints.

- b. Operation above FL 450 may be conducted on a point-to-point basis. Navigational guidance is provided on an area basis utilizing those facilities depicted on the enroute high altitude charts.
- c. **Radar Vectors.** Controllers may vector aircraft within controlled airspace for separation purposes, noise abatement considerations, when an operational advantage will be realized by the pilot or the controller, or when requested by the pilot. Vectors outside of controlled airspace will be provided only on pilot request. Pilots will be advised as to what the vector is to achieve when the vector is controller initiated and will take the aircraft off a previously assigned nonradar route. To the extent possible, aircraft operating on RNAV routes will be allowed to remain on their own navigation.

US 5-3

SECTION 3. EN ROUTE PROCEDURES

- d. When flying in Canadian airspace, pilots are cautioned to review Canadian Air Regulations.
1. Special attention should be given to the parts which differ from U.S. CFRs.
 - (a) The Canadian Airways Class B airspace restriction is an example. Class B airspace is all controlled low level airspace above 12,500 feet MSL or the MEA, whichever is higher, within which only IFR and controlled VFR flights are permitted. (Low level airspace means an airspace designated and defined as such in the Designated Airspace Handbook.)
 - (b) Unless issued a VFR flight clearance by ATC, regardless of the weather conditions or the height of the terrain, no person may operate an aircraft under VMC within Class B airspace.
 - (c) The requirement for entry into Class B airspace is a student pilot permit (under the guidance or control of a flight instructor).
 - (d) VFR flight requires visual contact with the ground or water at all times.
 2. Segments of VOR airways and high level routes in Canada are based on L/MF navigation aids and are charted in brown color instead of blue on en route charts. [Jeppesen shows these VOR Airways and high-level routes in screened blue on Enroute Charts.]

FIGURE 5-3-1

Adhering to Airways or Routes

US 5-3

SECTION 3. EN ROUTE PROCEDURES

5-3-5 AIRWAY OR ROUTE COURSE CHANGES

- a. Pilots of aircraft are required to adhere to airways or routes being flown. Special attention must be given to this requirement during course changes. Each course change consists of variables that make the technique applicable in each case a matter only the pilot can resolve. Some variables which must be considered are turn radius, wind effect, airspeed, degree of turn, and cockpit instrumentation. An early turn, as illustrated below, is one method of adhering to airways or routes. The use of any available cockpit instrumentation, such as Distance Measuring Equipment, may be used by the pilot to lead the turn when making course changes. This *is consistent* with the intent of 14 CFR Section 91.181, which requires pilots to operate along the centerline of an airway and along the direct course between navigational aids or fixes.
- b. Turns which begin at or after fix passage may exceed airway or route boundaries. FIG 5-3-1 contains an example flight track depicting this, together with an example of an early turn.
- c. Without such actions as leading a turn, aircraft operating in excess of 290 knots true air speed (TAS) can exceed the normal airway or route boundaries depending on the amount of course change required, wind direction and velocity, the character of the turn fix (DME, over-head navigation aid, or intersection), and the pilot's technique in making a course change. For example, a flight operating at 17,000 feet MSL with a TAS of 400 knots, a 25 degree bank, and a course change of more than 40 degrees would exceed the width of the airway or route; i.e., 4 nautical miles each side of centerline. However, in the airspace below 18,000 feet MSL, operations in excess of 290 knots TAS are not prevalent and the provision of additional IFR separation in all course change situations for the occasional aircraft making a turn in excess of 290 knots TAS creates an unacceptable waste of airspace and imposes a penalty upon the preponderance of traffic which operate at low speeds. Consequently, the FAA expects pilots to lead turns and take other actions they consider necessary during course changes to adhere as closely as possible to the airways or route being flown.

5-3-6 CHANGEOVER POINTS (COPS)

- a. COPs are prescribed for Federal airways, jet routes, area navigation routes, or other direct routes for which an MEA is designated under 14 CFR Part 95. The COP is a point along the route or airway segment between two adjacent navigation facilities or waypoints where changeover in navigation guidance should occur. At this point, the pilot should change navigation receiver frequency from the station behind the aircraft to the station ahead.
- b. The COP is normally located midway between the navigation facilities for straight route segments, or at the intersection of radials or courses forming a dogleg in the case of dogleg route segments. When the COP is NOT located at the midway point, aeronautical charts will depict the COP location and give the mileage to the radio aids.
- c. COPs are established for the purpose of preventing loss of navigation guidance, to prevent frequency interference from other facilities, and to prevent use of different facilities by different aircraft in the same airspace. Pilots are urged to observe COPs to the fullest extent.

US 5-3

SECTION 3. EN ROUTE PROCEDURES

5-3-7 MINIMUM TURNING ALTITUDE (MTA)

Due to increased airspeeds at 10,000 ft MSL or above, the published minimum enroute altitude (MEA) may not be sufficient for obstacle clearance when a turn is required over a fix, NAVAID, or waypoint. In these instances, an expanded area in the vicinity of the turn point is examined to determine whether the published MEA is sufficient for obstacle clearance. In some locations (normally mountainous), terrain/obstacles in the expanded search area may necessitate a higher minimum altitude while conducting the turning maneuver. Turning fixes requiring a higher minimum turning altitude (MTA) will be denoted on government charts by the minimum crossing altitude (MCA) icon ("x" flag) and an accompanying note describing the MTA restriction. An MTA restriction will normally consist of the air traffic service (ATS) route leading to the turn point, the ATS route leading from the turn point, and the required altitude; e.g., MTA V330 E TO V520 W 16000. When an MTA is applicable for the intended route of flight, pilots must ensure they are at or above the charted MTA not later than the turn point and maintain at or above the MTA until joining the centerline of the ATS route following the turn point. Once established on the centerline following the turning fix, the MEA/MOCA determines the minimum altitude available for assignment. An MTA may also preclude the use of a specific altitude or a range of altitudes during a turn. For example, the MTA may restrict the use of 10,000 through 11,000 ft MSL. In this case, any altitude greater than 11,000 ft MSL is unrestricted, as are altitudes less than 10,000 ft MSL provided MEA/MOCA requirements are satisfied.

5-3-8 HOLDING

- a. Whenever an aircraft is cleared to a fix other than the destination airport and delay is expected, it is the responsibility of ATC to issue complete holding instructions (unless the pattern is charted), an EFC time and best estimate of any additional en route/terminal delay.

NOTE: Only those holding patterns depicted on U.S. government or commercially produced (meeting FAA requirements) low/high altitude en route, and area or STAR charts should be used.

- b. If the holding pattern is charted and the controller doesn't issue complete holding instructions, the pilot is expected to hold as depicted on the appropriate chart. When the pattern is charted on the assigned procedure or route being flown, ATC may omit all holding instructions except the charted holding direction and the statement *AS PUBLISHED*; for example, *HOLD EAST AS PUBLISHED*. ATC must always issue complete holding instructions when pilots request them.
- c. If no holding pattern is charted and holding instructions have not been issued, the pilot should ask ATC for holding instructions prior to reaching the fix. This procedure will eliminate the possibility of an aircraft entering a holding pattern other than that desired by ATC. If unable to obtain holding instructions prior to reaching the fix (due to frequency congestion, stuck microphone, etc.), then enter a standard pattern on the course on which the aircraft approached the fix and request further clearance as soon as possible. In this event, the altitude/flight level of the aircraft at the clearance limit will be protected so that separation will be provided as required.

US 5-3

SECTION 3. EN ROUTE PROCEDURES

- d. When an aircraft is 3 minutes or less from a clearance limit and a clearance beyond the fix has not been received, the pilot is expected to start a speed reduction so that the aircraft will cross the fix, initially, at or below the maximum holding airspeed.
- e. When no delay is expected, the controller should issue a clearance beyond the fix as soon as possible and, whenever possible, at least 5 minutes before the aircraft reaches the clearance limit.
- f. Pilots should report to ATC the time and altitude/flight level at which the aircraft reaches the clearance limit and report leaving the clearance limit.

NOTE: *In the event of two-way communications failure, pilots are required to comply with 14 CFR Section 91.185.*

- g. When holding at a VOR station, pilots should begin the turn to the outbound leg at the time of the first complete reversal of the to/from indicator.
- h. Patterns at the most generally used holding fixes are depicted (charted) on U.S. Government or commercially produced (meeting FAA requirements) Low or High Altitude En Route, Area, Departure Procedure, and STAR Charts. Pilots are expected to hold in the pattern depicted unless specifically advised otherwise by ATC.

NOTE: *Holding patterns that protect for a maximum holding airspeed other than the standard may be depicted by an icon, unless otherwise depicted. The icon is a standard holding pattern symbol (racetrack) with the airspeed restriction shown in the center. In other cases, the airspeed restriction will be depicted next to the standard holding pattern symbol. [On Jeppesen Enroute charts, the maximum holding speed and applicable holding altitudes are published in the form of a note adjacent to the depicted racetrack pattern.]*

REFERENCE—AIM, Paragraph 5-3-8j2, Holding.

- i. An ATC clearance requiring an aircraft to hold at a fix where the pattern is not charted will include the following information: (See FIG 5-3-2.)
 - 1. Direction of holding from the fix in terms of the eight cardinal compass points (i.e., N, NE, E, SE, etc.).
 - 2. Holding fix (the fix may be omitted if included at the beginning of the transmission as the clearance limit).
 - 3. Radial, course, bearing, airway or route on which the aircraft is to hold.
 - 4. Leg length in miles if DME or RNAV is to be used (leg length will be specified in minutes on pilot request or if the controller considers it necessary).
 - 5. Direction of turn if left turns are to be made, the pilot requests, or the controller considers it necessary.
 - 6. Time to expect further clearance and any pertinent additional delay information.

US 5-3
SECTION 3. EN ROUTE PROCEDURES

FIGURE 5-3-2
Holding Patterns

US 5-3
SECTION 3. EN ROUTE PROCEDURES

FIGURE 5-3-3

Holding Pattern Descriptive Terms

j. Holding pattern airspace protection is based on the following procedures.

1. **Descriptive Terms.**

- (a) **Standard Pattern.** Right turns (See FIG 5-3-3.)
- (b) **Nonstandard Pattern.** Left turns

2. **Airspeeds.**

(a) All aircraft may hold at the following altitudes and maximum holding airspeeds:

Altitude (MSL)	Airspeed (KIAS)
MHA - 6,000'	200
6,001' - 14,000'	230
14,001' and above	265

NOTE: These are the maximum indicated air speeds applicable to all holding.

(b) The following are exceptions to the maximum holding airspeeds:

- (1) Holding patterns from 6,001' to 14,000' may be restricted to a maximum airspeed of 210 KIAS. This nonstandard pattern will be depicted by an icon.
- (2) Holding patterns may be restricted to a maximum speed. The speed restriction is depicted in parenthesis inside the holding pattern on the chart: e.g., (175). The aircraft should be at or below the maximum speed prior to initially crossing the holding fix to avoid exiting the protected airspace. Pilots unable to comply with the maximum airspeed restriction should notify ATC.
- (3) Holding patterns at USAF airfields only - 310 KIAS maximum, unless otherwise depicted.
- (4) Holding patterns at Navy fields only - 230 KIAS maximum, unless otherwise depicted.

US 5-3

SECTION 3. EN ROUTE PROCEDURES

- (5) All helicopter/power lift aircraft holding on a “COPTER” instrument procedure is predicated on a minimum airspeed of 90 KIAS unless charted otherwise.
 - (6) When a climb-in hold is specified by a published procedure (for example, “Climb-in holding pattern to depart XYZ VORTAC at or above 10,000.” or “All aircraft climb-in TRUCK holding pattern to cross TRUCK Int at or above 11,500 before proceeding on course.”), additional obstacle protection area has been provided to allow for greater airspeeds in the climb for those aircraft requiring them. A maximum airspeed of 310 KIAS is permitted in Climb-in-holding, unless a maximum holding airspeed is published, in which case that maximum airspeed is applicable. The airspeed limitations in 14 CFR Section 91.117, Aircraft Speed, still apply.
- (c) The following phraseology may be used by an ATCS to advise a pilot of the maximum holding airspeed for a holding pattern airspace area.

PHRASEOLOGY:

(AIRCRAFT IDENTIFICATION) (holding instructions, when needed) MAXIMUM HOLDING AIRSPEED IS (speed in knots).

FIGURE 5-3-4

Holding Pattern Entry Procedures

3. **Entry Procedures.** Holding protected airspace is designed based in part on pilot compliance with the three recommended holding pattern entry procedures discussed below. Deviations from these recommendations, coupled with excessive airspeed crossing the holding fix, may in some cases result in the aircraft exceeding holding protected airspace. (See FIG 5-3-4.)
- (a) **Parallel Procedure.** When approaching the holding fix from anywhere in sector (a), the parallel entry procedure would be to turn to a heading to parallel the holding course outbound on the nonholding side for one minute, turn in the direction of

US 5-3

SECTION 3. EN ROUTE PROCEDURES

the holding pattern through more than 180 degrees, and return to the holding fix or intercept the holding course inbound.

- (b) **Teardrop Procedure.** When approaching the holding fix from anywhere in sector (b), the teardrop entry procedure would be to fly to the fix, turn outbound to a heading for a 30 degree teardrop entry within the pattern (on the holding side) for a period of one minute, then turn in the direction of the holding pattern to intercept the inbound holding course.
- (c) **Direct Entry Procedure.** When approaching the holding fix from anywhere in sector (c), the direct entry procedure would be to fly directly to the fix and turn to follow the holding pattern.
- (d) While other entry procedures may enable the aircraft to enter the holding pattern and remain within protected airspace, the parallel, teardrop and direct entries are the procedures for entry and holding recommended by the FAA, and were derived as part of the development of the size and shape of the obstacle protection areas for holding.
- (e) **Nonstandard Holding Pattern.** Fix end and outbound end turns are made to the left. Entry procedures to a nonstandard pattern are oriented in relation to the 70 degree line on the holding side just as in the standard pattern.

4. Timing.

- (a) **Inbound Leg.**

- (1) At or below 14,000 feet MSL: 1 minute.
 - (2) Above 14,000 feet MSL: 1½ minutes.

NOTE: The initial outbound leg should be flown for 1 minute or 1 1/2 minutes (appropriate to altitude). Timing for subsequent outbound legs should be adjusted, as necessary, to achieve proper inbound leg time. Pilots may use any navigational means available; i.e., DME, RNAV, etc., to ensure the appropriate inbound leg times.

- (b) **Outbound leg** timing begins *over/abeam* the fix, whichever occurs later. If the abeam position cannot be determined, start timing when turn to outbound is completed.

5. Distance Measuring Equipment (DME)/ GPS Along-Track Distance (ATD).

DME/GPS holding is subject to the same entry and holding procedures except that distances (nautical miles) are used in lieu of time values. The outbound course of the DME/GPS holding pattern is called the outbound leg of the pattern. The controller or the instrument approach procedure chart will specify the length of the outbound leg. The end of the outbound leg is determined by the DME or ATD readout. The holding fix on conventional procedures, or controller defined holding based on a conventional navigation aid with DME, is a specified course or radial and distances are from the DME station for both the inbound and outbound ends of the holding pattern. When flying

US 5-3

SECTION 3. EN ROUTE PROCEDURES

published GPS overlay or stand alone procedures with distance specified, the holding fix will be a waypoint in the database and the end of the outbound leg will be determined by the ATD. Some GPS overlay and early stand alone procedures may have timing specified. (See FIG 5-3-5, FIG 5-3-6 and FIG 5-3-7.) See paragraph 1-1-17, Global Positioning System (GPS), for requirements and restriction on using GPS for IFR operations.

FIGURE 5-3-5

Inbound Toward NAVAID

NOTE: When the inbound course is toward the NAVAID, the fix distance is 10 NM, and the leg length is 5 NM, then the end of the outbound leg will be reached when the DME reads 15 NM.

FIGURE 5-3-6

Inbound Leg Away from NAVAID

NOTE: When the inbound course is away from the NAVAID and the fix distance is 28 NM, and the leg length is 8 NM, then the end of the outbound leg will be reached when the DME reads 20 NM.

NOTE: The inbound course is always toward the waypoint and the ATD is zero at the waypoint. The end of the outbound leg of the holding pattern is reached when the ATD reads the specified distance.

6. **Use of RNAV Distance in lieu of DME Distance.** Substitution of RNAV computed distance to or from a NAVAID in place of DME distance is permitted when holding. However, the actual holding location and pattern flown will be further from the NAVAID than designed due to the lack of slant range in the position solution (see FIG 5-3-7). This may result in a slight difference between RNAV distance readout in reference to the NAVAID and the DME readout, especially at higher altitudes. When used solely for DME substitution, the difference between RNAV distance to/from a fix and DME slant range distance can be considered negligible and no pilot action is required.

US 5-3

SECTION 3. EN ROUTE PROCEDURES

REFERENCE—AIM Paragraph 1-2-3, *Use of Suitable Area Navigation (RNAV) Systems on Conventional Procedures and Routes.*

FIGURE 5-3-7

Difference Between DME Distance From NAVAID & RNAV Computed Distance From NAVAID

7. **Use of RNAV Guidance and Holding.** RNAV systems, including multi-sensor Flight Management Systems (FMS) and stand-alone GPS receivers, may be used to furnish lateral guidance when executing a hold. The manner in which holding is implemented in an RNAV system varies widely between aircraft and RNAV system manufacturers. Holding pattern data may be extracted from the RNAV database for published holds or may be manually entered for ad-hoc ATC-assigned holds. Pilots are expected to be familiar with the capabilities and limitations of the specific RNAV system used for holding.
 - (a) All holding, including holding defined on an RNAV or RNP procedure, is based on the conventional NAVAID holding design criteria, including the holding protected airspace construction. There are differences between the holding entry and flight track assumed in conventional holding pattern design and the entry and track that may be flown when RNAV guidance is used to execute holding. Individually, these differences may not affect the ability of the aircraft to remain within holding pattern protected airspace. However, cumulatively, they can result in deviations sufficient to result in excursions up to limits of the holding pattern protected airspace, and in some circumstances beyond protected airspace. The following difference and

US 5-3

SECTION 3. EN ROUTE PROCEDURES

considerations apply when an RNAV system furnishes the lateral guidance used to fly a holding pattern:

- (1) Many systems use ground track angle instead of heading to select the entry method. While the holding pattern design allows a 5 degree tolerance, this may result in an unexpected entry when the winds induce a large drift angle.
- (2) The holding protected airspace is based on the assumption that the aircraft will fly-over the holding fix upon initial entry. RNAV systems may execute a “fly-by” turn when approaching the holding fix prior to entry. A “fly-by” turn during a direct entry from the holding pattern side of holding course may result in excursions beyond protected airspace, especially as the intercept angle and ground speed increase.
- (3) During holding, RNAV systems furnish lateral steering guidance using either a constant bank or constant radius to achieve the desired inbound and outbound turns. An aircraft’s flight guidance system may use reduced bank angles for all turns including turns in holding, especially at higher altitudes, that may result in exceeding holding protected airspace. Use of a shallower bank angle will expand both the width and length of the aircraft track, especially as wind speed increases. If the flight guidance system’s bank angle limit feature is pilot-selectable, a minimum 25 degree bank angle should be selected regardless of altitude unless aircraft operating limitations specify otherwise and the pilot advises ATC.
- (4) Where a holding distance is published, the turn from the outbound leg begins at the published distance from the holding fix, thus establishing the design turn point required to remain within protected airspace. RNAV systems apply a database coded or pilot-entered leg distance as a maximum length of the *inbound* leg to the holding fix. The RNAV system then calculates a turn point from the outbound leg required to achieve this inbound leg length. This often results in an RNAV-calculated turn point on the outbound leg beyond the design turn point. (See FIG 5-3-8). With a strong headwind against the outbound leg, RNAV systems may fly up to and possibly beyond the limits of protected airspace before turning inbound. (See FIG 5-3-9.) This is especially true at higher altitudes where wind speeds are greater and ground speed results in a wider holding pattern.

US 5-3
SECTION 3. EN ROUTE PROCEDURES

FIGURE 5-3-8

RNAV Lateral Guidance and Holding — No Wind

FIGURE 5-3-9

RNAV Lateral Guidance and Holding — Effect of Wind

- (5) Some RNAV systems compute the holding pattern based on the aircraft's altitude and speed at a point prior to entering the hold. If the indicated air-speed is not reduced to comply with the maximum holding speed before this point, the computed pattern may exceed the protected airspace. Loading or executing a holding pattern may result in the speed and time limits applicable to the aircraft's current altitude being used to define the holding pattern for RNAV lateral guidance. This may result in an incorrect hold being flown by the RNAV system. For example, entering or executing the holding pattern above 14,000 feet when intending to hold below 14,000 feet may result in applying 1½ minute timing below 14,000 feet.

NOTE: Some systems permit the pilot to modify leg time of holding patterns defined in the navigation database; for example, a hold-in-lieu of procedure turn. In most RNAV systems, the holding pattern time remains at the pilot-

US 5-3

SECTION 3. EN ROUTE PROCEDURES

modified time and will not revert back to the coded time if the aircraft descends to a lower altitude where a shorter time interval applies.

- (b) RNAV systems are not able to alert the pilot for excursions outside of holding pattern protected airspace since the dimensions of this airspace are not included in the navigation database. In addition, the dimensions of holding pattern protected airspace vary with altitude for a charted holding pattern, even when the hold is used for the same application. Close adherence to the pilot actions described in this section reduce the likelihood of exceeding the boundary of holding pattern protected airspace when using RNAV lateral guidance to conduct holding.
 - (c) Holding patterns may be stored in the RNAV system's navigation database and include coding with parameters defining how the RNAV system will conduct the hold. For example, coding will determine whether holding is conducted to manual termination (HM), continued holding until the aircraft reaches a specified altitude (HA), or holding is conducted until the holding fix is crossed the first time after entry (HF). Some systems do not store all holding patterns, and may only store patterns associated with missed approaches and hold-in-lieu of procedure turn (HILPT). Some store all holding as standard patterns and require pilot action to conduct non-standard holding (left turns).
 - (1) Pilots are cautioned that multiple holding patterns may be established at the same fix. These holding patterns may differ in respect to turn directions and leg lengths depending on their application as an en route holding pattern, a holding pattern charted on a SID or STAR, or when used on an instrument approach procedure. Many RNAV systems limit the database coding at a particular fix to a single holding pattern definition. Pilots extracting the holding pattern from the navigation database are responsible for confirming that the holding pattern conforms to the assigned charted holding pattern in terms of turn direction, speed limit, timing, and distance.
 - (2) If ATC assigns holding that is not charted, then the pilot is responsible for programming the RNAV system with the assigned holding course, turn direction, speed limit, leg length, or leg time.
 - (3) Changes made after the initial execution may not apply until the next circuit of the holding pattern if the aircraft is in close proximity to the holding fix.
8. **Pilot Action.** The following actions are recommended to ensure that the aircraft remains within holding protected airspace when holding is performed using either conventional NAVAID guidance or when using RNAV lateral guidance.
- (a) **Speed.** When ATC furnishes advance notice of holding, start speed reduction to be at or below the maximum holding speed allowed at least 3 minutes prior to crossing the holding fix. If advance notice by ATC is not provided, begin speed reduction as expeditiously as practical. It is acceptable to allow RNAV systems to determine an appropriate deceleration point prior to the holding fix and to manage the speed reduction to the RNAV computed holding speed. If the pilot does not

US 5-3

SECTION 3. EN ROUTE PROCEDURES

permit the RNAV system to manage the deceleration from the computed point, the actual hold pattern size at holding entry may differ from the holding pattern size computed by the RNAV system.

- (1) Aircraft are expected to enter holding at or below the maximum holding speed established in paragraph 5-3-8 j 2(a) or the charted maximum holding speed.

[a] All fixed wing aircraft conducting holding should fly at speeds at or above 90 KIAS to minimize the influence of wind drift.

[b] When RNAV lateral guidance is used in fixed wing airplanes, it is desirable to enter and conduct holding at the lowest practical airspeed consistent with the airplane's recommended holding speed to address the cumulative errors associated with RNAV holding and increase the probability of remaining within protected airspace. It is acceptable to allow RNAV systems to determine a recommended holding speed *that is at or below the maximum holding speed*.

[c] Helicopter holding is based on a minimum airspeed of 90 KIAS.

- (2) Advise ATC immediately if unable to comply with the maximum holding airspeed and request an alternate clearance.

NOTE: *Speeds above the maximum or published holding speed may be necessary due to turbulence, icing, etc. Exceeding maximum holding airspeed may result in aircraft excursions beyond the holding pattern protected airspace. In a non-radar environment, the pilot should advise ATC that they cannot accept the assigned hold.*

- (3) Ensure the RNAV system applies the proper time and speed restrictions to a holding pattern. This is especially critical when climbing or descending to a holding pattern altitude where time and speed restrictions are different than at the present aircraft altitude.
- (b) Bank Angle. For holding not involving the use of RNAV lateral guidance, make all turns during entry and while holding at:
- (1) 3 degrees per second, or
 - (2) 30 degree bank angle, or
 - (3) 25 degree bank angle, provided a flight director system is used.

NOTE: *Use whichever requires the least bank angle.*

- (4) When using RNAV lateral guidance to conduct holding, it is acceptable to permit the RNAV system to calculate the appropriate bank angle for the outbound and inbound turns. Do not use flight guidance system bank angle limiting functions of less than 25 degrees unless the feature is not pilot-selectable, required by the aircraft limitations, or its use is necessary to comply with the aircraft's minimum maneuvering speed margins. If the bank angle must

US 5-3

SECTION 3. EN ROUTE PROCEDURES

be limited to less than 25 degrees, advise ATC that additional area for holding is required.

- (c) Compensate for wind effect primarily by drift correction on the inbound and outbound legs. When outbound, triple the inbound drift correction to avoid major turning adjustments; for example, if correcting left by 8 degrees when inbound, correct right by 24 degrees when outbound.
 - (d) Determine entry turn from aircraft heading upon arrival at the holding fix; +/- 5 degrees in heading is considered to be within allowable good operating limits for determining entry. When using RNAV lateral guidance for holding, it is permissible to allow the system to compute the holding entry.
 - (e) RNAV lateral guidance may execute a fly-by turn beginning at an excessively large distance from the holding fix. Reducing speed to the maximum holding speed at least 3 minutes prior to reaching the holding fix and using the recommended 25 degree bank angle will reduce potential excursions beyond protected airspace.
 - (f) When RNAV guidance is used for holding, pilots should be prepared to intervene if the turn from outbound leg to the inbound leg does not begin within a reasonable distance of the charted leg length, especially when holding is used as a course reversal HILPT. Pilot intervention is not required when holding in an ATC-assigned holding pattern that is not charted. However, notify ATC when the outbound leg length becomes excessive when RNAV guidance is used for holding.
- k. When holding at a fix and instructions are received specifying the time of departure from the fix, the pilot should adjust the aircraft's flight path within the limits of the established holding pattern in order to leave the fix at the exact time specified. After departing the holding fix, normal speed is to be resumed with respect to other governing speed requirements, such as terminal area speed limits, specific ATC requests, etc. Where the fix is associated with an instrument approach and timed approaches are in effect, a procedure turn must not be executed unless the pilot advises ATC, since aircraft holding are expected to proceed inbound on final approach directly from the holding pattern when approach clearance is received.
- l. Radar surveillance of holding pattern airspace areas.
- 1. Whenever aircraft are holding, ATC will usually provide radar surveillance of the holding airspace on the controller's radar display.
 - 2. The controller will attempt to detect any holding aircraft that stray outside the holding airspace and will assist any detected aircraft to return to the assigned airspace.

NOTE: *Many factors could prevent ATC from providing this additional service, such as workload, number of targets, precipitation, ground clutter, and radar system capability. These circumstances may make it unfeasible to maintain radar identification of aircraft to detect aircraft straying from the holding pattern. The provision of this service depends entirely upon whether controllers believe they are in a position to provide it*

US 5-3

SECTION 3. EN ROUTE PROCEDURES

and does not relieve a pilot of their responsibility to adhere to an accepted ATC clearance.

3. ATC is responsible for traffic and obstruction separation when they have assigned holding that is not associated with a published (charted) holding pattern. Altitudes assigned will be at or above the minimum vectoring or minimum IFR altitude.
4. If an aircraft is established in a published holding pattern at an assigned altitude above the published minimum holding altitude and subsequently cleared for the approach, the pilot may descend to the published minimum holding altitude. The holding pattern would only be a segment of the IAP *if* it is published on the instrument procedure chart and is used in lieu of a procedure turn.
- m. For those holding patterns where there are no published minimum holding altitudes, the pilot, upon receiving an approach clearance, must maintain the last assigned altitude until leaving the holding pattern and established on the inbound course. Thereafter, the published minimum altitude of the route segment being flown will apply. It is expected that the pilot will be assigned a holding altitude that will permit a normal descent on the inbound course.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

5-4-1 STANDARD TERMINAL ARRIVAL (STAR) PROCEDURES

a. A STAR is an ATC coded IFR arrival route established for application to arriving IFR aircraft destined for certain airports. STARs simplify clearance delivery procedures, and also facilitate transition between en route and instrument approach procedures.

1. STAR procedures may have mandatory speeds and/or crossing altitudes published. Other STARs may have planning information depicted to inform pilots what clearances or restrictions to “expect.” “Expect” altitudes/speeds are not considered STAR procedures crossing restrictions unless verbally issued by ATC. Published speed restrictions are independent of altitude restrictions and are mandatory unless modified by ATC. Pilots should plan to cross waypoints with a published speed restriction, at the published speed, and should not exceed this speed past the associated waypoint unless authorized by ATC or a published note to do so.

NOTE: The “expect” altitudes/speeds are published so that pilots may have the information for planning purposes. These altitudes/speeds must not be used in the event of lost communications unless ATC has specifically advised the pilot to expect these altitudes/speeds as part of a further clearance.

REFERENCE—14 CFR Section 91.185(c)(2)(iii).

2. Pilots navigating on, or navigating a published route inbound to, a STAR procedure must maintain last assigned altitude until receiving authorization to descend so as to comply with all published/issued restrictions. This authorization will contain the phraseology “DESCEND VIA.” If vectored or cleared to deviate off a STAR, pilots must consider the STAR canceled, unless the controller adds “expect to resume STAR”; pilots should then be prepared to rejoin the STAR at a subsequent fix or procedure leg. If a descent clearance has been received that included a crossing restriction, pilots should expect the controller to issue an altitude to maintain. If the STAR contains published altitude and/or speed restrictions, those restrictions are canceled and pilots will receive an altitude to maintain and, if necessary, a speed.

(a) Clearance to “descend via” authorizes pilots to:

- (1) Descend at pilot’s discretion to meet published restrictions and laterally navigate on a STAR.
- (2) When cleared to a waypoint depicted on a STAR, to descend from a previously assigned altitude at pilot’s discretion to the altitude depicted at that waypoint.
- (3) Once established on the depicted arrival, to descend and to meet all published or assigned altitude and/or speed restrictions.

NOTE:

1. When otherwise cleared along a route or procedure that contains published speed restrictions, the pilot must comply with those speed restrictions independent of any descend via clearance.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

2. *ATC anticipates pilots will begin adjusting speed the minimum distance necessary prior to a published speed restriction so as to cross the waypoint/fix at the published speed. Once at the published speed, ATC expects pilots will maintain the published speed until additional adjustment is required to comply with further published or ATC assigned speed restrictions or as required to ensure compliance with 14 CFR Section 91.117.*
3. *The “descend via” is used in conjunction with STARs to reduce phraseology by not requiring the controller to restate the altitude at the next waypoint/fix to which the pilot has been cleared.*
4. *Air traffic will assign an altitude to cross the waypoint/fix, if no altitude is depicted at the waypoint/fix, for aircraft on a direct routing to a STAR. Air traffic must ensure obstacle clearance when issuing a “descend via” instruction to the pilot.*
5. *Minimum en route altitudes (MEA) are not considered restrictions; however, pilots must remain above all MEAs, unless receiving an ATC instruction to descend below the MEA.*

EXAMPLE:**(1) Lateral/routing clearance only.**

“Cleared Tyler One arrival.”

NOTE: *In Example 1, pilots are cleared to fly the lateral path of the procedure. Compliance with any published speed restrictions is required. No descent is authorized.*

(2) Routing with assigned altitude.

“Cleared Tyler One arrival, descend and maintain flight level two four zero.”

“Cleared Tyler One arrival, descend at pilot's discretion, maintain flight level two four zero.”

NOTE: *In Example 2, the first clearance requires the pilot to descend to FL 240 as directed, comply with any published speed restrictions, and maintain FL 240 until cleared for further vertical navigation with a newly assigned altitude or a “descend via” clearance.*

The second clearance authorizes the pilot to descend to FL 240 at his discretion, to comply with any published speed restrictions, and then maintain FL 240 until issued further instructions.

(3) Lateral/routing and vertical navigation clearance.

“Descend via the Eagul Five arrival.”

“Descend via the Eagul Five arrival, except, cross Vnnom at or above one two thousand.”

US 5-4

SECTION 4. ARRIVAL PROCEDURES

NOTE: In Example 3, the first clearance authorized the aircraft to descend at pilot's discretion on the Eagul Five arrival; the pilot must descend so as to comply with all published altitude and speed restrictions.

The second clearance authorizes the same, but requires the pilot to descend so as to cross at Vnnom at or above 12,000.

(4) **Lateral/routing and vertical navigation clearance when assigning altitude not published on procedure.**

"Descend via the Eagul Five arrival, except after Geeno, maintain one zero thousand."

"Descend via the Eagul Five arrival, except cross Geeno at one one thousand then maintain seven thousand."

NOTE: In Example 4, the first clearance authorized the aircraft to track laterally on the Eagul Five Arrival and to descend at pilot's discretion so as to comply with all altitude and speed restrictions until reaching Geeno and then maintain 10,000. Upon reaching 10,000, aircraft should maintain 10,000 until cleared by ATC to continue to descend.

The second clearance requires the same, except the aircraft must cross Geeno at 11,000 and is then authorized to continue descent to and maintain 7,000.

(5) **Direct routing to intercept a STAR and vertical navigation clearance.**

"Proceed direct Leoni, descend via the Leoni One arrival."

"Proceed direct Denis, cross Denis at or above flight level two zero zero, then descend via the Mmell One arrival."

NOTE: In Example 5, in the first clearance an altitude is published at Leoni; the aircraft proceeds to Leoni, crosses Leoni at the published altitude and then descends via the arrival. If a speed restrictions is published at Leoni, the aircraft will slow to comply with the published speed.

In the second clearance, there is no altitude published at Denis; the aircraft must cross Denis at or above FL200, and then descends via the arrival.

- (b) Pilots cleared for vertical navigation using the phraseology "descend via" must inform ATC upon initial contact with a new frequency, of the altitude leaving, "descending via (procedure name)," the runway transition or landing direction if assigned, and any assigned restrictions not published on the procedure.

EXAMPLE:

1. Delta 121 is cleared to descend via the Eagul Five arrival, runway 26 transition: "Delta One Twenty One leaving flight level one niner zero, descending via the Eagul Five arrival runway two-six transition."

US 5-4
SECTION 4. ARRIVAL PROCEDURES

2. Delta 121 is cleared to descend via the Eagul Five arrival, but ATC has changed the bottom altitude to 12,000: "Delta One Twenty One leaving flight level one niner zero for one two thousand, descending via the Eagul Five arrival, runway two-six transition."
 3. (JetBlue 602 is cleared to descend via the Ivane Two arrival, landing south): "JetBlue six zero two leaving flight level two one zero descending via the Ivane Two arrival landing south."
- b. Pilots of IFR aircraft destined to locations for which STARs have been published may be issued a clearance containing a STAR whenever ATC deems it appropriate.
 - c. Use of STARs requires pilot possession of at least the approved chart. RNAV STARs must be retrievable by the procedure name from the aircraft database and conform to charted procedure. As with any ATC clearance or portion thereof, it is the responsibility of each pilot to accept or refuse an issued STAR. Pilots should notify ATC if they do not wish to use a STAR by placing "NO STAR" in the remarks section of the flight plan or by the less desirable method of verbally stating the same to ATC.
 - d. STAR charts are published in the Terminal Procedures Publications (TPP) and are available on subscription from the National Aeronautical Charting Office. [Jeppesen provides STAR charts in Airway Manual coverages, as appropriate, and to air carriers via subscription.]
 - e. **PBN STAR.**
 1. Public PBN STARs are normally designed using RNAV 1, RNP 1, or A-RNP NavSpecs. These procedures require system performance currently met by GPS or DME/DME/IRU PBN systems that satisfy the criteria discussed in AC 90-100A, U.S. Terminal and En Route Area Navigation (RNAV) Operations. These procedures, using RNAV 1 and RNP 1 NavSpecs, must maintain a total system error of not more than 1 NM for 95% of the total flight time. Minimum values for A-RNP procedures will be charted in the PBN box (for example, 1.00 or 0.30).
 2. In the U.S., a specific procedure's PBN requirements will be prominently displayed in separate, standardized notes boxes. For procedures with PBN elements, the "PBN box" will contain the procedure's NavSpec(s); and, if required: specific sensors or infrastructure needed for the navigation solution, any additional or advanced functional requirements, the minimum RNP value, and any amplifying remarks. Items listed in this PBN box are REQUIRED for the procedure's PBN elements.

5-4-2 LOCAL FLOW TRAFFIC MANAGEMENT PROGRAM

- a. This program is a continuing effort by the FAA to enhance safety, minimize the impact of aircraft noise and conserve aviation fuel. The enhancement of safety and reduction of noise is achieved in this program by minimizing low altitude maneuvering of arriving turbojet and turboprop aircraft weighing more than 12,500 pounds and, by permitting departure aircraft to climb to higher altitudes sooner, as arrivals are operating at higher altitudes at the points where their flight paths cross. The application of these procedures also reduces exposure time between controlled aircraft and uncontrolled aircraft at the lower altitudes in and around

US 5-4

SECTION 4. ARRIVAL PROCEDURES

the terminal environment. Fuel conservation is accomplished by absorbing any necessary arrival delays for aircraft included in this program operating at the higher and more fuel efficient altitudes.

- b. A fuel efficient descent is basically an uninterrupted descent (except where level flight is required for speed adjustment) from cruising altitude to the point when level flight is necessary for the pilot to stabilize the aircraft on final approach. The procedure for a fuel efficient descent is based on an altitude loss which is most efficient for the majority of aircraft being served. This will generally result in a descent gradient window of 250-350 feet per nautical mile.
- c. When crossing altitudes and speed restrictions are issued verbally or are depicted on a chart, ATC will expect the pilot to descend first to the crossing altitude and then reduce speed. Verbal clearances for descent will normally permit an uninterrupted descent in accordance with the procedure as described in paragraph b above. Acceptance of a charted fuel efficient descent (Runway Profile Descent) clearance requires the pilot to adhere to the altitudes, speeds, and headings depicted on the charts unless otherwise instructed by ATC. PILOTS RECEIVING A CLEARANCE FOR A FUEL EFFICIENT DESCENT ARE EXPECTED TO ADVISE ATC IF THEY DO NOT HAVE RUNWAY PROFILE DESCENT CHARTS PUBLISHED FOR THAT AIRPORT OR ARE UNABLE TO COMPLY WITH THE CLEARANCE.

5-4-3 APPROACH CONTROL

- a. Approach control is responsible for controlling all instrument flight operating within its area of responsibility. Approach control may serve one or more airfields, and control is exercised primarily by direct pilot and controller communications. Prior to arriving at the destination radio facility, instructions will be received from ARTCC to contact approach control on a specified frequency.
- b. **Radar Approach Control.**
 - 1. Where radar is approved for approach control service, it is used not only for radar approaches (Airport Surveillance Radar [ASR] and Precision Approach Radar [PAR]) but is also used to provide vectors in conjunction with published nonradar approaches based on radio NAVAIDs (ILS, VOR, NDB, TACAN). Radar vectors can provide course guidance and expedite traffic to the final approach course of any established IAP or to the traffic pattern for a visual approach. Approach control facilities that provide this radar service will operate in the following manner:
 - (a) Arriving aircraft are either cleared to an outer fix most appropriate to the route being flown with vertical separation and, if required, given holding information or, when radar handoffs are effected between the ARTCC and approach control, or between two approach control facilities, aircraft are cleared to the airport or to a fix so located that the handoff will be completed prior to the time the aircraft reaches the fix. When radar handoffs are utilized, successive arriving flights may be handed off to approach control with radar separation in lieu of vertical separation.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- (b) After release to approach control, aircraft are vectored to the final approach course (ILS, RNAV, GLS, VOR, ADF, etc.). Radar vectors and altitude or flight levels will be issued as required for spacing and separating aircraft. *Therefore, pilots must not deviate from the headings issued by approach control.* Aircraft will normally be informed when it is necessary to vector across the final approach course for spacing or other reasons. If approach course crossing is imminent and the pilot has not been informed that the aircraft will be vectored across the final approach course, the pilot should query the controller.
 - (c) The pilot is not expected to turn inbound on the final approach course unless an approach clearance has been issued. This clearance will normally be issued with the final vector for interception of the final approach course, and the vector will be such as to enable the pilot to establish the aircraft on the final approach course prior to reaching the final approach fix.
 - (d) In the case of aircraft already inbound on the final approach course, approach clearance will be issued prior to the aircraft reaching the final approach fix. When established inbound on the final approach course, radar separation will be maintained and the pilot will be expected to complete the approach utilizing the approach aid designated in the clearance (ILS, RNAV, GLS, VOR, radio beacons, etc.) as the primary means of navigation. Therefore, once established on the final approach course, pilots must not deviate from it unless a clearance to do so is received from ATC.
 - (e) After passing the final approach fix on final approach, aircraft are expected to continue inbound on the final approach course and complete the approach or effect the missed approach procedure published for that airport.
- 2. ARTCCs are approved for and may provide approach control services to specific airports. The radar systems used by these centers do not provide the same precision as an ASR/PAR used by approach control facilities and towers, and the update rate is not as fast. Therefore, pilots may be requested to report established on the final approach course.
 - 3. Whether aircraft are vectored to the appropriate final approach course or provide their own navigation on published routes to it, radar service is automatically terminated when the landing is completed or when instructed to change to advisory frequency at uncontrolled airports, whichever occurs first.

5-4-4 ADVANCE INFORMATION ON INSTRUMENT APPROACH

- a. When landing at airports with approach control services and where two or more IAPs are published, pilots will be provided in advance of their arrival with the type of approach to expect or that they may be vectored for a visual approach. This information will be broadcast either by a controller or on ATIS. It will not be furnished when the visibility is three miles or better and the ceiling is at or above the highest initial approach altitude established for any low altitude IAP for the airport.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- b. The purpose of this information is to aid the pilot in planning arrival actions; however, it is not an ATC clearance or commitment and is subject to change. Pilots should bear in mind that fluctuating weather, shifting winds, blocked runway, etc., are conditions which may result in changes to approach information previously received. It is important that pilots advise ATC immediately they are unable to execute the approach ATC advised will be used, or if they prefer another type of approach.
- c. Aircraft destined to uncontrolled airports, which have automated weather data with broadcast capability, should monitor the ASOS/AWOS frequency to ascertain the current weather for the airport. The pilot must advise ATC when he/she has received the broadcast weather and state his/her intentions.

NOTE:

1. *ASOS/AWOS should be set to provide one-minute broadcast weather updates at uncontrolled airports that are without weather broadcast capability by a human observer.*
 2. *Controllers will consider the long line disseminated weather from an automated weather system at an uncontrolled airport as trend and planning information only and will rely on the pilot for current weather information for the airport. If the pilot is unable to receive the current broadcast weather, the last long line disseminated weather will be issued to the pilot. When receiving IFR services, the pilot/aircraft operator is responsible for determining if weather/visibility is adequate for approach/landing.*
- d. When making an IFR approach to an airport not served by a tower or FSS, after ATC advises "CHANGE TO ADVISORY FREQUENCY APPROVED" you should broadcast your intentions, including the type of approach being executed, your position, and when over the final approach fix inbound (nonprecision approach) or when over the outer marker or fix used in lieu of the outer marker inbound (precision approach). Continue to monitor the appropriate frequency (UNICOM, etc.) for reports from other pilots.

5-4-5 INSTRUMENT APPROACH PROCEDURE (IAP) CHARTS

- a. 14 CFR Section 91.175(a), Instrument approaches to civil airports, requires the use of SIAPs prescribed for the airport in 14 CFR Part 97 unless otherwise authorized by the Administrator (including ATC). If there are military procedures published at a civil airport, aircraft operating under 14 CFR Part 91 must use the civil procedure(s). Civil procedures are defined with "FAA" in parenthesis; e.g., (FAA), at the top, center of the procedure chart. DOD procedures are defined using the abbreviation of the applicable military service in parenthesis; e.g., (USAF), (USN), (USA). 14 CFR Section 91.175(g), Military airports, requires civil pilots flying into or out of military airports to comply with the IAPs and takeoff and landing minimums prescribed by the authority having jurisdiction at those airports. Unless an emergency exists, civil aircraft operating at military airports normally require advance authorization, commonly referred to as "Prior Permission Required" or "PPR." Information on obtaining a PPR for a particular military airport can be found in the Chart Supplement U.S.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

NOTE: Civil aircraft may conduct practice VFR approaches using DOD instrument approach procedures when approved by the air traffic controller.

1. IAPs (standard and special, civil and military) are based on joint civil and military criteria contained in the U.S. Standard for TERPS. The design of IAPs based on criteria contained in TERPS, takes into account the interrelationship between airports, facilities, and the surrounding environment, terrain, obstacles, noise sensitivity, etc. Appropriate altitudes, courses, headings, distances, and other limitations are specified and, once approved, the procedures are published and distributed by government and commercial cartographers as instrument approach charts.
2. Not all IAPs are published in chart form. Radar IAPs are established where requirements and facilities exist but they are printed in tabular form in appropriate U.S. Government Flight Information Publications. [Jeppesen publishes all civil IAPs in chart form. Military radar IAPs are published in either chart form or tabular form. Military TACAN IAPs are not published by Jeppesen.]
3. The navigation equipment required to join and fly an instrument approach procedure is indicated by the title of the procedure and notes on the chart.
 - (a) Straight-in IAPs are identified by the navigational system providing the final approach guidance and the runway to which the approach is aligned (e.g. VOR RWY 13). Circling only approaches are identified by the navigational system providing final approach guidance and a letter (e.g., VOR A). More than one navigational system separated by a slash indicates that more than one type of equipment must be used to execute the **final approach** (e.g., VOR/DME RWY 31). More than one navigational system separated by the word "or" indicates either type of equipment may be used to execute the **final approach** (e.g., VOR or GPS RWY 15).
 - (b) In some cases, other types of navigation systems including radar may be required to execute other portions of the approach or to navigate to the IAF (e.g., an NDB procedure turn to an ILS, an NDB in the missed approach, or radar required to join the procedure or identify a fix). When radar or other equipment is required for procedure entry from the en route environment, a note will be charted in the **planview** of the approach procedure chart (e.g., RADAR REQUIRED or ADF REQUIRED). When radar or other equipment is required on portions of the procedure outside the final approach segment, including the missed approach, a note will be charted in the **notes box** of the pilot briefing portion of the approach chart (e.g., RADAR REQUIRED or DME REQUIRED). Notes are not charted when VOR is required outside the final approach segment. Pilots should ensure that the aircraft is equipped with the required NAVAID(s) in order to execute the approach, including the missed approach.

NOTE: Some military (i.e., U.S. Air Force and U.S. Navy) IAPs have these "additional equipment required" notes charted only in the planview of the approach procedure and do not conform to the same application standards used by the FAA.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- (c) The FAA has initiated a program to provide a new notation for LOC approaches when charted on an ILS approach requiring other navigational aids to fly the final approach course. The LOC minimums will be annotated with the NAVAID required (e.g., "DME Required" or "RADAR Required.") During the transition period, ILS approaches will still exist without the annotation.
- (d) Many ILS approaches having minima based on RVR are eligible for a landing minimum of RVR 1800. Some of these approaches are to runways that have touchdown zone and centerline lights. For many runways that do not have touchdown and centerline lights, it is still possible to allow a landing minimum of RVR 1800. For these runways, the normal ILS minimum of RVR 2400 can be annotated with a single or double asterisk or the dagger symbol "⁷", for example "*** 696/24 200 (200/1/2)." A note is included on the chart stating "***RVR 1800 authorized with use of FD or AP or HUD to DA." The pilot must use the flight director, or autopilot with an approved approach coupler, or head up display to decision altitude or to the initiation of a missed approach. In the interest of safety, single pilot operators should not fly approaches to 1800 RVR minimums on runways without touchdown and centerline lights using only a flight director, unless accompanied by the use of an autopilot with an approach coupler.
- (e) The naming of multiple approaches of the same type to the same runway is also changing. Multiple approaches with the same guidance will be annotated with an alphabetical suffix beginning at the end of the alphabet and working backwards for subsequent procedures (e.g., ILS Z RWY 28, ILS Y RWY 28, etc.). The existing annotations such as ILS 2 RWY 28 or Silver ILS RWY 28 will be phased out and replaced with the new designation. The Cat II and Cat III designations are used to differentiate between multiple ILSs to the same runway unless there are multiples of the same type.
- (f) RNAV (GPS) approaches to LNAV, LP, LNAV/VNAV and LPV lines of minima using WAAS and RNAV (GPS) approaches to LNAV and LNAV/VNAV lines of minima using GPS are charted as RNAV (GPS) RWY (Number) (e.g., RNAV (GPS) RWY 21). VOR/DME RNAV approaches will continue to be identified as VOR/DME RNAV RWY (Number) (e.g., VOR/DME RNAV RWY 21).
- (g) Performance-Based Navigation (PBN) Box. As charts are updated, a procedure's PBN requirements and conventional equipment requirements will be prominently displayed in separate, standardized notes boxes. For procedures with PBN elements, the PBN box will contain the procedure's navigation specification(s); and, if required: specific sensors or infrastructure needed for the navigation solution, any additional or advanced functional requirements, the minimum Required Navigation Performance (RNP) value, and any amplifying remarks. Items listed in this PBN box are REQUIRED for the procedure's PBN elements. For example, an ILS with an RNAV missed approach would require a specific capability to fly the missed approach portion of the procedure. That required capability will be listed in the PBN box. The separate Equipment Requirements box will list ground-based

US 5-4

SECTION 4. ARRIVAL PROCEDURES

equipment requirements. On procedures with both PBN elements and equipment requirements, the PBN requirements box will be listed first. The publication of these notes will continue incrementally until all charts have been amended to comply with the new standard.

4. Approach minimums are based on the local altimeter setting for that airport, unless annotated otherwise; e.g., Oklahoma City/Will Rogers World approaches are based on having a Will Rogers World altimeter setting. When a different altimeter source is required, or more than one source is authorized, it will be annotated on the approach chart; e.g., use Sidney altimeter setting, if not received, use Scottsbluff altimeter setting. Approach minimums may be raised when a nonlocal altimeter source is authorized. When more than one altimeter source is authorized, and the minima are different, they will be shown by separate lines in the approach minima box or a note; e.g., use Manhattan altimeter setting; when not available use Salina altimeter setting and increase all MDAs 40 feet. When the altimeter must be obtained from a source other than air traffic a note will indicate the source; e.g., Obtain local altimeter setting on CTAF. When the altimeter setting(s) on which the approach is based is not available, the approach is not authorized. Baro-VNAV must be flown using the local altimeter setting only. Where no local altimeter is available, the LNAV/VNAV line will still be published for use by WAAS receivers with a note that Baro-VNAV is not authorized. When a local and at least one other altimeter setting source is authorized and the local altimeter is not available Baro-VNAV is not authorized; however, the LNAV/VNAV minima can still be used by WAAS receivers using the alternate altimeter setting source.

NOTE: *Barometric Vertical Navigation (baro-VNAV). An RNAV system function which uses barometric altitude information from the aircraft's altimeter to compute and present a vertical guidance path to the pilot. The specified vertical path is computed as a geometric path, typically computed between two waypoints or an angle based computation from a single waypoint. Further guidance may be found in Advisory Circular 90-105.*

5. A pilot adhering to the altitudes, flight paths, and weather minimums depicted on the IAP chart or vectors and altitudes issued by the radar controller, is assured of terrain and obstruction clearance and runway or airport alignment during approach for landing.
6. IAPs are designed to provide an IFR descent from the en route environment to a point where a safe landing can be made. They are prescribed and approved by appropriate civil or military authority to ensure a safe descent during instrument flight conditions at a specific airport. It is important that pilots understand these procedures and their use prior to attempting to fly instrument approaches.
7. TERPS criteria are provided for the following types of instrument approach procedures:
 - (a) Precision Approach (PA). An instrument approach based on a navigation system that provides course and glidepath deviation information meeting the precision standards of ICAO Annex 10. For example, PAR, ILS, and GLS are precision approaches.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- (b) Approach with Vertical Guidance (APV). An instrument approach based on a navigation system that is not required to meet the precision approach standards of ICAO Annex 10 but provides course and glidepath deviation information. For example, Baro-VNAV, LDA with glidepath, LNAV/VNAV and LPV are APV approaches.
- (c) Nonprecision Approach (NPA). An instrument approach based on a navigation system which provides course deviation information, but no glidepath deviation information. For example, VOR, NDB and LNAV. As noted in subparagraph k, Vertical Descent Angle (VDA) on Nonprecision Approaches, some approach procedures may provide a Vertical Descent Angle as an aid in flying a stabilized approach, without requiring its use in order to fly the procedure. This does not make the approach an APV procedure, since it must still be flown to an MDA and has not been evaluated with a glidepath.
- b. The method used to depict prescribed altitudes on instrument approach charts differs according to techniques employed by different chart publishers. Prescribed altitudes may be depicted in four different configurations: minimum, maximum, mandatory, and recommended. The U.S. Government distributes charts produced by National Geospatial-Intelligence Agency (NGA) and FAA. Altitudes are depicted on these charts in the profile view with underscore, overscore, both or none to identify them as minimum, maximum, mandatory or recommended. [On Jeppesen Approach Charts, all altitudes are Minimum unless labeled Maximum, Mandatory, or Recommended.]
1. Minimum altitude will be depicted with the altitude value underscored. Aircraft are required to maintain altitude at or above the depicted value, e.g., 3000.
 2. Maximum altitude will be depicted with the altitude value overscored. Aircraft are required to maintain altitude at or below the depicted value, e.g., 4000.
 3. Mandatory altitude will be depicted with the altitude value both underscored and overscored. Aircraft are required to maintain altitude at the depicted value, e.g., 5000.
 4. Recommended altitude will be depicted with no overscore or underscore. These altitudes are depicted for descent planning, e.g., 6000.

NOTE:

1. *Pilots are cautioned to adhere to altitudes as prescribed because, in certain instances, they may be used as the basis for vertical separation of aircraft by ATC. When a depicted altitude is specified in the ATC clearance, that altitude becomes mandatory as defined above.*
2. *The ILS glide slope is intended to be intercepted at the published glide slope intercept altitude. This point marks the PFAF and is depicted by the "lightning bolt" symbol on U.S. Government charts. Intercepting the glide slope at this altitude marks the beginning of the final approach segment and ensures required obstacle clearance during descent from the glide slope intercept altitude to the lowest published decision altitude for the approach. Interception and tracking of the glide*

US 5-4

SECTION 4. ARRIVAL PROCEDURES

slope prior to the published glide slope interception altitude does not necessarily ensure that minimum, maximum, and/or mandatory altitudes published for any preceding fixes will be complied with during the descent. If the pilot chooses to track the glide slope prior to the glide slope interception altitude, they remain responsible for complying with published altitudes for any preceding stepdown fixes encountered during the subsequent descent.

- 3. Approaches used for simultaneous (parallel) independent and simultaneous close parallel operations procedurally require descending on the glideslope from the altitude at which the approach clearance is issued (refer to 5-4-15 and 5-4-16). For simultaneous close parallel (PRM) approaches, the Attention All Users Page (AAUP) may publish a note which indicates that descending on the glideslope/glidepath meets all crossing restrictions. However, if no such note is published, and for simultaneous independent approaches (4300 and greater runway separation) where an AAUP is not published, pilots are cautioned to monitor their descent on the glideslope/path outside of the PFAF to ensure compliance with published crossing restrictions during simultaneous operations.*
- 4. When parallel approach courses are less than 2500 feet apart and reduced in-trail spacing is authorized for simultaneous dependent operations, a chart note will indicate that simultaneous operations require use of vertical guidance and that the pilot should maintain last assigned altitude until established on glide slope. These approaches procedurally require utilization of the ILS glide slope for wake turbulence mitigation. Pilots should not confuse these simultaneous dependent operations with (SOIA) simultaneous close parallel PRM approaches, where PRM appears in the approach title.*
- 5. Altitude restrictions depicted at stepdown fixes within the final approach segment are applicable only when flying a Non-Precision Approach to a straight-in or circling line of minima identified as a MDA(H). Stepdown fix altitude restrictions within the final approach segment do not apply to pilots using Precision Approach (ILS) or Approach with Vertical Guidance (LPV, LNAV/VNAV) lines of minima identified as a DA(H), since obstacle clearance on these approaches are based on the aircraft following the applicable vertical guidance. Pilots are responsible for adherence to stepdown fix altitude restrictions when outside the final approach segment (i.e., initial or intermediate segment), regardless of which type of procedure the pilot is flying. (See FIG 5-4-1.)*

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-1

Instrument Approach Procedure Stepdown Fixes

- c. The **Minimum Safe Altitudes (MSA)** is published for emergency use on IAP or departure procedure (DP) graphic charts. MSAs provide 1,000 feet of clearance over all obstacles, but do not necessarily assure acceptable navigation signal coverage. The MSA depiction on the plan view of an approach chart or on a DP graphic chart contains the identifier of the center point of the MSA, the applicable radius of the MSA, a depiction of the sector(s), and the minimum altitudes above mean sea level which provide obstacle clearance. For conventional navigation systems, the MSA is normally based on the primary omnidirectional facility on which the IAP or DP graphic chart is predicated, but may be based on the airport reference point (ARP) if no suitable facility is available. For RNAV approaches or DP graphic charts, the MSA is based on an RNAV waypoint. MSAs normally have a 25 NM radius; however, for conventional navigation systems, this radius may be expanded to 30 NM if necessary to encompass the airport landing surfaces. A single sector altitude is normally established, however when the MSA is based on a facility and it is necessary to obtain relief from obstacles, an MSA with up to four sectors may be established.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

d. Terminal Arrival Area (TAA)

1. The TAA provides a transition from the en route structure to the terminal environment with little required pilot/air traffic control interface for aircraft equipped with Area Navigation (RNAV) systems. A TAA provides minimum altitudes with standard obstacle clearance when operating within the TAA boundaries. TAAs are primarily used on RNAV approaches but may be used on an ILS approach when RNAV is the sole means for navigation to the IF; however, they are not normally used in areas of heavy concentration of air traffic.
2. The basic design of the RNAV procedure underlying the TAA is normally the “T” design (also called the “Basic T”). The “T” design incorporates two IAFs plus a dual purpose IF/IAF that functions as both an intermediate fix and an initial approach fix. The T configuration continues from the IF/IAF to the final approach fix (FAF) and then to the missed approach point (MAP). The two base leg IAFs are typically aligned in a straight-line perpendicular to the intermediate course connecting at the IF/IAF. A Hold-in-Lieu-of Procedure Turn (HILPT) is anchored at the IF/IAF and depicted on U.S. Government publications using the “hold-in-lieu-of-PT” holding pattern symbol. When the HILPT is necessary for course alignment and/or descent, the dual purpose IF/IAF serves as an IAF during the entry into the pattern. Following entry into the HILPT pattern and when flying a route or sector labeled “NoPT,” the dual-purpose fix serves as an IF, marking the beginning of the Intermediate Segment. See FIG 5-4-2 and FIG 5-4-3 for the Basic “T” TAA configuration.

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-2
Basic "T" Design

Plan View

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-3
Basic "T" Design

3. The standard TAA based on the "T" design consists of three areas defined by the Initial Approach Fix (IAF) legs and the intermediate segment course beginning at the IF/IAF. These areas are called the straight-in, left-base, and right-base areas. (See FIG 5-4-4). TAA area lateral boundaries are identified by magnetic courses TO the IF/IAF. The straight-in area can be further divided into pie-shaped sectors with the boundaries identified by magnetic courses TO the (IF/IAF), and may contain stepdown sections defined by arcs based on RNAV distances from the IF/IAF. (See FIG 5-4-5). The right/left-base areas can only be subdivided using arcs based on RNAV distances from the IAFs for those areas.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-4

TAA Area

Plan View

To Straight-in IF(IAF)

**Aircraft maintain designated altitudes within each area.**

4. Entry from the terminal area onto the procedure is normally accomplished via a no procedure turn (NoPT) routing or via a course reversal maneuver. The published procedure will be annotated "NoPT" to indicate when the course reversal is not authorized when flying within a particular TAA sector. Otherwise, the pilot is expected to execute the course reversal under the provisions of 14 CFR Section 91.175. The pilot may elect to use the course reversal pattern when it is not required by the procedure, but must receive clearance from air traffic control before beginning the procedure.
- (a) ATC should not clear an aircraft to the left base leg or right base leg IAF within a TAA at an intercept angle exceeding 90 degrees. Pilots must not execute the HILPT course reversal when the sector or procedure segment is labeled "NoPT."
 - (b) ATC may clear aircraft direct to the fix labeled IF/IAF if the course to the IF/IAF is within the straight-in sector labeled "NoPT" and the intercept angle does not exceed 90 degrees. Pilots are expected to proceed direct to the IF/IAF and accomplish a straight-in approach. Do not execute HILPT course reversal. Pilots are also expected to fly the straight-in approach when ATC provides radar vectors and monitoring to the IF/IAF and issues a "straight-in" approach clearance; otherwise, the pilot is expected to execute the HILPT course reversal.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

REFERENCE—*AIM, Paragraph 5-4-6, Approach Clearance.*

- (c) On rare occasions, ATC may clear the aircraft for an approach at the airport without specifying the approach procedure by name or by a specific approach (for example, “cleared RNAV Runway 34 approach”) without specifying a particular IAF. In either case, the pilot should proceed direct to the IAF or to the IF/IAF associated with the sector that the aircraft will enter the TAA and join the approach course from that point and if required by that sector (i.e., sector is not labeled “NoPT”), complete the HILPT course reversal.

NOTE: *If approaching with a TO bearing that is on a sector boundary, the pilot is expected to proceed in accordance with a “NoPT” routing unless otherwise instructed by ATC.*

- 5. Altitudes published within the TAA replace the MSA altitude. However, unlike MSA altitudes the TAA altitudes are operationally usable altitudes. These altitudes provide at least 1,000 feet of obstacle clearance, more in mountainous areas. It is important that the pilot knows which area of the TAA the aircraft will enter in order to comply with the minimum altitude requirements. The pilot can determine which area of the TAA the aircraft will enter by determining the magnetic bearing of the aircraft TO the fix labeled IF/IAF. The bearing should then be compared to the published lateral boundary bearings that define the TAA areas. Do not use magnetic bearing to the right-base or left-base IAFs to determine position.
 - (a) An ATC clearance direct to an IAF or to the IF/IAF without an approach clearance does not authorize a pilot to descend to a lower TAA altitude. If a pilot desires a lower altitude without an approach clearance, request the lower TAA altitude from ATC. Pilots not sure of the clearance should confirm their clearance with ATC or request a specific clearance. Pilots entering the TAA with two-way radio communications failure (14 CFR Section 91.185, IFR Operations: Two-way Radio Communications Failure), must maintain the highest altitude prescribed by Section 91.185(c)(2) until arriving at the appropriate IAF.
 - (b) Once cleared for the approach, pilots may descend in the TAA sector to the minimum altitude depicted within the defined area/subdivision, unless instructed otherwise by air traffic control. Pilots should plan their descent within the TAA to permit a normal descent from the IF/IAF to the FAF. In FIG 5-4-5, pilots within the left or right-base areas are expected to maintain a minimum altitude of 6,000 feet until within 17 NM of the associated IAF. After crossing the 17 NM arc, descent is authorized to the lower charted altitudes. Pilots approaching from the northwest are expected to maintain a minimum altitude of 6,000 feet, and when within 22 NM of the IF/IAF, descend to a minimum altitude of 2,000 feet MSL until crossing the IF/IAF.

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-5
Sectored TAA Areas

6. U.S. Government charts depict TAAs using icons located in the plan view outside the depiction of the actual approach procedure. (See FIG 5-4-6). Use of icons is necessary to avoid obscuring any portion of the "T" procedure (altitudes, courses, minimum altitudes, etc.). The icon for each TAA area will be located and oriented on the plan view with respect to the direction of arrival to the approach procedure, and will show all TAA minimum altitudes and sector/radius subdivisions. The IAF for each area of the TAA is included on the icon where it appears on the approach to help the pilot orient the icon to the approach procedure. The IAF name and the distance of the TAA area boundary from the IAF are included on the outside arc of the TAA area icon.

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-6
RNAV (GPS) Approach Chart

7. TAA's may be modified from the standard size and shape to accommodate operational or ATC requirements. Some areas may be eliminated, while the other areas are expanded. The "T" design may be modified by the procedure designers where required by

US 5-4

SECTION 4. ARRIVAL PROCEDURES

terrain or ATC considerations. For instance, the “T” design may appear more like a regularly or irregularly shaped “Y,” upside down “L,” or an “I.”

- (a) FIG 5-4-7 depicts a TAA without a left base leg and right base leg. In this generalized example, pilots approaching on a bearing TO the IF/IAF from 271 clockwise to 089 are expected to execute a course reversal because the amount of turn required at the IF/IAF exceeds 90 degrees. The term “NoPT” will be annotated on the boundary of the TAA icon for the other portion of the TAA.

FIGURE 5-4-7

TAA with Left and Right Base Areas Eliminated

- (b) FIG 5-4-8 depicts another TAA modification that pilots may encounter. In this generalized example, the left base area and part of the straight-in area have been eliminated. Pilots operating within the TAA between 210 clockwise to 360 bearing TO the IF/IAF are expected to proceed direct to the IF/IAF and then execute the course reversal in order to properly align the aircraft for entry onto the intermediate segment or to avoid an excessive descent rate. Aircraft operating in areas from 001 clockwise to 090 bearing TO the IF/IAF are expected to proceed direct to the right base IAF and not execute course reversal maneuver. Aircraft cleared direct the IF/IAF by ATC in this sector will be expected to accomplish HILTP. Aircraft operating in areas 091 clockwise to 209 bearing TO the IF/IAF are expected to proceed direct to the IF/IAF and not execute the course reversal. These two

US 5-4

SECTION 4. ARRIVAL PROCEDURES

areas are annotated “NoPT” at the TAA boundary of the icon in these areas when displayed on the approach chart’s plan view.

FIGURE 5-4-8

TAA with Left Base and Part of Straight-In Area Eliminated

(c) FIG 5-4-9 depicts a TAA with right base leg and part of the straight-in area eliminated.

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-9

TAA with Right Base Eliminated

8. When an airway does not cross the lateral TAA boundaries, a feeder route will be established from an airway fix or NAVAID to the TAA boundary to provide a transition from the en route structure to the appropriate IAF. Each feeder route will terminate at the TAA boundary and will be aligned along a path pointing to the associated IAF. Pilots should descend to the TAA altitude after crossing the TAA boundary and cleared for the approach by ATC. (See FIG 5-4-10).

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-10

Examples of a TAA with Feeders from an Airway

9. Each waypoint on the "T" is assigned a pronounceable 5-letter name, except the missed approach waypoint. These names are used for ATC communications, RNAV databases, and aeronautical navigation products. The missed approach waypoint is assigned a pronounceable name when it is not located at the runway threshold.

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-11

Minimum Vectoring Altitude Charts

e. **Minimum Vectoring Altitudes (MVAs)** are established for use by ATC when radar ATC is exercised. MVA charts are prepared by air traffic facilities at locations where there are numerous different minimum IFR altitudes. Each MVA chart has sectors large enough to accommodate vectoring of aircraft within the sector at the MVA. Each sector boundary is at least 3 miles from the obstruction determining the MVA. To avoid a large sector with an excessively high MVA due to an isolated prominent obstruction, the obstruction may be enclosed in a buffer area whose boundaries are at least 3 miles from the obstruction. This is done to facilitate vectoring around the obstruction. (See FIG 5-4-11.)

1. The minimum vectoring altitude in each sector provides 1,000 feet above the highest obstacle in nonmountainous areas and 2,000 feet above the highest obstacle in designated mountainous areas. Where lower MVAs are required in designated mountainous areas to achieve compatibility with terminal routes or to permit vectoring to an IAP, 1,000 feet of obstacle clearance may be authorized with the use of ATC surveillance. The minimum vectoring altitude will provide at least 300 feet above the floor of controlled airspace.

NOTE: *OROCA is a published altitude which provides 1,000 feet of terrain and obstruction clearance in the U.S. (2,000 feet of clearance in designated mountainous areas). These altitudes are not assessed for NAVAID signal coverage, air traffic control surveillance, or communications coverage, and are published for general situational awareness, flight planning and in-flight contingency use.*

2. Because of differences in the areas considered for MVA, and those applied to other minimum altitudes, and the ability to isolate specific obstacles, some MVAs may be lower than the nonradar Minimum En Route Altitudes (MEAs), Minimum Obstruction Clearance Altitudes (MOCAs) or other minimum altitudes depicted on charts for a given

US 5-4
SECTION 4. ARRIVAL PROCEDURES

location. While being radar vectored, IFR altitude assignments by ATC will be at or above MVA.

3. The MVA/MIA may be lower than the TAA minimum altitude. If ATC has assigned an altitude to an aircraft that is below the TAA minimum altitude, the aircraft will either be assigned an altitude to maintain until established on a segment of a published route or instrument approach procedure, or climbed to the TAA altitude.
- f. **Circling.** Circling minimums charted on an RNAV (GPS) approach chart may be lower than the LNAV/VNAV line of minima, but never lower than the LNAV line of minima (straight-in approach). Pilots may safely perform the circling maneuver at the circling published line of minima if the approach and circling maneuver is properly performed according to aircraft category and operational limitations.

FIGURE 5-4-12

Example of LNAV and Circling Minima Lower Than LNAV/VNAV DA.

Harrisburg International RNAV (GPS) RWY 13

CATEGORY		A	B	C	D
LPV	DA	558 / 24 250 (300 – ½)			
LNAV/ VNAV	DA	1572 – 5 1264 (1300 – 5)			
LNAV	MDA	1180 / 24 872 (900 – ½)	1180 / 40 872 (900 – ¾)	1180 / 2 872 (900 – 2)	1180 / 2¼ 872 (900 – 2¼)
CIRCLING		1180 / 1 870 (900 – 1)	1180 / 1¼ 870 (900 – 1¼)	1180 – 2½ 870 (900 – 2½)	1180 – 2¾ 870 (900 – 2¾)

US 5-4

SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-13

Explanation of LNAV and/or Circling Minima Lower than LNAV/VNAV DA

g. FIG 5-4-13 provides a visual representation of an obstacle evaluation and calculation of LNAV MDA, Circling MDA, LNAV/VNAV DA.

1. **No vertical guidance (LNAV).** A line is drawn horizontal at obstacle height and 250 feet added for Required Obstacle Clearance (ROC). The controlling obstacle used to determine LNAV MDA can be different than the controlling obstacle used in determining ROC for circling MDA. Other factors may force a number larger than 250 ft to be added to the LNAV OCS. The number is rounded up to the next higher 20 foot increment.
2. **Circling MDA.** The circling MDA will provide 300 foot obstacle clearance within the area considered for obstacle clearance and may be lower than the LNAV/VNAV DA, but never lower than the straight in LNAV MDA. This may occur when different controlling obstacles are used or when other controlling factors force the LNAV MDA to be higher than 250 feet above the LNAV OCS. In FIG 5-4-12, the required obstacle clearance for both the LNAV and Circle resulted in the same MDA, but lower than the LNAV/VNAV DA. FIG 5-4-13 provides an illustration of this type of situation.
3. **Vertical guidance (LNAV/VNAV).** A line is drawn horizontal at obstacle height until reaching the obstacle clearance surface (OCS). At the OCS, a vertical line is drawn until reaching the glide path. This is the DA for the approach. This method places the offending obstacle in front of the LNAV/VNAV DA so it can be seen and avoided. In some situations, this may result in the LNAV/VNAV DA being higher than the LNAV and/or Circling MDA.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- h. **The Visual Descent Point (VDP)**, identified by the symbol (V), is a defined point on the final approach course of a nonprecision straight-in approach procedure from which a stabilized visual descent from the MDA to the runway touchdown point may be commenced. The pilot should not descend below the MDA prior to reaching the VDP. The VDP will be identified by DME or RNAV along-track distance to the MAP. The VDP distance is based on the lowest MDA published on the IAP and harmonized with the angle of the visual glide slope indicator (VGSi) (if installed) or the procedure VDA (if no VGSi is installed). A VDP may not be published under certain circumstances which may result in a destabilized descent between the MDA and the runway touchdown point. Such circumstances include an obstacle penetrating the visual surface between the MDA and runway threshold, lack of distance measuring capability, or the procedure design prevents a VDP to be identified.
1. VGSi systems may be used as a visual aid to the pilot to determine if the aircraft is in a position to make a stabilized descent from the MDA. When the visibility is close to minimums, the VGSi may not be visible at the VDP due to its location beyond the MAP.
 2. Pilots not equipped to receive the VDP should fly the approach procedure as though no VDP had been provided.
 3. On a straight-in nonprecision IAP, descent below the MDA between the VDP and the MAP may be inadvisable or impossible. Aircraft speed, height above the runway, descent rate, amount of turn, and runway length are some of the factors which must be considered by the pilot to determine if a safe descent and landing can be accomplished.
- i. A visual segment obstruction evaluation is accomplished during procedure design on all IAPs. Obstacles (both lighted and unlighted) are allowed to penetrate the visual segment obstacle identification surfaces. Identified obstacle penetrations may cause restrictions to instrument approach operations which may include an increased approach visibility requirement, not publishing a VDP, and/or prohibiting night instrument operations to the runway. There is no implicit obstacle protection from the MDA/DA to the touchdown point. Accordingly, it is the responsibility of the pilot to visually acquire and avoid obstacles below the MDA/DA during transition to landing.
1. Unlighted obstacle penetrations may result in prohibiting night instrument operations to the runway. A chart note will be published in the pilot briefing strip "Procedure NA at Night."
 2. Use of a VGSi may be approved in lieu of obstruction lighting to restore night instrument operations to the runway. A chart note will be published in the pilot briefing strip "Straight-in Rwy XX at Night, operational VGSi required, remain on or above VGSi glidepath until threshold."
- j. The highest obstacle (man-made, terrain, or vegetation) will be charted on the planview of an IAP. Other obstacles may be charted in either the planview or the airport sketch based on distance from the runway and available chart space. The elevation of the charted obstacle will be shown to the nearest foot above mean sea level. Obstacles without a verified accuracy are indicated by a $\pm$ symbol following the elevation value.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- k. **Vertical Descent Angle (VDA).** FAA policy is to publish a VDA/TCH on all nonprecision approaches except those published in conjunction with vertically guided minimums (i.e., ILS or LOC RWY XX) or no-FAF procedures without a step-down fix (i.e., on-airport VOR or NDB). A VDA does not guarantee obstacle protection below the MDA in the visual segment. The presence of a VDA does not change any nonprecision approach requirements.
1. Obstacles may penetrate the obstacle identification surface below the MDA in the visual segment of an IAP that has a published VDA/TCH. When the VDA/TCH is not authorized due to an obstacle penetration that would require a pilot to deviate from the VDA between MDA and touchdown, the VDA/TCH will be replaced with the note "Visual Segment - Obstacles" in the profile view of the IAP (See FIG 5-4-14). Accordingly, pilots are advised to carefully review approach procedures to identify where the optimum stabilized descent to landing can be initiated. Pilots that follow the previously published descent angle, provided by the RNAV system, below the MDA on procedures with this note may encounter obstacles in the visual segment. Pilots must visually avoid any obstacles below the MDA.
 - (a) VDA/TCH data is furnished by FAA on the official source document for publication on IAP charts and for coding in the navigation database unless, as noted previously, replaced by the note "Visual Segment - Obstacles."
 - (b) Commercial chart providers and navigation systems may publish or calculate a VDA/TCH even when the FAA does not provide such data. Pilots are cautioned that they are responsible for obstacle avoidance in the visual segment regardless of the presence or absence of a VDA/TCH and associated navigation system advisory vertical guidance.
 2. The threshold crossing height (TCH) used to compute the descent angle is published with the VDA. The VDA and TCH information are charted on the profile view of the IAP following the fix (FAF/stepdown) used to compute the VDA. If no PA/APV IAP is established to the same runway, the VDA will be equal to or higher than the glide path angle of the VGSI installed on the same runway provided it is within instrument procedure criteria. A chart note will indicate if the VGSI is not coincident with the VDA. Pilots must be aware that the published VDA is for advisory information only and not to be considered instrument procedure derived vertical guidance. The VDA solely offers an aid to help pilots establish a continuous, stabilized descent during final approach.

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-14

Example of a Chart Note

3. Pilots may use the published angle and estimated/actual groundspeed to find a target rate of descent from the rate of descent table published in the back of the U.S. Terminal Procedures Publication. This rate of descent can be flown with the Vertical Velocity Indicator (VVI) in order to use the VDA as an aid to flying a stabilized descent. No special equipment is required.
4. A straight-in aligned procedure may be restricted to circling only minimums when an excessive descent gradient necessitates. The descent angle between the FAF/step-down fix and the Circling MDA must not exceed the maximum descent angle allowed by TERPS criteria. A published VDA on these procedures does not imply that landing straight ahead is recommended or even possible. The descent rate based on the VDA may exceed the capabilities of the aircraft and the pilot must determine how to best maneuver the aircraft within the circling area in order to land safely.
- I. In isolated cases, an IAP may contain a published visual flight path. These procedures are annotated "Fly Visual to Airport" or "Fly Visual." A dashed arrow indicating the visual flight path will be included in the profile and plan views with an approximate heading and distance to the end of the runway.
 1. The depicted ground track associated with the "Fly Visual to Airport" segment should be flown as a "Dead Reckoning" course. When executing the "Fly Visual to Airport" segment, the flight visibility must not be less than that prescribed in the IAP; the pilot must remain clear of clouds and proceed to the airport maintaining visual contact with the ground. Altitude on the visual flight path is at the discretion of the pilot, and it is the

US 5-4

SECTION 4. ARRIVAL PROCEDURES

responsibility of the pilot to visually acquire and avoid obstacles in the “Fly Visual to Airport” segment.

2. Missed approach obstacle clearance is assured only if the missed approach is commenced at the published MAP. Before initiating an IAP that contains a “Fly Visual to Airport” segment, the pilot should have preplanned climb out options based on aircraft performance and terrain features. Obstacle clearance is the responsibility of the pilot when the approach is continued beyond the MAP.

NOTE: *The FAA Administrator retains the authority to approve instrument approach procedures where the pilot may not necessarily have one of the visual references specified in 14 CFR §91.175 and related rules. It is not a function of procedure design to ensure compliance with §91.175. The annotation “Fly Visual to Airport” provides relief from §91.175 requirements that the pilot have distinctly visible and identifiable visual references prior to descent below MDA/DA.*

- m. **Area Navigation (RNAV) Instrument Approach Charts.** Reliance on RNAV systems for instrument operations is becoming more commonplace as new systems such as GPS and augmented GPS such as the Wide Area Augmentation System (WAAS) are developed and deployed. In order to support full integration of RNAV procedures into the National Airspace System (NAS), the FAA developed a new charting format for IAPs (See FIG 5-4-6). This format avoids unnecessary duplication and proliferation of instrument approach charts. The original stand alone GPS charts, titled simply “GPS,” are being converted to the newer format as the procedures are revised. One reason for the revision is the addition of WAAS based minima to the approach chart. The reformatted approach chart is titled “RNAV (GPS) RWY XX.” Up to four lines of minima are included on these charts. Ground Based Augmentation System (GBAS) Landing System (GLS) was a placeholder for future WAAS and LAAS minima, and the minima was always listed as N/A. The GLS minima line has now been replaced by the WAAS LPV (Localizer Performance with Vertical Guidance) minima on most RNAV (GPS) charts. LNAV/VNAV (lateral navigation/vertical navigation) was added to support both WAAS electronic vertical guidance and Barometric VNAV. LPV and LNAV/VNAV are both APV procedures as described in paragraph 5-4-5a7. The original GPS minima, titled “S-XX,” for straight in runway XX, is retitled LNAV (lateral navigation). Circling minima may also be published. A new type of nonprecision WAAS minima will also be published on this chart and titled LP (localizer performance). LP will be published in locations where vertically guided minima cannot be provided due to terrain and obstacles and therefore, no LPV or LNAV/VNAV minima will be published. GBAS procedures are published on a separate chart and the GLS minima line is to be used only for GBAS. ATC clearance for the RNAV procedure authorizes a properly certified pilot to utilize any minimums for which the aircraft is certified (for example, a WAAS equipped aircraft utilizes the LPV or LP minima but a GPS only aircraft may not). The RNAV chart includes information formatted for quick reference by the pilot or flight crew at the top of the chart. This portion of the chart, developed based on a

US 5-4

SECTION 4. ARRIVAL PROCEDURES

study by the Department of Transportation, Volpe National Transportation System Center, is commonly referred to as the pilot briefing.

1. The minima lines are:

- (a) **GLS.** “GLS” is the acronym for GBAS Landing System. The U.S. version of GBAS has traditionally been referred to as LAAS. The worldwide community has adopted GBAS as the official term for this type of navigation system. To coincide with international terminology, the FAA is also adopting the term GBAS to be consistent with the international community. This line was originally published as a placeholder for both WAAS and LAAS minima and marked as N/A since no minima was published. As the concepts for GBAS and WAAS procedure publication have evolved, GLS will now be used only for GBAS minima, which will be on a separate approach chart. Most RNAV(GPS) approach charts have had the GLS minima line replaced by a WAAS LPV line of minima.
- (b) **LPV.** “LPV” is the acronym for localizer performance with vertical guidance. RNAV (GPS) approaches to LPV lines of minima take advantage of the improved accuracy of WAAS lateral and vertical guidance to provide an approach that is very similar to a Category I Instrument Landing System (ILS). The approach to LPV line of minima is designed for angular guidance with increasing sensitivity as the aircraft gets closer to the runway. The sensitivities are nearly identical to those of the ILS at similar distances. This was done intentionally to allow the skills required to proficiently fly an ILS to readily transfer to flying RNAV (GPS) approaches to the LPV line of minima. Just as with an ILS, the LPV has vertical guidance and is flown to a DA. Aircraft can fly this minima line with a statement in the Aircraft Flight Manual that the installed equipment supports LPV approaches. This includes Class 3 and 4 TSO-C146 GPS/WAAS equipment.
- (c) **LNAV/VNAV.** LNAV/VNAV identifies APV minimums developed to accommodate an RNAV IAP with vertical guidance, usually provided by approach certified Baro-VNAV, but with lateral and vertical integrity limits larger than a precision approach or LPV. LNAV stands for Lateral Navigation; VNAV stands for Vertical Navigation. This minima line can be flown by aircraft with a statement in the Aircraft Flight Manual that the installed equipment supports GPS approaches and has an approach-approved barometric VNAV, or if the aircraft has been demonstrated to support LNAV/VNAV approaches. This includes Class 2, 3 and 4 TSO-C146 GPS/WAAS equipment. Aircraft using LNAV/VNAV minimums will descend to landing via an internally generated descent path based on satellite or other approach approved VNAV systems. Since electronic vertical guidance is provided, the minima will be published as a DA. Other navigation systems may be specifically authorized to use this line of minima, see Section A, Terms/Landing Minima Data, of the U.S. Terminal Procedures books.
- (d) **LP.** “LP” is the acronym for localizer performance. Approaches to LP lines of minima take advantage of the improved accuracy of WAAS to provide approaches, with lateral guidance and angular guidance. Angular guidance does

US 5-4

SECTION 4. ARRIVAL PROCEDURES

not refer to a glideslope angle but rather to the increased lateral sensitivity as the aircraft gets closer to the runway, similar to localizer approaches. However, the LP line of minima is a Minimum Descent Altitude (MDA) rather than a DA (H). Procedures with LP lines of minima will not be published with another approach that contains approved vertical guidance (LNAV/VNAV or LPV). It is possible to have LP and LNAV published on the same approach chart but LP will only be published if it provides lower minima than an LNAV line of minima. LP is not a fail-down mode for LPV. LP will only be published if terrain, obstructions, or some other reason prevent publishing a vertically guided procedure. WAAS avionics may provide GNSS-based advisory vertical guidance during an approach to an LP line of minima. Barometric altimeter information remains the primary altitude reference for complying with any altitude restrictions. WAAS equipment may not support LP, even if it supports LPV, if it was approved before TSO-C145b and TSO-C146b. Receivers approved under previous TSOs may require an upgrade by the manufacturer in order to be used to fly to LP minima. Receivers approved for LP must have a statement in the approved Flight Manual or Supplemental Flight Manual including LP as one of the approved approach types.

- (e) **LNAV.** This minima is for lateral navigation only, and the approach minimum altitude will be published as a minimum descent altitude (MDA). LNAV provides the same level of service as the present GPS stand alone approaches. LNAV minimums support the following navigation systems: WAAS, when the navigation solution will not support vertical navigation; and, GPS navigation systems which are presently authorized to conduct GPS approaches.

NOTE: GPS receivers approved for approach operations in accordance with: AC 20-138, *Airworthiness Approval of Positioning and Navigation Systems*, qualify for this minima. WAAS navigation equipment must be approved in accordance with the requirements specified in TSO-C145() or TSO-C146() and installed in accordance with Advisory Circular AC 20-138.

- 2. Other systems may be authorized to utilize these approaches. See the description in Section A of the U.S. Terminal Procedures books for details. Operational approval must also be obtained for Baro-VNAV systems to operate to the LNAV/VNAV minimums. Baro-VNAV may not be authorized on some approaches due to other factors, such as no local altimeter source being available. Baro-VNAV is not authorized on LPV procedures. Pilots are directed to their local Flight Standards District Office (FSDO) for additional information.

NOTE: RNAV and Baro-VNAV systems must have a manufacturer supplied electronic database which must include the waypoints, altitudes, and vertical data for the procedure to be flown. The system must be able to retrieve the procedure by name from the aircraft navigation database, not just as a manually entered series of waypoints.

3. ILS or RNAV (GPS) charts.

- (a) Some RNAV (GPS) charts will also contain an ILS line of minima to make use of the ILS precision final in conjunction with the RNAV GPS capabilities for the por-

US 5-4

SECTION 4. ARRIVAL PROCEDURES

tions of the procedure prior to the final approach segment and for the missed approach. Obstacle clearance for the portions of the procedure other than the final approach segment is still based on GPS criteria.

NOTE: *Some GPS receiver installations inhibit GPS navigation whenever **ANY** ILS frequency is tuned. Pilots flying aircraft with receivers installed in this manner must wait until they are on the intermediate segment of the procedure prior to the PFAF (PFAF is the active waypoint) to tune the ILS frequency and must tune the ILS back to a VOR frequency in order to fly the GPS based missed approach.*

- (b) **Charting.** There are charting differences between ILS, RNAV (GPS), and GLS approaches.

- (1) The LAAS procedure is titled "GLS RWY XX" on the approach chart.
- (2) The VDB provides information to the airborne receiver where the guidance is synthesized.
- (3) The LAAS procedure is identified by a four alpha-numeric character field referred to as the RPI or approach ID and is similar to the IDENT feature of the ILS.
- (4) The RPI is charted.
- (5) Most RNAV(GPS) approach charts have had the GLS (NA) minima line replaced by an LPV line of minima.
- (6) Since the concepts for LAAS and WAAS procedure publication have evolved, GLS will now be used only for LAAS minima, which will be on a separate approach chart.

4. Required Navigation Performance (RNP)

- (a) Pilots are advised to refer to the "TERMS/LANDING MINIMUMS DATA" (Section A) of the U.S. Government Terminal Procedures books for aircraft approach eligibility requirements by specific RNP level requirements.
- (b) Some aircraft have RNP approval in their AFM without a GPS sensor. The lowest level of sensors that the FAA will support for RNP service is DME/DME. However, necessary DME signal may not be available at the airport of intended operations. For those locations having an RNAV chart published with LNAV/VNAV minimums, a procedure note may be provided such as "DME/DME RNP-0.3 NA." This means that RNP aircraft dependent on DME/DME to achieve RNP-0.3 are not authorized to conduct this approach. Where DME facility availability is a factor, the note may read "DME/DME RNP-0.3 Authorized; ABC and XYZ Required." This means that ABC and XYZ facilities have been determined by flight inspection to be required in the navigation solution to assure RNP-0.3. VOR/DME updating must not be used for approach procedures.

5. Chart Terminology

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- (a) Decision Altitude (DA) replaces the familiar term Decision Height (DH). DA conforms to the international convention where altitudes relate to MSL and heights relate to AGL. DA will eventually be published for other types of instrument approach procedures with vertical guidance, as well. DA indicates to the pilot that the published descent profile is flown to the DA (MSL), where a missed approach will be initiated if visual references for landing are not established. Obstacle clearance is provided to allow a momentary descent below DA while transitioning from the final approach to the missed approach. The aircraft is expected to follow the missed instructions while continuing along the published final approach course to at least the published runway threshold waypoint or MAP (if not at the threshold) before executing any turns.
 - (b) Minimum Descent Altitude (MDA) has been in use for many years, and will continue to be used for the LNAV only and circling procedures.
 - (c) Threshold Crossing Height (TCH) has been traditionally used in “precision” approaches as the height of the glide slope above threshold. With publication of LNAV/VNAV minimums and RNAV descent angles, including graphically depicted descent profiles, TCH also applies to the height of the “descent angle,” or glide-path, at the threshold. Unless otherwise required for larger type aircraft which may be using the IAP, the typical TCH is 30 to 50 feet.
6. The MINIMA FORMAT will also change slightly.
- (a) Each line of minima on the RNAV IAP is titled to reflect the level of service available; e.g., GLS, LPV, LNAV/VNAV, LP, and LNAV. CIRCLING minima will also be provided.
 - (b) The minima title box indicates the nature of the minimum altitude for the IAP. For example:
 - (1) DA will be published next to the minima line title for minimums supporting vertical guidance such as for GLS, LPV or LNAV/VNAV.
 - (2) MDA will be published as the minima line on approaches with lateral guidance only, LNAV, or LP. Descent below the MDA must meet the conditions stated in 14 CFR Section 91.175.
 - (3) Where two or more systems, such as LPV and LNAV/VNAV, share the same minima, each line of minima will be displayed separately.
7. Chart Symbolology changed slightly to include:
- (a) **Descent Profile.** The published descent profile and a graphical depiction of the vertical path to the runway will be shown. Graphical depiction of the RNAV vertical guidance will differ from the traditional depiction of an ILS glide slope (feather) through the use of a shorter vertical track beginning at the decision altitude.
 - (1) It is FAA policy to design IAPs with minimum altitudes established at fixes/waypoints to achieve optimum stabilized (constant rate) descents within each

US 5-4

SECTION 4. ARRIVAL PROCEDURES

procedure segment. This design can enhance the safety of the operations and contribute toward reduction in the occurrence of controlled flight into terrain (CFIT) accidents. Additionally, the National Transportation Safety Board (NTSB) recently emphasized that pilots could benefit from publication of the appropriate IAP descent angle for a stabilized descent on final approach. The RNAV IAP format includes the descent angle to the hundredth of a degree; e.g., **3.00 degrees**. The angle will be provided in the graphically depicted descent profile.

- (2) The stabilized approach may be performed by reference to vertical navigation information provided by WAAS or LNAV/VNAV systems; or for LNAV-only systems, by the pilot determining the appropriate aircraft attitude/groundspeed combination to attain a constant rate descent which best emulates the published angle. To aid the pilot, U.S. Government Terminal Procedures Publication charts publish an expanded Rate of Descent Table on the inside of the back hard cover for use in planning and executing precision descents under known or approximate groundspeed conditions.
- (b) **Visual Descent Point (VDP).** A VDP will be published on most RNAV IAPs. VDPs apply only to aircraft utilizing LP or LNAV minima, not LPV or LNAV/VNAV minimums.
- (c) **Missed Approach Symbolology.** In order to make missed approach guidance more readily understood, a method has been developed to display missed approach guidance in the profile view through the use of quick reference icons. Due to limited space in the profile area, only four or fewer icons can be shown. However, the icons may not provide representation of the entire missed approach procedure. The entire set of textual missed approach instructions are provided at the top of the approach chart in the pilot briefing. (See FIG 5-4-6).
- (d) **Waypoints.** All RNAV or GPS stand-alone IAPs are flown using data pertaining to the particular IAP obtained from an onboard database, including the sequence of all WPs used for the approach and missed approach, except that step down waypoints may not be included in some TSO-C129 receiver databases. Included in the database, in most receivers, is coding that informs the navigation system of which WPs are fly-over (FO) or fly-by (FB). The navigation system may provide guidance appropriately — including leading the turn prior to a fly-by WP; or causing overflight of a fly-over WP. Where the navigation system does not provide such guidance, the pilot must accomplish the turn lead or waypoint overflight manually. Chart symbology for the FB WP provides pilot awareness of expected actions. Refer to the legend of the U.S. Terminal Procedures books.
- (e) TAAs are described in paragraph 5-4-5d, Terminal Arrival Area (TAA). When published, the RNAV chart depicts the TAA areas through the use of “icons” representing each TAA area associated with the RNAV procedure (See FIG 5-4-6). These icons are depicted in the plan view of the approach chart, generally arranged on the chart in accordance with their position relative to the aircraft's

US 5-4

SECTION 4. ARRIVAL PROCEDURES

arrival from the en route structure. The WP, to which navigation is appropriate and expected within each specific TAA area, will be named and depicted on the associated TAA icon. Each depicted named WP is the IAF for arrivals from within that area. TAAs may not be used on all RNAV procedures because of airspace congestion or other reasons.

- (f) **Published Temperature Limitations.** There are currently two temperature limitations that may be published in the notes box of the middle briefing strip on an instrument approach procedure (IAP). The two published temperature limitations are:
- (1) A temperature range limitation associated with the use of baro-VNAV that may be published on a United States PBN IAP titled RNAV (GPS) or RNAV (RNP); and/or
 - (2) A Cold Temperature Airport (CTA) limitation designated by a snowflake ICON and temperature in Celsius (C) that is published on every IAP for the airfield.

REFERENCE—AIM, Chapter 7, Section 3, *Cold Temperature Barometric Altimeter Errors, Setting Procedures and Cold Temperature Airports (CTA).*

- (g) **WAAS Channel Number/Approach ID.** The WAAS Channel Number is an optional equipment capability that allows the use of a 5-digit number to select a specific final approach segment without using the menu method. The Approach ID is an airport unique 4-character combination for verifying the selection and extraction of the correct final approach segment information from the aircraft database. It is similar to the ILS ident, but displayed visually rather than aurally. The Approach ID consists of the letter W for WAAS, the runway number, and a letter other than L, C, or R, which could be confused with Left, Center and Right, e.g., W35A. Approach IDs are assigned in the order that WAAS approaches are built to that runway number at that airport. The WAAS Channel Number and Approach ID are displayed in the upper left corner of the approach procedure pilot briefing.
- (h) At locations where outages of WAAS vertical guidance may occur daily due to initial system limitations, the notes “WAAS outages may occur daily. WAAS VNAV NOTAM Service not provided.” will be placed on RNAV (GPS) approach charts. Many of these outages will be very short in duration, but may result in the disruption of the vertical portion of the approach. The notes indicate that NOTAMs or Air Traffic advisories are not provided for outages which occur in the WAAS LNAV/VNAV or LPV vertical service. Use LNAV or circling minima for flight planning at these locations, whether as a destination or alternate. For flight operations at these locations, when the WAAS avionics indicate that LNAV/VNAV or LPV service is available, then vertical guidance may be used to complete the approach using the displayed level of service. Should an outage occur during the procedure, reversion to LNAV minima may be required. As the WAAS coverage is expanded, these notes will be removed.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

NOTE: Properly trained and approved, as required, TSO-C145() and TSO-C146() equipped users (WAAS users) with and using approved baro-VNAV equipment may plan for LNAV/VNAV DA at an alternate airport. Specifically authorized WAAS users with and using approved baro-VNAV equipment may also plan for RNP 0.3 DA at the alternate airport as long as the pilot has verified RNP availability through an approved prediction program.

5-4-6 APPROACH CLEARANCE

- a. An aircraft which has been cleared to a holding fix and subsequently “cleared . . . approach” has not received new routing. Even though clearance for the approach may have been issued prior to the aircraft reaching the holding fix, ATC would expect the pilot to proceed via the holding fix (his/her last assigned route), and the feeder route associated with that fix (if a feeder route is published on the approach chart) to the initial approach fix (IAF) to commence the approach. *WHEN CLEARED FOR THE APPROACH, THE PUBLISHED OFF AIRWAY (FEEDER) ROUTES THAT LEAD FROM THE EN ROUTE STRUCTURE TO THE IAF ARE PART OF THE APPROACH CLEARANCE.*
- b. If a feeder route to an IAF begins at a fix located along the route of flight prior to reaching the holding fix, and clearance for an approach is issued, a pilot should commence the approach via the published feeder route; i.e., the aircraft would not be expected to overfly the feeder route and return to it. The pilot is expected to commence the approach in a similar manner at the IAF, if the IAF for the procedure is located along the route of flight to the holding fix.
- c. If a route of flight directly to the initial approach fix is desired, it should be so stated by the controller with phraseology to include the words “direct . . . ;” “proceed direct” or a similar phrase which the pilot can interpret without question. When uncertain of the clearance, immediately query ATC as to what route of flight is desired.
- d. The name of an instrument approach, as published, is used to identify the approach, even though a component of the approach aid, such as the glideslope on an Instrument Landing System, is inoperative or unreliable. The controller will use the name of the approach as published, but must advise the aircraft at the time an approach clearance is issued that the inoperative or unreliable approach aid component is unusable, except when the title of the published approach procedures otherwise allows; for example, ILS Rwy 05 or LOC Rwy 05.
- e. The following applies to aircraft on radar vectors and/or cleared “direct to” in conjunction with an approach clearance:
 1. Maintain the last altitude assigned by ATC until the aircraft is established on a published segment of a transition route, or approach procedure segment, or other published route, for which a lower altitude is published on the chart. If already on an established route, or approach or arrival segment, you may descend to whatever minimum altitude is listed for that route or segment.
 2. Continue on the vector heading until intercepting the next published ground track applicable to the approach clearance.
 3. Once reaching the final approach fix via the published segments, the pilot may continue on approach to a landing.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

4. If proceeding to an IAF with a published course reversal (procedure turn or hold-in-lieu of PT pattern), except when cleared for a straight in approach by ATC, the pilot must execute the procedure turn/hold-in-lieu of PT, and complete the approach.
5. If cleared to an IAF/IF via a NoPT route, or no procedure turn/hold-in-lieu of PT is published, continue with the published approach.
6. In addition to the above, RNAV aircraft may be issued a clearance direct to the IAF/IF at intercept angles not greater than 90 degrees for both conventional and RNAV instrument approaches. Controllers may issue a heading or a course direct to a fix between the IF and FAF at intercept angles not greater than 30 degrees for both conventional and RNAV instrument approaches. In all cases, controllers will assign altitudes that ensure obstacle clearance and will permit a normal descent to the FAF. When clearing aircraft direct to the IF, ATC will radar monitor the aircraft until the IF and will advise the pilot to expect clearance direct to the IF at least 5 miles from the fix. ATC must issue a straight-in approach clearance when clearing an aircraft direct to an IAF/IF with a procedure turn or hold-in-lieu of a procedure turn, and ATC does not want the aircraft to execute the course reversal.

NOTE: Refer to 14 CFR 91.175 (i).

7. RNAV aircraft may be issued a clearance direct to the FAF that is also charted as an IAF, in which case the pilot is expected to execute the depicted procedure turn or hold-in-lieu of procedure turn. ATC will not issue a straight-in approach clearance. If the pilot desires a straight-in approach, they must request vectors to the final approach course outside of the FAF or fly a published "NoPT" route. When visual approaches are in use, ATC may clear an aircraft direct to the FAF.

NOTE:

1. *In anticipation of a clearance by ATC to any fix published on an instrument approach procedure, pilots of RNAV aircraft are advised to select an appropriate IAF or feeder fix when loading an instrument approach procedure into the RNAV system.*
2. *Selection of "Vectors-to-Final" or "Vectors" option for an instrument approach may prevent approach fixes located outside of the FAF from being loaded into an RNAV system. Therefore, the selection of these options is discouraged due to increased workload for pilots to reprogram the navigation system.*
8. Arrival Holding. Some approach charts have an arrival holding pattern depicted at an IAF or at a feeder fix located along an airway. The arrival hold is depicted using a "thin line" since it is not always a mandatory part of the instrument procedure.
 - (a) Arrival holding is charted where holding is frequently required prior to starting the approach procedure so that detailed holding instructions are not required. The arrival holding pattern is not authorized unless assigned by ATC. Holding at the same fix may also be depicted on the en route chart.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

(b) Arrival holding is also charted where it is necessary to use a holding pattern to align the aircraft for procedure entry from an airway due to turn angle limitations imposed by procedure design standards. When the turn angle from an airway into the approach procedure exceeds the permissible limits, an arrival holding pattern may be published along with a note on the procedure specifying the fix, the airway, and arrival direction where use of the arrival hold is required for procedure entry. Unlike a hold-in-lieu of procedure turn, use of the arrival holding pattern is not authorized until assigned by ATC. If ATC does not assign the arrival hold before reaching the holding fix, the pilot should request the hold for procedure entry. Once established on the inbound holding course and an approach clearance has been received, the published procedure can commence. Alternatively, if using the holding pattern for procedure entry is not desired, the pilot may ask ATC for maneuvering airspace to align the aircraft with the feeder course.

EXAMPLE: Planview Chart Note: "Proc NA via V343 northeast bound without holding at JOXIT. ATC CLNC REQD."

f. An RF leg is defined as a constant radius circular path around a defined turn center that starts and terminates at a fix. An RF leg may be published as part of a procedure. Since not all aircraft have the capability to fly these leg types, pilots are responsible for knowing if they can conduct an RNAV approach with an RF leg. Requirements for RF legs will be indicated on the approach chart in the notes section or at the applicable initial approach fix. Controllers will clear RNAV-equipped aircraft for instrument approach procedures containing RF legs:

1. Via published transitions, or
2. In accordance with paragraph e6 above, and
3. ATC will not clear aircraft direct to any waypoint beginning or within an RF leg, and will not assign fix/waypoint crossing speeds in excess of charted speed restrictions.

EXAMPLE: Controllers will not clear aircraft direct to THIRD because that waypoint begins the RF leg, and aircraft cannot be vectored or cleared to TURNN or vectored to intercept the approach segment at any point between THIRD and FORTH because this is the RF leg. (See FIG 5-4-15.)

g. When necessary to cancel a previously issued approach clearance, the controller will advise the pilot "Cancel Approach Clearance" followed by any additional instructions when applicable.

5-4-7 INSTRUMENT APPROACH PROCEDURES

a. Aircraft approach category means a grouping of aircraft based on a speed of V_{REF} at the maximum certified landing weight, if specified, or if V_{REF} is not specified, $1.3V_{SO}$ at the maximum certified landing weight. V_{REF} , V_{SO} , and the maximum certified landing weight are those values as established for the aircraft by the certification authority of the country of registry. A pilot must maneuver the aircraft within the circling approach protected area (see FIG 5-4-29) to achieve the obstacle and terrain clearances provided by procedure design criteria.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- b. In addition to pilot techniques for maneuvering, one acceptable method to reduce the risk of flying out of the circling approach protected area is to use either the minima corresponding to the category determined during certification or minima associated with a higher category. Helicopters may use Category A minima. If it is necessary to operate at a speed in excess of the upper limit of the speed range for an aircraft's category, the minimums for the higher category should be used. This may occur with certain aircraft types operating in heavy/gusty wind, icing, or non-normal conditions. For example, an airplane which fits into Category B, but is circling to land at a speed of 145 knots, should use the approach Category D minimums. As an additional example, a Category A airplane (or helicopter) which is operating at 130 knots on a straight-in approach should use the approach Category C minimums.
- c. A pilot who chooses an alternative method when it is necessary to maneuver at a speed that exceeds the category speed limit (for example, where higher category minimums are not published) should consider the following factors that can significantly affect the actual ground track flown:
1. Bank angle. For example, at 165 knots groundspeed, the radius of turn increases from 4,194 feet using 30 degrees of bank to 6,654 feet when using 20 degrees of bank. When using a shallower bank angle, it may be necessary to modify the flightpath or indicated airspeed to remain within the circling approach protected area. Pilots should be aware that excessive bank angle can lead to a loss of aircraft control.
 2. Indicated airspeed. Procedure design criteria typically utilize the highest speed for a particular category. If a pilot chooses to operate at a higher speed, other factors should be modified to ensure that the aircraft remains within the circling approach protected area.
 3. Wind speed and direction. For example, it is not uncommon to maneuver the aircraft to a downwind leg where the groundspeed will be considerably higher than the indicated airspeed. Pilots must carefully plan the initiation of all turns to ensure that the aircraft remains within the circling approach protected area.
 4. Pilot technique. Pilots frequently have many options with regard to flightpath when conducting circling approaches. Sound planning and judgment are vital to proper execution. The lateral and vertical path to be flown should be carefully considered using current weather and terrain information to ensure that the aircraft remains within the circling approach protected area.
- d. It is important to remember that 14 CFR Section 91.175(c) requires that "where a DA/DH or MDA is applicable, no pilot may operate an aircraft below the authorized MDA or continue an approach below the authorized DA/DH unless the aircraft is continuously in a position from which a descent to a landing on the intended runway can be made at a normal rate of descent using normal maneuvers, and for operations conducted under Part 121 or Part 135 unless that descent rate will allow touchdown to occur within the touchdown zone of the runway of intended landing."
- e. See the following category limits:
1. Category A: Speed less than 91 knots.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

2. Category B: Speed 91 knots or more but less than 121 knots.
3. Category C: Speed 121 knots or more but less than 141 knots.
4. Category D: Speed 141 knots or more but less than 166 knots.
5. Category E: Speed 166 knots or more.

NOTE: V_{REF} in the above definition refers to the speed used in establishing the approved landing distance under the airworthiness regulations constituting the type certification basis of the airplane, regardless of whether that speed for a particular airplane is $1.3 V_{SO}$, $1.23 V_{SR}$, or some higher speed required for airplane controllability. This speed, at the maximum certificated landing weight, determines the lowest applicable approach category for all approaches regardless of actual landing weight.

- f. When operating on an unpublished route or while being radar vectored, the pilot, when an approach clearance is received, must, in addition to complying with the minimum altitudes for IFR operations (14 CFR Section 91.177), maintain the last assigned altitude unless a different altitude is assigned by ATC, or until the aircraft is established on a segment of a published route or IAP. After the aircraft is so established, published altitudes apply to descent within each succeeding route or approach segment unless a different altitude is assigned by ATC. Notwithstanding this pilot responsibility, for aircraft operating on unpublished routes or while being radar vectored, ATC will, except when conducting a radar approach, issue an IFR approach clearance only after the aircraft is established on a segment of a published route or IAP, or assign an altitude to maintain until the aircraft is established on a segment of a published route or instrument approach procedure. For this purpose, the procedure turn of a published IAP must not be considered a segment of that IAP until the aircraft reaches the initial fix or navigation facility upon which the procedure turn is predicated.

EXAMPLE: Cross Redding VOR at or above five thousand, cleared VOR runway three four approach.

or

Five miles from outer marker, turn right heading three three zero, maintain two thousand until established on the localizer, cleared ILS runway three six approach.

NOTE:

1. The altitude assigned will assure IFR obstruction clearance from the point at which the approach clearance is issued until established on a segment of a published route or IAP. If uncertain of the meaning of the clearance, immediately request clarification from ATC.
 2. An aircraft is not established on an approach while below published approach altitudes. If the MVA/MIA allows, and ATC assigns an altitude below an IF or IAF altitude, the pilot will be issued an altitude to maintain until past a point that the aircraft is established on the approach.
- g. Several IAPs, using various navigation and approach aids may be authorized for an airport. ATC may advise that a particular approach procedure is being used, primarily to expedite

US 5-4

SECTION 4. ARRIVAL PROCEDURES

traffic. If issued a clearance that specifies a particular approach procedure, notify ATC immediately if a different one is desired. In this event it may be necessary for ATC to withhold clearance for the different approach until such time as traffic conditions permit. However, a pilot involved in an emergency situation will be given priority. If the pilot is not familiar with the specific approach procedure, ATC should be advised and they will provide detailed information on the execution of the procedure.

REFERENCE—*AIM, Paragraph 5-4-4, Advance Information on Instrument Approach.*

- h. The name of an instrument approach, as published, is used to identify the approach, even though a component of the approach aid, such as the glideslope on an Instrument Landing System, is inoperative or unreliable. The controller will use the name of the approach as published, but must advise the aircraft at the time an approach clearance is issued that the inoperative or unreliable approach aid component is unusable, except when the title of the published approach procedures otherwise allows, for example, ILS or LOC.
- i. Except when being radar vectored to the final approach course, when cleared for a specifically prescribed IAP; i.e., “cleared ILS runway one niner approach” or when “cleared approach” i.e., execution of any procedure prescribed for the airport, pilots must execute the entire procedure commencing at an IAF or an associated feeder route as described on the IAP chart unless an appropriate new or revised ATC clearance is received, or the IFR flight plan is canceled.
- j. Pilots planning flights to locations which are private airfields or which have instrument approach procedures based on private navigation aids should obtain approval from the owner. In addition, the pilot must be authorized by the FAA to fly special instrument approach procedures associated with private navigation aids (see paragraph 5-4-8). Owners of navigation aids that are not for public use may elect to turn off the signal for whatever reason they may have; for example, maintenance, energy conservation, etc. Air traffic controllers are not required to question pilots to determine if they have permission to land at a private airfield or to use procedures based on privately owned navigation aids, and they may not know the status of the navigation aid. Controllers presume a pilot has obtained approval from the owner and the FAA for use of special instrument approach procedures and is aware of any details of the procedure if an IFR flight plan was filed to that airport.
- k. Pilots should not rely on radar to identify a fix unless the fix is indicated as “RADAR” on the IAP. Pilots may request radar identification of an OM, but the controller may not be able to provide the service due either to workload or not having the fix on the video map.
- l. If a missed approach is required, advise ATC and include the reason (unless initiated by ATC). Comply with the missed approach instructions for the instrument approach procedure being executed, unless otherwise directed by ATC.

REFERENCE—

AIM, Paragraph 5-4-21, Missed Approach.

AIM, Paragraph 5-5-5, Missed Approach.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

5-4-8 SPECIAL INSTRUMENT APPROACH PROCEDURES

Instrument Approach Procedure (IAP) charts reflect the criteria associated with the U.S. Standard for Terminal Instrument [Approach] Procedures (TERPs), which prescribes standardized methods for use in developing IAPs. Standard IAPs are published in the Federal Register (FR) in accordance with Title 14 of the Code of Federal Regulations, Part 97, and are available for use by appropriately qualified pilots operating properly equipped and airworthy aircraft in accordance with operating rules and procedures acceptable to the FAA. Special IAPs are also developed using TERPS but are not given public notice in the FR. The FAA authorizes only certain individual pilots and/or pilots in individual organizations to use special IAPs, and may require additional crew training and/or aircraft equipment or performance, and may also require the use of landing aids, communications, or weather services not available for public use. Additionally, IAPs that service private use airports or heliports are generally special IAPs. FDC NOTAMs for Specials, FDC T-NOTAMs, may also be used to promulgate safety-of-flight information relating to Specials provided the location has a valid landing area identifier and is serviced by the United States NOTAM system. Pilots may access NOTAMs online or through an FAA Flight Service Station (FSS). FSS specialists will not automatically provide NOTAM information to pilots for special IAPs during telephone pre-flight briefings. Pilots who are authorized by the FAA to use special IAPs must specifically request FDC NOTAM information for the particular special IAP they plan to use.

5-4-9 PROCEDURE TURN AND HOLD-IN-LIEU OF PROCEDURE TURN

- a. A procedure turn is the maneuver prescribed when it is necessary to reverse direction to establish the aircraft inbound on an intermediate or final approach course. The procedure turn or hold-in-lieu-of-PT is a required maneuver when it is depicted on the approach chart, unless cleared by ATC for a straight-in approach. Additionally, the procedure turn or hold-in-lieu-of-PT is not permitted when the symbol "No PT" is depicted on the initial segment being used, when a RADAR VECTOR to the final approach course is provided, or when conducting a timed approach from a holding fix. The altitude prescribed for the procedure turn is a *minimum* altitude until the aircraft is established on the inbound course. The maneuver must be completed within the distance specified in the profile view. For a hold-in-lieu-of-PT, the holding pattern direction must be flown as depicted and the specified leg length/timing must not be exceeded.

NOTE: *The pilot may elect to use the procedure turn or hold-in-lieu-of-PT when it is not required by the procedure, but must first receive an amended clearance from ATC. If the pilot is uncertain whether the ATC clearance intends for a procedure turn to be conducted or to allow for a straight-in approach, the pilot must immediately request clarification from ATC (14 CFR Section 91.123).*

1. On U.S. Government charts, a barbed arrow indicates the maneuvering side of the outbound course on which the procedure turn is made. [In lieu of the barbed arrow, Jeppesen charts the 45/180 degree procedure turn.] Headings are provided for course reversal using the 45 degree type procedure turn. However, the point at which the turn may be commenced and the type and rate of turn is left to the discretion of the pilot (limited by the charted remain within xx NM distance). Some of the options are the 45 degree

US 5-4

SECTION 4. ARRIVAL PROCEDURES

procedure turn, the racetrack pattern, the teardrop procedure turn, or the 80 degree ↔ 260 degree course reversal. Racetrack entries should be conducted on the maneuvering side where the majority of protected airspace resides. If an entry places the pilot on the non-maneuvering side of the PT, correction to intercept the outbound course ensures remaining within protected airspace. Some procedure turns are specified by procedural track. These turns must be flown exactly as depicted.

2. Descent to the procedure turn (PT) completion altitude from the PT fix altitude (when one has been published or assigned by ATC) must not begin until crossing over the PT fix or abeam and proceeding outbound. Some procedures contain a note in the chart profile view that says "Maintain (altitude) or above until established outbound for procedure turn" (See FIG 5-4-16). Newer procedures will simply depict an "at or above" altitude at the PT fix without a chart note (See FIG 5-4-17). Both are there to ensure required obstacle clearance is provided in the procedure turn entry zone (See FIG 5-4-18). Absence of a chart note or specified minimum altitude adjacent to the PT fix is an indication that descent to the procedure turn altitude can commence immediately upon crossing over the PT fix, regardless of the direction of flight. This is because the minimum altitudes in the PT entry zone and the PT maneuvering zone are the same.

FIGURE 5-4-15

Example of an RNAV Approach with RF Leg

FIGURE 5-4-16

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-17

FIGURE 5-4-18

- When the approach procedure involves a procedure turn, a maximum speed of not greater than 200 knots (IAS) should be observed from first overhauling the course reversal IAF through the procedure turn maneuver to ensure containment within the obstruction clearance area. Pilots should begin the outbound turn immediately after passing the procedure turn fix. The procedure turn maneuver must be executed within the distance specified in the profile view. The normal procedure turn distance is 10 miles. This may be reduced to a minimum of 5 miles where only Category A or helicop-

US 5-4

SECTION 4. ARRIVAL PROCEDURES

ter aircraft are to be operated or increased to as much as 15 miles to accommodate high performance aircraft.

4. A teardrop procedure or penetration turn may be specified in some procedures for a required course reversal. The teardrop procedure consists of departure from an initial approach fix on an outbound course followed by a turn toward and intercepting the inbound course at or prior to the intermediate fix or point. Its purpose is to permit an aircraft to reverse direction and lose considerable altitude within reasonably limited airspace. Where no fix is available to mark the beginning of the intermediate segment, it must be assumed to commence at a point 10 miles prior to the final approach fix. When the facility is located on the airport, an aircraft is considered to be on final approach upon completion of the penetration turn. However, the final approach segment begins on the final approach course 10 miles from the facility.
5. A holding pattern in lieu of procedure turn may be specified for course reversal in some procedures. In such cases, the holding pattern is established over an intermediate fix or a final approach fix. The holding pattern distance or time specified in the profile view must be observed. For a hold-in-lieu-of-PT, the holding pattern direction must be flown as depicted and the specified leg length/timing must not be exceeded. Maximum holding airspeed limitations as set forth for all holding patterns apply. The holding pattern maneuver is completed when the aircraft is established on the inbound course after executing the appropriate entry. If cleared for the approach prior to returning to the holding fix, and the aircraft is at the prescribed altitude, additional circuits of the holding pattern are not necessary nor expected by ATC. If pilots elect to make additional circuits to lose excessive altitude or to become better established on course, it is their responsibility to so advise ATC upon receipt of their approach clearance.
6. A procedure turn is not required when an approach can be made directly from a specified intermediate fix to the final approach fix. In such cases, the term "NoPT" is used with the appropriate course and altitude to denote that the procedure turn is not required. If a procedure turn is desired, and when cleared to do so by ATC, descent below the procedure turn altitude should not be made until the aircraft is established on the inbound course, since some NoPT altitudes may be lower than the procedure turn altitudes.

b. Limitations on Procedure Turns

1. In the case of a radar initial approach to a final approach fix or position, or a timed approach from a holding fix, or where the procedure specifies NoPT, no pilot may make a procedure turn unless, when final approach clearance is received, the pilot so advises ATC and a clearance is received to execute a procedure turn.
2. When a teardrop procedure turn is depicted and a course reversal is required, this type turn must be executed.
3. When a holding pattern replaces a procedure turn, the holding pattern must be followed, except when RADAR VECTORING is provided or when NoPT is shown on the approach course. The recommended entry procedures will ensure the aircraft remains

US 5-4

SECTION 4. ARRIVAL PROCEDURES

within the holding pattern's protected airspace. As in the procedure turn, the descent from the minimum holding pattern altitude to the final approach fix altitude (when lower) may not commence until the aircraft is established on the inbound course. Where a holding pattern is established in-lieu-of a procedure turn, the maximum holding pattern airspeeds apply.

REFERENCE—AIM, Paragraph 5-3-8j2, Holding.

4. The absence of the procedure turn barb in the plan view indicates that a procedure turn is not authorized for that procedure.

5-4-10 TIMED APPROACHES FROM A HOLDING FIX

- a. **TIMED APPROACHES** may be conducted when the following conditions are met:
 1. A control tower is in operation at the airport where the approaches are conducted.
 2. Direct communications are maintained between the pilot and the center or approach controller until the pilot is instructed to contact the tower.
 3. If more than one missed approach procedure is available, none require a course reversal.
 4. If only one missed approach procedure is available, the following conditions are met:
 - (a) Course reversal is not required; and,
 - (b) Reported ceiling and visibility are equal to or greater than the highest prescribed circling minimums for the IAP.
 5. When cleared for the approach, pilots must not execute a procedure turn. (14 CFR Section 91.175.)
- b. Although the controller will not specifically state that "timed approaches are in use," the assigning of a time to depart the final approach fix inbound (nonprecision approach) or the outer marker or fix used in lieu of the outer marker inbound (precision approach) is indicative that timed approach procedures are being utilized, or in lieu of holding, the controller may use radar vectors to the Final Approach Course to establish a mileage interval between aircraft that will ensure the appropriate time sequence between the final approach fix/outer marker or fix used in lieu of the outer marker and the airport.
- c. Each pilot in an approach sequence will be given advance notice as to the time they should leave the holding point on approach to the airport. When a time to leave the holding point has been received, the pilot should adjust the flight path to leave the fix as closely as possible to the designated time. (See FIG 5-4-19.)

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-19
Timed Approaches from a Holding Fix

EXAMPLE: At 12:03 local time, in the example shown, a pilot holding, receives instructions to leave the fix inbound at 12:07. These instructions are received just as the pilot has completed turn at the outbound end of the holding pattern and is proceeding inbound towards the fix. Arriving back over the fix, the pilot notes that the time is 12:04 and that there are 3 minutes to lose in order to leave the fix at the assigned time. Since the time remaining is more than two minutes, the pilot plans to fly a race track pattern rather than a 360 degree turn, which would use up 2 minutes. The turns at the ends of the race track pattern will consume approximately 2 minutes. Three minutes to go, minus 2 minutes required for the turns, leaves 1 minute for level flight. Since two portions of level flight will be required to get back to the fix inbound, the pilot halves the 1 minute remaining and plans to fly level for 30 seconds outbound before starting the turn back to the fix on final approach. If the winds were negli-

US 5-4

SECTION 4. ARRIVAL PROCEDURES

ble at flight altitude, this procedure would bring the pilot inbound across the fix precisely at the specified time of 12:07. However, if expecting headwind on final approach, the pilot should shorten the 30 second outbound course somewhat, knowing that the wind will carry the aircraft away from the fix faster while outbound and decrease the ground speed while returning to the fix. On the other hand, compensating for a tailwind on final approach, the pilot should lengthen the calculated 30 second outbound heading somewhat, knowing that the wind would tend to hold the aircraft closer to the fix while outbound and increase the ground speed while returning to the fix.

5-4-11 RADAR APPROACHES

- a. The only airborne radio equipment required for radar approaches is a functioning radio transmitter and receiver. The radar controller vectors the aircraft to align it with the runway centerline. The controller continues the vectors to keep the aircraft on course until the pilot can complete the approach and landing by visual reference to the surface. There are two types of radar approaches: Precision (PAR) and Surveillance (ASR).
- b. A radar approach may be given to any aircraft upon request and may be offered to pilots of aircraft in distress or to expedite traffic, however, an ASR might not be approved unless there is an ATC operational requirement, or in an unusual or emergency situation. Acceptance of a PAR or ASR by a pilot does not waive the prescribed weather minimums for the airport or for the particular aircraft operator concerned. The decision to make a radar approach when the reported weather is below the established minimums rests with the pilot.
- c. PAR and ASR minimums are published on separate pages in the FAA Terminal Procedures Publication (TPP). [PAR and ASR minimums are included on Jeppesen Radar IAP Charts.]
 1. **Precision Approach (PAR).** A PAR is one in which a controller provides highly accurate navigational guidance in azimuth and elevation to a pilot. Pilots are given headings to fly, to direct them to, and keep their aircraft aligned with the extended centerline of the landing runway. They are told to anticipate glide path interception approximately 10 to 30 seconds before it occurs and when to start descent. The published Decision Height will be given only if the pilot requests it. If the aircraft is observed to deviate above or below the glide path, the pilot is given the relative amount of deviation by use of terms "slightly" or "well" and is expected to adjust the aircraft's rate of descent/ascent to return to the glide path. Trend information is also issued with respect to the elevation of the aircraft and may be modified by the terms "rapidly" and "slowly"; e.g., "well above glide path, coming down rapidly." Range from touchdown is given at least once each mile. If an aircraft is observed by the controller to proceed outside of specified safety zone limits in azimuth and/or elevation and continue to operate outside these prescribed limits, the pilot will be directed to execute a missed approach or to fly a specified course unless the pilot has the runway environment (runway, approach lights, etc.) in sight. Navigational guidance in azimuth and elevation is provided the pilot until the aircraft reaches the published Decision Height (DH). Advisory course and glidepath information is furnished by the controller until the aircraft passes over the landing threshold, at which point the pilot is advised of any deviation from the runway centerline. Radar service is automatically terminated upon completion of the approach.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

2. **Surveillance Approach (ASR).** An ASR is one in which a controller provides navigational guidance in azimuth only. The pilot is furnished headings to fly to align the aircraft with the extended centerline of the landing runway. Since the radar information used for a surveillance approach is considerably less precise than that used for a precision approach, the accuracy of the approach will not be as great and higher minimums will apply. Guidance in elevation is not possible but the pilot will be advised when to commence descent to the Minimum Descent Altitude (MDA) or, if appropriate, to an intermediate step-down fix Minimum Crossing Altitude and subsequently to the prescribed MDA. In addition, the pilot will be advised of the location of the Missed Approach Point (MAP) prescribed for the procedure and the aircraft's position each mile on final from the runway, airport or heliport or MAP, as appropriate. If requested by the pilot, recommended altitudes will be issued at each mile, based on the descent gradient established for the procedure, down to the last mile that is at or above the MDA. Normally, navigational guidance will be provided until the aircraft reaches the MAP. Controllers will terminate guidance and instruct the pilot to execute a missed approach unless at the MAP the pilot has the runway, airport or heliport in sight or, for a helicopter point-in-space approach, the prescribed visual reference with the surface is established. Also, if, at any time during the approach the controller considers that safe guidance for the remainder of the approach cannot be provided, the controller will terminate guidance and instruct the pilot to execute a missed approach. Similarly, guidance termination and missed approach will be effected upon pilot request and, for civil aircraft only, controllers may terminate guidance when the pilot reports the runway, airport/heliport or visual surface route (point-in-space approach) in sight or otherwise indicates that continued guidance is not required. Radar service is automatically terminated at the completion of a radar approach.

NOTE: *The published MDA for straight-in approaches will be issued to the pilot before beginning descent. When a surveillance approach will terminate in a circle-to-land maneuver, the pilot must furnish the aircraft approach category to the controller. The controller will then provide the pilot with the appropriate MDA.*

3. **NO-GYRO Approach.** This approach is available to a pilot under radar control who experiences circumstances wherein the directional gyro or other stabilized compass is inoperative or inaccurate. When this occurs, the pilot should so advise ATC and request a No-Gyro vector or approach. Pilots of aircraft not equipped with a directional gyro or other stabilized compass who desire radar handling may also request a No-Gyro vector or approach. The pilot should make all turns at standard rate and should execute the turn immediately upon receipt of instructions. For example, "TURN RIGHT," "STOP TURN." When a surveillance or precision approach is made, the pilot will be advised after the aircraft has been turned onto final approach to make turns at half standard rate.

5-4-12 RADAR MONITORING OF INSTRUMENT APPROACHES

- a. PAR facilities operated by the FAA and the military services at some joint-use (civil and military) and military installations monitor aircraft on instrument approaches and issue radar

US 5-4

SECTION 4. ARRIVAL PROCEDURES

advisories to the pilot when weather is below VFR minimums (1,000 and 3), at night, or when requested by a pilot. This service is provided only when the PAR Final Approach Course coincides with the final approach of the navigational aid and only during the operational hours of the PAR. The radar advisories serve only as a secondary aid since the pilot has selected the navigational aid as the primary aid for the approach.

- b. Prior to starting final approach, the pilot will be advised of the frequency on which the advisories will be transmitted. If, for any reason, radar advisories cannot be furnished, the pilot will be so advised.

- c. Advisory information, derived from radar observations, includes information on:

- 1. Passing the final approach fix inbound (nonprecision approach) or passing the outer marker or fix used in lieu of the outer marker inbound (precision approach).

NOTE: *At this point, the pilot may be requested to report sighting the approach lights or the runway.*

- 2. Trend advisories with respect to elevation and/or azimuth radar position and movement will be provided.

NOTE: *Whenever the aircraft nears the PAR safety limit, the pilot will be advised that the aircraft is well above or below the glidepath or well left or right of course. Glidepath information is given only to those aircraft executing a precision approach, such as ILS. Altitude information is not transmitted to aircraft executing other than precision approaches because the descent portions of these approaches generally do not coincide with the depicted PAR glidepath.*

- 3. If, after repeated advisories, the aircraft proceeds outside the PAR safety limit or if a radical deviation is observed, the pilot will be advised to execute a missed approach unless the prescribed visual reference with the surface is established.

- d. Radar service is automatically terminated upon completion of the approach.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

5-4-13 SIMULTANEOUS APPROACHES TO PARALLEL RUNWAYS

FIGURE 5-4-20

Simultaneous Approaches

(Approach Courses Parallel and Offset between 2.5 and 3.0 degrees)

- a. ATC procedures permit ILS/RNAV/GLS instrument approach operations to dual or triple parallel runway configurations. ILS/RNAV/GLS approaches to parallel runways are grouped into three classes: Simultaneous Dependent Approaches; Simultaneous Independent Approaches; and Simultaneous Close Parallel PRM Approaches. RNAV approach procedures that are approved for simultaneous operations require GPS as the sensor for position updating. VOR/DME, DME/DME and IRU RNAV updating is not authorized. The classification of a parallel runway approach procedure is dependent on adjacent parallel runway centerline separation, ATC procedures, and airport ATC final approach radar monitoring and communications capabilities. At some airports, one or more approach courses may be offset up to 3 degrees. ILS approaches with offset localizer configurations result in loss of Category II/III capabilities and an increase in decision altitude/height (50').

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- b. Depending on weather conditions, traffic volume, and the specific combination of runways being utilized for arrival operations, a runway may be used for different types of simultaneous operations, including closely spaced dependent or independent approaches. Pilots should ensure that they understand the type of operation that is being conducted, and ask ATC for clarification if necessary.
- c. Parallel approach operations demand heightened pilot situational awareness. A thorough Approach Procedure Chart review should be conducted with, as a minimum, emphasis on the following approach chart information: name and number of the approach, localizer frequency, inbound localizer/azimuth course, glideslope/glidepath intercept altitude, glideslope crossing altitude at the final approach fix, decision height, missed approach instructions, special notes/procedures, and the assigned runway location/proximity to adjacent runways. Pilots are informed by ATC or through the ATIS that simultaneous approaches are in use.
- d. The close proximity of adjacent aircraft conducting simultaneous independent approaches, especially simultaneous close parallel PRM approaches mandates strict pilot compliance with all ATC clearances. ATC assigned airspeeds, altitudes, and headings must be complied with in a timely manner. Autopilot coupled approaches require pilot knowledge of procedures necessary to comply with ATC instructions. Simultaneous independent approaches, particularly simultaneous close parallel PRM approaches necessitate precise approach course tracking to minimize final monitor controller intervention, and unwanted No Transgression Zone (NTZ) penetration. In the unlikely event of a breakout, ATC will not assign altitudes lower than the minimum vectoring altitude. Pilots should notify ATC immediately if there is a degradation of aircraft or navigation systems.
- e. Strict radio discipline is mandatory during simultaneous independent and simultaneous close parallel PRM approach operations. This includes an alert listening watch and the avoidance of lengthy, unnecessary radio transmissions. Attention must be given to proper call sign usage to prevent the inadvertent execution of clearances intended for another aircraft. Use of abbreviated call signs must be avoided to preclude confusion of aircraft with similar sounding call signs. Pilots must be alert to unusually long periods of silence or any unusual background sounds in their radio receiver. A stuck microphone may block the issuance of ATC instructions on the tower frequency by the final monitor controller during simultaneous independent and simultaneous close parallel PRM approaches. In the case of PRM approaches, the use of a second frequency by the monitor controller mitigates the “stuck mike” or other blockage on the tower frequency.

REFERENCE—AIM, Chapter 4, Section 2, *Radio Communications Phraseology and Techniques*, gives additional communications information.

- f. Use of Traffic Collision Avoidance Systems (TCAS) provides an additional element of safety to parallel approach operations. Pilots should follow recommended TCAS operating procedures presented in approved flight manuals, original equipment manufacturer recommendations, professional newsletters, and FAA publications.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

5-4-14 SIMULTANEOUS DEPENDENT APPROACHES

FIGURE 5-4-21

Simultaneous Approaches

(Parallel Runways and Approach Courses)

- Simultaneous dependent approaches are an ATC procedure permitting approaches to airports having parallel runway centerlines separated by at least 2,500 feet up to 9,000 feet. Integral parts of a total system are ILS or other system providing approach navigation, radar, communications, ATC procedures, and required airborne equipment. RNAV equipment in the aircraft or GLS equipment on the ground and in the aircraft may replace the required airborne and ground based ILS equipment. Although non-precision minimums may be published, pilots must only use those procedures specifically authorized by chart note. For example, the chart note "LNAV NA during simultaneous operations," requires vertical guidance. When given a choice, pilots should always fly a precision approach whenever possible.
- A simultaneous dependent approach differs from a simultaneous independent approach in that, the minimum distance between parallel runway centerlines may be reduced; there is no requirement for radar monitoring or advisories; and a staggered separation of aircraft on the adjacent final course is required.
- A minimum of 1.0 NM radar separation (diagonal) is required between successive aircraft on the adjacent final approach course when runway centerlines are at least 2,500 feet but no

US 5-4

SECTION 4. ARRIVAL PROCEDURES

more than 3,600 feet apart. A minimum of 1.5 NM radar separation (diagonal) is required between successive aircraft on the adjacent final approach course when runway centerlines are more than 3,600 feet but no more than 8,300 feet apart. When runway centerlines are more than 8,300 feet but no more than 9,000 feet apart a minimum of 2 NM diagonal radar separation is provided. Aircraft on the same final approach course within 10 NM of the runway end are provided a minimum of 3 NM radar separation, reduced to 2.5 NM in certain circumstances. In addition, a minimum of 1,000 feet vertical or a minimum of three miles radar separation is provided between aircraft during turn on to the parallel final approach course.

- d. Whenever parallel approaches are in use, pilots are informed by ATC or via the ATIS that approaches to both runways are in use. The charted IAP also notes which runways may be used simultaneously. In addition, the radar controller will have the interphone capability of communicating with the tower controller where separation responsibility has not been delegated to the tower.

NOTE: *ATC will not specifically identify these operations as being dependent when advertised on the ATIS.*

EXAMPLE: Simultaneous ILS Runway 19 right and ILS Runway 19 left in use.

- e. At certain airports, simultaneous dependent approaches are permitted to runways spaced less than 2,500 feet apart. In this case, ATC will provide no less than the minimum authorized diagonal separation with the leader always arriving on the same runway. The trailing aircraft is permitted reduced diagonal separation, instead of the single runway separation normally utilized for runways spaced less than 2,500 feet apart. For wake turbulence mitigation reasons:

1. Reduced diagonal spacing is only permitted when certain aircraft wake category pairings exist; typically when the leader is either in the large or small wake turbulence category, and
2. All aircraft must descend on the glideslope from the altitude at which they were cleared for the approach during these operations.

When reduced separation is authorized, the IAP briefing strip indicates that simultaneous operations require the use of vertical guidance and that the pilot should maintain last assigned altitude until intercepting the glideslope. No special pilot training is required to participate in these operations.

NOTE: *Either simultaneous dependent approaches with reduced separation or SOIA PRM approaches may be conducted to Runways 28R and 28L at KSFO spaced 750 feet apart, depending on weather conditions and traffic volume. Pilots should use caution so as not to confuse these operations. Plan for SOIA procedures only when ATC assigns a PRM approach or the ATIS advertises PRM approaches are in use. KSFO is the only airport where both procedures are presently conducted.*

REFERENCE—AIM, Paragraph 5-4-16, *Simultaneous Close Parallel PRM Approaches and Simultaneous Offset Instrument Approaches (SOIA)*

US 5-4

SECTION 4. ARRIVAL PROCEDURES

5-4-15 SIMULTANEOUS INDEPENDENT ILS/RNAV/GLS APPROACHES**FIGURE 5-4-22**

Simultaneous Independent ILS/RNAV/GLS Approaches

- a. **System.** An approach system permitting simultaneous approaches to parallel runways with centerlines separated by at least 4,300 feet. Separation between 4,300 and 9,000 feet (9,200' for airports above 5,000') utilizing NTZ final monitor controllers. Simultaneous independent approaches require NTZ radar monitoring to ensure separation between aircraft on the adjacent parallel approach course. Aircraft position is tracked by final monitor controllers who will issue instructions to aircraft observed deviating from the assigned final approach course. Staggered radar separation procedures are not utilized. Integral parts of a total system are radar, communications, ATC procedures, and ILS or other required airborne equipment. A chart note identifies that the approach is authorized for simultaneous use.

When simultaneous operations are in use, it will be advertised on the ATIS. When advised that simultaneous approaches are in use, pilots must advise approach control immediately of malfunctioning or inoperative receivers, or if a simultaneous approach is not desired. Although non-precision minimums may be published, pilots must only use those procedures specifically authorized by chart note. For example, the chart note "LNAV NA during simulta-

US 5-4

SECTION 4. ARRIVAL PROCEDURES

neous operations,” requires vertical guidance. When given a choice, pilots should always fly a precision approach whenever possible.

NOTE: ATC does not use the word *independent* or *parallel* when advertising these operations on the ATIS.

EXAMPLE: Simultaneous ILS Runway 24 left and ILS Runway 24 right approaches in use.

b. Radar Services. These services are provided for each simultaneous independent approach.

1. During turn on to parallel final approach, aircraft are normally provided 3 miles radar separation or a minimum of 1,000 feet vertical separation. The assigned altitude must be maintained until intercepting the glidepath, unless cleared otherwise by ATC. Aircraft will not be vectored to intercept the final approach course at an angle greater than thirty degrees.

NOTE: Some simultaneous operations permit the aircraft to track an RNAV course beginning on downwind and continuing in a turn to intercept the final approach course. In this case, separation with the aircraft on the adjacent final approach course is provided by the monitor controller with reference to an NTZ.

2. The final monitor controller will have the capability of overriding the tower controller on the tower frequency.
3. Pilots will be instructed to contact the tower frequency prior to the point where NTZ monitoring begins.
4. Aircraft observed to overshoot the turn-on or to continue on a track which will penetrate the NTZ will be instructed to return to the correct final approach course immediately. The final monitor controller may cancel the approach clearance, and issue missed approach or other instructions to the deviating aircraft.

PHRASEOLOGY:

“(Aircraft call sign) YOU HAVE CROSSED THE FINAL APPROACH COURSE. TURN (left/right) IMMEDIATELY AND RETURN TO THE FINAL APPROACH COURSE,”

or

“(aircraft call sign) TURN (left/right) AND RETURN TO THE FINAL APPROACH COURSE.”

5. If a deviating aircraft fails to respond to such instructions or is observed penetrating the NTZ, the aircraft on the adjacent final approach course (if threatened), will be issued a breakout instruction.

PHRASEOLOGY:

“TRAFFIC ALERT (aircraft call sign) TURN (left/right) IMMEDIATELY HEADING (degrees), (climb/descend) AND MAINTAIN (altitude).”

6. Radar monitoring will automatically be terminated when visual separation is applied, the aircraft reports the approach lights or runway in sight, or the aircraft is 1 NM or less from

US 5-4

SECTION 4. ARRIVAL PROCEDURES

the runway threshold. Final monitor controllers will not advise pilots when radar monitoring is terminated.

NOTE: Simultaneous independent approaches conducted to runways spaced greater than 9,000 feet (or 9,200' at airports above 5,000') do not require an NTZ. However, from a pilot's perspective, the same alerts relative to deviating aircraft will be provided by ATC as are provided when an NTZ is being monitored. Pilots may not be aware as to whether or not an NTZ is being monitored.

5-4-16 SIMULTANEOUS CLOSE PARALLEL PRM APPROACHES AND SIMULTANEOUS OFFSET INSTRUMENT APPROACHES (SOIA)

FIGURE 5-4-23

PRM Approaches

Simultaneous Close Parallel

**a. System.**

1. PRM is an acronym for the high update rate Precision Runway Monitor surveillance system which is required to monitor the No Transgression Zone (NTZ) for specific parallel runway separations used to conduct simultaneous close parallel approaches. PRM is also published in the title as part of the approach name for IAPs used to conduct Simultaneous Close Parallel approaches. "PRM" alerts pilots that specific airborne equipment, training, and procedures are applicable.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

Because Simultaneous Close Parallel PRM approaches are independent, the NTZ and normal operating zone (NOZ) airspace between the final approach courses is monitored by two monitor controllers, one for each approach course. The NTZ monitoring system (final monitor aid) consists of a high resolution ATC radar display with automated tracking software which provides monitor controllers with aircraft identification, position, speed, and a ten-second projected position, as well as visual and aural NTZ penetration alerts. A PRM high update rate surveillance sensor is a component of this system only for specific runway spacing. Additional procedures for simultaneous independent approaches are described in Paragraph 5-4-15, Simultaneous Independent ILS/RNAV/GLS Approaches.

2. Simultaneous Close Parallel PRM approaches, whether conducted utilizing a high update rate PRM surveillance sensor or not, must meet all of the following requirements: pilot training, PRM in the approach title, NTZ monitoring utilizing a final monitor aid, radar display, publication of an AAUP, and use of a secondary PRM communications frequency. PRM approaches are depicted on a separate IAP titled (Procedure type) PRM Rwy XXX (Simultaneous Close Parallel or Close Parallel).

NOTE: ATC does not use the word “independent” when advertising these operations on the ATIS.

EXAMPLE: Simultaneous ILS PRM Runway 33 left and ILS PRM Runway 33 right approaches in use.

- (a) The pilot may request to conduct a different type of PRM approach to the same runway other than the one that is presently being used; for example, RNAV instead of ILS. However, pilots must always obtain ATC approval to conduct a different type of approach. Also, in the event of the loss of ground-based NAVAIDS, the ATIS may advertise other types of PRM approaches to the affected runway or runways.
- (b) The Attention All Users Page (AAUP) will address procedures for conducting PRM approaches.

- b. Requirements and Procedures. Besides system requirements and pilot procedures as identified in subparagraph a1 above, all pilots must have completed special training before accepting a clearance to conduct a PRM approach.

1. Pilot Training Requirement. Pilots must complete special pilot training, as outlined below, before accepting a clearance for a simultaneous close parallel PRM approach.

- (a) For operations under 14 CFR Parts 121, 129, and 135, pilots must comply with FAA-approved company training as identified in their Operations Specifications. Training includes the requirement for pilots to view the FAA training slide presentation, “Precision Runway Monitor (PRM) Pilot Procedures.” Refer to https://www.faa.gov/training_testing/training/prm/ or search key words “FAA PRM” for additional information and to view or download the slide presentation.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

(b) For operations under Part 91:

- (1) Pilots operating transport category aircraft must be familiar with PRM operations as contained in this section of the AIM. In addition, pilots operating transport category aircraft must view the slide presentation, "Precision Runway Monitor (PRM) Pilot Procedures." Refer to https://www.faa.gov/training_testing/training/prm/ or search key words "FAA PRM" for additional information and to view or download the slide presentation.
- (2) Pilots *not* operating transport category aircraft must be familiar with PRM and SOIA operations as contained in this section of the AIM. The FAA strongly recommends that pilots *not* involved in transport category aircraft operations view the FAA training slide presentation, "Precision Runway Monitor (PRM) Pilot Procedures." Refer to https://www.faa.gov/training_testing/training/prm/ or search key words "FAA PRM" for additional information and to view or download the slide presentation.

NOTE: *Depending on weather conditions, traffic volume, and the specific combination of runways being utilized for arrival operations, a runway may be used for different types of simultaneous operations, including closely spaced dependent or independent approaches. Use PRM procedures only when the ATIS advertises their use. For other types of simultaneous approaches, see paragraphs 5-4-14 and 5-4-15.*

- c. **ATC Directed Breakout.** An ATC directed "breakout" is defined as a vector off the final approach course of a threatened aircraft in response to another aircraft penetrating the NTZ.
- d. **Dual Communications.** The aircraft flying the PRM approach must have the capability of enabling the pilot/s to listen to two communications frequencies simultaneously. To avoid blocked transmissions, each runway will have two frequencies, a primary and a PRM monitor frequency. The tower controller will transmit on both frequencies. The monitor controller's transmissions, if needed, will override both frequencies. Pilots will **ONLY** transmit on the tower controller's frequency, but will listen to both frequencies. Select the PRM monitor frequency audio only when instructed by ATC to contact the tower. The volume levels should be set about the same on both radios so that the pilots will be able to hear transmissions on the PRM frequency if the tower is blocked. Site-specific procedures take precedence over the general information presented in this paragraph. Refer to the AAUP for applicable procedures at specific airports.
- e. **Radar Services.**
 1. During turn on to parallel final approach, aircraft will be provided 3 miles radar separation or a minimum of 1,000 feet vertical separation. The assigned altitude must be maintained until intercepting the glideslope/glidepath, unless cleared otherwise by ATC. Aircraft will not be vectored to intercept the final approach course at an angle greater than thirty degrees.
 2. The final monitor controller will have the capability of overriding the tower controller on the tower frequency as well as transmitting on the PRM frequency.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

3. Pilots will be instructed to contact the tower frequency prior to the point where NTZ monitoring begins. Pilots will begin monitoring the secondary PRM frequency at that time (see Dual VHF Communications Required below).
4. To ensure separation is maintained, and in order to avoid an imminent situation during PRM approaches, pilots must immediately comply with monitor controller instructions.
5. Aircraft observed to overshoot the turn or to continue on a track which will penetrate the NTZ will be instructed to return to the correct final approach course immediately. The final monitor controller may cancel the approach clearance, and issue missed approach or other instructions to the deviating aircraft.

PHRASEOLOGY:

“(Aircraft call sign) YOU HAVE CROSSED THE FINAL APPROACH COURSE. TURN (left/right) IMMEDIATELY AND RETURN TO THE FINAL APPROACH COURSE,”

or

“(Aircraft call sign) TURN (left/right) AND RETURN TO THE FINAL APPROACH COURSE.”

6. If a deviating aircraft fails to respond to such instructions or is observed penetrating the NTZ, the aircraft on the adjacent final approach course (if threatened) will be issued a breakout instruction.

PHRASEOLOGY:

“TRAFFIC ALERT (aircraft call sign) TURN (left/right) IMMEDIATELY HEADING (degrees), (climb/descend) AND MAINTAIN (altitude).”

7. Radar monitoring will automatically be terminated when visual separation is applied, or the aircraft reports the approach lights or runway in sight or within 1 NM of the runway threshold. Final monitor controllers will not advise pilots when radar monitoring is terminated.

f. **Attention All Users Page (AAUP).** At airports that conduct PRM operations, the AAUP informs pilots under the “General” section of information relative to all the PRM approaches published at a specific airport, and this section must be briefed in its entirety. Under the “Runway Specific” section, only items relative to the runway to be used for landing need be briefed. (See FIG 5-4-24.) A single AAUP is utilized for multiple PRM approach charts at the same airport, which are listed on the AAUP. The requirement for informing ATC if the pilot is unable to accept a PRM clearance is also presented. The “General” section of AAUP addresses the following:

1. Review of the procedure for executing a climbing or descending breakout;
2. Breakout phraseology beginning with the words, “Traffic Alert;”
3. Descending on the glideslope/glidepath meets all crossing restrictions;
4. Briefing the PRM approach also satisfies the non-PRM approach briefing of the same type of approach to the same runway; and

US 5-4**SECTION 4. ARRIVAL PROCEDURES****5. Description of the dual communications procedure.**

The “Runway Specific” section of the AAUP addresses those issues which only apply to certain runway ends that utilize PRM approaches. There may be no Runway Specific procedures, a single item applicable to only one runway end, or multiple items for a single or multiple runway end/s. Examples of SOIA runway specific procedures are as follows:

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-24

USA INTL (USA)

USA CITY

ATTENTION ALL USERS PAGE (AAUP)

(PRM CLOSE PARALLEL)

Pilots who are unable to participate will be afforded appropriate arrival services as operational conditions permit and must notify the controlling ATC facility as soon as practical, but at least 120 miles from destination.

ILS PRM or LOC PRM Rwy 10R, 10C, 28L, 28C
RNAV (GPS) PRM RWYS 10R, 10C, 28L, 28C

General

- Review procedure for executing a climbing and descending PRM breakout.
- Breakout phraseology: "TRAFFIC ALERT (call sign) TURN (left/right) IMMEDIATELY HEADING (degrees) CLIMB/DESCEND AND MAINTAIN (altitude)."
- All breakouts: Hand flown, initiate immediately.
- Descending on the glideslope/glidepath ensures compliance with any charted crossing restrictions.
- Dual VHF COMM: When assigned or planning a specific PRM approach, tune a second receiver to the PRM monitor frequency or, if silent, other active frequency (i.e., ATIS), set the volume, retune the PRM frequency if necessary, then deselect the audio. When directed by ATC, immediately switch to the tower frequency and select the secondary radio audio to ON.
- If later assigned the same runway, non-PRM approach, consider it briefed provided the same minimums are utilized. PRM related chart notes and frequency no longer apply.
- TCAS during breakout: Follow TCAS climb/descend if it differs from ATC, while executing the breakout turn.

Runway Specific

- Runway 10R: Exit at taxiway Tango whenever practical.

PRM APPROACH AAUP

41°59N-87°54W

USA INTL (USA)

g. Simultaneous Offset Instrument Approach (SOIA).

1. SOIA is a procedure used to conduct simultaneous approaches to runways spaced less than 3,000 feet, but at least 750 feet apart. The SOIA procedure utilizes a straight-in PRM approach to one runway, and a PRM offset approach with glideslope/glidepath to

US 5-4

SECTION 4. ARRIVAL PROCEDURES

the adjacent runway. In SOIA operations, aircraft are paired, with the aircraft conducting the straight-in PRM approach always positioned slightly ahead of the aircraft conducting the offset PRM approach.

2. The straight-in PRM approach plates used in SOIA operations are identical to other straight-in PRM approach plates, with an additional note, which provides the separation between the two runways used for simultaneous SOIA approaches. The offset PRM approach plate displays the required notations for closely spaced approaches as well as depicts the visual segment of the approach.
3. Controllers monitor the SOIA PRM approaches in exactly the same manner as is done for other PRM approaches. The procedures and system requirements for SOIA PRM approaches are identical with those used for simultaneous close parallel PRM approaches until near the offset PRM approach missed approach point (MAP), where visual acquisition of the straight-in aircraft by the aircraft conducting the offset PRM approach occurs. Since SOIA PRM approaches are identical to other PRM approaches (except for the visual segment in the offset approach), an understanding of the procedures for conducting PRM approaches is essential before conducting a SOIA PRM operation.
4. In SOIA, the approach course separation (instead of the runway separation) meets established close parallel approach criteria. (See FIG 5-4-25 for the generic SOIA approach geometry.) A visual segment of the offset PRM approach is established between the offset MAP and the runway threshold. Aircraft transition in visual conditions from the offset course, beginning at the offset MAP, to align with the runway and can be stabilized by 500 feet above ground level (AGL) on the extended runway centerline. A cloud ceiling for the approach is established so that the aircraft conducting the offset approach has nominally at least 30 seconds or more to acquire the leading straight-in aircraft prior to reaching the offset MAP. If visual acquisition is not accomplished prior to crossing the offset MAP, a missed approach must be executed.
5. Flight Management System (FMS) coding of the offset RNAV PRM and GLS PRM approaches in a SOIA operation is different than other RNAV and GLS approach coding in that it does not match the initial missed approach procedure published on the charted IAP. In the SOIA design of the offset approach, lateral course guidance terminates at the fictitious threshold point (FTP), which is an extension of the final approach course beyond the offset MAP to a point near the runway threshold. The FTP is designated in the approach coding as the MAP so that vertical guidance is available to the pilot to the runway threshold, just as vertical guidance is provided by the offset LDA glideslope. No matter what type of offset approach is being conducted, reliance on lateral guidance is discontinued at the charted MAP and replaced by visual maneuvering to accomplish runway alignment.
 - (a) As a result of this approach coding, when executing a missed approach at and after passing the charted offset MAP, a heading must initially be flown (either hand-flown or using autopilot "heading mode") before engaging LNAV. If the pilot engages LNAV immediately, the aircraft may continue to track toward the FTP

US 5-4

SECTION 4. ARRIVAL PROCEDURES

instead of commencing a turn toward the missed approach holding fix. Notes on the charted IAP and in the AAUP make specific reference to this procedure.

- (b) Some FMSs do not code waypoints inside of the FAF as part of the approach. Therefore, the depicted MAP on the charted IAP may not be included in the offset approach coding. Pilots utilizing those FMSs may identify the location of the waypoint by noting its distance from the FTP as published on the charted IAP. In those same FMSs, the straight-in SOIA approach will not display a waypoint inside the PFAF. The same procedures may be utilized to identify an uncoded waypoint. In this case, the location is determined by noting its distance from the runway waypoint or using an authorized distance as published on the charted IAP.
- (c) Because the FTP is coded as the MAP, the FMS map display will depict the initial missed approach course as beginning at the FTP. This depiction does not match the charted initial missed approach procedure on the IAP. Pilots are reminded that charted IAP guidance is to be followed, not the map display. Once the aircraft completes the initial turn when commencing a missed approach, the remainder of the procedure coding is standard and can be utilized as with any other IAP.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-25

SOIA Approach Geometry

**NOTE:****SAP**

The stabilized approach point is a design point along the extended centerline of the intended landing runway on the glide slope/glide path at 500 feet above the runway threshold elevation. It is used to verify a sufficient distance is provided for the visual maneuver after the offset course approach DA to permit the pilots to conform to approved, stabilized approach criteria. The SAP is not published on the IAP.

Offset**Course DA**

The point along the LDA, or other offset course, where the course separation with the adjacent ILS, or other straight-in course, reaches the minimum distance permitted to conduct closely spaced approaches. Typically that minimum distance will be 3,000 feet without the use of high update radar; with high update radar, course separation of less than 3,000 ft may be used when validated by a safety study. The altitude of the glide slope/glide path at that point determines the offset course approach decision altitude and is where the NTZ terminates. Maneuvering inside the DA is done in visual conditions.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

Visual Segment Offset Angle *Angle, as determined by the SOIA design tool, formed by the extension of the straight segment of the calculated flight track (between the offset course MAP/DA and the SAP) and the extended runway centerline. The size of the angle is dependent on the aircraft approach categories (Category D or only selected categories/speeds) that are authorized to use the offset course approach and the spacing between the runways.*

Visibility *Distance from the offset course approach DA to runway threshold in statute mile.*

Procedure *The aircraft on the offset course approach must see the runway-landing environment and, if ATC has advised that traffic on the straight-in approach is a factor, the offset course approach aircraft must visually acquire the straight-in approach aircraft and report it in sight to ATC prior to reaching the DA for the offset course approach.*

CC *The Clear of Clouds point is the position on the offset final approach course where aircraft first operate in visual meteorological conditions below the ceiling, when the actual weather conditions are at, or near, the minimum ceiling for SOIA operations. Ceiling is defined by the Aeronautical Information Manual.*

6. SOIA PRM approaches utilize the same dual communications procedures as do other PRM approaches.

NOTE: *At KSFO, pilots conducting SOIA operations select the monitor frequency audio when communicating with the final radar controller, not the tower controller as is customary. In this special case, the monitor controller's transmissions, if required, override the final controller's frequency. This procedure is addressed on the AAUP.*

- (a) SOIA utilizes the same AAUP format as do other PRM approaches. The minimum weather conditions that are required are listed. Because of the more complex nature of instructions for conducting SOIA approaches, the "Runway Specific" items are more numerous and lengthy.
- (b) Examples of SOIA offset runway specific notes:
 - (1) Aircraft must remain on the offset course until passing the offset MAP prior to maneuvering to align with the centerline of the offset approach runway.
 - (2) Pilots are authorized to continue past the offset MAP to align with runway centerline when:
 - [a] the straight-in approach traffic is in sight and is expected to remain in sight,
 - [b] ATC has been advised that "traffic is in sight." (ATC is not required to acknowledge this transmission),
 - [c] the runway environment is in sight. Otherwise, a missed approach must be executed. Between the offset MAP and the runway threshold, pilots conducting the offset PRM approach must not pass the straight-in air-

US 5-4

SECTION 4. ARRIVAL PROCEDURES

craft and are responsible for separating themselves visually from traffic conducting the straight-in PRM approach to the adjacent runway, which means maneuvering the aircraft as necessary to avoid that traffic until landing, and providing wake turbulence avoidance, if applicable. Pilots maintaining visual separation should advise ATC, as soon as practical, if visual contact with the aircraft conducting the straight-in PRM approach is lost and execute a missed approach unless otherwise instructed by ATC.

(c) Examples of SOIA straight-in runway specific notes:

- (1) To facilitate the offset aircraft in providing wake mitigation, pilots should descend on, not above, the glideslope/glidepath.
- (2) Conducting the straight-in approach, pilots should be aware that the aircraft conducting the offset approach will be approaching from the right/left rear and will be operating in close proximity to the straight-in aircraft.

7. Recap.

The following are differences between widely spaced simultaneous approaches (at least 4,300 feet between the runway centerlines) and Simultaneous PRM close parallel approaches which are of importance to the pilot:

- (a) **Runway Spacing.** Prior to PRM simultaneous close parallel approaches, most ATC-directed breakouts were the result of two aircraft in-trail on the same final approach course getting too close together. Two aircraft going in the same direction did not mandate quick reaction times. With PRM closely spaced approaches, two aircraft could be alongside each other, navigating on courses that are separated by less than 4,300 feet and as close as 3,000 feet. In the unlikely event that an aircraft “blunders” off its course and makes a worst case turn of 30 degrees toward the adjacent final approach course, closing speeds of 135 feet per second could occur that constitute the need for quick reaction. A blunder has to be recognized by the monitor controller, and breakout instructions issued to the endangered aircraft. The pilot will not have any warning that a breakout is imminent because the blundering aircraft will be on another frequency. It is important that, when a pilot receives breakout instructions, the assumption is made that a blundering aircraft is about to (or has penetrated the NTZ) and is heading toward his/her approach course. The pilot must initiate a breakout as soon as safety allows. While conducting PRM approaches, pilots must maintain an increased sense of awareness in order to immediately react to an ATC (breakout) instruction and maneuver (as instructed by ATC) away from a blundering aircraft.
- (b) **Communications.** Dual VHF communications procedures should be carefully followed. One of the assumptions made that permits the safe conduct of PRM approaches is that there will be no blocked communications.
- (c) **Hand-flown Breakouts.** The use of the autopilot is encouraged while flying a PRM approach, but the autopilot must be disengaged in the rare event that a breakout is

US 5-4

SECTION 4. ARRIVAL PROCEDURES

issued. Simulation studies of breakouts have shown that a hand-flown breakout can be initiated consistently faster than a breakout performed using the autopilot.

- (d) **TCAS.** The ATC breakout instruction is the primary means of conflict resolution. TCAS, if installed, provides another form of conflict resolution in the unlikely event other separation standards would fail. TCAS is not required to conduct a closely spaced approach.

The TCAS provides only vertical resolution of aircraft conflicts, while the ATC breakout instruction provides both vertical and horizontal guidance for conflict resolutions. Pilots should always immediately follow the TCAS Resolution Advisory (RA), whenever it is received. Should a TCAS RA be received before, during, or after an ATC breakout instruction is issued, the pilot should follow the RA, even if it conflicts with the climb/descent portion of the breakout maneuver. If following an RA requires deviating from an ATC clearance, the pilot must advise ATC as soon as practical. While following an RA, it is extremely important that the pilot also comply with the turn portion of the ATC breakout instruction unless the pilot determines safety to be factor. Adhering to these procedures assures the pilot that acceptable "breakout" separation margins will always be provided, even in the face of a normal procedural or system failure.

5-4-17 SIMULTANEOUS CONVERGING INSTRUMENT APPROACHES

- a. ATC may conduct instrument approaches simultaneously to converging runways; i.e., runways having an included angle from 15 to 100 degrees, at airports where a program has been specifically approved to do so.
- b. The basic concept requires that dedicated, separate standard instrument approach procedures be developed for each converging runway included. These approaches can be identified by the letter "V" in the title; for example, "ILS V Rwy 17 (CONVERGING)". Missed Approach Points must be at least 3 miles apart and missed approach procedures ensure that missed approach protected airspace does not overlap.
- c. Other requirements are: radar availability, nonintersecting final approach courses, precision approach capability for each runway and, if runways intersect, controllers must be able to apply visual separation as well as intersecting runway separation criteria. Intersecting runways also require minimums of at least 700 foot ceilings and 2 miles visibility. Straight in approaches and landings must be made.
- d. Whenever simultaneous converging approaches are in use, aircraft will be informed by the controller as soon as feasible after initial contact or via ATIS. Additionally, the radar controller will have direct communications capability with the tower controller where separation responsibility has not been delegated to the tower.

5-4-18 RNP AR (AUTHORIZATION REQUIRED) INSTRUMENT PROCEDURES

- a. RNP AR procedures require authorization analogous to the special authorization required for Category II or III ILS procedures. All operators require specific authorization from the FAA to

US 5-4

SECTION 4. ARRIVAL PROCEDURES

fly any RNP AR approach or departure procedure. The FAA issues RNP AR authorization via operations specification (OpSpec), management specification (MSpec), or letter of authorization (LOA). There are no exceptions. Operators can find comprehensive information on RNP AR aircraft eligibility, operating procedures, and training requirements in AC 90-101, Approval Guidance for RNP Procedures with AR.

- b. Unique characteristics of RNP AR Operations Approach title. The FAA titles all RNP AR instrument approach procedures (IAP) as “RNAV (RNP) RWY XX.” Internationally, operators may find RNP AR IAPs titled “RNP RWY XX (AR).” All RNP AR procedures will clearly state “Authorization Required” on the procedure chart.
- c. RNP value. RNP AR procedures are characterized by use of a lateral Obstacle Evaluation Area (OEA) equal to two times the RNP value ($2 \times \text{RNP}$) in nautical miles. No secondary lateral OEA or additional buffers are used. RNP AR procedures require a minimum lateral accuracy value of RNP 0.30. Each published line of minima in an RNP AR procedure has an associated RNP value that defines the procedure’s lateral performance requirement in the Final Approach Segment. Each approved RNP AR operator’s FAA-issued authorization will identify a minimum authorized RNP approach value. This value may vary depending on aircraft configuration or operational procedures (e.g., use of flight director or autopilot).
- d. Radius-to-fix (RF) legs. Many RNP AR IFPs contain RF legs. Aircraft eligibility for RF legs is required in any authorization for RNP AR operations.
- e. Missed Approach RNP value less than 1.00 NM. Some RNP AR IFPs require an RNP lateral accuracy value of less than 1.00 NM in the missed approach segment. The operator’s FAA-issued RNP AR authorization will specify whether the operator may fly a missed approach procedure requiring a lateral accuracy value less than 1.00 NM. AC 90-101 identifies specific operating procedures and training requirements applicable to this aspect of RNP AR procedures.
- f. Non-standard speeds or climb gradients. RNP AR approaches may require non-standard approach speeds and/or missed approach climb gradients. RNP AR approach charts will reflect any non-standard requirements and pilots must confirm they can meet those requirements before commencing the approach.
- g. RNP AR Departure Procedures (RNP AR DP). RNP AR approach authorization is a mandatory prerequisite for an operator to be eligible to perform RNP AR DPs. RNP AR DPs can utilize a minimum RNP value of RNP 0.30, may include higher than standard climb gradients, and may include RF turns. Close in RF turns associated with RNP AR DPs may begin as soon as the departure end of the runway (DER). For specific eligibility guidance, operators should refer to AC 90-101.

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-26

Example of an RNP AR DP

5-4-19 SIDE-STEP MANEUVER

- ATC may authorize a standard instrument approach procedure which serves either one of parallel runways that are separated by 1,200 feet or less followed by a straight-in landing on the adjacent runway.
- Aircraft that will execute a side-step maneuver will be cleared for a specified approach procedure and landing on the adjacent parallel runway. Example, "cleared ILS runway 7 left approach, side-step to runway 7 right." Pilots are expected to commence the side-step maneuver as soon as possible after the runway or runway environment is in sight. Compliance with minimum altitudes associated with stepdown fixes is expected even after the side-step maneuver is initiated.

NOTE: Side-step minima are flown to a Minimum Descent Altitude (MDA) regardless of the approach authorized.

- Landing minimums to the adjacent runway will be based on nonprecision criteria and therefore higher than the precision minimums to the primary runway, but will normally be lower than the published circling minimums.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

5-4-20 APPROACH AND LANDING MINIMUMS

- a. **Landing Minimums.** The rules applicable to landing minimums are contained in 14 CFR Section 91.175. TBL 5-4-1 may be used to convert RVR to ground or flight visibility. For converting RVR values that fall between listed values, use the next higher RVR value; do not interpolate. For example, when converting 1800 RVR, use 2400 RVR with the resultant visibility of $\frac{1}{2}$ mile.
- b. **Obstacle Clearance.** Final approach obstacle clearance is provided from the start of the final segment to the runway or missed approach point, whichever occurs last. Side-step obstacle protection is provided by increasing the width of the final approach obstacle clearance area.

TABLE 5-4-1 RVR Value Conversions

RVR	Visibility (statute miles)
1600	$\frac{1}{4}$
2400	$\frac{1}{2}$
3200	$\frac{5}{8}$
4000	$\frac{3}{4}$
4500	$\frac{7}{8}$
5000	1
6000	1 $\frac{1}{4}$

1. Circling approach protected areas are defined by the tangential connection of arcs drawn from each runway end (see FIG 5-4-27). Circling approach protected areas developed prior to late 2012 used fixed radius distances, dependent on aircraft approach category, as shown in the table on page B2 of the U.S. TPP. The approaches using standard circling approach areas can be identified by the absence of the “negative C” symbol on the circling line of minima. Circling approach protected areas developed after late 2012 use the radius distance shown in the table on page B2 of the U.S. TPP, dependent on aircraft approach category, and the altitude of the circling MDA, which accounts for true airspeed increase with altitude. The approaches using expanded circling approach areas can be identified by the presence of the “negative C” symbol on the circling line of minima (see FIG 5-4-28). Because of obstacles near the airport, a portion of the circling area may be restricted by a procedural note; for example, “Circling NA E of RWY 17-35.” Obstacle clearance is provided at the published minimums (MDA) for the pilot that makes a straight-in approach, side-steps, or circles. Once below the MDA the pilot must see and avoid obstacles. Executing the missed approach after starting to maneuver usually places the aircraft beyond the MAP. The

US 5-4

SECTION 4. ARRIVAL PROCEDURES

aircraft is clear of obstacles when at or above the MDA while inside the circling area, but simply joining the missed approach ground track from the circling maneuver may not provide vertical obstacle clearance once the aircraft exits the circling area. Additional climb inside the circling area may be required before joining the missed approach track. See paragraph 5-4-21, Missed Approach, for additional considerations when starting a missed approach at other than the MAP.

FIGURE 5-4-27

Final Approach Obstacle Clearance

NOTE: Circling approach area radii vary according to approach category and MSL circling altitude due to TAS changes – see FIG 5-4-28.

FIGURE 5-4-28

Standard and Expanded Circling Approach Radii in the U.S. TPP

STANDARD CIRCLING APPROACH MANEUVERING RADIUS

Circling approach protected areas developed prior to late 2012 used the radius distances shown in the following table, expressed in nautical miles (NM), dependent on aircraft approach category. The approaches using standard circling approach areas can be identified by the absence of the  symbol on the circling line of minima.

Circling MDA in feet MSL	Approach Category and Circling Radius (NM)				
	CAT A	CAT B	CAT C	CAT D	CAT E
All Altitudes	1.3	1.5	1.7	2.3	4.5

US 5-4

SECTION 4. ARRIVAL PROCEDURES

 EXPANDED CIRCLING APPROACH MANEUVERING AIRSPACE RADIUS

Circling approach protected areas developed after late 2012 use the radius distance shown in the following table, expressed in nautical miles (NM), dependent on aircraft approach category, and the altitude of the circling MDA, which accounts for true airspeed increase with altitude. The approaches using expanded circling approach areas can be identified by the presence of the  symbol on the circling line of minima.

Circling MDA in feet MSL	Approach Category and Circling Radius (NM)				
	CAT A	CAT B	CAT C	CAT D	CAT E
1000 or less	1.3	1.7	2.7	3.6	4.5
1001–3000	1.3	1.8	2.8	3.7	4.6
3001–5000	1.3	1.8	2.9	3.8	4.8
5001–7000	1.3	1.9	3.0	4.0	5.0
7001–9000	1.4	2.0	3.2	4.2	5.3
9001 and above	1.4	2.1	3.3	4.4	5.5

2. **Precision Obstacle Free Zone (POFZ).** A volume of airspace above an area beginning at the runway threshold, at the threshold elevation, and centered on the extended runway centerline. The POFZ is 200 feet (60m) long and 800 feet (240m) wide. The POFZ must be clear when an aircraft on a vertically guided final approach is within 2 nautical miles of the runway threshold and the official weather observation is a ceiling below 250 feet or visibility less than $\frac{3}{4}$ statute mile (SM) (or runway visual range below 4,000 feet). If the POFZ is not clear, the MINIMUM authorized height above touchdown (HAT) and visibility is 250 feet and $\frac{3}{4}$ SM. The POFZ is considered clear even if the wing of the aircraft holding on a taxiway waiting for runway clearance penetrates the POFZ; however, neither the fuselage nor the tail may infringe on the POFZ. The POFZ is applicable at all runway ends including displaced thresholds.

US 5-4
SECTION 4. ARRIVAL PROCEDURES**FIGURE 5-4-29**
Precision Object Free Zone (POFZ)

- c. **Straight-in Minimums** are shown on the IAP when the final approach course is within 30 degrees of the runway alignment and a normal descent can be made from the IFR altitude shown on the IAP to the runway surface. When either the normal rate of descent or the runway alignment factor of 30 degrees is exceeded, a straight-in minimum is not published and a circling minimum applies. The fact that a straight-in minimum is not published does not preclude pilots from landing straight-in if they have the active runway in sight and have sufficient time to make a normal approach for landing. Under such conditions and when ATC has cleared them for landing on that runway, pilots are not expected to circle even though only circling minimums are published. If they desire to circle, they should advise ATC.
- d. **Side-Step Maneuver Minimums.** Landing minimums for a side-step maneuver to the adjacent runway will normally be higher than the minimums to the primary runway.
- e. **Published Approach Minimums.** Approach minimums are published for different aircraft categories and consist of a minimum altitude (DA, DH, MDA) and required visibility. These minimums are determined by applying the appropriate TERPS criteria. When a fix is incorporated in a nonprecision final segment, two sets of minimums may be published: one for the pilot that is able to identify the fix, and a second for the pilot that cannot. Two sets of mini-

US 5-4

SECTION 4. ARRIVAL PROCEDURES

mums may also be published when a second altimeter source is used in the procedure. When a nonprecision procedure incorporates both a stepdown fix in the final segment and a second altimeter source, two sets of minimums are published to account for the stepdown fix and a note addresses minimums for the second altimeter source.

- f. **Circling Minimums.** In some busy terminal areas, ATC may not allow circling and circling minimums will not be published. Published circling minimums provide obstacle clearance when pilots remain within the appropriate area of protection. Pilots should remain at or above the circling altitude until the aircraft is continuously in a position from which a descent to a landing on the intended runway can be made at a normal rate of descent using normal maneuvers. Circling may require maneuvers at low altitude, at low airspeed, and in marginal weather conditions. Pilots must use sound judgment, have an indepth knowledge of their capabilities, and fully understand the aircraft performance to determine the exact circling maneuver since weather, unique airport design, and the aircraft position, altitude, and airspeed must all be considered. The following basic rules apply:

1. Maneuver the shortest path to the base or downwind leg, as appropriate, considering existing weather conditions. There is no restriction from passing over the airport or other runways.
2. It should be recognized that circling maneuvers may be made while VFR or other flying is in progress at the airport. Standard left turns or specific instruction from the controller for maneuvering must be considered when circling to land.
3. At airports without a control tower, it may be desirable to fly over the airport to observe wind and turn indicators and other traffic which may be on the runway or flying in the vicinity of the airport.

REFERENCE—AC 90-66A, *Recommended Standards Traffic patterns for Aeronautical Operations at Airports without Operating Control Towers.*

4. The missed approach point (MAP) varies depending upon the approach flown. For vertically guided approaches, the MAP is at the decision altitude/decision height. Non-vertically guided and circling procedures share the same MAP and the pilot determines this MAP by timing from the final approach fix, by a fix, a NAVAID, or a waypoint. Circling from a GLS, an ILS without a localizer line of minima or an RNAV (GPS) approach without an LNAV line of minima is prohibited.
- g. **Instrument Approach at a Military Field.** When instrument approaches are conducted by civil aircraft at military airports, they must be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

5-4-21 MISSED APPROACH

- a. When a landing cannot be accomplished, advise ATC and, upon reaching the missed approach point defined on the approach procedure chart, the pilot must comply with the missed approach instructions for the procedure being used or with an alternate missed approach procedure specified by ATC.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- b. Obstacle protection for missed approach is predicated on the missed approach being initiated at the decision altitude/height (DA/DH) or at the missed approach point and not lower than minimum descent altitude (MDA). A climb gradient of at least 200 feet per nautical mile is required, (except for Copter approaches, where a climb of at least 400 feet per nautical mile is required), unless a higher climb gradient is published in the notes section of the approach procedure chart. When higher than standard climb gradients are specified, the end point of the non-standard climb will be specified at either an altitude or a fix. Pilots must pre-plan to ensure that the aircraft can meet the climb gradient (expressed in feet per nautical mile) required by the procedure in the event of a missed approach, and be aware that flying at a higher than anticipated ground speed increases the climb rate requirement (feet per minute). Tables for the conversion of climb gradients (feet per nautical mile) to climb rate (feet per minute), based on ground speed, are included on page D1 of the U.S. Terminal Procedures booklets. Reasonable buffers are provided for normal maneuvers. However, no consideration is given to an abnormally early turn. Therefore, when an early missed approach is executed, pilots should, unless otherwise cleared by ATC, fly the IAP as specified on the approach plate to the missed approach point at or above the MDA or DH before executing a turning maneuver.
- c. If visual reference is lost while circling-to-land from an instrument approach, the missed approach specified for that particular procedure must be followed (unless an alternate missed approach procedure is specified by ATC). To become established on the prescribed missed approach course, the pilot should make an initial climbing turn toward the landing runway and continue the turn until established on the missed approach course. Inasmuch as the circling maneuver may be accomplished in more than one direction, different patterns will be required to become established on the prescribed missed approach course, depending on the aircraft position at the time visual reference is lost. Adherence to the procedure will help assure that an aircraft will remain laterally within the circling and missed approach obstruction clearance areas. Refer to paragraph h concerning vertical obstruction clearance when starting a missed approach at other than the MAP. (See FIG 5-4-30.)
- d. At locations where ATC radar service is provided, the pilot should conform to radar vectors when provided by ATC in lieu of the published missed approach procedure. (See FIG 5-4-31.)
- e. Some locations may have a preplanned alternate missed approach procedure for use in the event the primary NAVAID used for the missed approach procedure is unavailable. To avoid confusion, the alternate missed approach instructions are not published on the chart. However, the alternate missed approach holding pattern will be depicted on the instrument approach chart for pilot situational awareness and to assist ATC by not having to issue detailed holding instructions. The alternate missed approach may be based on NAVAIDs not used in the approach procedure or the primary missed approach. When the alternate missed approach procedure is implemented by NOTAM, it becomes a mandatory part of the procedure. The NOTAM will specify both the textual instructions and any additional equipment requirements necessary to complete the procedure. Air traffic may also issue instructions for the alternate missed approach when necessary, such as when the primary missed approach NAVAID fails during the approach. Pilots may reject an ATC clearance for an alternate

US 5-4

SECTION 4. ARRIVAL PROCEDURES

missed approach that requires equipment not necessary for the published approach procedure when the alternate missed approach is issued after beginning the approach. However, when the alternate missed approach is issued prior to beginning the approach the pilot must either accept the entire procedure (including the alternate missed approach), request a different approach procedure, or coordinate with ATC for alternative action to be taken, i.e., proceed to an alternate airport, etc.

- f. When approach has been missed, request clearance for specific action; i.e., to alternative airport, another approach, etc.
- g. Pilots must ensure that they have climbed to a safe altitude prior to proceeding off the published missed approach, especially in nonradar environments. Abandoning the missed approach prior to reaching the published altitude may not provide adequate terrain clearance. Additional climb may be required after reaching the holding pattern before proceeding back to the IAF or to an alternate.
- h. A clearance for an instrument approach procedure includes a clearance to fly the published missed approach procedure, unless otherwise instructed by ATC. The published missed approach procedure provides obstacle clearance only when the missed approach is conducted on the missed approach segment from or above the missed approach point, and assumes a climb rate of 200 feet/NM or higher, as published. If the aircraft initiates a missed approach at a point other than the missed approach point (see paragraph 5-4-5b), from below MDA or DA (H), or on a circling approach, obstacle clearance is not necessarily provided by following the published missed approach procedure, nor is separation assured from other air traffic in the vicinity.

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-30

Circling and Missed Approach Obstruction Clearance Areas

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-31

Missed Approach

In the event a balked (rejected) landing occurs at a position other than the published missed approach point, the pilot should contact ATC as soon as possible to obtain an amended clearance. If unable to contact ATC for any reason, the pilot should attempt to re-intercept a published segment of the missed approach and comply with route and altitude instructions. If unable to contact ATC, and in the pilot's judgment it is no longer appropriate to fly the published missed approach procedure, then consider either maintaining visual conditions if practicable and reattempt a landing, or a circle-climb over the airport. Should a missed approach become necessary when operating to an airport that is not served by an operating control tower, continuous contact with an air traffic facility may not be possible. In this case, the pilot should execute the appropriate go-around/missed approach procedure without delay and contact ATC when able to do so.

Prior to initiating an instrument approach procedure, the pilot should assess the actions to be taken in the event of a balked (rejected) landing beyond the missed approach point or below the MDA or DA (H) considering the anticipated weather conditions and available aircraft performance. 14 CFR 91.175(e) authorizes the pilot to fly an appropriate missed approach procedure that ensures obstruction clearance, but it does not necessarily consider separation from other air traffic. The pilot must consider other factors such as the aircraft's geographical location with respect to the prescribed missed approach point, direction of flight, and/or mini-

US 5-4

SECTION 4. ARRIVAL PROCEDURES

mum turning altitudes in the prescribed missed approach procedure. The pilot must also consider aircraft performance, visual climb restrictions, charted obstacles, published obstacle departure procedure, takeoff visual climb requirements as expressed by nonstandard takeoff minima, other traffic expected to be in the vicinity, or other factors not specifically expressed by the approach procedures.

5-4-22 USE OF ENHANCED FLIGHT VISION SYSTEMS (EFVS) ON INSTRUMENT APPROACHES

- a. **Introduction.** During an instrument approach, an EFVS can enable a pilot to see the approach lights, visual references associated with the runway environment, and other objects or features that might not be visible using natural vision alone. An EFVS uses a head-up display (HUD), or an equivalent display that is a head-up presentation, to combine flight information, flight symbology, navigation guidance, and a real-time image of the external scene to the pilot. Combining the flight information, navigation guidance, and sensor imagery on a HUD (or equivalent display) allows the pilot to continue looking forward along the flightpath throughout the entire approach, landing, and rollout.

An EFVS operation is an operation in which visibility conditions require an EFVS to be used in lieu of natural vision to perform an approach or landing, determine enhanced flight visibility, identify required visual references, or conduct a rollout. There are two types of EFVS operations:

1. EFVS operations to touchdown and rollout.
2. EFVS operations to 100 feet above the touchdown zone elevation (TDZE).

- b. **EFVS Operations to Touchdown and Rollout.** An EFVS operation to touchdown and rollout is an operation in which the pilot uses the enhanced vision imagery provided by an EFVS in lieu of natural vision to descend below DA or DH to touchdown and rollout. (See FIG 5-4-32.) These operations may be conducted only on Standard Instrument Approach Procedures (SIAP) or special IAPs that have a DA or DH (for example, precision or APV approach). An EFVS operation to touchdown and rollout may not be conducted on an approach that has circling minimums. The regulations for EFVS operations to touchdown and rollout can be found in 14 CFR §91.176(a).

US 5-4

SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-32

EFVS Operation to Touchdown and Rollout

- c. **EFVS Operations to 100 Feet Above the TDZE.** An EFVS operation to 100 feet above the TDZE is an operation in which the pilot uses the enhanced vision imagery provided by an EFVS in lieu of natural vision to descend below DA/DH or MDA down to 100 feet above the TDZE. (See FIG 5-4-33.) To continue the approach below 100 feet above the TDZE, a pilot must have sufficient flight visibility to identify the required visual references using natural vision and must continue to use the EFVS to ensure the enhanced flight visibility meets the visibility requirements of the IAP being flown. These operations may be conducted on SIAPs or special IAPs that have a DA/DH or MDA. An EFVS operation to 100 feet above the TDZE may not be conducted on an approach that has circling minimums. The regulations for EFVS operations to 100 feet above the TDZE can be found in 14 CFR §91.176(b).

US 5-4
SECTION 4. ARRIVAL PROCEDURES

FIGURE 5-4-33

EFVS Operation to 100 ft Above the TDZE

- d. **EFVS Equipment Requirements.** An EFVS that is installed on a U.S.-registered aircraft and is used to conduct EFVS operations must conform to an FAA-type design approval (i.e., a type certificate (TC), amended TC, or supplemental type certificate (STC)). A foreign-registered aircraft used to conduct EFVS operations that does not have an FAA-type design approval must be equipped with an EFVS that has been approved by either the State of the Operator or the State of Registry to meet the requirements of ICAO Annex 6. Equipment requirements for an EFVS operation to touchdown and rollout can be found in 14 CFR §91.176(a)(1), and the equipment requirements for an EFVS operation to 100 feet above the TDZE can be found in 14 CFR §91.176(b)(1). An operator can determine the eligibility of their aircraft to conduct EFVS operations by referring to the Airplane Flight Manual, Airplane Flight Manual Supplement, Rotorcraft Flight Manual, or Rotorcraft Flight Manual Supplement as applicable.
- e. **Operating Requirements.** Any operator who conducts EFVS operations to touchdown and rollout (14 CFR §91.176(a)) must have an OpSpec, MSpec, or LOA that specifically authorizes those operations. Parts 91K, 121, 125, 129, and 135 operators who conduct EFVS operations to 100 feet above the TDZE (14 CFR §91.176(b)) must have an OpSpec,

US 5-4

SECTION 4. ARRIVAL PROCEDURES

MSpec, or LOA that specifically authorizes the operation. Part 91 operators (other than 91K operators) are not required to have an LOA to conduct EFVS operations to 100 feet above the TDZE in the United States. However, an optional LOA is available to facilitate operational approval from foreign Civil Aviation Authorities (CAA). To conduct an EFVS operation to touchdown and rollout during an authorized Category II or III operation, the operator must have:

1. An OpSpec, MSpec, or LOA authorizing EFVS operations to touchdown and rollout (14 CFR §91.176(a)); and
 2. An OpSpec, MSpec, or LOA authorizing Category II or Category III operations.
- f. **EFVS Operations in Rotorcraft.** Currently, EFVS operations in rotorcraft can only be conducted on IAPs that are flown to a runway. Instrument approach criteria, procedures, and appropriate visual references have not yet been developed for straight-in landing operations below DA/DH or MDA under IFR to heliports or platforms. An EFVS cannot be used in lieu of natural vision to descend below published minimums on copter approaches to a point in space (PinS) followed by a “proceed visual flight rules (VFR)” visual segment, or on approaches designed to a specific landing site using a “proceed visually” visual segment.
- g. **EFVS Pilot Requirements.** A pilot who conducts EFVS operations must receive ground and flight training specific to the EFVS operation to be conducted. The training must be obtained from an authorized training provider under a training program approved by the FAA. Additionally, recent flight experience and proficiency or competency check requirements apply to EFVS operations. These requirements are addressed in 14 CFR §§61.66, 91.1065, 121.441, Appendix F to Part 121, 125.287, and 135.293.
- h. **Enhanced Flight Visibility and Visual Reference Requirements.** To descend below DA/DH or MDA during EFVS operations under 14 CFR §91.176(a) or (b), a pilot must make a determination that the enhanced flight visibility observed by using an EFVS is not less than what is prescribed by the IAP being flown. In addition, the visual references required in 14 CFR §91.176(a) or (b) must be distinctly visible and identifiable to the pilot using the EFVS. The determination of enhanced flight visibility is a separate action from that of identifying required visual references, and is different from ground-reported visibility. Even though the reported visibility or the visibility observed using natural vision may be less, as long as the EFVS provides the required enhanced flight visibility and a pilot meets all of the other requirements, the pilot can continue descending below DA/DH or MDA using the EFVS. Suitable enhanced flight visibility is necessary to ensure the aircraft is in a position to continue the approach and land. It is important to understand that using an EFVS does not result in obtaining lower minima with respect to the visibility or the DA/DH or MDA specified in the IAP. An EFVS simply provides another means of operating in the visual segment of an IAP. The DA/DH or MDA and the visibility value specified in the IAP to be flown do not change.
- i. **Flight Planning and Beginning or Continuing an Approach Under IFR.** A Part 121, 125, or 135 operator's OpSpec or LOA for EFVS operations may authorize an EFVS operational credit dispatching or releasing a flight and for beginning or continuing an instrument approach procedure. When a pilot reaches DA/DH or MDA, the pilot conducts the EFVS

US 5-4

SECTION 4. ARRIVAL PROCEDURES

operation in accordance with 14 CFR §91.176(a) or (b) and their authorization to conduct EFVS operations.

- j. **Missed Approach Considerations.** In order to conduct an EFVS operation, the EFVS must be operable. In the event of a failure of any required component of an EFVS at any point in the approach to touchdown, a missed approach is required. However, this provision does not preclude a pilot's authority to continue an approach if continuation of an approach is considered by the pilot to be a safer course of action.
- k. **Light Emitting Diode (LED) Airport Lighting Impact on EFVS Operations.** Incandescent lamps are being replaced with LEDs at some airports in threshold lights, taxiway edge lights, taxiway centerline lights, low intensity runway edge lights, windcone lights, beacons, and some obstruction lighting. Additionally, there are plans to replace incandescent lamps with LEDs in approach lighting systems. Pilots should be aware that LED lights cannot be sensed by infrared-based EFVSs. Further, the FAA does not currently collect or disseminate information about where LED lighting is installed.
- l. **Other Vision Systems.** Unlike an EFVS that meets the equipment requirements of 14 CFR §91.176, a Synthetic Vision System (SVS) or Synthetic Vision Guidance System (SVGS) does not provide a real-time sensor image of the outside scene and also does not meet the equipment requirements for EFVS operations. A pilot cannot use a synthetic vision image on a head-up or a head-down display in lieu of natural vision to descend below DA/DH or MDA. An EFVS can, however, be integrated with an SVS, also known as a Combined Vision System (CVS). A CVS can be used to conduct EFVS operations if all of the requirements for an EFVS are satisfied and the SVS image does not interfere with the pilot's ability to see the external scene, to identify the required visual references, or to see the sensor image.
- m. **Additional Information.** Operational criteria for EFVS can be found in Advisory Circular (AC) 90-106, Enhanced Flight Vision System Operations, and airworthiness criteria for EFVS can be found in AC 20-167, Airworthiness Approval of Enhanced Vision System, Synthetic Vision System, Combined Vision System, and Enhanced Flight Vision System Equipment.

5-4-23 VISUAL APPROACH

- a. A visual approach is conducted on an IFR flight plan and authorizes a pilot to proceed visually and clear of clouds to the airport. The pilot must have either the airport or the preceding identified aircraft in sight. This approach must be authorized and controlled by the appropriate air traffic control facility. Reported weather at the airport must have a ceiling at or above 1,000 feet and visibility 3 miles or greater. ATC may authorize this type of approach when it will be operationally beneficial. Visual approaches are an IFR procedure conducted under IFR in visual meteorological conditions. Cloud clearance requirements of 14 CFR Section 91.155 are not applicable, unless required by operation specifications. When conducting visual approaches, pilots are encouraged to use other available navigational aids to assist in positive lateral and vertical alignment with the runway.
- b. **Operating to an Airport Without Weather Reporting Service.** ATC will advise the pilot when weather is not available at the destination airport. ATC may initiate a visual approach

US 5-4

SECTION 4. ARRIVAL PROCEDURES

provided there is a reasonable assurance that weather at the airport is a ceiling at or above 1,000 feet and visibility 3 miles or greater (e.g., area weather reports, PIREPs, etc.).

- c. **Operating to an Airport With an Operating Control Tower.** Aircraft may be authorized to conduct a visual approach to one runway while other aircraft are conducting IFR or VFR approaches to another parallel, intersecting, or converging runway. ATC may authorize a visual approach after advising all aircraft involved that other aircraft are conducting operations to the other runway. This may be accomplished through use of the ATIS.
1. When operating to parallel runways separated by less than 2,500 feet, ATC will ensure approved separation is provided unless the succeeding aircraft reports sighting the preceding aircraft to the adjacent parallel and visual separation is applied.
 2. When operating to parallel runways separated by at least 2,500 feet but less than 4,300 feet, ATC will ensure approved separation is provided until the aircraft are issued an approach clearance and one pilot has acknowledged receipt of a visual approach clearance, and the other pilot has acknowledged receipt of a visual or instrument approach clearance, and aircraft are established on a heading or established on a direct course to a fix or cleared on an RNAV/instrument approach procedure which will intercept the extended centerline of the runway at an angle not greater than 30 degrees.
 3. When operating to parallel runways separated by 4,300 feet or more, ATC will ensure approved separation is provided until one of the aircraft has been issued and the pilot has acknowledged receipt of the visual approach clearance, and each aircraft is assigned a heading, or established on a direct course to a fix, or cleared on an RNAV/instrument approach procedure which will allow the aircraft to intercept the extended centerline of the runway at an angle not greater than 30 degrees.
- NOTE:** *The intent of the 30 degree intercept angle is to reduce the potential for overshoots of the final and to preclude side-by-side operations with one or both aircraft in a belly-up configuration during the turn-on.*
- d. **Clearance for Visual Approach.** At locations with an operating control tower, ATC will issue approach clearances that will include an assigned runway. At locations without an operating control tower or where a part-time tower is closed, ATC will issue a visual approach clearance to the airport only.
- e. **Separation Responsibilities.** If the pilot has the airport in sight but cannot see the aircraft to be followed, ATC may clear the aircraft for a visual approach; however, ATC retains both separation and wake vortex separation responsibility. When visually following a preceding aircraft, acceptance of the visual approach clearance constitutes acceptance of pilot responsibility for maintaining a safe approach interval and adequate wake turbulence separation.
- f. A visual approach is not an IAP and therefore has no missed approach segment. If a go-around is necessary for any reason, aircraft operating at controlled airports will be issued an appropriate clearance or instruction by the tower to enter the traffic pattern for landing or proceed as otherwise instructed. In either case, the pilot is responsible to maintain terrain and obstruction avoidance until reaching an ATC assigned altitude if issued, and ATC will provide approved separation or visual separation from other IFR aircraft. At uncontrolled airports, air-

US 5-4

SECTION 4. ARRIVAL PROCEDURES

craft are expected to remain clear of clouds and complete a landing as soon as possible. If a landing cannot be accomplished, the aircraft is expected to remain clear of clouds and contact ATC as soon as possible for further clearance. Separation from other IFR aircraft will be maintained under these circumstances.

- g. Visual approaches reduce pilot/controller workload and expedite traffic by shortening flight paths to the airport. It is the pilot's responsibility to advise ATC as soon as possible if a visual approach is not desired.
- h. Authorization to conduct a visual approach is an IFR authorization and does not alter IFR flight plan cancellation responsibility.

REFERENCE—AIM, Paragraph 5-1-15, *Canceled IFR Flight Plan*.

- i. Radar service is automatically terminated, without advising the pilot, when the aircraft is instructed to change to advisory frequency.

5-4-24 CHARTED VISUAL FLIGHT PROCEDURE (CVFP)

- a. CVFPs are charted visual approaches established for environmental/noise considerations, and/or when necessary for the safety and efficiency of air traffic operations. The approach charts depict prominent landmarks, courses, and recommended altitudes to specific runways. CVFPs are designed to be used primarily for turbojet aircraft.
- b. These procedures will be used only at airports with an operating control tower.
- c. Most approach charts will depict some NAVAID information which is for supplemental navigational guidance only.
- d. Unless indicating a Class B airspace floor, all depicted altitudes are for noise abatement purposes and are recommended only. Pilots are not prohibited from flying other than recommended altitudes if operational requirements dictate.
- e. When landmarks used for navigation are not visible at night, the approach will be annotated "PROCEDURE NOT AUTHORIZED AT NIGHT."
- f. CVFPs usually begin within 20 flying miles from the airport.
- g. Published weather minimums for CVFPs are based on minimum vectoring altitudes rather than the recommended altitudes depicted on charts.
- h. CVFPs are not instrument approaches and do not have missed approach segments.
 - i. ATC will not issue clearances for CVFPs when the weather is less than the published minimum.
 - j. ATC will clear aircraft for a CVFP after the pilot reports sighting a charted landmark or a preceding aircraft. If instructed to follow a preceding aircraft, pilots are responsible for maintaining a safe approach interval and wake turbulence separation.
- k. Pilots should advise ATC if at any point they are unable to continue an approach or lose sight of a preceding aircraft. Missed approaches will be handled as a go-around.

US 5-4

SECTION 4. ARRIVAL PROCEDURES

- I. When conducting visual approaches, pilots are encouraged to use other available navigational aids to assist in positive lateral and vertical alignment with the assigned runway.

5-4-25 CONTACT APPROACH

- a. Pilots operating in accordance with an IFR flight plan, provided they are clear of clouds and have at least 1 mile flight visibility and can reasonably expect to continue to the destination airport in those conditions, may request ATC authorization for a contact approach.
- b. Controllers may authorize a contact approach provided:

1. The contact approach is specifically requested by the pilot. ATC cannot initiate this approach.

EXAMPLE: Request contact approach.

2. The reported ground visibility at the destination airport is at least 1 statute mile.
3. The contact approach will be made to an airport having a standard or special instrument approach procedure.
4. Approved separation is applied between aircraft so cleared and between these aircraft and other IFR or special VFR aircraft.

EXAMPLE: Cleared contact approach (and, if required) at or below (altitude) (routing) if not possible (alternative procedures) and advise.

- c. A contact approach is an approach procedure that may be used by a pilot (with prior authorization from ATC) in lieu of conducting a standard or special IAP to an airport. It is not intended for use by a pilot on an IFR flight clearance to operate to an airport not having a published and functioning IAP. Nor is it intended for an aircraft to conduct an instrument approach to one airport and then, when "in the clear," discontinue that approach and proceed to another airport. In the execution of a contact approach, the pilot assumes the responsibility for obstruction clearance. If radar service is being received, it will automatically terminate when the pilot is instructed to change to advisory frequency.

5-4-26 LANDING PRIORITY

A clearance for a specific type of approach (ILS, RNAV, GLS, ADF, VOR or Visual Approach) to an aircraft operating on an IFR flight plan does not mean that landing priority will be given over other traffic. ATCTs handle all aircraft, regardless of the type of flight plan, on a "first-come, first-served" basis. Therefore, because of local traffic or runway in use, it may be necessary for the controller in the interest of safety, to provide a different landing sequence. In any case, a landing sequence will be issued to each aircraft as soon as possible to enable the pilot to properly adjust the aircraft's flight path.

5-4-27 OVERHEAD APPROACH MANEUVER

- a. Pilots operating in accordance with an IFR flight plan in Visual Meteorological Conditions (VMC) may request ATC authorization for an overhead maneuver. An overhead maneuver is not an instrument approach procedure. Overhead maneuver patterns are developed at air-

US 5-4

SECTION 4. ARRIVAL PROCEDURES

ports where aircraft have an operational need to conduct the maneuver. An aircraft conducting an overhead maneuver is considered to be VFR and the IFR flight plan is canceled when the aircraft reaches the initial point on the initial approach portion of the maneuver. (See FIG 5-4-34.) The existence of a standard overhead maneuver pattern does not eliminate the possible requirement for an aircraft to conform to conventional rectangular patterns if an overhead maneuver cannot be approved. Aircraft operating to an airport without a functioning control tower must initiate cancellation of an IFR flight plan prior to executing the overhead maneuver. Cancellation of the IFR flight plan must be accomplished after crossing the landing threshold on the initial portion of the maneuver or after landing. Controllers may authorize an overhead maneuver and issue the following to arriving aircraft:

1. Pattern altitude and direction of traffic. This information may be omitted if either is standard.

PHRASEOLOGY:

PATTERN ALTITUDE (altitude). RIGHT TURNS.

2. Request for a report on initial approach.

PHRASEOLOGY:

REPORT INITIAL.

3. "Break" information and a request for the pilot to report. The "Break Point" will be specified if nonstandard. Pilots may be requested to report "break" if required for traffic or other reasons.

PHRASEOLOGY:

BREAK AT (specified point).

REPORT BREAK.

FIGURE 5-4-34

Overhead Maneuver

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

5-5-1 GENERAL

- a. The roles and responsibilities of the pilot and controller for effective participation in the ATC system are contained in several documents. Pilot responsibilities are in the CFRs and the air traffic controllers' are in the FAA Order JO 7110.65, Air Traffic Control, and supplemental FAA directives. Additional and supplemental information for pilots can be found in the current Aeronautical Information Manual (AIM), Notices to Air Missions, Advisory Circulars and aeronautical charts. Since there are many other excellent publications produced by nongovernment organizations, as well as other government organizations, with various updating cycles, questions concerning the latest or most current material can be resolved by cross-checking with the above mentioned documents.
- b. The pilot-in-command of an aircraft is directly responsible for, and is the final authority as to the safe operation of that aircraft. In an emergency requiring immediate action, the pilot-in-command may deviate from any rule in the General Subpart A and Flight Rules Subpart B in accordance with 14 CFR Section 91.3.
- c. The air traffic controller is responsible to give first priority to the separation of aircraft and to the issuance of radar safety alerts, second priority to other services that are required, but do not involve separation of aircraft and third priority to additional services to the extent possible.
- d. In order to maintain a safe and efficient air traffic system, it is necessary that each party fulfill their responsibilities to the fullest.
- e. The responsibilities of the pilot and the controller intentionally overlap in many areas providing a degree of redundancy. Should one or the other fail in any manner, this overlapping responsibility is expected to compensate, in many cases, for failures that may affect safety.
- f. The following, while not intended to be all inclusive, is a brief listing of pilot and controller responsibilities for some commonly used procedures or phases of flight. More detailed explanations are contained in other portions of this publication, the appropriate CFRs, ACs and similar publications. The information provided is an overview of the principles involved and is not meant as an interpretation of the rules nor is it intended to extend or diminish responsibilities.

5-5-2 AIR TRAFFIC CLEARANCE

- a. **Pilot.**
 1. Acknowledges receipt and understanding of an ATC clearance.
 2. Reads back any hold short of runway instructions issued by ATC.
 3. Requests clarification or amendment, as appropriate, any time a clearance is not fully understood or considered unacceptable from a safety standpoint.
 4. Promptly complies with an air traffic clearance upon receipt except as necessary to cope with an emergency. Advises ATC as soon as possible and obtains an amended clearance, if deviation is necessary.

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

NOTE: A clearance to land means that appropriate separation on the landing runway will be ensured. A landing clearance does not relieve the pilot from compliance with any previously issued altitude crossing restriction.

b. Controller.

1. Issues appropriate clearances for the operation to be conducted, or being conducted, in accordance with established criteria.
2. Assigns altitudes in IFR clearances that are at or above the minimum IFR altitudes in controlled airspace.
3. Ensures acknowledgement by the pilot for issued information, clearances, or instructions.
4. Ensures that readbacks by the pilot of altitude, heading, or other items are correct. If incorrect, distorted, or incomplete, makes corrections as appropriate.

5-5-3 CONTACT APPROACH**a. Pilot.**

1. Must request a contact approach and makes it in lieu of a standard or special instrument approach.
2. By requesting the contact approach, indicates that the flight is operating clear of clouds, has at least one mile flight visibility, and reasonably expects to continue to the destination airport in those conditions.
3. Assumes responsibility for obstruction clearance while conducting a contact approach.
4. Advises ATC immediately if unable to continue the contact approach or if encounters less than 1 mile flight visibility.
5. Is aware that if radar service is being received, it may be automatically terminated when told to contact the tower.

REFERENCE—*Pilot/Controller Glossary Term — Radar Service Terminated.*

b. Controller.

1. Issues clearance for a contact approach only when requested by the pilot. Does not solicit the use of this procedure.
2. Before issuing the clearance, ascertains that reported ground visibility at destination airport is at least 1 mile.
3. Provides approved separation between the aircraft cleared for a contact approach and other IFR or special VFR aircraft. When using vertical separation, does not assign a fixed altitude, but clears the aircraft at or below an altitude which is at least 1,000 feet below any IFR traffic but not below Minimum Safe Altitudes prescribed in 14 CFR Section 91.119.

US 5-5
SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

4. Issues alternative instructions if, in their judgment, weather conditions may make completion of the approach impracticable.

5-5-4 INSTRUMENT APPROACH
a. Pilot.

1. Be aware that the controller issues clearance for approach based only on known traffic.
2. Follows the procedure as shown on the IAP, including all restrictive notations, such as:
 - (a) Procedure not authorized at night;
 - (b) Approach not authorized when local area altimeter not available;
 - (c) Procedure not authorized when control tower not in operation;
 - (d) Procedure not authorized when glide slope not used;
 - (e) Straight-in minimums not authorized at night; etc.
 - (f) Radar required; or
 - (g) The circling minimums published on the instrument approach chart provide adequate obstruction clearance and pilots should not descend below the circling altitude until the aircraft is in a position to make final descent for landing. Sound judgment and knowledge of the pilot's and the aircraft's capabilities are the criteria for determining the exact maneuver in each instance since airport design and the aircraft position, altitude and airspeed must all be considered.

REFERENCE—*AIM, Paragraph 5-4-20, Approach and Landing Minimums.*

3. Upon receipt of an approach clearance while on an unpublished route or being radar vectored:
 - (a) Complies with the minimum altitude for IFR; and
 - (b) Maintains the last assigned altitude until established on a segment of a published route or IAP, at which time published altitudes apply.
4. There are currently two temperature limitations that may be published in the notes box of the middle briefing strip on an instrument approach procedure (IAP). The two published temperature limitations are:
 - (a) A temperature range limitation associated with the use of baro-VNAV that may be published on a United States PBN IAP titled RNAV (GPS) or RNAV (RNP); and/or
 - (b) A Cold Temperature Airport (CTA) limitation designated by a snowflake ICON and temperature in Celsius (C) that is published on every IAP for the airfield.
5. Any planned altitude correction for the intermediate and/or missed approach holding segments must be coordinated with ATC. Pilots do not have to advise ATC of a correction in the final segment.

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

REFERENCE—AIM, Chapter 7, Section 3, Cold Temperature Barometric Altimeter Errors, Setting Procedures, and Cold Temperature Airports (CTA).

b. Controller.

1. Issues an approach clearance based on known traffic.
2. Issues an IFR approach clearance only after the aircraft is established on a segment of published route or IAP, or assigns an appropriate altitude for the aircraft to maintain until so established.

5-5-5 MISSED APPROACH**a. Pilot.**

1. Executes a missed approach when one of the following conditions exist:
 - (a) Arrival at the Missed Approach Point (MAP) or the Decision Height (DH) and visual reference to the runway environment is insufficient to complete the landing.
 - (b) Determines that a safe approach or landing is not possible (see subparagraph 5-4-21h).
 - (c) Instructed to do so by ATC.
2. Advises ATC that a missed approach will be made. Include the reason for the missed approach unless the missed approach is initiated by ATC.
3. Complies with the missed approach instructions for the IAP being executed from the MAP, unless other missed approach instructions are specified by ATC.
4. If executing a missed approach prior to reaching the MAP, fly the lateral navigation path of the instrument procedure to the MAP. Climb to the altitude specified in the missed approach procedure, except when a maximum altitude is specified between the final approach fix (FAF) and the MAP. In that case, comply with the maximum altitude restriction. Note, this may require a continued descent on the final approach.
5. Cold Temperature Airports (CTA) are designated by a snowflake ICON and temperature in Celsius (C) that are published in the notes box of the middle briefing strip on an instrument approach procedure (IAP). Pilots should apply a cold temperature correction to the missed approach final holding altitude when the reported temperature is at or below the CTA temperature limitation. Pilots must inform ATC of the correction.

REFERENCE—AIM, Chapter 7, Section 3, Cold Temperature Barometric Altimeter Errors, Setting Procedures, and Cold Temperature Airports (CTA).

6. Following a missed approach, requests clearance for specific action; i.e., another approach, hold for improved conditions, proceed to an alternate airport, etc.

b. Controller.

1. Issues an approved alternate missed approach procedure if it is desired that the pilot execute a procedure other than as depicted on the instrument approach chart.

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

2. May vector a radar identified aircraft executing a missed approach when operationally advantageous to the pilot or the controller.
3. In response to the pilot's stated intentions, issues a clearance to an alternate airport, to a holding fix, or for reentry into the approach sequence, as traffic conditions permit.

5-5-6 VECTORS**a. Pilot.**

1. Promptly complies with headings and altitudes assigned to you by the controller.
2. Questions any assigned heading or altitude believed to be incorrect.
3. If operating VFR and compliance with any radar vector or altitude would cause a violation of any CFR, advises ATC and obtains a revised clearance or instructions.

b. Controller.

1. Vectors aircraft in Class A, Class B, Class C, Class D, and Class E airspace:
 - (a) For separation.
 - (b) For noise abatement.
 - (c) To obtain an operational advantage for the pilot or controller.
2. Vectors aircraft in Class A, Class B, Class C, Class D, Class E, and Class G airspace when requested by the pilot.
3. Except where authorized for radar approaches, radar departures, special VFR, or when operating in accordance with vectors below minimum altitude procedures, vector IFR aircraft at or above minimum vectoring altitudes.
4. May vector aircraft off assigned procedures. When published altitude or speed restrictions are included, controllers must assign an altitude, or if necessary, a speed.
5. May vector VFR aircraft, not at an ATC assigned altitude, at any altitude. In these cases, terrain separation is the pilot's responsibility.

5-5-7 SAFETY ALERT**a. Pilot.**

1. Initiates appropriate action if a safety alert is received from ATC.
2. Be aware that this service is not always available and that many factors affect the ability of the controller to be aware of a situation in which unsafe proximity to terrain, obstructions, or another aircraft may be developing.

b. Controller.

1. Issues a safety alert if aware an aircraft under their control is at an altitude which, in the controller's judgment, places the aircraft in unsafe proximity to terrain, obstructions or another aircraft. Types of safety alerts are:

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

- (a) **Terrain or Obstruction Alert.** Immediately issued to an aircraft under their control if aware the aircraft is at an altitude believed to place the aircraft in unsafe proximity to terrain or obstructions.
 - (b) **Aircraft Conflict Alert.** Immediately issued to an aircraft under their control if aware of an aircraft not under their control at an altitude believed to place the aircraft in unsafe proximity to each other. With the alert, they offer the pilot an alternative, if feasible.
2. Discontinue further alerts if informed by the pilot action is being taken to correct the situation or that the other aircraft is in sight.

5-5-8 SEE AND AVOID

- a. **Pilot.** When meteorological conditions permit, regardless of type of flight plan or whether or not under control of a radar facility, the pilot is responsible to see and avoid other traffic, terrain, or obstacles.
- b. **Controller.**
 - 1. Provides radar traffic information to radar identified aircraft operating outside positive control airspace on a workload permitting basis.
 - 2. Issues safety alerts to aircraft under their control if aware the aircraft is at an altitude believed to place the aircraft in unsafe proximity to terrain, obstructions, or other aircraft.

5-5-9 SPEED ADJUSTMENTS

- a. **Pilot.**
 - 1. Advises ATC any time cruising airspeed varies plus or minus 5 percent or 10 knots, whichever is greater, from that given in the flight plan.
 - 2. Complies with speed adjustments from ATC unless:
 - (a) The minimum or maximum safe airspeed for any particular operation is greater or less than the requested airspeed. In such cases, advises ATC.
NOTE: *It is the pilot's responsibility and prerogative to refuse speed adjustments considered excessive or contrary to the aircraft's operating specifications.*
 - (b) Operating at or above 10,000 feet MSL on an ATC assigned SPEED ADJUSTMENT of more than 250 knots IAS and subsequent clearance is received for descent below 10,000 feet MSL. In such cases, pilots are expected to comply with 14 CFR Section 91.117(a).
 - 3. When complying with speed adjustment assignments, maintains an indicated airspeed within plus or minus 10 knots or 0.02 Mach number of the specified speed.
- b. **Controller.**
 - 1. Assigns speed adjustments to aircraft when necessary but not as a substitute for good vectoring technique.

US 5-5
SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

2. Adheres to the restrictions published in the FAA Order JO 7110.65, Air Traffic Control, as to when speed adjustment procedures may be applied.
3. Avoids speed adjustments requiring alternate decreases and increases.
4. Assigns speed adjustments to a specified IAS (KNOTS)/Mach number or to increase or decrease speed using increments of 5 knots or multiples thereof.
5. Terminates ATC-assigned speed adjustments when no longer required by issuing further instructions to pilots in the following manner:
 - (a) Advises pilots to “resume normal speed” when the aircraft is on a heading, random routing, charted procedure, or route without published speed restrictions.
 - (b) Instructs pilots to “comply with speed restrictions” when the aircraft is joining or resuming a charted procedure or route with published speed restrictions.

CAUTION: *The phraseology “Climb via SID” requires compliance with all altitude and/or speed restrictions depicted on the procedure.*

 - (c) Instructs pilots to “resume published speed” when aircraft are cleared via a charted instrument flight procedure that contains published speed restrictions.
 - (d) Advises aircraft to “delete speed restrictions” when ATC assigned or published speed restrictions on a charted procedure are no longer required.
 - (e) Clears pilots for approach without restating previously issued speed adjustments.

REFERENCE—

Pilot/Controller Glossary Term — Resume Normal Speed.

Pilot/Controller Glossary Term — Resume Published Speed.

6. Gives due consideration to aircraft capabilities to reduce speed while descending.
7. Does not assign speed adjustments to aircraft at or above FL 390 without pilot consent.

5-5-10 TRAFFIC ADVISORIES (TRAFFIC INFORMATION)
a. Pilot.

1. Acknowledges receipt of traffic advisories.
2. Informs controller if traffic in sight.
3. Advises ATC if a vector to avoid traffic is desired.
4. Does not expect to receive radar traffic advisories on all traffic. Some aircraft may not appear on the radar display. Be aware that the controller may be occupied with higher priority duties and unable to issue traffic information for a variety of reasons.
5. Advises controller if service is not desired.

b. Controller.

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

1. Issues radar traffic to the maximum extent consistent with higher priority duties except in Class A airspace.
2. Provides vectors to assist aircraft to avoid observed traffic when requested by the pilot.
3. Issues traffic information to aircraft in the Class B, Class C, and Class D surface areas for sequencing purposes.
4. Controllers are required to issue traffic advisories to each aircraft operating on intersecting or nonintersecting converging runways where projected flight paths will cross.

5-5-11 VISUAL APPROACH**a. Pilot.**

1. If a visual approach is not desired, advises ATC.
2. Complies with controller's instructions for vectors toward the airport of intended landing or to a visual position behind a preceding aircraft.
3. The pilot must, at all times, have either the airport or the preceding aircraft in sight. After being cleared for a visual approach, proceed to the airport in a normal manner or follow the preceding aircraft. Remain clear of clouds while conducting a visual approach.
4. If the pilot accepts a visual approach clearance to visually follow a preceding aircraft, you are required to establish a safe landing interval behind the aircraft you were instructed to follow. You are responsible for wake turbulence separation.
5. Advise ATC immediately if the pilot is unable to continue following the preceding aircraft, cannot remain clear of clouds, needs to climb, or loses sight of the airport.
6. In the event of a go-around, the pilot is responsible to maintain terrain and obstruction avoidance until reaching an ATC assigned altitude if issued.
7. Be aware that radar service is automatically terminated, without being advised by ATC, when the pilot is instructed to change to advisory frequency.
8. Be aware that there may be other traffic in the traffic pattern and the landing sequence may differ from the traffic sequence assigned by approach control or ARTCC.

b. Controller.

1. Do not clear an aircraft for a visual approach unless reported weather at the airport is ceiling at or above 1,000 feet and visibility is 3 miles or greater. When weather is not available for the destination airport, inform the pilot and do not initiate a visual approach to that airport unless there is reasonable assurance that descent and flight to the airport can be made visually.
2. Issue visual approach clearance when the pilot reports sighting either the airport or a preceding aircraft which is to be followed.
3. Provide separation except when visual separation is being applied by the pilot.

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

4. Continue flight following and traffic information until the aircraft has landed or has been instructed to change to advisory frequency.
5. Inform the pilot when the preceding aircraft is a heavy.
6. When weather is available for the destination airport, do not initiate a vector for a visual approach unless the reported ceiling at the airport is 500 feet or more above the MVA and visibility is 3 miles or more. If vectoring weather minima are not available but weather at the airport is ceiling at or above 1,000 feet and visibility of 3 miles or greater, visual approaches may still be conducted.
7. Informs the pilot conducting the visual approach of the aircraft class when pertinent traffic is known to be a heavy aircraft.

5-5-12 VISUAL SEPARATION**a. Pilot.**

1. Acceptance of instructions to follow another aircraft or to provide visual separation from it is an acknowledgment that the pilot will maneuver the aircraft as necessary to avoid the other aircraft or to maintain in-trail separation. Pilots are responsible to maintain visual separation until flight paths (altitudes and/or courses) diverge.
2. If instructed by ATC to follow another aircraft or to provide visual separation from it, promptly notify the controller if you lose sight of that aircraft, are unable to maintain continued visual contact with it, or cannot accept the responsibility for your own separation for any reason.
3. The pilot also accepts responsibility for wake turbulence separation under these conditions.

b. Controller. Applies visual separation only:

1. Within the terminal area when a controller has both aircraft in sight or by instructing a pilot who sees the other aircraft to maintain visual separation from it.
2. Pilots are responsible to maintain visual separation until flight paths (altitudes and/or courses) diverge.
3. Within en route airspace when aircraft are on opposite courses and one pilot reports having seen the other aircraft and that the aircraft have passed each other.

5-5-13 VFR-ON-TOP**a. Pilot.**

1. This clearance must be requested by the pilot on an IFR flight plan, and if approved, allows the pilot the choice (subject to any ATC restrictions) to select an altitude or flight level in lieu of an assigned altitude.

NOTE: *VFR-on-top is not permitted in certain airspace areas, such as Class A airspace, certain restricted areas, etc. Consequently, IFR flights operating VFR-on-top will avoid such airspace.*

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

REFERENCE—

AIM, Paragraph 4-4-8, IFR Clearance VFR-on-top.

AIM, Paragraph 4-4-11, IFR Separation Standards.

AIM, Paragraph 5-3-2, Position Reporting.

AIM, Paragraph 5-3-3, Additional Reports.

2. By requesting a VFR-on-top clearance, the pilot assumes the sole responsibility to be vigilant so as to see and avoid other aircraft and to:
 - (a) Fly at the appropriate VFR altitude as prescribed in 14 CFR Section 91.159.
 - (b) Comply with the VFR visibility and distance from clouds criteria in 14 CFR Section 91.155, *Basic VFR weather minimums*.
 - (c) Comply with instrument flight rules that are applicable to this flight; i.e., minimum IFR altitudes, position reporting, radio communications, course to be flown, adherence to ATC clearance, etc.
3. Should advise ATC prior to any altitude change to ensure the exchange of accurate traffic information.

b. Controller.

1. May clear an aircraft to maintain VFR-on-top if the pilot of an aircraft on an IFR flight plan requests the clearance.
2. Informs the pilot of an aircraft cleared to climb to VFR-on-top the reported height of the tops or that no top report is available; issues an alternate clearance if necessary; and once the aircraft reports reaching VFR-on-top, reclears the aircraft to maintain VFR-on-top.
3. Before issuing clearance, ascertain that the aircraft is not in or will not enter Class A airspace.

5-5-14 INSTRUMENT DEPARTURES**a. Pilot.**

1. Prior to departure considers the type of terrain and other obstructions on or in the vicinity of the departure airport.
2. Determines if obstruction avoidance can be maintained visually or that the departure procedure should be followed.
3. Determines whether an obstacle departure procedure (ODP) and/or DP is available for obstruction avoidance. One option may be a Visual Climb Over Airport (VCOA). Pilots must advise ATC as early as possible of the intent to fly the VCOA prior to departure.
4. At airports where IAPs have not been published, hence no published departure procedure, determines what action will be necessary and takes such action that will assure a safe departure.

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

b. **Controller.**

1. At locations with airport traffic control service, when necessary, specifies direction of takeoff, turn, or initial heading to be flown after takeoff, consistent with published departure procedures (DP) or diverse vector areas (DVA), where applicable.
2. At locations without airport traffic control service but within Class E surface area when necessary to specify direction of takeoff, turn, or initial heading to be flown, obtains pilot's concurrence that the procedure will allow the pilot to comply with local traffic patterns, terrain, and obstruction avoidance.
3. When the initial heading will take the aircraft off an assigned procedure (for example, an RNAV SID with a published lateral path to a waypoint and crossing restrictions from the departure end of runway), the controller will assign an altitude to maintain with the initial heading.
4. Includes established departure procedures as part of the ATC clearance when pilot compliance is necessary to ensure separation.
5. At locations with both SIDs and DVAs, ATC will provide an amended departure clearance to cancel a previously assigned SID and subsequently utilize a DVA or vice versa. The amended clearance will be provided to the pilot in a timely manner so that the pilot may confirm adequate climb performance exists to determine if the amended clearance is acceptable, and brief the changes in advance of entering the runway.
6. At locations with a DVA, ATC is not permitted to utilize a SID and DVA concurrently.

5-5-15 MINIMUM FUEL ADVISORYa. **Pilot.**

1. Advise ATC of your minimum fuel status when your fuel supply has reached a state where, upon reaching destination, you cannot accept any undue delay.
2. Be aware this is not an emergency situation, but merely an advisory that indicates an emergency situation is possible should any undue delay occur.
3. On initial contact the term "minimum fuel" should be used after stating call sign.

EXAMPLE: Salt Lake Approach, United 621, "minimum fuel."

4. Be aware a minimum fuel advisory does not imply a need for traffic priority.
5. If the remaining usable fuel supply suggests the need for traffic priority to ensure a safe landing, you should declare an emergency due to low fuel and report fuel remaining in minutes.

REFERENCE—*Pilot/Controller Glossary Term — Fuel Remaining.*

b. **Controller.**

1. When an aircraft declares a state of minimum fuel, relay this information to the facility to whom control jurisdiction is transferred.

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

2. Be alert for any occurrence which might delay the aircraft.

5-5-16 RNAV AND RNP OPERATIONS**a. Pilot.**

1. If unable to comply with the requirements of an RNAV or RNP procedure, pilots must advise air traffic control as soon as possible. For example, "N1234, failure of GPS system, unable RNAV, request amended clearance."
2. Pilots are not authorized to fly a published RNAV or RNP procedure (instrument approach, departure, or arrival procedure) unless it is retrievable by the procedure name from the current aircraft navigation database and conforms to the charted procedure. The system must be able to retrieve the procedure by name from the aircraft navigation database, not just as a manually entered series of waypoints.
3. Whenever possible, RNAV routes (Q- or T- route) should be extracted from the database in their entirety, rather than loading RNAV route waypoints from the database into the flight plan individually. However, selecting and inserting individual, named fixes from the database is permitted, provided all fixes along the published route to be flown are inserted.
4. Pilots must not change any database waypoint type from a fly-by to fly-over, or vice versa. No other modification of database waypoints or the creation of user-defined waypoints on published RNAV or RNP procedures is permitted, except to:
 - (a) Change altitude and/or airspeed waypoint constraints to comply with an ATC clearance/instruction.
 - (b) Insert a waypoint along the published route to assist in complying with ATC instruction, example, "Descend via the WILMS arrival except cross 30 north of BRUCE at/or below FL 210." This is limited only to systems that allow along-track waypoint construction.
5. Pilots of FMS-equipped aircraft, who are assigned an RNAV DP or STAR procedure and subsequently receive a change of runway, transition or procedure, must verify that the appropriate changes are loaded and available for navigation.
6. For RNAV 1 DPs and STARs, pilots must use a CDI, flight director and/or autopilot, in lateral navigation mode. Other methods providing an equivalent level of performance may also be acceptable.
7. For RNAV 1 DPs and STARs, pilots of aircraft without GPS, using DME/DME/IRU, must ensure the aircraft navigation system position is confirmed, within 1,000 feet, at the start point of take-off roll. The use of an automatic or manual runway update is an acceptable means of compliance with this requirement. Other methods providing an equivalent level of performance may also be acceptable.
8. For procedures or routes requiring the use of GPS, if the navigation system does not automatically alert the flight crew of a loss of GPS, the operator must develop procedures to verify correct GPS operation.

US 5-5

SECTION 5. PILOT/CONTROLLER ROLES AND RESPONSIBILITIES

9. RNAV terminal procedures (DP and STAR) may be amended by ATC issuing radar vectors and/or clearances direct to a waypoint. Pilots should avoid premature manual deletion of waypoints from their active “legs” page to allow for rejoining procedures.
10. RAIM Prediction: If TSO-C129 equipment is used to solely satisfy the RNAV and RNP requirement, GPS RAIM availability must be confirmed for the intended route of flight (route and time). If RAIM is not available, pilots need an approved alternate means of navigation.

REFERENCE—AIM, Paragraph 5-1-16, RNAV and RNP Operations.

11. **Definition of “established” for RNAV and RNP operations.** An aircraft is considered to be established on-course during RNAV and RNP operations anytime it is within 1 times the required accuracy for the segment being flown. For example, while operating on a Q-Route (RNAV 2), the aircraft is considered to be established on-course when it is within 2 NM of the course centerline.

NOTE:

1. *Pilots must be aware of how their navigation system operates, along with any AFM limitations, and confirm that the aircraft's lateral deviation display (or map display if being used as an allowed alternate means) is suitable for the accuracy of the segment being flown. Automatic scaling and alerting changes are appropriate for some operations. For example, TSO-C129 systems change within 30 miles of destination and within 2 miles of FAF to support approach operations. For some navigation systems and operations, manual selection of scaling will be necessary.*
2. *Pilots flying FMS equipped aircraft with barometric vertical navigation (Baro-VNAV) may descend when the aircraft is established on-course following FMS leg transition to the next segment. Leg transition normally occurs at the turn bisector for a fly-by waypoint (reference paragraph 1-2-1 for more on waypoints). When using full automation, pilots should monitor the aircraft to ensure the aircraft is turning at appropriate lead times and descending once established on-course.*
3. *Pilots flying TSO-C129 navigation system equipped aircraft without full automation should use normal lead points to begin the turn. Pilots may descend when established on-course on the next segment of the approach.*

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

5-6-1 NATIONAL SECURITY

National security in the control of air traffic is governed by 14 Code of Federal Regulations (CFR) Part 99, *Security Control of Air Traffic*.

5-6-2 NATIONAL SECURITY REQUIREMENTS

- a. Pursuant to 14 CFR 99.7, *Special Security Instructions*, each person operating an aircraft in an Air Defense Identification Zone (ADIZ) or Defense Area must, in addition to the applicable rules of Part 99, comply with special security instructions issued by the FAA Administrator in the interest of national security, pursuant to agreement between the FAA and the Department of Defense (DOD), or between the FAA and a U.S. Federal security or intelligence agency.
- b. In addition to the requirements prescribed in this section, national security requirements for aircraft operations to or from, within, or transiting U.S. territorial airspace are in effect pursuant to 14 CFR 99.7; 49 United States Code (USC) 40103, *Sovereignty and Use of Airspace*; and 49 USC 41703, *Navigation of Foreign Civil Aircraft*. Aircraft operations to or from, within, or transiting U.S. territorial airspace must also comply with all other applicable regulations published in 14 CFR.
- c. Due to increased security measures in place at many areas and in accordance with 14 CFR 91.103, *Preflight Action*, prior to departure, pilots must become familiar with all available information concerning that flight. Pilots are responsible to comply with 14 CFR 91.137 (*Temporary flight restrictions in the vicinity of disaster/hazard areas*), 91.138 (*Temporary flight restrictions in national disaster areas in the State of Hawaii*), 91.141 (*Flight restrictions in the proximity of the Presidential and other parties*), and 91.143 (*Flight limitation in the proximity of space flight operations*) when conducting flight in an area where a temporary flight restrictions area is in effect, and should check appropriate NOTAMs during flight planning. In addition, NOTAMs may be issued for National Security Areas (NSA) that temporarily prohibit flight operations under the provisions of 14 CFR 99.7.

REFERENCE—

AIM, Paragraph 3-4-8, National Security Areas.

AIM, Paragraph 3-5-3, Temporary Flight Restrictions.

- d. Noncompliance with the national security requirements for aircraft operations contained in this section may result in denial of flight entry into U.S. territorial airspace or ground stop of the flight at a U.S. airport.
- e. Pilots of aircraft that do not adhere to the procedures in the national security requirements for aircraft operations contained in this section may be intercepted, and/or detained and interviewed by federal, state, or local law enforcement or other government personnel.

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

5-6-3 DEFINITIONS

- a. *Air Defense Identification Zone (ADIZ)* means an area of airspace over land or water, in which the ready identification, location, and control of all aircraft (except Department of Defense and law enforcement aircraft) is required in the interest of national security.
- b. *Defense Area* means any airspace of the contiguous U.S. that is not an ADIZ in which the control of aircraft is required for reasons of national security.
- c. *U.S. territorial airspace*, for the purposes of this section, means the airspace over the U.S., its territories, and possessions, and the airspace over the territorial sea of the U.S., which extends 12 nautical miles from the baselines of the U.S., determined in accordance with international law.
- d. *To U.S. territorial airspace* means any flight that enters U.S. territorial airspace after departure from a location outside of the U.S., its territories or possessions, for landing at a destination in the U.S., its territories or possessions.
- e. *From U.S. territorial airspace* means any flight that exits U.S. territorial airspace after departure from a location in the U.S., its territories or possessions, and lands at a destination outside the U.S., its territories or possessions.
- f. *Within U.S. territorial airspace* means any flight departing from a location inside of the U.S., its territories or possessions, which operates en route to a location inside the U.S., its territories or possessions.
- g. *Transit or transiting U.S. territorial airspace* means any flight departing from a location outside of the U.S., its territories or possessions, which operates in U.S. territorial airspace en route to a location outside the U.S., its territories or possessions without landing at a destination in the U.S., its territories or possessions.
- h. *Aeronautical facility*, for the purposes of this section, means a communications facility where flight plans or position reports are normally filed during flight operations.

5-6-4 ADIZ REQUIREMENTS

- a. To facilitate early identification of all aircraft in the vicinity of U.S. airspace boundaries, Air Defense Identification Zones (ADIZ) have been established. All aircraft must meet certain requirements to facilitate early identification when operating into, within, and across an ADIZ, as described in 14 CFR 99.
- b. Requirements for aircraft operations are as follows:
 - 1. **Transponder Requirements.** Unless otherwise authorized by ATC, each aircraft conducting operations into, within, or across the contiguous U.S. ADIZ must be equipped with an operable radar beacon transponder having altitude reporting capability, and that transponder must be turned on and set to reply on the appropriate code or as assigned by ATC. (See 14 CFR 99.13, *Transponder-On Requirements*, for additional information.)

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

2. **Two-way Radio.** In accordance with 14 CFR 99.9, *Radio Requirements*, any person operating in an ADIZ must maintain two-way radio communication with an appropriate aeronautical facility. For two-way radio communications failure, follow instructions contained in 14 CFR 99.9.
3. **Flight Plan.** In accordance with 14 CFR 99.11, *Flight Plan Requirements*, and 14 CFR 99.9, except as specified in subparagraph 5-6-4e, no person may operate an aircraft into, within, or from a departure point within an ADIZ, unless the person files, activates, and closes a flight plan with an appropriate aeronautical facility, or is otherwise authorized by air traffic control as follows:
 - (a) Pilots must file an Instrument Flight Rules (IFR) flight plan or file a Defense Visual Flight Rules (DVFR) flight plan containing the time and point of ADIZ penetration;
 - (b) The pilot must activate the DVFR flight plan with U.S. Flight Service and set the aircraft transponder to the assigned discrete beacon code prior to entering the ADIZ;
 - (c) The IFR or DVFR aircraft must depart within 5 minutes of the estimated departure time contained in the flight plan, except for (d) below;
 - (d) If the airport of departure within the Alaskan ADIZ has no facility for filing a flight plan, the flight plan must be filed immediately after takeoff or when within range of an appropriate aeronautical facility;
 - (e) State aircraft (U.S. or foreign) planning to operate through an ADIZ should enter ICAO Code M in Item 8 of the flight plan to assist in identification of the aircraft as a state aircraft.

c. Position Reporting Before Penetration of ADIZ.

In accordance with 14 CFR 99.15, *Position Reports*, before entering the ADIZ, the pilot must report to an appropriate aeronautical facility as follows:

1. **IFR flights in controlled airspace.** The pilot must maintain a continuous watch on the appropriate frequency and report the time and altitude of passing each designated reporting point or those reporting points specified or requested by ATC, except that while the aircraft is under radar control, only the passing of those reporting points specifically requested by ATC need be reported. (See 14 CFR 91.183(a), *IFR Communications*.)
2. **DVFR flights and IFR flights in uncontrolled airspace:**
 - (a) The time, position, and altitude at which the aircraft passed the last reporting point before penetration and the estimated time of arrival over the next appropriate reporting point along the flight route;
 - (b) If there is no appropriate reporting point along the flight route, the pilot reports at least 15 minutes before penetration: the estimated time, position, and altitude at which the pilot will penetrate; or

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

- (c) If the departure airport is within an ADIZ or so close to the ADIZ boundary that it prevents the pilot from complying with (a) or (b) above, the pilot must report immediately after departure: the time of departure, the altitude, and the estimated time of arrival over the first reporting point along the flight route.
3. **Foreign civil aircraft.** If the pilot of a foreign civil aircraft that intends to enter the U.S. through an ADIZ cannot comply with the reporting requirements in subparagraphs c1 or c2 above, as applicable, the pilot must report the position of the aircraft to the appropriate aeronautical facility not less than 1 hour and not more than 2 hours average direct cruising distance from the U.S.
- d. **Land-Based ADIZ.** Land-Based ADIZ are activated and deactivated over U.S. metropolitan areas as needed, with dimensions, activation dates and other relevant information disseminated via NOTAM. Pilots unable to comply with all NOTAM requirements must remain clear of Land-Based ADIZ. Pilots entering a Land-Based ADIZ without authorization or who fail to follow all requirements risk interception by military fighter aircraft.
- e. **Exceptions to ADIZ requirements.**
1. Except for the national security requirements in paragraph 5-6-2, transponder requirements in subparagraph 5-6-4b1, and position reporting in subparagraph 5-6-4c, the ADIZ requirements in 14 CFR Part 99 described in this section do not apply to the following aircraft operations pursuant to Section 99.1(b), Applicability:
 - (a) Within the 48 contiguous States or within the State of Alaska, on a flight which remains within 10 NM of the point of departure;
 - (b) Operating at true airspeed of less than 180 knots in the Hawaii ADIZ or over any island, or within 12 NM of the coastline of any island, in the Hawaii ADIZ;
 - (c) Operating at true airspeed of less than 180 knots in the Alaska ADIZ while the pilot maintains a continuous listening watch on the appropriate frequency; or
 - (d) Operating at true airspeed of less than 180 knots in the Guam ADIZ.
 2. An FAA air route traffic control center (ARTCC) may exempt certain aircraft operations on a local basis in concurrence with the DOD or pursuant to an agreement with a U.S. Federal security or intelligence agency. (See 14 CFR 99.1 for additional information.)
- f. A VFR flight plan filed inflight makes an aircraft subject to interception for positive identification when entering an ADIZ. Pilots are therefore urged to file the required DVFR flight plan either in person or by telephone prior to departure when able.

5-6-5 CIVIL AIRCRAFT OPERATIONS TO OR FROM U.S. TERRITORIAL AIRSPACE

- a. Civil aircraft, except as described in subparagraph 5-6-5b below, are authorized to operate to or from U.S. territorial airspace if in compliance with all of the following conditions:
1. File and are on an active flight plan (IFR, VFR, or DVFR);

US 5-6
SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

2. Are equipped with an operational transponder with altitude reporting capability, and continuously squawk an ATC assigned transponder code;
 3. Maintain two-way radio communications with ATC;
 4. Comply with all other applicable ADIZ requirements described in paragraph 5-6-4 and any other national security requirements in paragraph 5-6-2;
 5. Comply with all applicable U.S. Customs and Border Protection (CBP) requirements, including Advance Passenger Information System (APIS) requirements (see subparagraph 5-6-5c below for CBP APIS information), in accordance with 19 CFR Part 122, *Air Commerce Regulations*; and
 6. Are in receipt of, and are operating in accordance with, an FAA routing authorization if the aircraft is registered in a U.S. State Department-designated special interest country or is operating with the ICAO three letter designator (3LD) of a company in a country listed as a U.S. State Department-designated special interest country, unless the operator holds valid FAA Part 129 operations specifications. VFR and DVFR flight operations are prohibited for any aircraft requiring an FAA routing authorization. (See paragraph 5-6-11 for FAA routing authorization information).
- b. Civil aircraft registered in the U.S., Canada, or Mexico with a maximum certificated takeoff gross weight of 100,309 pounds (45,500 kgs) or less that are operating without an operational transponder, and/or the ability to maintain two-way radio communications with ATC, are authorized to operate to or from U.S. territorial airspace over Alaska if in compliance with all of the following conditions:
1. Depart and land at an airport within the U.S. or Canada;
 2. Enter or exit U.S. territorial airspace over Alaska north of the fifty-fourth parallel;
 3. File and are on an active flight plan;
 4. Comply with all other applicable ADIZ requirements described in paragraph 5-6-4 and any other national security requirements in paragraph 5-6-2;
 5. Squawk 1200 if VFR and equipped with a transponder; and
 6. Comply with all applicable U.S. CBP requirements, including Advance Passenger Information System (APIS) requirements (see subparagraph 5-6-5c below for CBP APIS information), in accordance with 19 CFR Part 122, *Air Commerce Regulations*.
- c. **CBP APIS Information.** Information about U.S. CBP APIS requirements is available at <http://www.cbp.gov>.

5-6-6 CIVIL AIRCRAFT OPERATIONS WITHIN U.S. TERRITORIAL AIRSPACE

- a. Civil aircraft with a maximum certificated takeoff gross weight less than or equal to 100,309 pounds (45,500 kgs) are authorized to operate within U.S. territorial airspace in accordance with all applicable regulations and VFR in airport traffic pattern areas of U.S. airports near the U.S. border, except for those described in subparagraph 5-6-6b below.

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

- b. Civil aircraft with a maximum certificated takeoff gross weight less than or equal to 100,309 pounds (45,500 kgs) and registered in a U.S. State Department-designated special interest country or operating with the ICAO 3LD of a company in a country listed as a U.S. State Department-designated special interest country, unless the operator holds valid FAA Part 129 operations specifications, must operate within U.S. territorial airspace in accordance with the same requirements as civil aircraft with a maximum certificated takeoff gross weight greater than 100,309 pounds (45,500 kgs), as described in subparagraph 5-6-6c below.
- c. Civil aircraft with a maximum certificated takeoff gross weight greater than 100,309 pounds (45,500 kgs) are authorized to operate within U.S. territorial airspace if in compliance with all of the following conditions:
 - 1. File and are on an active flight plan (IFR or VFR);
 - 2. Equipped with an operational transponder with altitude reporting capability, and continuously squawk an ATC assigned transponder code;
 - 3. Equipped with an operational ADS-B Out when operating in airspace specified in 14 CFR 91.225;
 - 4. Maintain two-way radio communications with ATC;
 - 5. Aircraft not registered in the U.S. must operate under an approved Transportation Security Administration (TSA) aviation security program (see paragraph 5-6-10 for TSA aviation security program information) or in accordance with an FAA/TSA airspace waiver (see paragraph 5-6-9 for FAA/TSA airspace waiver information), except as authorized in 5-6-6c7. below;
 - 6. Are in receipt of, and are operating in accordance with an FAA routing authorization and an FAA/TSA airspace waiver if the aircraft is registered in a U.S. State Department-designated special interest country or is operating with the ICAO 3LD of a company in a country listed as a U.S. State Department-designated special interest country, unless the operator holds valid FAA Part 129 operations specifications. VFR and DVFR flight operations are prohibited for any aircraft requiring an FAA routing authorization. (See paragraph 5-6-11 for FAA routing authorization information.); and
 - 7. Aircraft not registered in the U.S., when conducting post-maintenance, manufacturer, production, or acceptance flight test operations, are exempt from the requirements in 5-6-6c5 above if all of the following requirements are met:
 - (a) A U.S. company must have operational control of the aircraft;
 - (b) An FAA-certificated pilot must serve as pilot in command;
 - (c) Only crewmembers are permitted onboard the aircraft; and
 - (d) "Maintenance Flight" is included in the remarks section of the flight plan.

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

5-6-7 CIVIL AIRCRAFT OPERATIONS TRANSITING U.S. TERRITORIAL AIRSPACE

- a. Civil aircraft (except those operating in accordance with subparagraphs 5-6-7b, 5-6-7c, 5-6-7d, and 5-6-7e) are authorized to transit U.S. territorial airspace if in compliance with all of the following conditions:
1. File and are on an active flight plan (IFR, VFR, or DVFR);
 2. Equipped with an operational transponder with altitude reporting capability and continuously squawk an ATC assigned transponder code;
 3. Equipped with an operational ADS-B Out when operating in airspace specified in 14 CFR 91.225;
 4. Maintain two-way radio communications with ATC;
 5. Comply with all other applicable ADIZ requirements described in paragraph 5-6-4 and any other national security requirements in paragraph 5-6-2;
 6. Are operating under an approved TSA aviation security program (see paragraph 5-6-10 for TSA aviation security program information) or are operating with and in accordance with an FAA/TSA airspace waiver (see paragraph 5-6-9 for FAA/TSA airspace waiver information), if:
 - (a) The aircraft is not registered in the U.S.; or
 - (b) The aircraft is registered in the U.S. and its maximum takeoff gross weight is greater than 100,309 pounds (45,500 kgs);
 7. Are in receipt of, and are operating in accordance with, an FAA routing authorization if the aircraft is registered in a U.S. State Department-designated special interest country or is operating with the ICAO 3LD of a company in a country listed as a U.S. State Department-designated special interest country, unless the operator holds valid FAA Part 129 operations specifications. VFR and DVFR flight operations are prohibited for any aircraft requiring an FAA routing authorization. (See paragraph 5-6-11 for FAA routing authorization information.)
- b. Civil aircraft registered in Canada or Mexico, and engaged in operations for the purposes of air ambulance, firefighting, law enforcement, search and rescue, or emergency evacuation are authorized to transit U.S. territorial airspace within 50 NM of their respective borders with the U.S., with or without an active flight plan, provided they have received and continuously transmit an ATC-assigned transponder code.
- c. Civil aircraft registered in Canada, Mexico, Bahamas, Bermuda, Cayman Islands, or the British Virgin Islands with a maximum certificated takeoff gross weight of 100,309 pounds (45,500 kgs) or less are authorized to transit U.S. territorial airspace if in compliance with all of the following conditions:
1. File and are on an active flight plan (IFR, VFR, or DVFR) that enters U.S. territorial airspace directly from any of the countries listed in this subparagraph 5-6-7c. Flights that include a stop in a non-listed country prior to entering U.S. territorial airspace must

US 5-6
SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

comply with the requirements prescribed by subparagraph 5-6-7a above, including operating under an approved TSA aviation security program (see paragraph 5-6-10 for TSA aviation program information) or operating with, and in accordance with, an FAA/TSA airspace waiver (see paragraph 5-6-9 for FAA/TSA airspace waiver information).

2. Equipped with an operational transponder with altitude reporting capability and continuously squawk an ATC assigned transponder code; and
 3. Maintain two-way radio communications with ATC.
 4. Comply with all other applicable ADIZ requirements described in paragraph 5-6-4 and any other national security requirements in paragraph 5-6-2.
- d. Civil aircraft registered in Canada, Mexico, Bahamas, Bermuda, Cayman Islands, or the British Virgin Islands with a maximum certificated takeoff gross weight greater than 100,309 pounds (45,500 kgs) must comply with the requirements subparagraph 5-6-7a, including operating under an approved TSA aviation security program (see paragraph 5-6-10 for TSA aviation program information) or operating with, and in accordance with, an FAA/TSA airspace waiver (see paragraph 5-6-9 for FAA/TSA airspace waiver information).
- e. Civil aircraft registered in the U.S., Canada, or Mexico with a maximum certificated takeoff gross weight of 100,309 pounds (45,500 kgs) or less that are operating without an operational transponder and/or the ability to maintain two-way radio communications with ATC, are authorized to transit U.S. territorial airspace over Alaska if in compliance with all of the following conditions:
1. Enter and exit U.S. territorial airspace over Alaska north of the fifty-fourth parallel;
 2. File and are on an active flight plan;
 3. Squawk 1200 if VFR and equipped with a transponder.
 4. Comply with all other applicable ADIZ requirements described in paragraph 5-6-4 and any other national security requirements in paragraph 5-6-2.

5-6-8 FOREIGN STATE AIRCRAFT OPERATIONS

- a. Foreign state aircraft are authorized to operate in U.S. territorial airspace if in compliance with all of the following conditions:
1. File and are on an active IFR flight plan;
 2. Equipped with an operational transponder with altitude reporting capability and continuously squawk an ATC assigned transponder code;
 3. Equipped with an operational ADS-B Out when operating in airspace specified in 14 CFR 91.225;
 4. Maintain two-way radio communications with ATC;
 5. Comply with all other applicable ADIZ requirements described in paragraph 5-6-4 and any other national security requirements in paragraph 5-6-2.

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

- b. **Diplomatic Clearances.** Foreign state aircraft may operate to or from, within, or in transit of U.S. territorial airspace only when authorized by the U.S. State Department by means of a diplomatic clearance, except as described in subparagraph 5-6-8i below.
1. Information about diplomatic clearances is available at the U.S. State Department web-site <https://www.state.gov/diplomatic-aircraft-clearance-procedures-for-foreign-state-aircraft-to-operate-in-united-states-national-airspace/> (lower case only).
 2. A diplomatic clearance may be initiated by contacting the U.S. State Department via email at DCAS@state.gov or via phone at (202) 453-8390.

NOTE: *A diplomatic clearance is not required for foreign state aircraft operations that transit U.S. controlled oceanic airspace but do not enter U.S. territorial airspace. (See subparagraph 5-6-8d for flight plan information.)*

- c. An FAA routing authorization for state aircraft operations of special interest countries listed in subparagraph 5-6-11b. is required before the U.S. State Department will issue a diplomatic clearance for such operations. (See subparagraph 5-6-11 for FAA routing authorizations information).
- d. Foreign state aircraft operating with a diplomatic clearance must navigate U.S. territorial airspace on an active IFR flight plan, unless specifically approved for VFR flight operations by the U.S. State Department in the diplomatic clearance.

NOTE: *Foreign state aircraft operations to or from, within, or transiting U.S. territorial airspace; or transiting any U.S. controlled oceanic airspace, should enter ICAO code M in Item 8 of the flight plan to assist in identification of the aircraft as a state aircraft.*

- e. A foreign aircraft that operates to or from, within, or in transit of U.S. territorial airspace while conducting a state aircraft operation is not authorized to change its status as a state aircraft during any portion of the approved, diplomatically cleared itinerary.
- f. f. A foreign aircraft described in subparagraph 5-6-8e above may operate from or within U.S. territorial airspace as a civil aircraft operation, once it has completed its approved, diplomatically cleared itinerary, if the aircraft operator is:
1. A foreign air carrier that holds valid FAA Part 129 operations specifications; and
 2. Is in compliance with all other requirements applied to foreign civil aircraft operations from or within U.S. territorial airspace. (See paragraphs 5-6-5 and 5-6-6.)

- g. Foreign state aircraft operations are not authorized to or from Ronald Reagan Washington National Airport (KDCA).
- h. Foreign state aircraft operating with a U.S. Department of State issued Diplomatic Clearance Number in the performance of official missions are authorized to deviate from the Automatic Dependent Surveillance-Broadcast (ADS-B) Out requirements contained in 14 CFR §§91.225 and 91.227. All foreign state aircraft and/or operators associated with Department of Defense missions should contact their respective offices for further information on handling. Foreign state aircraft not associated with Department of Defense should coordinate with U.S. Department of State through the normal diplomatic clearance process.

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

- i. **Diplomatic Clearance Exceptions.** State aircraft operations on behalf of the governments of Canada and Mexico conducted for the purposes of air ambulance, firefighting, law enforcement, search and rescue, or emergency evacuation are authorized to transit U.S. territorial airspace within 50 NM of their respective borders with the U.S., with or without an active flight plan, provided they have received and continuously transmit an ATC assigned transponder code. State aircraft operations on behalf of the governments of Canada and Mexico conducted under this subparagraph 5-6-8h are not required to obtain a diplomatic clearance from the U.S. State Department.

5-6-9 FAA/TSA AIRSPACE WAIVERS

- a. Operators may submit requests for FAA/TSA airspace waivers at <https://waivers.faa.gov> by selecting “international” as the waiver type.
- b. Information regarding FAA/TSA airspace waivers can be found at: <http://www.tsa.gov/for-industry/general-aviation> or can be obtained by contacting TSA at (571) 227-2071.
- c. All existing FAA/TSA waivers issued under previous FDC NOTAMS remain valid until the expiration date specified in the waiver, unless sooner superseded or rescinded.

5-6-10 TSA AVIATION SECURITY PROGRAMS

- a. Applicants for U.S. air operator certificates will be provided contact information for TSA aviation security programs by the U.S. Department of Transportation during the certification process.
- b. For information about applicable TSA security programs:
1. U.S. air carriers and commercial operators must contact their TSA Principal Security Specialist (PSS); and
 2. Foreign air carriers must contact their International Industry Representative (IIR).

5-6-11 FAA FLIGHT ROUTING AUTHORIZATIONS

- a. Information about FAA routing authorizations for U.S. State Department-designated special interest country flight operations to or from, within, or transiting U.S. territorial airspace is available by country at:
1. FAA website http://www.faa.gov/air_traffic/publications/us_restrictions/; or
 2. Phone by contacting the FAA System Operations Support Center (SOSC) at (202) 267-8115.
- b. Special Interest Countries. The U.S. State Department-designated special interest countries are Cuba, Iran, The Democratic People’s Republic of Korea (North Korea), The People’s Republic of China, The Russian Federation, Sudan, and Syria.

NOTE: FAA flight routing authorizations are not required for aircraft registered in Hong Kong, Taiwan, or Macau.

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

- c. Aircraft operating with the ICAO 3LD assigned to a company or entity from a country listed as a State Department-designated special interest country and holding valid FAA Part 129 operations specifications do not require FAA flight routing authorization.
- d. FAA routing authorizations will only be granted for IFR operations. VFR and DVFR flight operations are prohibited for any aircraft requiring an FAA routing authorization.

5-6-12 EMERGENCY SECURITY CONTROL OF AIR TRAFFIC (ESCAT)

- a. During defense emergency or air defense emergency conditions, additional special security instructions may be issued in accordance with 32 CFR Part 245, *Plan for the Emergency Security Control of Air Traffic (ESCAT)*.
- b. Under the provisions of 32 CFR Part 245, the military will direct the action to be taken in regard to landing, grounding, diversion, or dispersal of aircraft in the defense of the U.S. during emergency conditions.
- c. At the time a portion or all of ESCAT is implemented, ATC facilities will broadcast appropriate instructions received from the Air Traffic Control System Command Center (ATCSCC) over available ATC frequencies. Depending on instructions received from the ATCSCC, VFR flights may be directed to land at the nearest available airport, and IFR flights will be expected to proceed as directed by ATC.
- d. Pilots on the ground may be required to file a flight plan and obtain an approval (through FAA) prior to conducting flight operation.

5-6-13 INTERCEPTION PROCEDURES

a. General.

- 1. In conjunction with the FAA, Air Defense Sectors monitor air traffic and could order an intercept in the interest of national security or defense. Intercepts during peacetime operations are vastly different than those conducted under increased states of readiness. The interceptors may be fighters or rotary wing aircraft. The reasons for aircraft intercept include, but are not limited to:
 - (a) Identify an aircraft;
 - (b) Track an aircraft;
 - (c) Inspect an aircraft;
 - (d) Divert an aircraft;
 - (e) Establish communications with an aircraft.
- 2. When specific information is required (i.e., markings, serial numbers, etc.) the interceptor pilot(s) will respond only if, in their judgment, the request can be conducted in a safe manner. Intercept procedures are described in some detail in the paragraphs below. In all situations, the interceptor pilot will consider safety of flight for all concerned throughout the intercept procedure. The interceptor pilot(s) will use caution to avoid startling the

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

intercepted crew or passengers and understand that maneuvers considered normal for interceptor aircraft may be considered hazardous to other aircraft.

3. All aircraft operating in US national airspace are highly encouraged to maintain a listening watch on VHF/UHF guard frequencies (121.5 or 243.0 MHz). If subjected to a military intercept, it is incumbent on civilian aviators to understand their responsibilities and to comply with ICAO standard signals relayed from the intercepting aircraft. Specifically, aviators are expected to contact air traffic control without delay (if able) on the local operating frequency or on VHF/UHF guard. Noncompliance may result in the use of force.

b. Fighter intercept phases (See FIG 5-6-1).

1. Approach Phase.

As standard procedure, intercepted aircraft are approached from behind. Typically, interceptor aircraft will be employed in pairs, however, it is not uncommon for a single aircraft to perform the intercept operation. Safe separation between interceptors and intercepted aircraft is the responsibility of the intercepting aircraft and will be maintained at all times.

2. Identification Phase.

Interceptor aircraft will initiate a controlled closure toward the aircraft of interest, holding at a distance no closer than deemed necessary to establish positive identification and to gather the necessary information. The interceptor may also fly past the intercepted aircraft while gathering data at a distance considered safe based on aircraft performance characteristics.

3. Post Intercept Phase.

An interceptor may attempt to establish communications via standard ICAO signals. In time-critical situations where the interceptor is seeking an immediate response from the intercepted aircraft or if the intercepted aircraft remains non-compliant to instruction, the interceptor pilot may initiate a divert maneuver. In this maneuver, the interceptor flies across the intercepted aircraft's flight path (minimum 500 feet separation and commencing from slightly below the intercepted aircraft altitude) in the general direction the intercepted aircraft is expected to turn. The interceptor will rock its wings (daytime) or flash external lights/select afterburners (night) while crossing the intercepted aircraft's flight path. The interceptor will roll out in the direction the intercepted aircraft is expected to turn before returning to verify the aircraft of interest is complying. The intercepted aircraft is expected to execute an immediate turn to the direction of the intercepting aircraft. If the aircraft of interest does not comply, the interceptor may conduct a second climbing turn across the intercepted aircraft's flight path (minimum 500 feet separation and commencing from slightly below the intercepted aircraft altitude) while expending flares as a warning signal to the intercepted aircraft to comply immediately and to turn in the direction indicated and to leave the area. The interceptor is responsible to maintain safe separation during these and all intercept maneuvers. Flight safety is paramount.

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

NOTE:

1. *NORAD interceptors will take every precaution to preclude the possibility of the intercepted aircraft experiencing jet wash/wake turbulence; however, there is a potential that this condition could be encountered.*
2. *During Night/IMC, the intercept will be from below flight path.*

FIGURE 5-6-1

Intercept Procedures

c. Helicopter Intercept phases (See FIG 5-6-2)

1. Approach Phase.

Aircraft intercepted by helicopter may be approached from any direction, although the helicopter should close for identification and signaling from behind. Generally, the helicopter will approach off the left side of the intercepted aircraft. Safe separation between the helicopter and the unidentified aircraft will be maintained at all times.

2. Identification Phase.

The helicopter will initiate a controlled closure toward the aircraft of interest, holding at a distance no closer than deemed necessary to establish positive identification and gather

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

the necessary information. The intercepted pilot should expect the interceptor helicopter to take a position off his left wing slightly forward of abeam.

3. Post Intercept Phase.

Visual signaling devices may be used in an attempt to communicate with the intercepted aircraft. Visual signaling devices may include, but are not limited to, LED scrolling signboards or blue flashing lights. If compliance is not attained through the use of radios or signaling devices, standard ICAO intercept signals (TBL 5-6-1) may be employed. In order to maintain safe aircraft separation, it is incumbent upon the pilot of the intercepted aircraft not to fall into a trail position (directly behind the helicopter) if instructed to follow the helicopter. This is because the helicopter pilot may lose visual contact with the intercepted aircraft.

NOTE: *Intercepted aircraft must not follow directly behind the helicopter thereby allowing the helicopter pilot to maintain visual contact with the intercepted aircraft and ensuring safe separation is maintained.*

FIGURE 5-6-2

Helicopter Intercept Procedures

d. Summary of Intercepted Aircraft Actions. An intercepted aircraft must, without delay:

1. Adhere to instructions relayed through the use of visual devices, visual signals, and radio communications from the intercepting aircraft.
2. Attempt to establish radio communications with the intercepting aircraft or with the appropriate air traffic control facility by making a general call on guard frequencies (121.5 or 243.0 MHz), giving the identity, position, and nature of the flight.

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

3. If transponder equipped, select Mode 3/A Code 7700 unless otherwise instructed by air traffic control.

NOTE: *If instruction received from any agency conflicts with that given by the intercepting aircraft through visual or radio communications, the intercepted aircraft must seek immediate clarification.*

4. The crew of the intercepted aircraft must continue to comply with interceptor aircraft signals and instructions until positively released.

5-6-14 LAW ENFORCEMENT OPERATIONS BY CIVIL AND MILITARY ORGANIZATIONS

a. Special law enforcement operations.

1. Special law enforcement operations include in-flight identification, surveillance, interdiction, and pursuit activities performed in accordance with official civil and/or military mission responsibilities.
2. To facilitate accomplishment of these special missions, exemptions from specified sections of the CFRs have been granted to designated departments and agencies. However, it is each organization's responsibility to apprise ATC of their intent to operate under an authorized exemption before initiating actual operations.
3. Additionally, some departments and agencies that perform special missions have been assigned coded identifiers to permit them to apprise ATC of ongoing mission activities and solicit special air traffic assistance.

5-6-15 INTERCEPTION SIGNALS

TBL 5-6-1 and TBL 5-6-2.

US 5-6
SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES
TABLE 5-6-1 Intercepting Signals

INTERCEPTING SIGNALS Signals initiated by intercepting aircraft and responses by intercepted aircraft (as set forth in ICAO Annex 2 — Appendix 1, 2.1)				
Series	INTERCEPTING Aircraft Signals	Meaning	INTERCEPTED Aircraft Responds	Meaning
1	DAY — Rocking wings from a position slightly above and ahead of, and normally to the left of, the intercepted aircraft and, after acknowledgement, a slow level turn, normally to the left, on to the desired heading. NIGHT — Same and, in addition, flashing navigational lights at irregular intervals. <i>NOTE 1 — Meteorological conditions or terrain may require the intercepting aircraft to take up a position slightly above and ahead of, and to the right of, the intercepted aircraft and to make the subsequent turn to the right.</i> <i>NOTE 2 — If the intercepted aircraft is not able to keep pace with the intercepting aircraft, the latter is expected to fly a series of race-track patterns and to rock its wings each time it passes the intercepted aircraft.</i>	You have been intercepted. Follow me.	AEROPLANES: DAY — Rocking wings and following. NIGHT — Same and, in addition, flashing navigational lights at irregular intervals. HELICOPTERS: DAY or NIGHT — Rocking aircraft, flashing navigational lights at irregular intervals and following.	Understood, will comply.

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

TABLE 5-6-1 Intercepting Signals (continued)

INTERCEPTING SIGNALS Signals initiated by intercepting aircraft and responses by intercepted aircraft (as set forth in ICAO Annex 2 — Appendix 1, 2.1)				
Series	INTERCEPTING Aircraft Signals	Meaning	INTERCEPTED Aircraft Responds	Meaning
2	DAY or NIGHT — An abrupt break-away maneuver from the intercepted aircraft consisting of a climbing turn of 90 degrees or more without crossing the line of flight of the intercepted aircraft.	You may proceed.	AEROPLANES: DAY or NIGHT — Rocking wings. HELICOPTERS: DAY or NIGHT — Rocking aircraft.	Understood, will comply.
3	DAY — Circling aerodrome, lowering landing gear and overflying runway in direction of landing or, if the intercepted aircraft is a helicopter, overflying the helicopter landing area. NIGHT — Same and, in addition, showing steady landing lights.	Land at this aerodrome.	AEROPLANES: DAY — Lowering landing gear, following the intercepting aircraft and, if after overflying the runway landing is considered safe, proceeding to land. NIGHT — Same and, in addition, showing steady landing lights (if carried). HELICOPTERS: DAY or NIGHT — Following the intercepting aircraft and proceeding to land, showing a steady landing light (if carried).	Understood, will comply.

US 5-6
SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES
TABLE 5-6-2 Intercepting Signals

INTERCEPTING SIGNALS Signals and Responses During Aircraft Intercept Signals initiated by intercepted aircraft and responses by intercepting aircraft (as set forth in ICAO Annex 2 — Appendix 1, 2.2)				
Series	INTERCEPTED Aircraft Signals	Meaning	INTERCEPTING Aircraft Responds	Meaning
4	DAY or NIGHT — Raising landing gear (if fitted) and flashing landing lights while passing over runway in use or helicopter landing area at a height exceeding 300m (1,000 ft) but not exceeding 600m (2,000 ft) (in the case of a helicopter, at a height exceeding 50m (170 ft) but not exceeding 100m (330 ft) above the aerodrome level, and continuing to circle runway in use or helicopter landing area. If unable to flash landing lights, flash any other lights available.	Aerodrome you have designated is inadequate.	DAY or NIGHT — If it is desired that the intercepted aircraft follow the intercepting aircraft to an alternate aerodrome, the intercepting aircraft raises its landing gear (if fitted) and uses the Series 1 signals prescribed for intercepting aircraft. If it is decided to release the intercepted aircraft, the intercepting aircraft uses the Series 2 signals prescribed for intercepting aircraft.	Understood, follow me. Understood, you may proceed.
5	DAY or NIGHT — Regular switching on and off of all available lights but in such a manner as to be distinct from flashing lights.	Cannot comply.	DAY or NIGHT — Use Series 2 signals prescribed for intercepting aircraft.	Understood.
6	DAY or NIGHT — Irregular flashing of all available lights.	In distress.	DAY or NIGHT — Use Series 2 signals prescribed for intercepting aircraft.	Understood.

5-6-16 ADIZ BOUNDARIES AND DESIGNATED MOUNTAINOUS AREAS

(See FIG 5-6-3.)

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

FIGURE 5-6-3

Air Defense Identification Zone Boundaries Designated Mountainous Areas

**5-6-17 VISUAL WARNING SYSTEM (VWS)**

The VWS signal consists of highly-focused red and green colored laser lights designed to illuminate in an alternating red and green signal pattern. These lasers may be directed at specific aircraft suspected of making unauthorized entry into the Washington, DC Special Flight Rules Area (DC SFRA) proceeding on a heading or flight path that may be interpreted as a threat or that operate contrary to the operating rules for the DC SFRA. The beam is neither hazardous to the eyes of pilots/aircrew or passengers, regardless of altitude or distance from the source nor will the beam affect aircraft systems.

- If you are communicating with ATC, and this signal is directed at your aircraft, you are required to contact ATC and advise that you are being illuminated by a visual warning system.
- If this signal is directed at you, and you are not communicating with ATC, you are advised to turn to the most direct heading away from the center of the DC SFRA as soon as possible. Immediately contact ATC on an appropriate frequency, VHF Guard 121.5 or UHF Guard

US 5-6

SECTION 6. NATIONAL SECURITY AND INTERCEPTION PROCEDURES

243.0, and provide your aircraft identification, position, and nature of the flight. Failure to follow these procedures may result in interception by military aircraft. Further noncompliance with interceptor aircraft or ATC may result in the use of force.

- c. Pilots planning to operate aircraft in or near the DC SFRA are to familiarize themselves with aircraft intercept procedures. This information applies to all aircraft operating within the DC SFRA including DOD, Law Enforcement, and aircraft engaged in aeromedical operations and does not change procedures established for reporting unauthorized laser illumination as published in FAA Advisory Circulars and Notices.

REFERENCE—CFR 91.161

- d. More details including a video demonstration of the VWS are available from the following FAA website: www.faa.gov/VisualWarningSystem/VisualWarning.htm.

US 7-2

SECTION 2. BAROMETRIC ALTIMETER ERRORS AND SETTING PROCEDURES

7-2-1 GENERAL

- a. Aircraft altimeters are subject to the following errors and weather factors:
 1. Instrument error.
 2. Position error from aircraft static pressure systems.
 3. Nonstandard atmospheric pressure.
 4. Nonstandard temperatures.
- b. The standard altimeter 29.92 inches Mercury ("Hg.) setting at the higher altitudes eliminates station barometer errors, some altimeter instrument errors, and errors caused by altimeter settings derived from different geographical sources.

7-2-2 BAROMETRIC PRESSURE ALTIMETER ERRORS

- a. High Barometric Pressure: Cold, dry air masses may produce barometric pressures in excess of 31.00 "Hg. Many aircraft altimeters cannot be adjusted above 31.00 "Hg. When an aircraft's altimeter cannot be set to pressure settings above 31.00 "Hg, the aircraft's true altitude will be higher than the indicated altitude on the barometric altimeter.
- b. Low Barometric Pressure: An abnormal low-pressure condition exists when the barometric pressure is less than 28.00 "Hg. Flight operations are not recommended when an aircraft's altimeter is unable to be set below 28.00 "Hg. In this situation, the aircraft's true altitude is lower than the indicated altitude. This situation may be exacerbated when operating in extremely cold temperatures, which may result in the aircraft's true altitude being significantly lower than the indicated altitude.

NOTE: EXTREME CAUTION SHOULD BE EXERCISED WHEN FLYING IN PROXIMITY TO OBSTRUCTIONS OR TERRAIN IN LOW PRESSURES AND/OR LOW TEMPERATURES.

7-2-3 ALTIMETER ERRORS

- a. Manufacturing and installation specifications, along with 14 CFR Part 43, Appendix E requirement for periodic tests and inspections, helps reduce mechanical, elastic, temperature, and installation errors. (See Instrument Flying Handbook.) Scale error may be observed while performing a ground altimeter check using the following procedure:
 1. Set the current reported airfield altimeter setting on the altimeter setting scale.
 2. Read the altitude on the altimeter. The altitude should read the known field elevation if you are located on the same reference level used to establish the altimeter setting.
 3. If the difference from the known field elevation and the altitude read from the altimeter is plus or minus 75 feet or greater, the accuracy of the altimeter is questionable and the problem should be referred to an appropriately rated repair station for evaluation and possible correction.
- b. It is important to set the current altimeter settings for the area of operation when flying at an enroute altitude that does not require a standard altimeter setting of 29.92 "Hg. If the altimeter is not set to the current altimeter setting when flying from an area of high pressure into an

US 7-2

SECTION 2. BAROMETRIC ALTIMETER ERRORS AND SETTING PROCEDURES

area of low pressure, the aircraft will be closer to the surface than the altimeter indicates. An inch Hg. error in the altimeter setting equals 1,000 feet of altitude. For example, setting 29.90 "Hg instead of 30.90 "Hg. To quote an old saying: "GOING FROM A HIGH TO A LOW, LOOK OUT BELOW."

c. The aircraft cruising altitude or flight level is maintained by referencing the barometric altimeter. Procedures for setting altimeters during high and low barometric pressure events must be set using the following procedures:

1. Below 18,000 feet mean sea level (MSL).

(a) Barometric pressure is 31.00 "Hg or less.

- (1) Set the altimeter to a current reported altimeter setting from a station along the route and within 100 NM of the aircraft, or;
- (2) If there is no station within this area, use the current reported altimeter setting of an appropriate available station, or;

NOTE: *Air traffic controllers will furnish this information at least once when en route or on an instrument flight plan within their controlled airspace.*

- (3) If the aircraft is not equipped with a radio, set the altimeter to the elevation of the departure airport or use an available appropriate altimeter setting prior to departure.

(b) When the barometric pressure exceeds 31.00 "Hg., a NOTAM will be published to define the affected geographic area. The NOTAM will also institute the following procedures:

- (1) All aircraft: All aircraft will set 31.00 "Hg. for en route operations below 18,000 feet MSL. Maintain this setting until out of the affected area or until reaching the beginning of the final approach segment on an instrument approach. Set the current altimeter setting (above 31.00 "Hg.) approaching the final segment, if possible. If no current altimeter setting is available, or if a setting above 31.00 "Hg. cannot be made on the aircraft's altimeter, leave 31.00 "Hg. set in the altimeter and continue the approach.
- (2) Set 31.00 "Hg. in the altimeter prior to reaching the lowest of any mandatory/crossing altitudes or 1,500 feet above ground level (AGL) when on a departure or missed approach.

NOTE: *Air traffic control will issue actual altimeter settings and advise pilots to set 31.00 "Hg. in their altimeters for en route operations below 18,000 feet MSL in affected areas.*

- (3) No additional restrictions apply for aircraft operating into an airport that are able to set and measure altimeter settings above 31.00 "Hg.
- (4) Flight operations are restricted to VFR weather conditions to and from an airport that is unable to accurately measure barometric pressures above 31.00

US 7-2

SECTION 2. BAROMETRIC ALTIMETER ERRORS AND SETTING PROCEDURES

“Hg. These airports will report the barometric pressure as “missing” or “in excess of 31.00 “Hg.”.

- (5) VFR aircraft. VFR operating aircraft have no additional restrictions. Pilots must use caution when flight planning and operating in these conditions.
- (6) IFR aircraft: IFR aircraft unable to set an altimeter setting above 31.00 “Hg. should apply the following:

- [a] The suitability of departure alternate airports, destination airports, and destination alternate airports will be determined by increasing the published ceiling and visibility requirements when unable to set the aircraft altimeter above 31.00 “Hg. Any reported or forecast altimeter setting over 31.00 “Hg. will be rounded up to the next tenth to calculate the required increases. The ceiling will be increased by 100 feet and the visibility by 1/4 statute mile for each 1/10 “Hg. over 31.00 “Hg. Use these adjusted values in accordance with operating regulations and operations specifications.

EXAMPLE: Destination airport altimeter is 31.21 “Hg. The planned approach is an instrument landing system (ILS) with a decision altitude (DA) 200 feet and visibility 1/2 mile (200–1/2). Subtract 31.00 “Hg. from 31.21 “Hg. to get .21 “Hg. .21 “Hg rounds up to .30 “Hg. Calculate the increased requirement: 100 feet per 1/10 equates to a 300 feet increase for .30 “Hg. 1/4 statute mile per 1/10 equates to a 3/4 statute mile increase for .30 “Hg. The destination weather requirement is determined by adding the 300–3/4 increase to 200–1/2. The destination weather requirement is now 500–1¼.

- [b] 31.00 “Hg. will remain set during the complete instrument approach. The aircraft has arrived at the DA or minimum descent altitude (MDA) when the published DA or MDA is displayed on the barometric altimeter.

NOTE: *The aircraft will be approximately 300 feet higher than the indicated barometric altitude using this method.*

- [c] These restrictions do not apply to authorized Category II/III ILS operations and certificate holders using approved atmospheric pressure at airport elevation (QFE) altimetry systems.
- (7) The FAA Flight Procedures & Airspace Group, Flight Technologies and Procedures Division may authorize temporary waivers to permit emergency resupply or emergency medical service operation.
- 2. At or above 18,000 feet MSL. All operators will set 29.92 “Hg. (standard setting) in the barometric altimeter. The lowest usable flight level is determined by the atmospheric pressure in the area of operation as shown in TBL 7-2-1. Air Traffic Control (ATC) will assign this flight level.

US 7-2
SECTION 2. BAROMETRIC ALTIMETER ERRORS AND SETTING PROCEDURES
TABLE 7-2-1 Lowest Usable Flight Level

Altimeter Setting (Current Reported)	Lowest Usable Flight Level
29.92 or higher	180
29.91 to 28.92	190
28.91 to 27.92	200

3. When the minimum altitude per 14 CFR Section 91.159 and 14 CFR Section 91.177 is above 18,000 feet MSL, the lowest usable flight level must be the flight level equivalent of the minimum altitude plus the number of feet specified in TBL 7-2-2. ATC will accomplish this calculation.

TABLE 7-2-2 Lowest Flight Level Correction Factor

Altimeter Setting	Correction Factor
29.92 or higher	None
29.91 to 29.42	500 feet
29.41 to 28.92	1000 feet
28.91 to 28.42	1500 feet
28.41 to 27.92	2000 feet
27.91 to 27.42	2500 feet

EXAMPLE: The minimum safe altitude of a route is 19,000 feet MSL and the altimeter setting is reported between 29.92 and 29.43 "Hg, the lowest usable flight level will be 195, which is the flight level equivalent of 19,500 feet MSL (minimum altitude (TBL 7-2-1) plus 500 feet).

US 7-3

SECTION 3. CTA BARO ALT ERRORS SETTING PROCEDURES

7-3-1 EFFECT OF COLD TEMPERATURE ON BAROMETRIC ALTIMETERS

- a. Temperature has an effect on the accuracy of barometric altimeters, indicated altitude, and true altitude. The standard temperature at sea level is 15 degrees Celsius (59 degrees Fahrenheit). The temperature gradient from sea level is minus 2 degrees Celsius (3.6 degrees Fahrenheit) per 1,000 feet. For example, at 5000 feet above sea level, the ambient temperature on a standard day would be 5 degrees Celsius. When the ambient (at altitude) temperature is colder than standard, the aircraft's true altitude is lower than the indicated barometric altitude. When the ambient temperature is warmer than the standard day, the aircraft's true altitude is higher than the indicated barometric altitude.
- b. TBL 7-3-1 indicates how much error may exist when operating in non-standard cold temperatures. To use the table, find the reported temperature in the left column, and read across the top row to locate the height above the airport (subtract the airport elevation from the flight altitude). Find the intersection of the temperature row and height above airport column. This number represents how far the aircraft may be below the indicated altitude due to possible cold temperature induced error.

TABLE 7-3-1 ICAO Cold Temperature Error Table

	HEIGHT ABOVE AIRPORT IN FEET

7-3-2 PRE-FLIGHT PLANNING FOR COLD TEMPERATURE
ALTIMETER ERRORS

Flight planning into a CTA may be accomplished prior to flight. Use the predicted coldest temperature for plus or minus 1 hour of the estimated time of arrival and compare against the CTA published temperature. If the predicted temperature is at or below CTA temperature, calculate an altitude correction using TBL 7-3-1. This correction may be used at the CTA if the actual arrival temperature is the same as the temperature used to calculate the altitude correction during preflight planning.

US 7-3

SECTION 3. CTA BARO ALT ERRORS SETTING PROCEDURES

**7-3-3 EFFECTS OF COLD TEMPERATURE ON BARO-VERTICAL
NAVIGATION (VNAV) VERTICAL GUIDANCE**

Non-standard temperatures can result in a change to effective vertical paths and actual descent rates when using aircraft baro-VNAV equipment for vertical guidance on final approach segments. A lower than standard temperature will result in a shallower descent angle and reduced descent rate. Conversely, a higher than standard temperature will result in a steeper angle and increased descent rate. Pilots should consider potential consequences of these effects on approach minima, power settings, sight picture, visual cues, etc., especially for high-altitude or terrain-challenged locations and during low-visibility conditions.

REFERENCE— *AIM Paragraph 5-4-5. Instrument Approach Procedure (IAP) Charts.*

- a. Uncompensated Baro-VNAV note on 14 CFR Part 97 IAPs. The area navigation (RNAV) global positioning system (GPS) and RNAV required navigation performance (RNP) notes, "For uncompensated Baro-VNAV systems, lateral navigation (LNAV)/VNAV NA below -XX°C (-XX°F) or above XX°C (XXX°F)" and "For uncompensated Baro-VNAV systems, procedure NA below -XX°C (-XX°F) or above XX°C (XXX°F)" apply to baro-VNAV equipped aircraft. These temperatures and how they are used are independent of the temperature and procedures applied for a Cold Temperature Airport.
 1. The uncompensated baro-VNAV chart note and temperature range on an RNAV (GPS) approach is applicable to the LNAV/VNAV line of minima. Baro-VNAV equipped aircraft without a temperature compensating system may not use the RNAV (GPS) approach LNAV/VNAV line of minima when the actual temperature is above or below the charted temperature range.
 2. The uncompensated baro-VNAV chart note and temperature range on an RNAV (RNP) approach applies to the entire procedure. For aircraft without a baro-VNAV and temperature compensating system, the RNAV (RNP) approach is not authorized when the actual temperature is above or below the charted uncompensated baro-VNAV temperature range.
- b. Baro-VNAV temperature range versus CTA temperature: The baro-VNAV and CTA temperatures are independent and do not follow the same correction or reporting procedures. However, there are times when both procedures, each according to its associated temperature, should be accomplished on the approach.
- c. Operating and ATC reporting procedures.
 1. Do not use the CTA operating or reporting procedure found in this section, 7-3-4 a. thru 7-3-5 e. when complying with the baro-VNAV temperature note on an RNAV (GPS) approach. Correction is not required nor expected to be applied to procedure altitudes or VNAV paths outside of the final approach segment.
 2. Operators must advise ATC when making temperature corrections on RNP authorization required (AR) approaches while adhering to baro-VNAV temperature note.

US 7-3

SECTION 3. CTA BARO ALT ERRORS SETTING PROCEDURES

3. Reporting altitude corrections is required when complying with CTAs in conjunction with the baro-VNAV temperature note. The CTA altitude corrections will be reported in this situation. No altitude correction reporting is required in the final segment.

NOTE: When executing an approach with vertical guidance at a CTA (i.e., ILS, localizer performance with vertical guidance (LPV), LNAV/VNAV), pilots are reminded to intersect the glideslope/glidepath at the corrected intermediate altitude (if applicable) and follow the published glideslope/glidepath to the corrected minima. The ILS glideslope and WAAS generated glidepath are unaffected by cold temperatures and provide vertical guidance to the corrected DA. Begin descent on the ILS glideslope or WAAS generated glidepath when directed by aircraft instrumentation. Temperature affects the precise final approach fix (PFAF) true altitude where a baro-VNAV generated glidepath begins. The PFAF altitude must be corrected when below the CTA temperature restriction for the intermediate segment or outside of the baro-VNAV temperature restriction when using the LNAV/VNAV line of minima to the corrected DA.

7-3-4 COLD TEMPERATURE AIRPORTS (CTA)

- a. General: The FAA has determined that operating in cold temperatures has placed some 14 CFR Part 97 instrument approach procedures in the United States National Airspace System at risk for loss of required obstacle clearance (ROC). An airport that is determined to be at risk will have an ICON and temperature published on the instrument approach procedure (IAP) in the terminal procedures publication (TPP).
- b. CTA identification in TPP: A CTA is identified by a “snowflake” icon (❄️) and temperature limit, in Celsius, on U.S. Government approach charts.
- c. A current list of CTAs is located at: https://www.faa.gov/air_traffic/flight_info/aeronav/digital_products/dtpp/search/. Airports are listed by ICAO code, Airport Name, Temperature in Celsius, and affected segment(s).
- d. Airport Criteria. The CTA risk analysis is performed on airports that have at least one runway of 2500 ft. Pilots operating into an airport with a runway length less than 2500 ft. may make a cold temperature altitude correction in cold temperature conditions, if desired. Comply with operating and reporting procedures for CTAs.
- e. ATC Reporting Requirements. Pilots must advise ATC with the corrected altitude when applying an altitude correction on any approach segment with the exception of the final segment.
- f. Methods to apply correction: The FAA recommends operators/pilots use either the All Segments Method or the Individual Segments Method when making corrections at CTAs.

7-3-5 COLD TEMPERATURE AIRPORT PROCEDURES

- a. PILOTS MUST NOT MAKE AN ALTIMETER CHANGE to accomplish an altitude correction. Pilots must ensure that the altimeter is set to the current altimeter setting provided by ATC in accordance with 14 CFR §91.121.
- b. Actions on when and where to make corrections: Pilots will make an altitude correction to the published, “at”, “at or above”, and “at or below” altitudes on all designated segment(s) to all

US 7-3

SECTION 3. CTA BARO ALT ERRORS SETTING PROCEDURES

runways for all published instrument approach procedures when the reported airport temperature is at or below the published CTA temperature on the approach plate. A pilot may request an altitude correction (if desired) on any approach at any United States airport when extreme cold temperature is encountered. Pilots making a correction must comply with ATC reporting requirements.

- c. Correctable altitudes: ATC does not apply a cold temperature correction to their Minimum Vectoring Altitude (MVA) or Minimum IFR Altitude (MIA) charts. Pilots must request approval from ATC to apply a cold temperature correction to any ATC assigned altitude. Pilots must not correct altitudes published on Standard Instrument Departures (SIDs), Obstacle Departure Procedures (ODPs), and Standard Terminal Arrivals (STARs).
- d. Use of corrected MDA/DA: Pilots will use the corrected MDA or DA as the minimum altitude for an approach. Pilots must meet the requirements in 14 CFR Part 91.175 in order to operate below the corrected MDA or DA. Pilots must see and avoid obstacles when descending below the minimum altitude on the approach.

NOTE: *The corrected DA or MDA does not affect the visibility minima published for the approach. With the application of a cold temperature correction to the DA or MDA, the airplane should be in a position on the glideslope/glidepath or at the published missed approach point to identify the runway environment.*

- e. How to apply Cold Temperature Altitude Corrections on an Approach.
 - 1. All Segments Method: Pilots may correct all segment altitudes from the initial approach fix (IAF) altitude to the missed approach (MA) final holding altitude. Pilots familiar with the information in this section and the procedures for accomplishing the all segments method, only need to use the published “snowflake” icon, /CTA temperature limit on the approach chart for making corrections. Pilots are not required to reference the CTA list. The altitude correction is calculated as follows:
 - (a) Manual correction: Pilots will make a manual correction when the aircraft is not equipped with a temperature compensating system or when a compensating system is not used to make the correction. Use TBL 7-3-1, ICAO Cold Temperature Error Table to calculate the correction needed for the approach segment(s).
 - (1) Correct all altitudes from the final approach fix (FAF)/PFAF up to and including the IAF altitude: Calculate the correction by taking the FAF/PFAF altitude and subtracting the airport elevation. Use this number to enter the height above airport column in TBL 7-3-1 until reaching the reported temperature from the “Reported Temperature” row. Round this number as applicable and then add to all altitudes from the FAF altitude through the IAF altitude.
 - (2) Correct all altitudes in the final segment: Calculate the correction by taking the MDA or DA for the approach being flown and subtract the airport elevation. Use this number to enter the height above airport column in TBL 7-3-1 until reaching the reported temperature from the “Reported Temperature” row. Use this number or round up to next nearest 100. Add this number to MDA or DA, as applicable, and any applicable step-down fixes in the final segment.

US 7-3
SECTION 3. CTA BARO ALT ERRORS SETTING PROCEDURES

- (3) Correct final holding altitude in the MA Segment: Calculate the correction by taking the final missed approach (MA) holding altitude and subtract the airport elevation. Use this number to enter the height above airport column in TBL 7-3-1 until reaching the reported temperature from the "Reported Temperature" row. Round this number as applicable and then add to the final MA altitude only.
- (b) Aircraft with temperature compensating systems: If flying an aircraft equipped with a system capable of temperature compensation, follow the instructions for applying temperature compensation provided in the airplane flight manual (AFM), AFM supplement, or system operating manual. Ensure that temperature compensation system is on and active prior to the IAF and remains active throughout the entire approach and missed approach.
- (1) Pilots that have a system that is able to calculate a temperature-corrected DA or MDA may use the system for this purpose.
- (2) Pilots that have a system unable to calculate a temperature corrected DA or MDA will manually calculate an altitude correction for the MDA or DA.

NOTE: Some systems apply temperature compensation only to those altitudes associated with an instrument approach procedure loaded into the active flight plan while other systems apply temperature compensation to all procedure altitudes or user entered altitudes in the active flight plan, including altitudes associated with a STAR. For those systems that apply temperature compensation to all altitudes in the active flight plan, delay activating temperature compensation until the aircraft has passed the last altitude constraint associated with the active STAR.

2. Individual Segment(s) Method: Pilots are allowed to correct only the marked segment(s) indicated in the CTA list. https://www.faa.gov/air_traffic/flight_info/aeronav/digital_products/dtpp/search/. Pilots using the Individual Segment(s) Method will reference the CTA list to determine which segment(s) need a correction. See FIG 7-3-1.

FIGURE 7-3-1 Example Cold Temperature Restricted Airport List – Required Segments

Identifier	Airport name	Temperature	Intermediate	Final	Missed Appr
3U3	Bowman Field	-33C	X		
6S5	Ravalli County	-23C			X
6S8	Laurel Municipal	-30C	X		
7S0	Ronan	-27C	X		
8S1	Polson	-20C	X	X	
32S	Stevensville	-20C	X		

- (a) Manual Correction: Pilots will make a manual correction when the aircraft is not equipped with a temperature compensating system or when a compensating

US 7-3

SECTION 3. CTA BARO ALT ERRORS SETTING PROCEDURES

system is not used to make the correction. Use TBL 7-3-1, ICAO Cold Temperature Error Table, to calculate the correction needed for the approach segment(s).

- (1) Intermediate Segment: All altitudes from the FAF/PFAF up to but not including the intermediate fix (IF) altitude. Calculate the correction by taking FAF/PFAF altitude and subtracting the airport elevation. Use this number to enter the height above airport column in TBL 7-3-1 until reaching the reported temperature from the "Reported Temperature" row. Round this number as applicable and then add to FAF altitude and all step-down altitudes within the intermediate segment (inside of the waypoint labeled "(IF)").
 - (2) Final segment: Calculate correction by taking the MDA or DA for the approach flown and subtract the airport elevation. Use this number to enter the height above airport column in TBL 7-3-1 until reaching the reported temperature from the "Reported Temperature" row. Use this number or round up to next nearest 100. Add this number to MDA or DA, as applicable, and any applicable step-down fixes in the final segment.
 - (3) Missed Approach Segment: Calculate the correction by taking the final MA holding altitude and subtract the airport elevation. Use this number to enter the height above airport column in TBL 7-3-1 until reaching the reported temperature from the "Reported Temperature" row. Round this number as applicable and then add to the final MA altitude only.
- (b) Aircraft with temperature compensating system: If flying an aircraft equipped with a system capable of temperature compensation, follow the instructions for applying temperature compensation provided in the AFM, AFM supplement, or system operating manual. Ensure the temperature compensation system is on and active prior to the segment(s) being corrected. Manually calculate an altimetry correction for the MDA or DA. Determine an altimetry correction from the ICAO table based on the reported airport temperature and the height difference between the MDA or DA, as applicable, and the airport elevation, or use the compensating system to calculate a temperature corrected altitude for the published MDA or DA if able.
- f. Acceptable Use of Table for manual CTA altitude correction: (See TBL 7-3-1.) Pilots may calculate a correction with a visual interpolation of the chart when using reported temperature and height above airport. This calculated altitude correction may then be rounded to the nearest whole hundred or rounded up. For example, a correction of 130 ft. from the chart may be rounded to 100 ft. or 200 ft. A correction of 280 ft. will be rounded up to 300 ft. This rounded correction will be added to the appropriate altitudes for the "Individual" or "All" segment method. The correction calculated from the table for the MDA or DA may be used as is or rounded up, but never rounded down. This number will be added to the MDA, DA, and all step-down fixes inside of the FAF as applicable.
1. No extrapolation above the 5000 ft. column is required. Pilots may use the 5000 ft. "height above airport in feet" column for calculating corrections when the calculated altitude is greater than 5000 ft. above reporting station elevation. Pilots must add the correction(s) from the table to the affected segment altitude(s) and fly at the new corrected

US 7-3

SECTION 3. CTA BARO ALT ERRORS SETTING PROCEDURES

altitude. Do not round down when using the 5000 ft. column for calculated height above airport values greater than 5000 ft. Pilots may extrapolate above the 5000 ft. column to apply a correction if desired.

2. These techniques have been adopted to minimize pilot distraction by limiting the number of entries into the table when making corrections. Although not all altitudes on the approach will be corrected back to standard day values, a safe distance above the terrain/obstacle will be maintained on the corrected approach segment(s). Pilots may calculate a correction for each fix based on the fix altitude if desired.

NOTE: Pilots may use *Real Time Mesoscale Analysis (RTMA): Alternate Report of Surface Temperature*, for computing altitude corrections, when airport temperatures are not available via normal reporting. The RTMA website is http://nomads.ncep.noaa.gov/pub/data/ncctf/com/rtna/prod/airport_temps/.

- g. Communication: Pilots must request approval from ATC whenever applying a cold temperature altitude correction. Pilots do not need to inform ATC of the final approach segment correction (i.e., new MDA or DA). This request should be made on initial radio contact with the ATC facility issuing the approach clearance. ATC requires this information in order to ensure appropriate vertical separation between known traffic. Pilots should query ATC when vectored altitudes to a segment are lower than the requested corrected altitude. Pilots are encouraged to self-announce corrected altitude when flying into a non-towered airfield.

1. The following are examples of appropriate pilot-to-ATC communication when applying cold-temperature altitude corrections.

- (a) On initial check-in with ATC providing approach clearance: Missoula, MT (example below).
 - Vectors to final approach course: Outside of IAFs: *“Request 9700 ft. for cold temperature operations.”*
 - Vectors to final approach course: Inside of ODIRE: *“Request 7300 ft. for cold temperature operations.”*
 - Missed Approach segment: *“Require final holding altitude, 12500 ft. on missed approach for cold temperature operations.”*
- (b) Pilots cleared by ATC for an instrument approach procedure; “Cleared the RNAV (GPS) Y RWY 12 approach (from any IAF)”. Missoula, MT (example below).
 - IAF: *“Request 9700 ft. for cold temperature operations at LANNY, CHARL, or ODIRE.”*

7-3-6 EXAMPLES FOR CALCULATING ALTITUDE CORRECTIONS ON CTAs

All 14 CFR Part 97 IAPs must be corrected at an airport. The following example provides the steps for correcting the different segments of an approach and will be applied to all 14 CFR Part 97 IAPs:

US 7-3

SECTION 3. CTA BARO ALT ERRORS SETTING PROCEDURES

a. Missoula Intl (KMSO). Reported Temperature -12°C: RNAV (GPS) Y RWY 12.

1. All Segments Method: All segments corrected from IAF through MA holding altitude.

(a) Manual Calculation:

(1) Cold Temperature Restricted Airport Temperature Limit: -12°C.

(2) Altitude at the Final Approach Fix (FAF) (SUPPY) = 6200 ft.

(3) Airport elevation = 3206 ft.

(4) Difference: 6200 ft. - 3206 ft. = 2994 ft.

(5) Use TBL 7-3-1, ICAO Cold Temperature Error Table, a height above airport of 2994 ft. and -12°C. Visual interpolation is approximately 300 ft. Actual interpolation is 300 ft.

(6) Add 300 ft. to the FAF and all procedure altitudes outside of the FAF up to and including IAF altitude(s):

[a] LANNY (IAF), CHARL (IAF), and ODIRE (IAF Holding-in-Lieu): 9400 + 300 = 9700 ft.

[b] CALIP (stepdown fix): 7000 + 300 = 7300 ft.

[c] SUPPY (FAF): 6200 + 300 = 6500 ft.

(7) Correct altitudes within the final segment altitude based on the minima used. LP MDA = 4520 ft.

(8) Difference: 4520 ft. - 3206 ft. = 1314 ft.

(9) AIM 7-3-1 Table: 1314 ft. at -12°C is approximately 150 ft. Use 150 ft. or round up to 200 ft.

(10) Add corrections to altitudes up to but not including the FAF:

[a] BEGPE (stepdown fix): 4840 + 150 = 4990 ft.

[b] LNAV MDA: 4520 + 150 = 4670 ft.

(11) Correct JENKI/Missed Approach Holding Altitude: MA altitude is 12000:

[a] JENKI: 12000 - 3206 = 8794 ft.

(12) Table 7-3-1: 8794 ft. at -12°C. Enter table at -12°C and intersect the 5000 ft. height above airport column. The approximate value is 500 ft.

(13) Add correction to holding fix final altitude:

[a] JENKI: 12000 + 500 = 12500 ft.

b. Temperature Compensating System: Operators using a temperature compensating RNAV system to make altitude corrections will be set to the current airport temperature (-12°C) and activated prior to passing the IAF. A manual calculation of the cold temperature altitude correction is required for the MDA/DA.

US 7-3

SECTION 3. CTA BARO ALT ERRORS SETTING PROCEDURES

1. Individual Segments Method: Missoula requires correction in the intermediate and final segments. However, in this example, the missed approach is also shown.
 - (a) Manual Calculation: Use the appropriate steps in the All Segments Method above to apply a correction to the required segment.
 - (1) Intermediate. Use steps 7-3-6 a. 1. (a) (1) thru (6). Do not correct the IAF or IF when using individual segments method.
 - (2) Final. Use steps 7-3-6 a. 1. (a) (7) thru (10).
 - (3) Missed Approach. Use steps 7-3-6 a. 1. (a) (11) thru (13).
 - (b) Temperature Compensating System: Operators using a temperature compensating RNAV system to make altitude corrections will be set to the current airport temperature (-12°C) and activated at a point needed to correct the altitude for the segment. A manual calculation of the cold temperature altitude correction is required for the MDA/DA.

FIGURE 7-3-2

Missoula Intl RNAV (GPS) Y RWY 12

US 7-4

SECTION 4. WAKE TURBULENCE

7-4-1 GENERAL

- a. Every aircraft generates wake turbulence while in flight. Wake turbulence is a function of an aircraft producing lift, resulting in the formation of two counter-rotating vortices trailing behind the aircraft.
- b. Wake turbulence from the generating aircraft can affect encountering aircraft due to the strength, duration, and direction of the vortices. Wake turbulence can impose rolling moments exceeding the roll-control authority of encountering aircraft, causing possible injury to occupants and damage to aircraft. Pilots should always be aware of the possibility of a wake turbulence encounter when flying through the wake of another aircraft, and adjust the flight path accordingly.

7-4-2 VORTEX GENERATION

- a. The creation of a pressure differential over the wing surface generates lift. The lowest pressure occurs over the upper wing surface and the highest pressure under the wing. This pressure differential triggers the roll up of the airflow at the rear of the wing resulting in swirling air masses trailing downstream of the wing tips. After the roll up is completed, the wake consists of two counter-rotating cylindrical vortices. (See FIG 7-4-1.) The wake vortex is formed with most of the energy concentrated within a few feet of the vortex core.

FIGURE 7-4-1

Wake Vortex Generation

- b. More aircraft are being manufactured or retrofitted with winglets. There are several types of winglets, but their primary function is to increase fuel efficiency by improving the lift-to-drag ratio. Studies have shown that winglets have a negligible effect on wake turbulence generation, particularly with the slower speeds involved during departures and arrivals.

US 7-4

SECTION 4. WAKE TURBULENCE

7-4-3 VORTEX STRENGTH

- a. Weight, speed, wingspan, and shape of the generating aircraft's wing all govern the strength of the vortex. The vortex characteristics of any given aircraft can also be changed by extension of flaps or other wing configuring devices. However, the vortex strength from an aircraft increases proportionately to an increase in operating weight or a decrease in aircraft speed. Since the turbulence from a "dirty" aircraft configuration hastens wake decay, the greatest vortex strength occurs when the generating aircraft is **HEAVY, CLEAN, and SLOW**.

b. Induced Roll

1. In rare instances, a wake encounter could cause catastrophic inflight structural damage to an aircraft. However, the usual hazard is associated with induced rolling moments that can exceed the roll-control authority of the encountering aircraft. During inflight testing, aircraft intentionally flew directly up trailing vortex cores of larger aircraft. These tests demonstrated that the ability of aircraft to counteract the roll imposed by wake vortex depends primarily on the wingspan and counter-control responsiveness of the encountering aircraft. These tests also demonstrated the difficulty of an aircraft to remain within a wake vortex. The natural tendency is for the circulation to eject aircraft from the vortex.
2. Counter control is usually effective and induced roll minimal in cases where the wingspan and ailerons of the encountering aircraft extend beyond the rotational flow field of the vortex. It is more difficult for aircraft with short wingspan (relative to the generating aircraft) to counter the imposed roll induced by vortex flow. Pilots of short span aircraft, even of the high performance type, must be especially alert to vortex encounters. (See FIG 7-4-2.)

FIGURE 7-4-2**7-4-4 VORTEX BEHAVIOR**

- a. Trailing vortices have certain behavioral characteristics which can help a pilot visualize the wake location and thereby take avoidance precautions.

US 7-4

SECTION 4. WAKE TURBULENCE

1. An aircraft generates vortices from the moment it rotates on takeoff to touchdown, since trailing vortices are a by-product of wing lift. Prior to takeoff or touchdown pilots should note the rotation or touchdown point of the preceding aircraft. (See FIG 7-4-3.)
2. The vortex circulation is outward, upward and around the wing tips when viewed from either ahead or behind the aircraft. Tests with larger aircraft have shown that the vortices remain spaced a bit less than a wingspan apart, drifting with the wind, at altitudes greater than a wingspan from the ground. In view of this, if persistent vortex turbulence is encountered, a slight change of altitude (upward) and lateral position (upwind) should provide a flight path clear of the turbulence.
3. Flight tests have shown that the vortices from larger aircraft sink at a rate of several hundred feet per minute, slowing their descent and diminishing in strength with time and distance behind the generating aircraft. Pilots should fly at or above the preceding aircraft's flight path, altering course as necessary to avoid the area directly behind and below the generating aircraft. (See FIG 7-4-4.) Pilots, in all phases of flight, must remain vigilant of possible wake effects created by other aircraft. Studies have shown that atmospheric turbulence hastens wake breakup, while other atmospheric conditions can transport wake horizontally and vertically.
4. When the vortices of larger aircraft sink close to the ground (within 100 to 200 feet), they tend to move laterally over the ground at a speed of 2 or 3 knots. (See FIG 7-4-5.)

FIGURE 7-4-3

Wake Ends/Wake Begins

FIGURE 7-4-4

Vortex Flow Field

US 7-4
SECTION 4. WAKE TURBULENCE

FIGURE 7-4-5

Vortex Movement Near Ground - No Wind

FIGURE 7-4-6

Vortex Movement Near Ground - with Cross Winds

5. Pilots should be alert at all times for possible wake vortex encounters when conducting approach and landing operations. The pilot is ultimately responsible for maintaining an appropriate interval, and should consider all available information in positioning the aircraft in the terminal area, to avoid the wake turbulence created by a preceding aircraft. Test data shows that vortices can rise with the air mass in which they are embedded. The effects of wind shear can cause vortex flow field "tilting." In addition, ambient thermal lifting and orographic effects (rising terrain or tree lines) can cause a vortex flow field to rise and possibly bounce.

- b. A crosswind will decrease the lateral movement of the upwind vortex and increase the movement of the downwind vortex. Thus, a light wind with a cross runway component of 1 to 5 knots could result in the upwind vortex remaining in the touchdown zone for a period of time and hasten the drift of the downwind vortex toward another runway. (See FIG 7-4-6.) Similarly, a tailwind condition can move the vortices of the preceding aircraft forward into the touchdown zone. THE LIGHT QUARTERING TAILWIND REQUIRES MAXIMUM CAUTION. Pilots should be alert to large aircraft upwind from their approach and takeoff flight paths. (See FIG 7-4-7.)

US 7-4
SECTION 4. WAKE TURBULENCE

FIGURE 7-4-7

7-4-5 OPERATIONS PROBLEM AREAS

- a. A wake turbulence encounter can range from negligible to catastrophic. The impact of the encounter depends on the weight, wingspan, size of the generating aircraft, distance from the generating aircraft, and point of vortex encounter. The probability of induced roll increases when the encountering aircraft's heading is generally aligned with the flight path of the generating aircraft.
- b. AVOID THE AREA BELOW AND BEHIND THE WAKE GENERATING AIRCRAFT, ESPECIALLY AT LOW ALTITUDE WHERE EVEN A MOMENTARY WAKE ENCOUNTER COULD BE CATASTROPHIC.

NOTE: A common scenario for a wake encounter is in terminal airspace after accepting clearance for a visual approach behind landing traffic. Pilots must be cognizant of their position relative to the traffic and use all means of vertical guidance to ensure they do not fly below the flight path of the wake generating aircraft.

- c. Pilots should be particularly alert in calm wind conditions and situations where the vortices could:
 1. Remain in the touchdown area.
 2. Drift from aircraft operating on a nearby runway.
 3. Sink into the takeoff or landing path from a crossing runway.
 4. Sink into the traffic pattern from other airport operations.
 5. Sink into the flight path of VFR aircraft operating on the hemispheric altitude 500 feet below.
- d. Pilots should attempt to visualize the vortex trail of aircraft whose projected flight path they may encounter. When possible, pilots of larger aircraft should adjust their flight paths to minimize vortex exposure to other aircraft.

US 7-4

SECTION 4. WAKE TURBULENCE

7-4-6 VORTEX AVOIDANCE PROCEDURES

- a. Under certain conditions, airport traffic controllers apply procedures for separating IFR aircraft. If a pilot accepts a clearance to visually follow a preceding aircraft, the pilot accepts responsibility for separation and wake turbulence avoidance. The controllers will also provide to VFR aircraft, with whom they are in communication and which in the tower's opinion may be adversely affected by wake turbulence from a larger aircraft, the position, altitude and direction of flight of larger aircraft followed by the phrase "CAUTION - WAKE TURBULENCE." After issuing the caution for wake turbulence, the airport traffic controllers generally do not provide additional information to the following aircraft unless the airport traffic controllers know the following aircraft is overtaking the preceding aircraft. **WHETHER OR NOT A WARNING OR INFORMATION HAS BEEN GIVEN, HOWEVER, THE PILOT IS EXPECTED TO ADJUST AIRCRAFT OPERATIONS AND FLIGHT PATH AS NECESSARY TO PRECLUDE SERIOUS WAKE ENCOUNTERS.** When any doubt exists about maintaining safe separation distances between aircraft during approaches, pilots should ask the control tower for updates on separation distance and aircraft groundspeed.
- b. The following vortex avoidance procedures are recommended for the various situations:
1. **Landing behind a larger aircraft— same runway.** Stay at or above the larger aircraft's final approach flight path-note its touchdown point-land beyond it.
 2. **Landing behind a larger aircraft— when parallel runway is closer than 2,500 feet.** Consider possible drift to your runway. Stay at or above the larger aircraft's final approach flight path- note its touchdown point.
 3. **Landing behind a larger aircraft— crossing runway.** Cross above the larger aircraft's flight path.
 4. **Landing behind a departing larger aircraft— same runway.** Note the larger aircraft's rotation point- land well prior to rotation point.
 5. **Landing behind a departing larger aircraft— crossing runway.** Note the larger aircraft's rotation point- if past the intersection- continue the approach- land prior to the intersection. If larger aircraft rotates prior to the intersection, avoid flight below the larger aircraft's flight path. Abandon the approach unless a landing is ensured well before reaching the intersection.
 6. **Departing behind a larger aircraft.** Note the larger aircraft's rotation point and rotate prior to the larger aircraft's rotation point. Continue climbing above the larger aircraft's climb path until turning clear of the larger aircraft's wake. Avoid subsequent headings which will cross below and behind a larger aircraft. Be alert for any critical takeoff situation which could lead to a vortex encounter.
 7. **Intersection takeoffs— same runway.** Be alert to adjacent larger aircraft operations, particularly upwind of your runway. If intersection takeoff clearance is received, avoid subsequent heading which will cross below a larger aircraft's path.
 8. **Departing or landing after a larger aircraft executing a low approach, missed approach, or touch-and-go landing.** Because vortices settle and move laterally near

US 7-4

SECTION 4. WAKE TURBULENCE

the ground, the vortex hazard may exist along the runway and in your flight path after a larger aircraft has executed a low approach, missed approach, or a touch-and-go landing, particular in light quartering wind conditions. You should ensure that an interval of at least 2 minutes has elapsed before your takeoff or landing.

9. **En route VFR (thousand-foot altitude plus 500 feet).** Avoid flight below and behind a large aircraft's path. If a larger aircraft is observed above on the same track (meeting or overtaking) adjust your position laterally, preferably upwind.

7-4-7 HELICOPTERS

In a slow hover taxi or stationary hover near the surface, helicopter main rotor(s) generate downwash producing high velocity outwash vortices to a distance approximately three times the diameter of the rotor. When rotor downwash hits the surface, the resulting outwash vortices have behavioral characteristics similar to wing tip vortices produced by fixed wing aircraft. However, the vortex circulation is outward, upward, around, and away from the main rotor(s) in all directions. Pilots of small aircraft should avoid operating within three rotor diameters of any helicopter in a slow hover taxi or stationary hover. In forward flight, departing or landing helicopters produce a pair of strong, high-speed trailing vortices similar to wing tip vortices of larger fixed wing aircraft. Pilots of small aircraft should use caution when operating behind or crossing behind landing and departing helicopters.

7-4-8 PILOT RESPONSIBILITY

- a. Research and testing have been conducted, in addition to ongoing wake initiatives, in an attempt to mitigate the effects of wake turbulence. Pilots must exercise vigilance in situations where they are responsible for avoiding wake turbulence.
- b. Pilots are reminded that in operations conducted behind all aircraft, acceptance of instructions from ATC in the following situations is an acknowledgment that the pilot will ensure safe takeoff and landing intervals and accepts the responsibility for providing wake turbulence separation.
 1. Traffic information.
 2. Instructions to follow an aircraft; and
 3. The acceptance of a visual approach clearance.
- c. For operations conducted behind **super** or **heavy** aircraft, ATC will specify the word "**super**" or "**heavy**" as appropriate, when this information is known. Pilots of **super** or **heavy** aircraft should always use the word "**super**" or "**heavy**" in radio communications.
- d. Super, heavy, and large jet aircraft operators should use the following procedures during an approach to landing. These procedures establish a dependable baseline from which pilots of in-trail, lighter aircraft may reasonably expect to make effective flight path adjustments to avoid serious wake vortex turbulence.

US 7-4
SECTION 4. WAKE TURBULENCE

1. Pilots of aircraft that produce strong wake vortices should make every attempt to fly on the established glidepath, not above it; or, if glidepath guidance is not available, to fly as closely as possible to a "3-1" glidepath, not above it.

EXAMPLE: Fly 3,000 feet at 10 miles from touchdown, 1,500 feet at 5 miles, 1,200 feet at 4 miles, and so on to touchdown.

2. Pilots of aircraft that produce strong wake vortices should fly as closely as possible to the approach course centerline or to the extended centerline of the runway of intended landing as appropriate to conditions.
- e. Pilots operating lighter aircraft on visual approaches in-trail to aircraft producing strong wake vortices should use the following procedures to assist in avoiding wake turbulence. These procedures apply only to those aircraft that are on visual approaches.

1. Pilots of lighter aircraft should fly on or above the glidepath. Glidepath reference may be furnished by an ILS, by a visual approach slope system, by other ground-based approach slope guidance systems, or by other means. In the absence of visible glidepath guidance, pilots may very nearly duplicate a 3-degree glideslope by adhering to the "3 to 1" glidepath principle.

EXAMPLE: Fly 3,000 feet at 10 miles from touchdown, 1,500 feet at 5 miles, 1,200 feet at 4 miles, and so on to touchdown.

2. If the pilot of the lighter following aircraft has visual contact with the preceding heavier aircraft and also with the runway, the pilot may further adjust for possible wake vortex turbulence by the following practices:

- (a) Pick a point of landing no less than 1,000 feet from the arrival end of the runway.
- (b) Establish a line-of-sight to that landing point that is above and in front of the heavier preceding aircraft.
- (c) When possible, note the point of landing of the heavier preceding aircraft and adjust point of intended landing as necessary.

EXAMPLE: A puff of smoke may appear at the 1,000-foot markings of the runway, showing that touchdown was that point; therefore, adjust point of intended landing to the 1,500-foot markings.

- (d) Maintain the line-of-sight to the point of intended landing above and ahead of the heavier preceding aircraft; maintain it to touchdown.
- (e) Land beyond the point of landing of the preceding heavier aircraft. Ensure you have adequate runway remaining, if conducting a touch-and-go landing, or adequate stopping distance available for a full stop landing.

- f. During visual approaches pilots may ask ATC for updates on separation and groundspeed with respect to heavier preceding aircraft, especially when there is any question of safe separation from wake turbulence.

US 7-4

SECTION 4. WAKE TURBULENCE

- g. Pilots should notify ATC when a wake event is encountered. Be as descriptive as possible (i.e., bank angle, altitude deviations, intensity and duration of event, etc.) when reporting the event. ATC will record the event through their reporting system. You are also encouraged to use the Aviation Safety Reporting System (ASRS) to report wake events.

7-4-9 AIR TRAFFIC WAKE TURBULENCE SEPARATIONS

- a. Because of the possible effects of wake turbulence, controllers are required to apply no less than minimum required separation to all aircraft operating behind a Super or Heavy, and to Small aircraft operating behind a B757, when aircraft are IFR; VFR and receiving Class B, Class C, or TRSA airspace services; or VFR and being radar sequenced.
1. Separation is applied to aircraft operating directly behind a super or heavy at the same altitude or less than 1,000 feet below, and to small aircraft operating directly behind a B757 at the same altitude or less than 500 feet below:
 - (a) **Heavy** behind **super** — 6 miles.
 - (b) **Large** behind **super** — 7 miles.
 - (c) **Small** behind **super** — 8 miles.
 - (d) **Heavy** behind **heavy** — 4 miles.
 - (e) **Small/large** behind **heavy** — 5 miles.
 - (f) **Small** behind **B757** — 4 miles.
 2. Also, separation, measured at the time the preceding aircraft is over the landing threshold, is provided to small aircraft:
 - (a) **Small** landing behind **heavy** — 6 miles.
 - (b) **Small** landing behind **large, non-B757** — 4 miles.

REFERENCE—*Pilot/Controller Glossary Term — Aircraft Classes.*

- b. Additionally, appropriate time or distance intervals are provided to departing aircraft when the departure will be from the same threshold, a parallel runway separated by less than 2,500 feet with less than 500 feet threshold stagger, or on a crossing runway and projected flight paths will cross:
1. Three minutes or the appropriate radar separation when takeoff will be behind a super aircraft;
 2. Two minutes or the appropriate radar separation when takeoff will be behind a heavy aircraft.
 3. Two minutes or the appropriate radar separation when a small aircraft will takeoff behind a B757.

NOTE: *Controllers may not reduce or waive these intervals.*

US 7-4

SECTION 4. WAKE TURBULENCE

- c. A 3-minute interval will be provided when a **small** aircraft will takeoff:
1. From an intersection on the same runway (same or opposite direction) behind a departing **large** aircraft (except B757), or
 2. In the opposite direction on the same runway behind a large aircraft (except B757) takeoff or low/missed approach.

NOTE: *This 3-minute interval may be waived upon specific pilot request.*

- d. A 3-minute interval will be provided when a small aircraft will takeoff:
1. From an intersection on the same runway (same or opposite direction) behind a departing B757, or
 2. In the opposite direction on the same runway behind a B757 takeoff or low/missed approach.

NOTE: *This 3-minute interval may not be waived.*

- e. A 4-minute interval will be provided for all aircraft taking off behind a super aircraft, and a 3-minute interval will be provided for all aircraft taking off behind a heavy aircraft when the operations are as described in subparagraphs c1 and c2 above, and are conducted on either the same runway or parallel runways separated by less than 2,500 feet. Controllers may not reduce or waive this interval.
- f. Pilots may request additional separation (i.e., 2 minutes instead of 4 or 5 miles) for wake turbulence avoidance. This request should be made as soon as practical on ground control and at least before taxiing onto the runway.

NOTE: *14 CFR Section 91.3(a) states: "The pilot-in-command of an aircraft is directly responsible for and is the final authority as to the operation of that aircraft."*

- g. Controllers may anticipate separation and need not withhold a takeoff clearance for an aircraft departing behind a **large, heavy, or super** aircraft if there is reasonable assurance the required separation will exist when the departing aircraft starts takeoff roll.

NOTE: *With the advent of new wake turbulence separation methodologies known as Wake Turbulence Recategorization, some of the requirements listed above may vary at facilities authorized to operate in accordance with Wake Turbulence Recategorization directives.*

REFERENCE—

FAA Order JO 7110.659 Wake Turbulence Recategorization

FAA Order JO 7110.123 Wake Turbulence Recategorization – Phase II

FAA Order JO 7110.126, Consolidated Wake Turbulence

7-4-10 DEVELOPMENT AND NEW CAPABILITIES

- a. The suite of available wake turbulence tools, rules, and procedures is expanding, with the development of new methodologies. Based on extensive analysis of wake vortex behavior, new procedures and separation standards are being developed and implemented in the US

US 7-4

SECTION 4. WAKE TURBULENCE

and throughout the world. Wake research involves the wake generating aircraft as well as the wake toleration of the trailing aircraft.

- b. The FAA and ICAO are leading initiatives, in terminal environments, to implement next-generation wake turbulence procedures and separation standards. The FAA has undertaken an effort to recategorize the existing fleet of aircraft and modify associated wake turbulence separation minima. This initiative is termed Wake Turbulence Recategorization (RECAT), and changes the current weight-based classes (Super, Heavy, B757, Large, Small+, and Small) to a wake-based categorical system that utilizes the aircraft matrices of weight, wing-span, and approach speed. RECAT is currently in use at a limited number of airports in the National Airspace System.

US 7-5

SECTION 5. BIRD HAZARDS AND FLIGHT OVER NATIONAL REFUGES, PARKS, AND FORESTS

7-5-1 MIGRATORY BIRD ACTIVITY

- a. Bird strike risk increases because of bird migration during the months of March through April, and August through November.
- b. The altitudes of migrating birds vary with winds aloft, weather fronts, terrain elevations, cloud conditions, and other environmental variables. While over 90 percent of the reported bird strikes occur at or below 3,000 feet AGL, strikes at higher altitudes are common during migration. Ducks and geese are frequently observed up to 7,000 feet AGL and pilots are cautioned to minimize en route flying at lower altitudes during migration.
- c. Considered the greatest potential hazard to aircraft because of their size, abundance, or habit of flying in dense flocks are gulls, waterfowl, vultures, hawks, owls, egrets, blackbirds, and starlings. Four major migratory flyways exist in the U.S. The Atlantic flyway parallels the Atlantic Coast. The Mississippi Flyway stretches from Canada through the Great Lakes and follows the Mississippi River. The Central Flyway represents a broad area east of the Rockies, stretching from Canada through Central America. The Pacific Flyway follows the west coast and overflies major parts of Washington, Oregon, and California. There are also numerous smaller flyways which cross these major north-south migratory routes.

7-5-2 REDUCING BIRD STRIKE RISKS

- a. The most serious strikes are those involving ingestion into an engine (turboprops and turbine jet engines) or windshield strikes. These strikes can result in emergency situations requiring prompt action by the pilot.
- b. Engine ingestions may result in sudden loss of power or engine failure. Review engine out procedures, especially when operating from airports with known bird hazards or when operating near high bird concentrations.
- c. Windshield strikes have resulted in pilots experiencing confusion, disorientation, loss of communications, and aircraft control problems. Pilots are encouraged to review their emergency procedures before flying in these areas.
- d. When encountering birds en route, climb to avoid collision, because birds in flocks generally distribute themselves downward, with lead birds being at the highest altitude.
- e. Avoid overflight of known areas of bird concentration and flying at low altitudes during bird migration. Charted wildlife refuges and other natural areas contain unusually high local concentration of birds which may create a hazard to aircraft.

7-5-3 REPORTING BIRD STRIKES

Pilots are urged to report any bird or other wildlife strike using FAA Form 5200-7, Bird/Other Wildlife Strike Report (Appendix 1). Additional forms are available at any FSS; at any FAA Regional Office or at https://www.faa.gov/airports/airport_safety/wildlife/. The data derived from these reports are used to develop standards to cope with this potential hazard to aircraft and for documentation of necessary habitat control on airports.

US 7-5

SECTION 5. BIRD HAZARDS AND FLIGHT OVER NATIONAL REFUGES, PARKS, AND FORESTS

7-5-4 REPORTING BIRD AND OTHER WILDLIFE ACTIVITIES

If you observe birds or other animals on or near the runway, request airport management to disperse the wildlife before taking off. Also contact the nearest FAA ARTCC, FSS, or tower (including non-Federal towers) regarding large flocks of birds and report the:

- a. Geographic location.
- b. Bird type (geese, ducks, gulls, etc.).
- c. Approximate numbers.
- d. Altitude.
- e. Direction of bird flight path.

7-5-5 PILOT ADVISORIES ON BIRD AND OTHER WILDLIFE HAZARDS

Many airports advise pilots of other wildlife hazards caused by large animals on the runway through the Chart Supplement U.S. and the NOTAM system. [Also see Jeppesen Airport Directory.] Collisions of landing and departing aircraft and animals on the runway are increasing and are not limited to rural airports. These accidents have also occurred at several major airports. Pilots should exercise extreme caution when warned of the presence of wildlife on and in the vicinity of airports. If you observe deer or other large animals in close proximity to movement areas, advise the FSS, tower, or airport management.

7-5-6 FLIGHTS OVER CHARTED U.S. WILDLIFE REFUGES, PARKS, AND FOREST SERVICE AREAS

- a. The landing of aircraft is prohibited on lands or waters administered by the National Park Service, U.S. Fish and Wildlife Service, or U.S. Forest Service without authorization from the respective agency. Exceptions include:
 1. When forced to land due to an emergency beyond the control of the operator;
 2. At officially designated landing sites; or
 3. An approved official business of the Federal Government.
- b. Pilots are requested to maintain a minimum altitude of 2,000 feet above the surface of the following: National Parks, Monuments, Seashores, Lakeshores, Recreation Areas and Scenic Riverways administered by the National Park Service, National Wildlife Refuges, Big Game Refuges, Game Ranges and Wildlife Ranges administered by the U.S. Fish and Wildlife Service, and Wilderness and Primitive areas administered by the U.S. Forest Service.

NOTE: FAA Advisory Circular AC 91-36, *Visual Flight Rules (VFR) Flight Near Noise-Sensitive Areas*, defines the surface of a national park area (including parks, forests, primitive areas, wilderness areas, recreational areas, national seashores, national monuments, national lakeshores, and national wildlife refuge and range areas) as: the highest terrain within 2,000 feet laterally of the route of flight, or the upper-most rim of a canyon or valley.

US 7-5

SECTION 5. BIRD HAZARDS AND FLIGHT OVER NATIONAL REFUGES, PARKS, AND FORESTS

- c. Federal statutes prohibit certain types of flight activity and/or provide altitude restrictions over designated U.S. Wildlife Refuges, Parks, and Forest Service Areas. These designated areas, for example: Boundary Waters Canoe Wilderness Areas, Minnesota; Haleakala National Park, Hawaii; Yosemite National Park, California; and Grand Canyon National Park, Arizona, are charted on Sectional Charts.
- d. Federal regulations also prohibit airdrops by parachute or other means of persons, cargo, or objects from aircraft on lands administered by the three agencies without authorization from the respective agency. Exceptions include:
 - 1. Emergencies involving the safety of human life; or
 - 2. Threat of serious property loss.

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

7-6-1 ACCIDENT CAUSE FACTORS

- a. The 10 most frequent cause factors for general aviation accidents that involve the pilot-in-command are:
 1. **Inadequate preflight preparation and/or planning.**
 2. **Failure to obtain and/or maintain flying speed.**
 3. **Failure to maintain direction control.**
 4. **Improper level off.**
 5. **Failure to see and avoid objects or obstructions.**
 6. **Mismanagement of fuel.**
 7. **Improper inflight decisions or planning.**
 8. **Misjudgment of distance and speed.**
 9. **Selection of unsuitable terrain.**
 10. **Improper operation of flight controls.**
- b. This list remains relatively stable and points out the need for continued refresher training to establish a higher level of flight proficiency for all pilots. A part of the FAA's continuing effort to promote increased aviation safety is the Aviation Safety Program. For information on Aviation Safety Program activities contact your nearest Flight Standards District Office.
- c. **Alertness.** Be alert at all times, especially when the weather is good. Most pilots pay attention to business when they are operating in full IFR weather conditions, but strangely, air collisions almost invariably have occurred under ideal weather conditions. Unlimited visibility appears to encourage a sense of security which is not at all justified. Considerable information of value may be obtained by listening to advisories being issued in the terminal area, even though controller workload may prevent a pilot from obtaining individual service.
- d. **Giving Way.** If you think another aircraft is too close to you, give way instead of waiting for the other pilot to respect the right-of-way to which you may be entitled. It is a lot safer to pursue the right-of-way angle after you have completed your flight.

7-6-2 REPORTING RADIO/RADAR ALTIMETER ANOMALIES

- a. Background
 1. The radio altimeter (also known as radar altimeter or RADALT) is a safety-critical aircraft system used to determine an aircraft's height above terrain. It is the only sensor onboard the aircraft capable of providing a direct measurement of the clearance height above the terrain and obstacles. Information from radio altimeters is essential for flight operations as a main enabler of several safety-critical functions and systems on the aircraft. The receiver on the radio altimeter is highly accurate because it is extremely sensitive, making it susceptible to radio frequency interference (RFI). RFI in the C-band portion of the spectrum could impact the functions of the radio altimeter during any

US 7-6
SECTION 6. POTENTIAL FLIGHT HAZARDS

phase of flight — most critically during takeoff, approach, and landing phases. This could pose a serious risk to flight safety.

2. Installed radio altimeters normally supply critical height data to a wide range of automated safety systems, navigation systems, and cockpit displays. Harmful RFI affecting the radio altimeter can cause these safety and navigation systems to operate in unexpected ways and display erroneous information to the pilot. RFI can interrupt, or significantly degrade, radio altimeter functions — precluding radio altimeter-based terrain alerts and low-visibility approach and landing operations. Systems of concern include Terrain Awareness Warning Systems (TAWS), Enhanced Ground Proximity Warning Systems (EGPWS), and Traffic Collision Avoidance Systems (TCAS), to name a few. Pilots of radio altimeter equipped aircraft should become familiar with the radio altimeter's interdependence with the other aircraft systems and expected failure modes and indications that may be associated with harmful interference.
- b. **Actions.** Recognizing interference/anomalies in the radio altimeter can be difficult, as it may present as inoperative or erroneous data. Pilots need to monitor their automation, as well as their radio altimeters for discrepancies, and be prepared to take action. Pilots encountering radio altimeter interference/anomalies should transition to procedures that do not require the radio altimeter, and inform Air Traffic Control (ATC).
- c. **Inflight Reporting.** Pilots should report any radio altimeter anomaly to ATC as soon as practical.
- d. **Post Flight Reporting.**
 1. Pilots are encouraged to submit detailed reports of radio altimeter interference/anomalies post flight as soon as practical, by internet via the Radio Altimeter Anomaly Reporting Form at https://www.faa.gov/air_traffic/nas/RADALT_reports/.
 2. The post flight pilot reports of radio altimeter anomalies should contain as much of the following information as applicable:
 - (a) Date and time the anomaly was observed;
 - (b) Location of the aircraft at the time the anomaly started and ended (e.g., latitude, longitude or bearing/distance from a reference point or navigational aid);
 - (c) Magnetic heading;
 - (d) Altitude (MSL/AGL);
 - (e) Aircraft Type (make/model);
 - (f) Flight Number or Aircraft Registration Number;
 - (g) Meteorological conditions;
 - (h) Type of radio altimeter in use (e.g., make/model/software series or version), if known;
 - (i) Event overview;

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

- (j) Consequences/operational impact (e.g., impacted equipment, actions taken to mitigate the disruption and/or remedy provided by ATC, required post flight pilot and maintenance actions).

7-6-3 VFR IN CONGESTED AREAS

A high percentage of near midair collisions occur below 8,000 feet AGL and within 30 miles of an airport. When operating VFR in these highly congested areas, whether you intend to land at an airport within the area or are just flying through, it is recommended that extra vigilance be maintained and that you monitor an appropriate control frequency. Normally the appropriate frequency is an approach control frequency. By such monitoring action you can “get the picture” of the traffic in your area. When the approach controller has radar, radar traffic advisories may be given to VFR pilots upon request.

REFERENCE—*AIM, Paragraph 4-1-15, Radar Traffic Information Service.*

7-6-4 OBSTRUCTIONS TO FLIGHT

- a. **General.** Many structures exist that could significantly affect the safety of your flight when operating below 500 feet AGL, and particularly below 200 feet AGL. While 14 CFR Part 91.119 allows flight below 500 AGL when over sparsely populated areas or open water, such operations are very dangerous. At and below 200 feet AGL there are numerous power lines, antenna towers, etc., that are not marked and lighted as obstructions and; therefore, may not be seen in time to avoid a collision. Notices to Air Missions (NOTAMS) are issued on those lighted structures experiencing temporary light outages. However, some time may pass before the FAA is notified of these outages, and the NOTAM issued, thus pilot vigilance is imperative.
- b. **Antenna Towers.** Extreme caution should be exercised when flying less than 2,000 feet AGL because of numerous skeletal structures, such as radio and television antenna towers, that exceed 1,000 feet AGL with some extending higher than 2,000 feet AGL. Most skeletal structures are supported by guy wires which are very difficult to see in good weather and can be invisible at dusk or during periods of reduced visibility. These wires can extend about 1,500 feet horizontally from a structure; therefore, all skeletal structures should be avoided horizontally by at least 2,000 feet. Additionally, new towers may not be on your current chart because the information was not received prior to the printing of the chart.
- c. **Overhead Wires.** Overhead transmission and utility lines often span approaches to runways, natural flyways such as lakes, rivers, gorges, and canyons, and cross other landmarks pilots frequently follow such as highways, railroad tracks, etc. As with antenna towers, these high voltage/power lines or the supporting structures of these lines may not always be readily visible and the wires may be virtually impossible to see under certain conditions. In some locations, the supporting structures of overhead transmission lines are equipped with unique sequence flashing white strobe light systems to indicate that there are wires between the structures. However, many power lines do not require notice to the FAA and, therefore, are not marked and/or lighted. Many of those that do require notice do not exceed 200 feet AGL or meet the Obstruction Standard of 14 CFR Part 77 and, therefore, are not marked and/or

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

lighted. All pilots are cautioned to remain extremely vigilant for these power lines or their supporting structures when following natural flyways or during the approach and landing phase. This is particularly important for seaplane and/or float equipped aircraft when landing on, or departing from, unfamiliar lakes or rivers.

- d. **Other Objects/Structures.** There are other objects or structures that could adversely affect your flight such as construction cranes near an airport, newly constructed buildings, new towers, etc. Many of these structures do not meet charting requirements or may not yet be charted because of the charting cycle. Some structures do not require obstruction marking and/or lighting and some may not be marked and lighted even though the FAA recommended it.

7-6-5 AVOID FLIGHT BENEATH UNMANNED BALLOONS

- a. The majority of unmanned free balloons currently being operated have, extending below them, either a suspension device to which the payload or instrument package is attached, or a trailing wire antenna, or both. In many instances these balloon subsystems may be invisible to the pilot until the aircraft is close to the balloon, thereby creating a potentially dangerous situation. Therefore, good judgment on the part of the pilot dictates that aircraft should remain well clear of all unmanned free balloons and flight below them should be avoided at all times.
- b. Pilots are urged to report any unmanned free balloons sighted to the nearest FAA ground facility with which communication is established. Such information will assist FAA ATC facilities to identify and flight follow unmanned free balloons operating in the airspace.

7-6-6 UNMANNED AIRCRAFT SYSTEMS

- a. Unmanned Aircraft Systems (UAS), formerly referred to as “Unmanned Aerial Vehicles” (UAVs) or “drones,” are having an increasing operational presence in the NAS. Once the exclusive domain of the military, UAS are now being operated by various entities. Although these aircraft are “unmanned,” UAS are flown by a remotely located pilot and crew. Physical and performance characteristics of unmanned aircraft (UA) vary greatly and unlike model aircraft that typically operate lower than 400 feet AGL, UA may be found operating at virtually any altitude and any speed. Sizes of UA can be as small as several pounds to as large as a commercial transport aircraft. UAS come in various categories including airplane, rotorcraft, powered-lift (tilt- rotor), and lighter-than-air. Propulsion systems of UAS include a broad range of alternatives from piston powered and turbojet engines to battery and solar-powered electric motors.
- b. To ensure segregation of UAS operations from other aircraft, the military typically conducts UAS operations within restricted or other special use airspace. However, UAS operations are now being approved in the NAS outside of special use airspace through the use of FAA-issued Certificates of Waiver or Authorization (COA) or through the issuance of a special airworthiness certificate. COA and special airworthiness approvals authorize UAS flight operations to be contained within specific geographic boundaries and altitudes, usually require coordination with an ATC facility, and typically require the issuance of a NOTAM describing

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

the operation to be conducted. UAS approvals also require observers to provide “see-and-avoid” capability to the UAS crew and to provide the necessary compliance with 14 CFR Section 91.113. For UAS operations approved at or above FL180, UAS operate under the same requirements as that of manned aircraft (i.e., flights are operated under instrument flight rules, are in communication with ATC, and are appropriately equipped).

- c. UAS operations may be approved at either controlled or uncontrolled airports and are typically disseminated by NOTAM. In all cases, approved UAS operations must comply with all applicable regulations and/or special provisions specified in the COA or in the operating limitations of the special airworthiness certificate. At uncontrolled airports, UAS operations are advised to operate well clear of all known manned aircraft operations. Pilots of manned aircraft are advised to follow normal operating procedures and are urged to monitor the CTAF for any potential UAS activity. At controlled airports, local ATC procedures may be in place to handle UAS operations and should not require any special procedures from manned aircraft entering or departing the traffic pattern or operating in the vicinity of the airport.
- d. In addition to approved UAS operations described above, a recently approved agreement between the FAA and the Department of Defense authorizes small UAS operations wholly contained within Class G airspace, and in no instance, greater than 1200 feet AGL over military owned or leased property. These operations do not require any special authorization as long as the UA remains within the lateral boundaries of the military installation as well as other provisions including the issuance of a NOTAM. Unlike special use airspace, these areas may not be depicted on an aeronautical chart.
- e. There are several factors a pilot should consider regarding UAS activity in an effort to reduce potential flight hazards. Pilots are urged to exercise increased vigilance when operating in the vicinity of restricted or other special use airspace, military operations areas, and any military installation. Areas with a preponderance of UAS activity are typically noted on sectional charts advising pilots of this activity. Since the size of a UA can be very small, they may be difficult to see and track. If a UA is encountered during flight, as with manned aircraft, never assume that the pilot or crew of the UAS can see you, maintain increased vigilance with the UA and always be prepared for evasive action if necessary. Always check NOTAMs for potential UAS activity along the intended route of flight and exercise increased vigilance in areas specified in the NOTAM.

7-6-7 MOUNTAIN FLYING

- a. Your first experience of flying over mountainous terrain (particularly if most of your flight time has been over the flatlands of the midwest) could be a *never-to-be-forgotten nightmare* if proper planning is not done and if you are not aware of the potential hazards awaiting. Those familiar section lines are not present in the mountains; those flat, level fields for forced landings are practically nonexistent; abrupt changes in wind direction and velocity occur; severe updrafts and downdrafts are common, particularly near or above abrupt changes of terrain such as cliffs or rugged areas; even the clouds look different and can build up with startling rapidity. Mountain flying need not be hazardous if you follow the recommendations below.

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

- b. **File a Flight Plan.** Plan your route to avoid topography which would prevent a safe forced landing. The route should be over populated areas and well known mountain passes. Sufficient altitude should be maintained to permit gliding to a safe landing in the event of engine failure.
- c. Don't fly a light aircraft when the winds aloft, at your proposed altitude, exceed 35 miles per hour. Expect the winds to be of much greater velocity over mountain passes than reported a few miles from them. Approach mountain passes with as much altitude as possible. Down-drafts of from 1,500 to 2,000 feet per minute are not uncommon on the leeward side.
- d. Don't fly near or above abrupt changes in terrain. Severe turbulence can be expected, especially in high wind conditions.
- e. **Understand Mountain Obscuration.** The term Mountain Obscuration (MTOS) is used to describe a visibility condition that is distinguished from IFR because ceilings, by definition, are described as "above ground level" (AGL). In mountainous terrain clouds can form at altitudes significantly higher than the weather reporting station and at the same time nearby mountaintops may be obscured by low visibility. In these areas the ground level can also vary greatly over a small area. Beware if operating VFR-on-top. You could be operating closer to the terrain than you think because the tops of mountains are hidden in a cloud deck below. MTOS areas are identified daily on The Aviation Weather Center located at: <http://www.aviationweather.gov>.
- f. Navigating in confined terrain when flying through mountain passes can be challenging. For high-traffic mountain passes, VFR checkpoints may be provided on VFR navigation charts to increase situational awareness by indicating key landmarks inside confined terrain. A collocated VFR waypoint and checkpoint may be provided to assist with identifying natural entry points for commonly flown mountain passes. Pilots should reference the name of the charted VFR checkpoint, wherever possible, when making position reports on CTAF frequencies to reduce the risk of midair collisions. Pilots should evaluate the terrain along the route they intend to fly with respect to their aircraft type and performance capabilities, local weather, and their experience level to avoid flying into confined areas without adequate room to execute a 180 degree turn, should conditions require. Always fly with a planned escape route in mind.

REFERENCE—*AIM, Para 1-1-17, Global Positioning System (GPS).*

- g. VFR flight operations may be conducted at night in mountainous terrain with the application of sound judgment and common sense. Proper pre-flight planning, giving ample consideration to winds and weather, knowledge of the terrain and pilot experience in mountain flying are prerequisites for safety of flight. Continuous visual contact with the surface and obstructions is a major concern and flight operations under an overcast or in the vicinity of clouds should be approached with extreme caution.
- h. When landing at a high altitude field, the same indicated airspeed should be used as at low elevation fields. *Remember:* that due to the less dense air at altitude, this same indicated airspeed actually results in higher true airspeed, a faster landing speed, and more important, a longer landing distance. During gusty wind conditions which often prevail at high alti-

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

tude fields, a power approach and power landing is recommended. Additionally, due to the faster groundspeed, your takeoff distance will increase considerably over that required at low altitudes.

- i. **Effects of Density Altitude.** Performance figures in the aircraft owner's handbook for length of takeoff run, horsepower, rate of climb, etc., are generally based on standard atmosphere conditions (59 degrees Fahrenheit (15 degrees Celsius), pressure 29.92 inches of mercury) at sea level. However, inexperienced pilots, as well as experienced pilots, may run into trouble when they encounter an altogether different set of conditions. This is particularly true in hot weather and at higher elevations. Aircraft operations at altitudes above sea level and at higher than standard temperatures are commonplace in mountainous areas. Such operations quite often result in a drastic reduction of aircraft performance capabilities because of the changing air density. Density altitude is a measure of air density. It is not to be confused with pressure altitude, true altitude or absolute altitude. It is not to be used as a height reference, but as a determining criteria in the performance capability of an aircraft. Air density decreases with altitude. As air density decreases, density altitude increases. The further effects of high temperature and high humidity are cumulative, resulting in an increasing high density altitude condition. High density altitude reduces all aircraft performance parameters. To the pilot, this means that the normal horsepower output is reduced, propeller efficiency is reduced and a higher true airspeed is required to sustain the aircraft throughout its operating parameters. It means an increase in runway length requirements for takeoff and landings, and decreased rate of climb. An average small airplane, for example, requiring 1,000 feet for takeoff at sea level under standard atmospheric conditions will require a takeoff run of approximately 2,000 feet at an operational altitude of 5,000 feet.

NOTE: *A turbo-charged aircraft engine provides a slight advantage in that it provides sea level horsepower up to a specified altitude above sea level.*

1. **Density Altitude Advisories.** At airports with elevations of 2,000 feet and higher, control towers and FSSs will broadcast the advisory "Check Density Altitude" when the temperature reaches a predetermined level. These advisories will be broadcast on appropriate tower frequencies or, where available, ATIS. FSSs will broadcast these advisories as a part of Local Airport Advisory.
2. These advisories are provided by air traffic facilities, as a reminder to pilots that high temperatures and high field elevations will cause significant changes in aircraft characteristics. The pilot retains the responsibility to compute density altitude, when appropriate, as a part of preflight duties.

NOTE: *All FSSs will compute the current density altitude upon request.*

- j. **Mountain Wave.** Many pilots go all their lives without understanding what a mountain wave is. Quite a few have lost their lives because of this lack of understanding. One need not be a licensed meteorologist to understand the mountain wave phenomenon.
 1. Mountain waves occur when air is being blown over a mountain range or even the ridge of a sharp bluff area. As the air hits the upwind side of the range, it starts to climb, thus creating what is generally a smooth updraft which turns into a turbulent

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

downdraft as the air passes the crest of the ridge. From this point, for many miles downwind, there will be a series of downdrafts and updrafts. Satellite photos of the Rockies have shown mountain waves extending as far as 700 miles downwind of the range. Along the east coast area, such photos of the Appalachian chain have picked up the mountain wave phenomenon over a hundred miles eastward. All it takes to form a mountain wave is wind blowing across the range at 15 knots or better at an intersection angle of not less than 30 degrees.

2. Pilots from flatland areas should understand a few things about mountain waves in order to stay out of trouble. When approaching a mountain range from the upwind side (generally the west), there will usually be a smooth updraft; therefore, it is not quite as dangerous an area as the lee of the range. From the leeward side, it is always a good idea to add an extra thousand feet or so of altitude because downdrafts can exceed the climb capability of the aircraft. Never expect an updraft when approaching a mountain chain from the leeward. Always be prepared to cope with a downdraft and turbulence.
3. When approaching a mountain ridge from the downwind side, it is recommended that the ridge be approached at approximately a 45 degree angle to the horizontal direction of the ridge. This permits a safer retreat from the ridge with less stress on the aircraft should severe turbulence and downdraft be experienced. If severe turbulence is encountered, simultaneously reduce power and adjust pitch until aircraft approaches maneuvering speed, then adjust power and trim to maintain maneuvering speed and fly away from the turbulent area.

7-6-8 USE OF RUNWAY HALF-WAY SIGNS AT UNIMPROVED AIRPORTS

When installed, runway half-way signs provide the pilot with a reference point to judge takeoff acceleration trends. Assuming that the runway length is appropriate for takeoff (considering runway condition and slope, elevation, aircraft weight, wind, and temperature), typical takeoff acceleration should allow the airplane to reach 70 percent of lift-off airspeed by the midpoint of the runway. The “rule of thumb” is that should airplane acceleration not allow the airspeed to reach this value by the midpoint, the takeoff should be aborted, as it may not be possible to liftoff in the remaining runway.

Several points are important when considering using this “rule of thumb”:

- a. Airspeed indicators in small airplanes are not required to be evaluated at speeds below stall-in, and may not be usable at 70 percent of liftoff airspeed.
- b. This “rule of thumb” is based on a uniform surface condition. Puddles, soft spots, areas of tall and/or wet grass, loose gravel, etc., may impede acceleration or even cause deceleration. Even if the airplane achieves 70 percent of liftoff airspeed by the midpoint, the condition of the remainder of the runway may not allow further acceleration. The entire length of the runway should be inspected prior to takeoff to ensure a usable surface.
- c. This “rule of thumb” applies only to runway required for actual liftoff. In the event that obstacles affect the takeoff climb path, appropriate distance must be available after liftoff to accelerate to best angle of climb speed and to clear the obstacles. This will, in effect, require the

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

airplane to accelerate to a higher speed by midpoint, particularly if the obstacles are close to the end of the runway. In addition, this technique does not take into account the effects of upslope or tailwinds on takeoff performance. These factors will also require greater acceleration than normal and, under some circumstances, prevent takeoff entirely.

- d. Use of this “rule of thumb” does not alleviate the pilot's responsibility to comply with applicable Federal Aviation Regulations, the limitations and performance data provided in the FAA approved Airplane Flight Manual (AFM), or, in the absence of an FAA approved AFM, other data provided by the aircraft manufacturer.

In addition to their use during takeoff, runway half-way signs offer the pilot increased awareness of his or her position along the runway during landing operations.

NOTE: No FAA standard exists for the appearance of the runway half-way sign. FIG 7-6-1 shows a graphical depiction of a typical runway half-way sign.

FIGURE 7-6-1

Typical Runway Half-way Sign

7-6-9 SEAPLANE SAFETY

- a. Acquiring a seaplane class rating affords access to many areas not available to landplane pilots. Adding a seaplane class rating to your pilot certificate can be relatively uncomplicated and inexpensive. However, more effort is required to become a safe, efficient, competent “bush” pilot. The natural hazards of the backwoods have given way to modern man-made hazards. Except for the far north, the available bodies of water are no longer the exclusive domain of the airman. Seaplane pilots must be vigilant for hazards such as electric power lines, power, sail and rowboats, rafts, mooring lines, water skiers, swimmers, etc.

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

- b. Seaplane pilots must have a thorough understanding of the right-of-way rules as they apply to aircraft versus other vessels. Seaplane pilots are expected to know and adhere to both the U.S. Coast Guard's (USCG) Navigation Rules, International-Inland, and 14 CFR Section 91.115, Right-of-Way Rules; Water Operations. The navigation rules of the road are a set of collision avoidance rules as they apply to aircraft on the water. A seaplane is considered a vessel when on the water for the purposes of these collision avoidance rules. In general, a seaplane on the water must keep well clear of all vessels and avoid impeding their navigation. The CFR requires, in part, that aircraft operating on the water “. . . shall, insofar as possible, keep clear of all vessels and avoid impeding their navigation, and shall give way to any vessel or other aircraft that is given the right-of-way” This means that a seaplane should avoid boats and commercial shipping when on the water. If on a collision course, the seaplane should slow, stop, or maneuver to the right, away from the bow of the oncoming vessel. Also, while on the surface with an engine running, an aircraft must give way to all nonpowered vessels. Since a seaplane in the water may not be as maneuverable as one in the air, the aircraft on the water has right-of-way over one in the air, and one taking off has right-of-way over one landing. A seaplane is exempt from the USCG safety equipment requirements, including the requirements for Personal Flotation Devices (PFD). Requiring seaplanes on the water to comply with USCG equipment requirements in addition to the FAA equipment requirements would be an unnecessary burden on seaplane owners and operators.
- c. Unless they are under Federal jurisdiction, navigable bodies of water are under the jurisdiction of the state, or in a few cases, privately owned. Unless they are specifically restricted, aircraft have as much right to operate on these bodies of water as other vessels. To avoid problems, check with Federal or local officials in advance of operating on unfamiliar waters. In addition to the agencies listed in TBL 7-6-1, the nearest Flight Standards District Office can usually offer some practical suggestions as well as regulatory information. If you land on a restricted body of water because of an inflight emergency, or in ignorance of the restrictions you have violated, report as quickly as practical to the nearest local official having jurisdiction and explain your situation.
- d. When operating a seaplane over or into remote areas, appropriate attention should be given to survival gear. Minimum kits are recommended for summer and winter, and are required by law for flight into sparsely settled areas of Canada and Alaska. Alaska State Department of Transportation and Canadian Ministry of Transport officials can provide specific information on survival gear requirements. [Also see the Jeppesen Airway Manual coverages for Alaska and Canada.] The kit should be assembled in one container and be easily reachable and preferably floatable.
- e. The FAA recommends that each seaplane owner or operator provide flotation gear for occupants any time a seaplane operates on or near water. 14 CFR Section 91.205(b)(12) requires approved flotation gear for aircraft operated for hire over water and beyond power-off gliding distance from shore. FAA-approved gear differs from that required for navigable waterways under USCG rules. FAA-approved life vests are inflatable designs as compared to the USCG's noninflatable PFDs that may consist of solid, bulky material. Such USCG PFDs are impractical for seaplanes and other aircraft because they may block passage

US 7-6
SECTION 6. POTENTIAL FLIGHT HAZARDS

through the relatively narrow exits available to pilots and passengers. Life vests approved under Technical Standard Order (TSO) TSO-C13E contain fully inflatable compartments. The wearer inflates the compartments (AFTER exiting the aircraft) primarily by independent CO2 cartridges, with an oral inflation tube as a backup. The flotation gear also contains a water-activated, self-illuminating signal light. The fact that pilots and passengers can easily don and wear inflatable life vests (when not inflated) provides maximum effectiveness and allows for unrestricted movement. It is imperative that passengers are briefed on the location and proper use of available PFDs prior to leaving the dock.

TABLE 7-6-1 Jurisdictions Controlling Navigable Bodies of Water

Authority to Consult For Use of a Body of Water		
Location	Authority	Contact
Wilderness Area	U.S. Department of Agriculture, Forest Service	Local forest ranger
National Forest	USDA Forest Service	Local forest ranger
National Park	U.S. Department of the Interior, National Park Service	Local park ranger
Indian Reservation	USDI, Bureau of Indian Affairs	Local Bureau office
State Park	State government or state forestry or park service	Local state aviation office for further information
Canadian National and Provincial Parks	Supervised and restricted on an individual basis from province to province and by different departments of the Canadian government; consult Canadian Flight Information Manual and/or Water Aerodrome Supplement	Park Superintendent in an emergency

- f. The FAA recommends that seaplane owners and operators obtain Advisory Circular (AC) 91-69, Seaplane Safety for 14 CFR Part 91 Operations, free from the

U.S. Department of Transportation

Subsequent Distribution Office

Address: SVC-121.23, Ardmore East Business Center, 3341 Q 75th Avenue

SECTION 6. POTENTIAL FLIGHT HAZARDS

The USCG Navigation Rules International-Inland (COMDTINST 16672.2B) is available for a fee from the Government Publishing Office by facsimile request to (202) 512-2250, and can be ordered using Mastercard or Visa.

7-6-10 FLIGHT OPERATIONS IN VOLCANIC ASH

- a. Severe volcanic eruptions which send ash and sulphur dioxide (SO₂) gas into the upper atmosphere occur somewhere around the world several times each year. Flying into a volcanic ash cloud can be exceedingly dangerous. A B747-200 lost all four engines after such an encounter and a B747-400 had the same nearly catastrophic experience.

Piston-powered aircraft are less likely to lose power but severe damage is almost certain to ensue after an encounter with a volcanic ash cloud which is only a few hours old.

- b. Most important is to avoid any encounter with volcanic ash. The ash plume may not be visible, especially in instrument conditions or at night; and even if visible, it is difficult to distinguish visually between an ash cloud and an ordinary weather cloud. Volcanic ash clouds are not displayed on airborne or ATC radar. The pilot must rely on reports from air traffic controllers and other pilots to determine the location of the ash cloud and use that information to remain well clear of the area. Additionally, the presence of a sulphur-like odor throughout the cabin may indicate the presence of SO₂ emitted by volcanic activity, but may or may not indicate the presence of volcanic ash. Every attempt should be made to remain on the upwind side of the volcano.
- c. It is recommended that pilots encountering an ash cloud should immediately reduce thrust to idle (altitude permitting), and reverse course in order to escape from the cloud. Ash clouds may extend for hundreds of miles and pilots should not attempt to fly through or climb out of the cloud. In addition, the following procedures are recommended:
1. Disengage the autothrottle if engaged. This will prevent the autothrottle from increasing engine thrust;
 2. Turn on continuous ignition;
 3. Turn on all accessory airbleeds including all air conditioning packs, nacelles, and wing anti-ice. This will provide an additional engine stall margin by reducing engine pressure.
- d. The following has been reported by flightcrews who have experienced encounters with volcanic dust clouds:
1. Smoke or dust appearing in the cockpit.
 2. An acrid odor similar to electrical smoke.
 3. Multiple engine malfunctions, such as compressor stalls, increasing EGT, torching from tailpipe, and flameouts.
 4. At night, St. Elmo's fire or other static discharges accompanied by a bright orange glow in the engine inlets.
 5. A fire warning in the forward cargo area.

US 7-6
SECTION 6. POTENTIAL FLIGHT HAZARDS

- e. It may become necessary to shut down and then restart engines to prevent exceeding EGT limits. Volcanic ash may block the pitot system and result in unreliable airspeed indications.
- f. If you see a volcanic eruption and have not been previously notified of it, you may have been the first person to observe it. In this case, immediately contact ATC and alert them to the existence of the eruption. If possible, use the Volcanic Activity Reporting form (VAR) depicted in Appendix 2 of this manual. Items 1 through 8 of the VAR should be transmitted immediately. The information requested in items 9 through 16 should be passed after landing. If a VAR form is not immediately available, relay enough information to identify the position and nature of the volcanic activity. Do not become unnecessarily alarmed if there is merely steam or very low-level eruptions of ash.
- g. When landing at airports where volcanic ash has been deposited on the runway, be aware that even a thin layer of dry ash can be detrimental to braking action. Wet ash on the runway may also reduce effectiveness of braking. It is recommended that reverse thrust be limited to minimum practical to reduce the possibility of reduced visibility and engine ingestion of airborne ash.
- h. When departing from airports where volcanic ash has been deposited, it is recommended that pilots avoid operating in visible airborne ash. Allow ash to settle before initiating takeoff roll. It is also recommended that flap extension be delayed until initiating the before takeoff checklist and that a rolling takeoff be executed to avoid blowing ash back into the air.

7-6-11 EMERGENCY AIRBORNE INSPECTION OF OTHER AIRCRAFT

- a. Providing airborne assistance to another aircraft may involve flying in very close proximity to that aircraft. Most pilots receive little, if any, formal training or instruction in this type of flying activity. Close proximity flying without sufficient time to plan (i.e., in an emergency situation), coupled with the stress involved in a perceived emergency can be hazardous.
- b. The pilot in the best position to assess the situation should take the responsibility of coordinating the airborne intercept and inspection, and take into account the unique flight characteristics and differences of the category(s) of aircraft involved.
- c. Some of the safety considerations are:
 - 1. Area, direction and speed of the intercept;
 - 2. Aerodynamic effects (i.e., rotorcraft downwash);
 - 3. Minimum safe separation distances;
 - 4. Communications requirements, lost communications procedures, coordination with ATC;
 - 5. Suitability of diverting the distressed aircraft to the nearest safe airport; and
 - 6. Emergency actions to terminate the intercept.
- d. Close proximity, inflight inspection of another aircraft is uniquely hazardous. The pilot-in-command of the aircraft experiencing the problem/emergency must not relinquish control of

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

the situation and/or jeopardize the safety of their aircraft. The maneuver must be accomplished with minimum risk to both aircraft.

7-6-12 PRECIPITATION STATIC

- a. Precipitation static is caused by aircraft in flight coming in contact with uncharged particles. These particles can be rain, snow, fog, sleet, hail, volcanic ash, dust; any solid or liquid particles. When the aircraft strikes these neutral particles the positive element of the particle is reflected away from the aircraft and the negative particle adheres to the skin of the aircraft. In a very short period of time a substantial negative charge will develop on the skin of the aircraft. If the aircraft is not equipped with static dischargers, or has an ineffective static discharger system, when a sufficient negative voltage level is reached, the aircraft may go into "CORONA." That is, it will discharge the static electricity from the extremities of the aircraft, such as the wing tips, horizontal stabilizer, vertical stabilizer, antenna, propeller tips, etc. This discharge of static electricity is what you will hear in your headphones and is what we call P-static.
- b. A review of pilot reports often shows different symptoms with each problem that is encountered. The following list of problems is a summary of many pilot reports from many different aircraft. Each problem was caused by P-static:
 1. Complete loss of VHF communications.
 2. Erroneous magnetic compass readings (30 percent in error).
 3. High pitched squeal on audio.
 4. Motor boat sound on audio.
 5. Loss of all avionics in clouds.
 6. VLF navigation system inoperative most of the time.
 7. Erratic instrument readouts.
 8. Weak transmissions and poor receptivity of radios.
 9. "St. Elmo's Fire" on windshield.
- c. Each of these symptoms is caused by one general problem on the airframe. This problem is the inability of the accumulated charge to flow easily to the wing tips and tail of the airframe, and properly discharge to the airstream.
- d. Static dischargers work on the principal of creating a relatively easy path for discharging negative charges that develop on the aircraft by using a discharger with fine metal points, carbon coated rods, or carbon wicks rather than wait until a large charge is developed and discharged off the trailing edges of the aircraft that will interfere with avionics equipment. This process offers approximately 50 decibels (dB) static noise reduction which is adequate in most cases to be below the threshold of noise that would cause interference in avionics equipment.

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

- e. It is important to remember that precipitation static problems can only be corrected with the proper number of quality static dischargers, properly installed on a properly bonded aircraft. P-static is indeed a problem in the all weather operation of the aircraft, but there are effective ways to combat it. All possible methods of reducing the effects of P-static should be considered so as to provide the best possible performance in the flight environment.
- f. A wide variety of discharger designs is available on the commercial market. The inclusion of well-designed dischargers may be expected to improve airframe noise in P-static conditions by as much as 50 dB. Essentially, the discharger provides a path by which accumulated charge may leave the airframe quietly. This is generally accomplished by providing a group of tiny corona points to permit onset of corona-current flow at a low aircraft potential. Additionally, aerodynamic design of dischargers to permit corona to occur at the lowest possible atmospheric pressure also lowers the corona threshold. In addition to permitting a low-potential discharge, the discharger will minimize the radiation of radio frequency (RF) energy which accompanies the corona discharge, in order to minimize effects of RF components at communications and navigation frequencies on avionics performance. These effects are reduced through resistive attachment of the corona point(s) to the airframe, preserving direct current connection but attenuating the higher-frequency components of the discharge.
- g. Each manufacturer of static dischargers offers information concerning appropriate discharger location on specific airframes. Such locations emphasize the trailing outboard surfaces of wings and horizontal tail surfaces, plus the tip of the vertical stabilizer, where charge tends to accumulate on the airframe. Sufficient dischargers must be provided to allow for current-carrying capacity which will maintain airframe potential below the corona threshold of the trailing edges.
- h. In order to achieve full performance of avionic equipment, the static discharge system will require periodic maintenance. A pilot knowledgeable of P-static causes and effects is an important element in assuring optimum performance by early recognition of these types of problems.

7-6-13 LIGHT AMPLIFICATION BY STIMULATED EMISSION OF RADIATION (LASER) OPERATIONS AND REPORTING ILLUMINATION OF AIRCRAFT

- a. Lasers have many applications. Of concern to users of the National Airspace System are those laser events that may affect pilots, e.g., outdoor laser light shows or demonstrations for entertainment and advertisements at special events and theme parks. Generally, the beams from these events appear as bright blue-green in color; however, they may be red, yellow, or white. However, some laser systems produce light which is invisible to the human eye.
- b. FAA regulations prohibit the disruption of aviation activity by any person on the ground or in the air. The FAA and the Food and Drug Administration (the Federal agency that has the responsibility to enforce compliance with Federal requirements for laser systems and laser light show products) are working together to ensure that operators of these devices do not pose a hazard to aircraft operators.

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

- c. Pilots should be aware that illumination from these laser operations are able to create temporary vision impairment miles from the actual location. In addition, these operations can produce permanent eye damage. Pilots should make themselves aware of where these activities are being conducted and avoid these areas if possible.
- d. Recent and increasing incidents of unauthorized illuminations of aircraft by lasers, as well as the proliferation and increasing sophistication of laser devices available to the general public, dictates that the FAA, in coordination with other government agencies, take action to safeguard flights from these unauthorized illuminations.
- e. Pilots should report laser illumination activity to the controlling Air Traffic Control facilities, Federal Contract Towers or Flight Service Stations as soon as possible after the event. The following information should be included:
 - 1. UTC Date and Time of Event.
 - 2. Call Sign or Aircraft Registration Number.
 - 3. Type Aircraft.
 - 4. Nearest Major City.
 - 5. Altitude.
 - 6. Location of Event (Latitude/Longitude and/or Fixed Radial Distance (FRD)).
 - 7. Brief Description of the Event and any other Pertinent Information.
- f. Pilots are also encouraged to complete the Laser Beam Exposure Questionnaire located on the FAA Laser Safety Initiative website at <http://www.faa.gov/about/initiatives/lasers/> and submit electronically per the directions on the questionnaire, as soon as possible after landing.
- g. When a laser event is reported to an air traffic facility, a general caution warning will be broadcasted on all appropriate frequencies every five minutes for 20 minutes and broadcasted on the ATIS for one hour following the report.

PHRASEOLOGY:

UNAUTHORIZED LASER ILLUMINATION EVENT, (UTC time), (location), (altitude), (color), (direction).

EXAMPLE: "Unauthorized laser illumination event, at 0100z, 8 mile final runway 18R at 3,000 feet, green laser from the southwest."

REFERENCE—

FAA Order JO 7110.65, Paragraph 10-2-14, Unauthorized Laser Illumination of Aircraft.

FAA Order JO 7210.3, Paragraph 2-1-27, Reporting Laser Illumination of Aircraft.

- h. When these activities become known to the FAA, Notices to Air Missions (NOTAMs) are issued to inform the aviation community of the events. Pilots should consult NOTAMs or the Special Notices section of the Chart Supplement U.S. for information regarding these activities.

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

7-6-14 FLYING IN FLAT LIGHT, BROWN OUT CONDITIONS, AND WHITE OUT CONDITIONS

- a. **Flat Light.** Flat light is an optical illusion, also known as “**sector or partial white out.**” It is not as severe as “white out” but the condition causes pilots to lose their depth-of-field and contrast in vision. Flat light conditions are usually accompanied by overcast skies inhibiting any visual clues. Such conditions can occur anywhere in the world, primarily in snow covered areas but can occur in dust, sand, mud flats, or on glassy water. Flat light can completely obscure features of the terrain, creating an inability to distinguish distances and closure rates. As a result of this reflected light, it can give pilots the illusion that they are ascending or descending when they may actually be flying level. However, with good judgment and proper training and planning, it is possible to safely operate an aircraft in flat light conditions.
- b. **Brown Out.** A brownout (or *brown-out*) is an in-flight visibility restriction due to dust or sand in the air. In a brownout, the pilot cannot see nearby objects which provide the outside visual references necessary to control the aircraft near the ground. This can cause spatial disorientation and loss of situational awareness leading to an accident.
1. The following factors will affect the probability and severity of brownout: rotor disk loading, rotor configuration, soil composition, wind, approach speed, and approach angle.
 2. The brownout phenomenon causes accidents during helicopter landing and take-off operations in dust, fine dirt, sand, or arid desert terrain. Intense, blinding dust clouds stirred up by the helicopter rotor downwash during near-ground flight causes significant flight safety risks from aircraft and ground obstacle collisions, and dynamic rollover due to sloped and uneven terrain.
 3. This is a dangerous phenomenon experienced by many helicopters when making landing approaches in dusty environments, whereby sand or dust particles become swept up in the rotor outwash and obscure the pilot’s vision of the terrain. This is particularly dangerous because the pilot needs those visual cues from their surroundings in order to make a safe landing.
 4. Blowing sand and dust can cause an illusion of a tilted horizon. A pilot not using the flight instruments for reference may instinctively try to level the aircraft with respect to the false horizon, resulting in an accident. Helicopter rotor wash also causes sand to blow around outside the cockpit windows, possibly leading the pilot to experience an illusion where the helicopter appears to be turning when it is actually in a level hover. This can also cause the pilot to make incorrect control inputs which can quickly lead to disaster when hovering near the ground. In night landings, aircraft lighting can enhance the visual illusions by illuminating the brownout cloud.
- c. **White Out.** As defined in meteorological terms, white out occurs when a person becomes engulfed in a uniformly white glow. The glow is a result of being surrounded by blowing snow, dust, sand, mud or water. There are no shadows, no horizon or clouds and all depth-of-field and orientation are lost. A white out situation is severe in that there are no visual references. Flying is not recommended in any white out situation. Flat light conditions can lead

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

to a white out environment quite rapidly, and both atmospheric conditions are insidious; they sneak up on you as your visual references slowly begin to disappear. White out has been the cause of several aviation accidents.

- d. **Self Induced White Out.** This effect typically occurs when a helicopter takes off or lands on a snow-covered area. The rotor down wash picks up particles and re-circulates them through the rotor down wash. The effect can vary in intensity depending upon the amount of light on the surface. This can happen on the sunniest, brightest day with good contrast everywhere. However, when it happens, there can be a complete loss of visual clues. If the pilot has not prepared for this immediate loss of visibility, the results can be disastrous. Good planning does not prevent one from encountering flat light or white out conditions.
- e. **Never take off in a white out situation.**
1. Realize that in flat light conditions it may be possible to depart but not to return to that site. During takeoff, make sure you have a reference point. Do not lose sight of it until you have a departure reference point in view. Be prepared to return to the takeoff reference if the departure reference does not come into view.
 2. Flat light is common to snow skiers. One way to compensate for the lack of visual contrast and depth-of-field loss is by wearing amber tinted lenses (also known as blue blockers). Special note of caution: Eyewear is not ideal for every pilot. Take into consideration personal factors — age, light sensitivity, and ambient lighting conditions.
 3. So what should a pilot do when all visual references are lost?
 - (a) Trust the cockpit instruments.
 - (b) Execute a 180 degree turnaround and start looking for outside references.
 - (c) Above all — fly the aircraft.
- f. **Landing in Low Light Conditions.** When landing in a low light condition - use extreme caution. Look for intermediate reference points, in addition to checkpoints along each leg of the route for course confirmation and timing. The lower the ambient light becomes, the more reference points a pilot should use.
- g. **Airport Landings.**
1. Look for features around the airport or approach path that can be used in determining depth perception. Buildings, towers, vehicles or other aircraft serve well for this measurement. Use something that will provide you with a sense of height above the ground, in addition to orienting you to the runway.
 2. Be cautious of snowdrifts and snow banks - anything that can distinguish the edge of the runway. Look for subtle changes in snow texture or shading to identify ridges or changes in snow depth.
- h. **Off-Airport Landings.**

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

1. In the event of an off-airport landing, pilots have used a number of different visual cues to gain reference. Use whatever you must to create the contrast you need. Natural references seem to work best (trees, rocks, snow ribs, etc.)
 - (a) Over flight.
 - (b) Use of markers.
 - (c) Weighted flags.
 - (d) Smoke bombs.
 - (e) Any colored rags.
 - (f) Dye markers.
 - (g) Kool-aid.
 - (h) Trees or tree branches.
2. It is difficult to determine the depth of snow in areas that are level. Dropping items from the aircraft to use as reference points should be used as a visual aid only and not as a primary landing reference. Unless your marker is biodegradable, be sure to retrieve it after landing. Never put yourself in a position where no visual references exist.
3. Abort landing if blowing snow obscures your reference. Make your decisions early. Don't assume you can pick up a lost reference point when you get closer.
4. Exercise extreme caution when flying from sunlight into shade. Physical awareness may tell you that you are flying straight but you may actually be in a spiral dive with centrifugal force pressing against you. Having no visual references enhances this illusion. Just because you have a good visual reference does not mean that it's safe to continue. There may be snow-covered terrain not visible in the direction that you are traveling. Getting caught in a no visual reference situation can be fatal.

i. Flying Around a Lake.

1. When flying along lakeshores, use them as a reference point. Even if you can see the other side, realize that your depth perception may be poor. It is easy to fly into the surface. If you must cross the lake, check the altimeter frequently and maintain a safe altitude while you still have a good reference. Don't descend below that altitude.
 2. The same rules apply to seemingly flat areas of snow. If you don't have good references, avoid going there.
- j. **Other Traffic.** Be on the look out for other traffic in the area. Other aircraft may be using your same reference point. Chances are greater of colliding with someone traveling in the same direction as you, than someone flying in the opposite direction.
- k. **Ceilings.** Low ceilings have caught many pilots off guard. Clouds do not always form parallel to the surface, or at the same altitude. Pilots may try to compensate for this by flying with a slight bank and thus creating a descending turn.

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

- I. **Glaciers.** Be conscious of your altitude when flying over glaciers. The glaciers may be rising faster than you are climbing.

7-6-15 OPERATIONS IN GROUND ICING CONDITIONS

- a. The presence of aircraft airframe icing during takeoff, typically caused by improper or no deicing of the aircraft being accomplished prior to flight has contributed to many recent accidents in turbine aircraft. The General Aviation Joint Steering Committee (GAJSC) is the primary vehicle for government-industry cooperation, communication, and coordination on GA accident mitigation. The Turbine Aircraft Operations Subgroup (TAOS) works to mitigate accidents in turbine accident aviation. While there is sufficient information and guidance currently available regarding the effects of icing on aircraft and methods for deicing, the TAOS has developed a list of recommended actions to further assist pilots and operators in this area.

While the efforts of the TAOS specifically focus on turbine aircraft, it is recognized that their recommendations are applicable to and can be adapted for the pilot of a small, piston powered aircraft too.

- b. The following recommendations are offered:
1. Ensure that your aircraft's lift-generating surfaces are COMPLETELY free of contamination before flight through a tactile (hands on) check of the critical surfaces when feasible. Even when otherwise permitted, operators should avoid smooth or polished frost on lift-generating surfaces as an acceptable preflight condition.
 2. Review and refresh your cold weather standard operating procedures.
 3. Review and be familiar with the Airplane Flight Manual (AFM) limitations and procedures necessary to deal with icing conditions prior to flight, as well as in flight.
 4. Protect your aircraft while on the ground, if possible, from sleet and freezing rain by taking advantage of aircraft hangars.
 5. Take full advantage of the opportunities available at airports for deicing. Do not refuse deicing services simply because of cost.
 6. Always consider canceling or delaying a flight if weather conditions do not support a safe operation.
- c. If you haven't already developed a set of Standard Operating Procedures for cold weather operations, they should include:
1. Procedures based on information that is applicable to the aircraft operated, such as AFM limitations and procedures.
 2. Concise and easy to understand guidance that outlines best operational practices;
 3. A systematic procedure for recognizing, evaluating and addressing the associated icing risk, and offer clear guidance to mitigate this risk;

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

4. An aid (such as a checklist or reference cards) that is readily available during normal day-to-day aircraft operations.
- d. There are several sources for guidance relating to airframe icing, including:
 1. <http://aircrafticing.grc.nasa.gov/index.html>
 2. <http://www.ibac.org/is-bao/isbao.htm>

The FAA Approved Deicing Program Updates is published annually as a Flight Standards Information Bulletin for Air Transportation and contains detailed information on deicing and anti-icing procedures and holdover times. It may be accessed at the following website by selecting the current year's information bulletins: http://www.faa.gov/library/manuals/examiners_inspectors/8400/fsat

7-6-16 AVOID FLIGHT IN THE VICINITY OF EXHAUST PLUMES (SMOKE STACKS AND COOLING TOWERS)

- a. **Flight Hazards Exist Around Exhaust Plumes.** Exhaust plumes are defined as visible or invisible emissions from power plants, industrial production facilities, or other industrial systems that release large amounts of vertically directed unstable gases (effluent). High temperature exhaust plumes can cause significant air disturbances such as turbulence and vertical shear. Other identified potential hazards include, but are not necessarily limited to: reduced visibility, oxygen depletion, engine particulate contamination, exposure to gaseous oxides, and/or icing. Results of encountering a plume may include airframe damage, aircraft upset, and/or engine damage/failure. These hazards are most critical during low altitude flight in calm and cold air, especially in and around approach and departure corridors or airport traffic areas.

Whether plumes are visible or invisible, the total extent of their turbulent affect is difficult to predict. Some studies do predict that the significant turbulent effects of an exhaust plume can extend to heights of over 1,000 feet above the height of the top of the stack or cooling tower. Any effects will be more pronounced in calm stable air where the plume is very hot and the surrounding area is still and cold. Fortunately, studies also predict that any amount of crosswind will help to dissipate the effects. However, the size of the tower or stack is not a good indicator of the predicted effect the plume may produce. The major effects are related to the heat or size of the plume effluent, the ambient air temperature, and the wind speed affecting the plume. Smaller aircraft can expect to feel an effect at a higher altitude than heavier aircraft.

- b. **When able, a pilot should steer clear of exhaust plumes by flying on the upwind side of smokestacks or cooling towers.** When a plume is visible via smoke or a condensation cloud, remain clear and realize a plume may have both visible and invisible characteristics. Exhaust stacks without visible plumes may still be in full operation, and airspace in the vicinity should be treated with caution. As with mountain wave turbulence or clear air turbulence, an invisible plume may be encountered unexpectedly. Cooling towers, power plant stacks, exhaust fans, and other similar structures are depicted in FIG 7-6-2.

US 7-6

SECTION 6. POTENTIAL FLIGHT HAZARDS

Pilots are encouraged to exercise caution when flying in the vicinity of exhaust plumes. Pilots are also encouraged to reference the Chart Supplement U.S. where amplifying notes may caution pilots and identify the location of structure(s) emitting exhaust plumes.

The best available information on this phenomenon must come from pilots via the PIREP reporting procedures. All pilots encountering hazardous plume conditions are urgently requested to report time, location, and intensity (light, moderate, severe, or extreme) of the element to the FAA facility with which they are maintaining radio contact. If time and conditions permit, elements should be reported according to the standards for other PIREPs and position reports (AIM Paragraph 7-1-21, PIREPS Relating to Turbulence).

FIGURE 7-6-2

Plumes

**7-6-17 SPACE LAUNCH AND REENTRY AREA**

Locations where commercial space launch and/or reentry operations occur. Hazardous operations occur in space launch and reentry areas, and for pilot awareness, a rocket-shaped symbol is used to depict them on sectional aeronautical charts. These locations may have vertical launches from launch pads, horizontal launches from runways, and/or reentering vehicles coming back to land. Because of the wide range of hazards associated with space launch and reentry areas, pilots are expected to check NOTAMs for the specific area prior to flight to determine the location and lateral boundaries of the associated hazard area, and the active time. NOTAMs may include terms such as "rocket launch activity," "space launch," or "space reentry," depending upon the type of operation. Space launch and reentry areas are not established for amateur rocket operations conducted per 14 CFR Part 101.

US 7-6

Space Launch and Reentry Area Depicted on a Sectional Chart

US 7-7

SECTION 7. SAFETY, ACCIDENT, AND HAZARD REPORTS

7-7-1 AVIATION SAFETY REPORTING PROGRAM

- a. The FAA has established a voluntary Aviation Safety Reporting Program designed to stimulate the free and unrestricted flow of information concerning deficiencies and discrepancies in the aviation system. This is a positive program intended to ensure the safest possible system by identifying and correcting unsafe conditions before they lead to accidents. The primary objective of the program is to obtain information to evaluate and enhance the safety and efficiency of the present system.
- b. This cooperative safety reporting program invites pilots, controllers, flight attendants, maintenance personnel and other users of the airspace system, or any other person, to file written reports of actual or potential discrepancies and deficiencies involving the safety of aviation operations. The operations covered by the program include departure, en route, approach, and landing operations and procedures, air traffic control procedures and equipment, crew and air traffic control communications, aircraft cabin operations, aircraft movement on the airport, near midair collisions, aircraft maintenance and record keeping and airport conditions or services.
- c. The report should give the date, time, location, persons and aircraft involved (if applicable), nature of the event, and all pertinent details.
- d. To ensure receipt of this information, the program provides for the waiver of certain disciplinary actions against persons, including pilots and air traffic controllers, who file timely written reports concerning potentially unsafe incidents. To be considered timely, reports must be delivered or postmarked within 10 days of the incident unless that period is extended for good cause. Reports should be submitted on NASA ARC Forms 277, which are available free of charge, postage prepaid, at FAA Flight Standards District Offices and Flight Service Stations, and from NASA, ASRS, PO Box 189, Moffet Field, CA 94035.
- e. The FAA utilizes the National Aeronautics and Space Administration (NASA) to act as an independent third party to receive and analyze reports submitted under the program. This program is described in AC 00-46, Aviation Safety Reporting Program.

7-7-2 AIRCRAFT ACCIDENT AND INCIDENT REPORTING

- a. **Occurrences Requiring Notification.** The operator of an aircraft must immediately, and by the most expeditious means available, notify the nearest National Transportation Safety Board (NTSB) Field Office when:
 1. An aircraft accident or any of the following listed incidents occur:
 - (a) Flight control system malfunction or failure.
 - (b) Inability of any required flight crew member to perform their normal flight duties as a result of injury or illness.
 - (c) Failure of structural components of a turbine engine excluding compressor and turbine blades and vanes.
 - (d) Inflight fire.

US 7-7

SECTION 7. SAFETY, ACCIDENT, AND HAZARD REPORTS

- (e) Aircraft collide in flight.
 - (f) Damage to property, other than the aircraft, estimated to exceed \$25,000 for repair (including materials and labor) or fair market value in the event of total loss, whichever is less.
 - (g) For large multi-engine aircraft (more than 12,500 pounds maximum certificated takeoff weight):
 - (1) Inflight failure of electrical systems which requires the sustained use of an emergency bus powered by a back-up source such as a battery, auxiliary power unit, or air-driven generator to retain flight control or essential instruments;
 - (2) Inflight failure of hydraulic systems that results in sustained reliance on the sole remaining hydraulic or mechanical system for movement of flight control surfaces;
 - (3) Sustained loss of the power or thrust produced by two or more engines; and
 - (4) An evacuation of aircraft in which an emergency egress system is utilized.
2. An aircraft is overdue and is believed to have been involved in an accident.

b. Manner of Notification.

1. The most expeditious method of notification to the NTSB by the operator will be determined by the circumstances existing at that time. The NTSB has advised that any of the following would be considered examples of the type of notification that would be acceptable:
- (a) Direct telephone notification.
 - (b) Telegraphic notification.
 - (c) Notification to the FAA who would in turn notify the NTSB by direct communication; i.e., dispatch or telephone.

c. Items to be Included in Notification. The notification required above must contain the following information, if available:

- 1. Type, nationality, and registration marks of the aircraft.
- 2. Name of owner and operator of the aircraft.
- 3. Name of the pilot-in-command.
- 4. Date and time of the accident, or incident.
- 5. Last point of departure, and point of intended landing of the aircraft.
- 6. Position of the aircraft with reference to some easily defined geographical point.
- 7. Number of persons aboard, number killed, and number seriously injured.

US 7-7

SECTION 7. SAFETY, ACCIDENT, AND HAZARD REPORTS

8. Nature of the accident, or incident, the weather, and the extent of damage to the aircraft so far as is known; and
9. A description of any explosives, radioactive materials, or other dangerous articles carried.

d. Follow-up Reports.

1. The operator must file a report on NTSB Form 6120.1 or 6120.2, available from NTSB Field Offices or from the NTSB, Washington, DC, 20594:
 - (a) Within 10 days after an accident;
 - (b) When, after 7 days, an overdue aircraft is still missing;
 - (c) A report on an incident for which notification is required as described in subparagraph a(1) must be filed only as requested by an authorized representative of the NTSB.
2. Each crewmember, if physically able at the time the report is submitted, must attach a statement setting forth the facts, conditions, and circumstances relating to the accident or incident as they appeared. If the crewmember is incapacitated, a statement must be submitted as soon as physically possible.

e. Where to File the Reports.

1. The operator of an aircraft must file with the NTSB Field Office nearest the accident or incident any report required by this section.
2. The NTSB Field Offices are listed under U.S. Government in the telephone directories in the following cities: Anchorage, AK; Atlanta, GA; Chicago, IL; Denver, CO; Fort Worth, TX; Los Angeles, CA; Miami, FL; Parsippany, NJ; Seattle, WA.

7-7-3 NEAR MIDAIR COLLISION REPORTING

- a. **Purpose and Data Uses.** The primary purpose of the Near Midair Collision (NMAC) Reporting Program is to provide information for use in enhancing the safety and efficiency of the National Airspace System. Data obtained from NMAC reports are used by the FAA to improve the quality of FAA services to users and to develop programs, policies, and procedures aimed at the reduction of NMAC occurrences. All NMAC reports are thoroughly investigated by Flight Standards Facilities in coordination with Air Traffic Facilities. Data from these investigations are transmitted to FAA Headquarters in Washington, DC, where they are compiled and analyzed, and where safety programs and recommendations are developed.
- b. **Definition.** A near midair collision is defined as an incident associated with the operation of an aircraft in which a possibility of collision occurs as a result of proximity of less than 500 feet to another aircraft, or a report is received from a pilot or a flight crew member stating that a collision hazard existed between two or more aircraft.
- c. **Reporting Responsibility.** It is the responsibility of the pilot and/or flight crew to determine whether a near midair collision did actually occur and, if so, to initiate a NMAC report. Be

US 7-7

SECTION 7. SAFETY, ACCIDENT, AND HAZARD REPORTS

specific, as ATC will not interpret a casual remark to mean that a NMAC is being reported. The pilot should state "I wish to report a near midair collision."

- d. **Where to File Reports.** Pilots and/or flight crew members involved in NMAC occurrences are urged to report each incident immediately:
 - 1. By radio or telephone to the nearest FAA ATC facility or FSS.
 - 2. In writing, in lieu of the above, to the nearest Flight Standards District Office (FSDO).
- e. **Items to be Reported.**
 - 1. Date and time (UTC) of incident.
 - 2. Location of incident and altitude.
 - 3. Identification and type of reporting aircraft, aircrew destination, name and home base of pilot.
 - 4. Identification and type of other aircraft, aircrew destination, name and home base of pilot.
 - 5. Type of flight plans; station altimeter setting used.
 - 6. Detailed weather conditions at altitude or flight level.
 - 7. Approximate courses of both aircraft: indicate if one or both aircraft were climbing or descending.
 - 8. Reported separation in distance at first sighting, proximity at closest point horizontally and vertically, and length of time in sight prior to evasive action.
 - 9. Degree of evasive action taken, if any (from both aircraft, if possible).
 - 10. Injuries, if any.
- f. **Investigation.** The FSDO in whose area the incident occurred is responsible for the investigation and reporting of NMACs.
- g. Existing radar, communication, and weather data will be examined in the conduct of the investigation. When possible, all cockpit crew members will be interviewed regarding factors involving the NMAC incident. Air traffic controllers will be interviewed in cases where one or more of the involved aircraft was provided ATC service. Both flight and ATC procedures will be evaluated. When the investigation reveals a violation of an FAA regulation, enforcement action will be pursued.

7-7-4 UNIDENTIFIED FLYING OBJECT (UFO) REPORTS

- a. Persons wanting to report UFO/unexplained phenomena activity should contact a UFO/unexplained phenomena reporting data collection center, such as the National UFO Reporting Center, etc.
- b. If concern is expressed that life or property might be endangered, report the activity to the local law enforcement department.

US 7-7

SECTION 7. SAFETY, ACCIDENT, AND HAZARD REPORTS

**7-7-5 SAFETY ALERTS FOR OPERATORS (SAFO) AND
INFORMATION FOR OPERATORS (InFO)**

- a. SAFOs contain important safety information that is often time-critical. A SAFO may contain information and/or recommended (non-regulatory) action to be taken by the respective operators or parties identified in the SAFO. The audience for SAFOs varies with each subject and may include: Air carrier certificate holders, air operator certificate holders, general aviation operators, directors of safety, directors of operations, directors of maintenance, fractional ownership program managers, training center managers, accountable managers at repair stations, and other parties as applicable.
- b. InFOs are similar to SAFOs, but contain valuable information for operators that should help them meet administrative requirements or certain regulatory requirements with relatively low urgency or impact in safety.
- c. The SAFO and InFO system provides a means to rapidly distribute this information to operators and can be found at the following website: http://www.faa.gov/other_visit/aviation_industry/airline_operators/airline_safety/safo and http://www.faa.gov/other_visit/aviation_industry/airline_operators/airline_safety/info or search keyword FAA SAFO or FAA INFO. Free electronic subscription is available on the “ALL SAFOs” or “ALL InFOs” page of the website.

APPENDIX 5 FAA FORM 7233-1 - FLIGHT PLAN

Throughout this document where references are made to FAA Form 7233-1, Flight Plan, and FAA Form 7233-4, International Flight Plan, DOD use of the equivalent DOD Forms 175 and 1801 respectively, are implied and acceptable. Within U.S. controlled air space, FAA Form 7233-1, Flight Plan, may be used by filers of DOD/military flight plans and civilian stereo route flight plans. Use of the international format flight plan format is mandatory for:

- a. Any flight plan filed through a FSS or FAA contracted flight plan filing service; with the exception of Department of Defense flight plans and civilian stereo route flight plans, which can still be filed using the format prescribed in FAA Form 7233-1.

NOTE: *DOD Form DD-75 and FAA Form 7233-1 are considered to follow the same format.*

- b. Any flight that will depart U.S. domestic airspace. For DOD flight plan purposes, offshore Warning Areas may use FAA Form 7233-1 or military equivalent.
- c. Any flight requesting routing that requires Performance Based Navigation.
- d. Any flight requesting services that require filing of capabilities only supported in the international flight plan format.

NOTE: *The order of flight plan elements in FAA Form 7233-1 is equivalent to the DD-175.*

- e. Explanation of IFR/VFR Flight Plan Items.
 1. Block 1. Check the type of flight plan.
 2. Block 2. Enter your complete aircraft identification.
 3. Block 3. Enter the aircraft type.
 4. Block 4. Enter the true airspeed (TAS).
 5. Block 5. Enter the departure airport identifier.
 6. Block 6. Enter the proposed departure time in Zulu (Z). If airborne, specify the actual or proposed departure time as appropriate.
 7. Block 7. Enter the appropriate altitude.
 8. Block 8. Define the route of flight by using NAVAID identifier codes and airways.
 9. Block 9. Enter the destination airport identifier code.
 10. Block 10. Enter the estimated time en route in hours and minutes.
 11. Block 11. Enter remarks, if necessary.
 12. Block 12. Specify the fuel on board in hours and minutes.
 13. Block 13. Specify an alternate airport if desired.
 14. Block 14. Enter name and contact information for pilot in command.

NOTE: *This information is essential in the event of search and rescue operations.*

15. Block 15. Enter total number of persons on board (POB) including crew.
16. Block 16. Enter the aircraft color.

PRIVACY ACT STATEMENT: This statement is provided pursuant to the Privacy Act of 1974, 5 USC § 552a. The authority for collecting this information is contained in 49 U.S.C. §§ 40113, 44702, 44703, 44709, and 14 C.F.R. Part 6 - [Part 61, 63, 65, or 67]. The principal purpose for which the information is intended to be used is to allow you to submit your flight plan. Submission of the data is voluntary. Failure to provide all required information may result in you not being able to submit your flight plan. The information collected on this form will be included in a Privacy Act System of Records known as DOT/FAA 847, titled "Aviation Records on Individuals" and will be subject to the routine uses published in the System of Records Notice (SORN) for DOT/FAA 847 (see www.dot.gov/privacy/privacyactnotices).

Paperwork Reduction Act Statement: A federal agency may not conduct or sponsor, and a person is not required to respond to, nor shall a person be subject to a penalty for failure to comply with a collection of information subject to the requirements of the Paperwork Reduction Act unless that collection of information displays a current valid OMB Control Number. The OMB Control Number for this information collection is 2120-0026. Public reporting for this collection of information is estimated to be approximately 2.5 minutes per response, including the time for reviewing instructions, completing and reviewing the collection of information. All responses to this collection of information are mandatory per 14 CFR Part 91. Comments concerning the accuracy of this burden and suggestions for reducing the burden should be directed to the FAA at: 800 Independence Ave. SW, Washington, DC 20591. Attn: Information Collection Clearance Officer, ASP-110. Form Approved: OMB No. 2120-0026 Exp. 7/31/2020

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

a. The FAA will accept a flight plan in international format for IFR, VFR, SFRA, and DVFR flights. File the flight plan electronically via a Flight Service Station (FSS), FAA contracted flight plan filing service, or other commercial flight plan filing service. Depending on the filing service chosen, the method of entering data may be different but the information required is generally the same.

b. The international flight plan format is mandatory for:

1. Any flight plan filed through a FSS or FAA contracted flight plan filing service; with the exception of Department of Defense flight plans and civilian stereo route flight plans, which can still be filed using the format prescribed in FAA Form 7233-1.

NOTE: *DOD Form DD-175 and FAA Form 7233-1 are considered to follow the same format.*

2. Any flight that will depart U.S. domestic airspace. For DOD flight plan purposes, off-shore Warning Areas may use FAA Form 7233-1 or military equivalent.
3. Any flight requesting routing that requires Performance Based Navigation.
4. Any flight requesting services that require filing of capabilities only supported in the international flight plan format.

NOTE: *Additional information to assist with filing a flight plan using the international format can be found at <http://www.faa.gov/ato?k=fpl>.*

c. Flight Plan Contents

1. A flight plan will include information shown below:

- (a) Flight Specific Information (TBL 4-1)
- (b) Aircraft Specific Information (TBL 4-19)
- (c) Flight Routing Information (TBL 4-20)
- (d) Flight Specific Supplementary Information (Item 19)

2. The tables indicate where the information is located in the international flight plan format, the information required for U.S. domestic flights, and the location of equivalent information in the domestic flight plan format.
3. International flights, including those that temporarily leave domestic U.S. airspace and return, require all applicable information in the international flight plan. Additional information can be found in ICAO Doc. 4444 (Procedures for Air Navigation Services, Air Traffic Management), and ICAO Doc. 7030 (Regional Supplemental Procedures) as well as the Aeronautical Information Publications (AIPs), Aeronautical Information Circulars (AICs), and NOTAMs of applicable other countries.

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

Table 4-1 Flight Specific Information

Item	International Flight Plan (FAA Form 7233-4)	Domestic U.S. Requirements	Equivalent Item on Domestic Flight Plan (FAA Form 7233-1)
Aircraft Identification	Item 7	Required	Item 2
Flight Rules	Item 8	Required	Item 1
Type of Flight	Item 8	No need to file for domestic U.S. flight	N/A
Equipment and Capabilities	Item 10 Item 18 PBN/; NAV/; COM/; DAT/; SUR/	Required	Item 3
Date of Flight	Item 18 DOF/	Include when date of flight is not today	N/A
Reasons for Special Handling	Item 18 STS/; RMK/	Include when special category is applicable	Item 11
Remarks	Item 18 RMK/	Include when necessary	Item 11
Operator	Item 18 OPR/	No need to file for domestic U.S. flight	N/A
Flight Plan Originator	Item 18 ORGN/	No need to file for domestic U.S. flight	N/A

d. Instructions for Flight-Specific Information Items

1. Aircraft Identification (Item 7) Aircraft Identification is always required. Aircraft identification must not exceed seven alphanumeric characters and be either:
 - (a) The ICAO designator for the aircraft operating agency, followed by the flight identification (for example, KLM511, NGA213, JTR25). When in radiotelephony the call sign to be used by the aircraft will consist of the ICAO telephony designator for the operating agency followed by the flight identification (for example, KLM511, NIGERIA213, JESTER25);
 - (b) The nationality or common mark and registration of the aircraft (for example, EIAKO, 4XBCD, N2567GA), when:
 - (1) In radiotelephony, the call sign to be used by the aircraft will consist of this identification alone (for example, CGAJS) or preceded by the ICAO telephony designator for the aircraft operating agency (for example, BLIZZARD CGAJS); or

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

- (2) The aircraft is not equipped with radio.

NOTE:

1. *Standards for nationality, common and registration marks to be used are contained in Annex 7, Chapter 2.*
2. *Provisions for using radiotelephony call signs are contained in Annex 10, Volume II, Chapter 5. ICAO designators and telephony designators for aircraft operating agencies are contained in Doc 8585—Designators for Aircraft Operating Agencies, Aeronautical Authorities and Services.*

NOTE: *Some countries' aircraft identifications begin with a number, which cannot be processed by U.S. ATC automation. The FAA will add a leading letter temporarily to gain automation acceptance for aircraft identifications that begin with a numeral. For flight-processing systems (e.g., ERAM or STARS) which will not accept a call sign that begins with a number, if the call sign is 6 characters or less, add a Q at the beginning of the call sign. If the call sign is 7 characters, delete the first character and replace it with a Q. Put the original call sign in the remarks section of the flight plan.*

EXAMPLE:

9HRA becomes Q9HRA

5744233 becomes Q744233

2. Flight Rules (Item 8a)

- (a) Flight rules are always required.
- (b) Flight rules must indicate IFR (I) or VFR (V).
- (c) For composite flight plans, submit separate flight plans for the IFR and VFR portions of the flight. Specify in Item 15 the point or points where change of flight rules is planned. The IFR plan will be routed to ATC, and the VFR plan will be routed to a Flight Service for Search and Rescue services.

NOTE: *The pilot is responsible for opening and closing the VFR flight plan. ATC does not have knowledge of a VFR flight plan's status.*

3. Type of Flight (Item 8b)

- (a) The type of flight is optional for flights remaining wholly within U.S. domestic airspace.
- (b) Indicate the type of flight as follows:
 - G – General Aviation
 - S – Scheduled Air Service
 - N – Non-Scheduled Air Transport Operation
 - M – Military

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

- X – other than any of the defined categories above
- 4. Equipment and Capabilities (Item 10, Item 18 NAV/, COM/, DAT/, SUR/)
 - (a) Equipment and capabilities that can be filed in a flight plan include:
 - Navigation capabilities in Item 10a, Item 18 PBN/, and Item 18 NAV/
 - Voice communication capabilities in Item 10a and Item 18 COM/
 - Data communication capabilities in Item 10a and Item 18 DAT/
 - Approach capabilities in Item 10a and Item 18 NAV/
 - Surveillance capabilities in Item 10b and Item 18 SUR/
 - (b) Codes allowed in Item 10a are shown in Table 4-2. Codes allowed in Item 10b are shown in TBL 4-3. Codes recognized in Item 18 NAV/, COM/, DAT/, and SUR/ are shown in TBL 4-4. Note that other service providers may define additional allowable (and required) codes for use in Item 18 NAV/, COM/, DAT/, or SUR/. Codes to designate PBN capability are described in TBL 4-5.

Radio communication, navigation and approach aid equipment and capabilities

ENTER one letter as follows:

N if no COM/NAV/approach aid equipment for the route to be flown is carried, or the equipment is unserviceable,

OR

S if standard COM/NAV/approach aid equipment for the route to be flown is carried and serviceable (see Note 1),

AND/OR

ENTER one or more of the following letters from TBL 4-2 to indicate the serviceable COM/NAV/ approach aid equipment and capabilities available.

Table 4-2 Item 10a Navigation, Communication, and Approach Aid Capabilities

A	GBAS Landing System	J7	CPDLC FANS 1/A SATCOM (Iridium)
B	LPV (APV with SBAS)	K	MLS
C	LORAN C	L	ILS
D	DME	M1	ATC SATVOICE (INMARSAT)
E1	FMC WPR ACARS	M2	Reserved
E2	D-FIS ACARS	M3	ATC RTF (Iridium)
E3	PDC ACARS	O	VOR
F	ADF	P1	CPDLC RCP 400 (See Note 7)

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

Table 4-2 Item 10a Navigation, Communication, and Approach Aid Capabilities (continued)

G	GNSS (<i>See Note 2</i>)	P2	CPDLC RCP 240 (<i>See Note 7</i>)
H	HF RTF	P3	SATVOICE RCP 400 (<i>See Note 7</i>)
I	Inertial Navigation	P4-P9	Reserved for RCP
J1	CPDLC ATN VDL Mode 2 (<i>See Note 3</i>)	R	PBN Approved (<i>See Note 4</i>)
J2	CPDLC FANS 1/A HFDL	T	TACAN
J3	CPDLC FANS 1/A VDL Mode A	U	UHF RTF
J4	CPDLC FANS 1/A Mode 2	V	VHF RTF
J5	CPDLC FANS 1/A SATCOM (INMAR-SAT)	W	RVSM Approved
J6	Reserved	X	MNPS Approved /North Atlantic (NAT) High Level Airspace (HLA) approved
		Y	VHF with 8.33 kHz Channel Spacing Capability
		Z	Other equipment carried or other capabilities (<i>See Note 5</i>)

Any alphanumeric characters not indicated above are reserved.

NOTE:

1. If the letter “S” is used, standard equipment is considered to be VHF RTF, VOR, and ILS, unless another combination is prescribed by the appropriate ATS authority.
2. If the letter “G” is used, the types of external GNSS augmentation, if any, are specified in Item 18 following the indicator NAV/ and separated by a space.

EXAMPLE: NAV/SBAS
NOTE:

3. See RTCA/EUROCAE Interoperability Requirements Standard for ATN Baseline 1 (ATN B1 INTEROP Standard – DO-280B/ED-110B) for data link services air traffic control clearance and information/air traffic control communications management/air traffic control microphone check.
4. If the letter “R” is used, the performance-based navigation levels that can be met are specific in Item 18 following the indicator PBN/. Guidance material on the application of performance-based navigation to a specific route segment, route, or area is contained in the Performance-based Navigation (PBN) Manual (Doc 9613)

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

5. If the letter "Z" is used, specify in Item 18 the other equipment carried or other capabilities, preceded by COM/, NAV/, and/or DAT, as appropriate.
6. Information on navigation capability is provided to ATC for clearance and routing purposes.
7. Guidance on the application of performance-based communication, which prescribes RCP to an air traffic service in a specific area, is contained in the Performance-based Communication and Surveillance (PBCS) Manual (Doc 9869).

Table 4-3 Item 10b Surveillance Capabilities

ENTER "N" if no surveillance equipment for the route to be flown is carried, or the equipment is unserviceable,

or

ENTER One or more of the following descriptors, to a maximum of 20 characters, to describe the serviceable surveillance equipment and/or capabilities on board.

ENTER no more than one transponder code (Modes A, C, or S)

SSR Modes A and C:

A	Transponder	Mode A (4 digits – 4096 codes)
C	Transponder	Mode A (4 digits – 4096 codes) and Mode C

SSR Mode S:

E	Transponder	Mode S, including aircraft identification, pressure-altitude, and extended squitter (ADS-B) capability
H	Transponder	Mode S, including aircraft identification, pressure-altitude, and enhanced surveillance capability
I	Transponder	Mode S, including aircraft identification, but no pressure-altitude capability
L	Transponder	Mode S, including aircraft identification, pressure-altitude, extended squitter (ADS-B), and enhanced surveillance capability
P	Transponder	Mode S, including pressure-altitude, but no aircraft identification capability
S	Transponder	Mode S, including both pressure-altitude and aircraft identification capability
X	Transponder	Mode S, with neither aircraft identification nor pressure-altitude

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN
Table 4-3 Item 10b Surveillance Capabilities (continued)

NOTE: Enhanced surveillance capability is the ability of the aircraft to down-link aircraft derived data via Mode S transponder.

ADS-B:

- B1 ADS-B with dedicated 1090 MHz ADS-B “out” capability
- B2 ADS-B with dedicated 1090 MHz ADS-B “out” and “in” capability
- U1 ADS-B with “out” capability using UAT
- U2 ADS-B with “out” and “in” capability using UAT
- V1 ADS-B with “out” capability using VDL Mode 4
- V2 ADS-B with “out” and “in” capability using VDL Mode 4

NOTE: File no more than one code for each type of capability, e.g., file B1 or B2 and not both

ADS-C:

- D1 ADS-C with FANS 1/A capabilities
- G1 ADS-C with ATN capabilities

Alphanumeric characters not included above are reserved.

EXAMPLE: ADE3RV/HB2U2V2G1

NOTE:

1. The RSP specification(s), if applicable, will be listed in Item 18 following the indicator SUR/, using the characters “RSP” followed by the specifications value. Currently RSP180 and RSP400 are in use.
2. List additional surveillance equipment or capabilities in Item 18 following the indicator SUR/.

Table 4-4 Item 18 NAV/, COM/, DAT/, and SUR/ capabilities used by FAA

Item	Purpose	Entry	Explanation
NAV/ entries used by FAA	Radius to Fix (RF) capability	Z1	RNP-capable flight is authorized for Radius to Fix operations.
	Fixed Radius Transitions (FRT)	Z2	RNP-capable flight is authorized for Fixed Radius Transitions.
	Time of Arrival Control (TOAC)	Z5	RNP-capable flight is authorized for Time of Arrival Control.
	Advanced RNP (A-RNP)	P1	Flight is authorized for A-RNP operations.
	Helicopter RNP 0.3	R1	Flight is authorized for RNP 0.3 operations (pertains to helicopters only).

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

Table 4-4 Item 18 NAV/, COM/, DAT/, and SUR/ capabilities used by FAA (continued)

Item	Purpose	Entry	Explanation
	RNP 2 Continental	M1	Flight is authorized for RNP 2 continental operations.
	RNP 2 Oceanic/ Remote	M2	Flight is authorized for RNP 2 oceanic/ remote operations.
COM/ en- tries used by FAA	N/A	N/A	The FAA currently does not use any entries in COM/.
DAT/ en- tries used by FAA	Capability and pref- erence for delivery of pre-departure clearance	Priority number followed by: – FANS – FANSP – PDC – VOICE	Entries are combined with a priority number, for example; 1FANS2PDC means a prefer- ence for departure clearance delivered via FANS 1/A; with capability to also receive the clearance via ACARS PDC. FANS = FANS 1/A DCL FANSP = FANS 1/A+ DCL PDC = ACARS PDC VOICE = PDC via voice (no automated de- livery)
SUR/ entries used by FAA	Req. Surveillance Performance	RSP180	Aircraft is authorized for Required Surveil- lance Performance RSP180
		RSP400	Aircraft is authorized for Required Surveil- lance Performance RSP400
	ADS-B	260B	Aircraft has 1090 MHz Extended Squitter ADS-B compliant with RTCA DO-260B (complies with FAA requirements)
		282B	Aircraft has 978 MHz UAT ADS-B compliant with RTCA DO-282B (complies with FAA re- quirements)

NOTE 1: Other entries in NAV/, COM/, DAT/, and SUR/ are permitted for interna-
tional flights when instructed by other service providers. Direction on use of these
capabilities by the FAA is detailed in the following sections.

NOTE 2: In NAV/, descriptors for advanced capabilities (Z1, P1, R1, M1, and M2)
should be entered as a single character string with no intervening spaces, and
separated from any other entries in NAV/ by a space.

EXAMPLE: NAV/Z1P1M2 SBAS

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

Table 4-5 Item 18. PBN/ Specifications (Include as many of the applicable descriptors, up to a maximum of 8 entries (not more than 16 characters)).

PBN/ RNAV SPECIFICATIONS	
A1	RNAV 10 (RNP 10)
B1	RNAV 5 all permitted sensors
B2	RNAV 5 GNSS
B3	RNAV 5 DME/DME
B4	RNAV 5 VOR/DME
B5	RNAV 5 INS or IRS
B6	RNAV 5 LORAN C
C1	RNAV 2 all permitted sensors
C2	RNAV 2 GNSS
C3	RNAV 2 DME/DME
C4	RNAV 2 DME/DME/IRU
D1	RNAV 1 all permitted sensors
D2	RNAV 1 GNSS
D3	RNAV 1 DME/DME
D4	RNAV 1 DME/DME/IRU
PBN/ RNP SPECIFICATIONS	
L1	RNP 4
O1	Basic RNP 1 all permitted sensors
O2	Basic RNP 1 GNSS
O3	Basic RNP 1 DME/DME
O4	Basic RNP 1 DME/DME/IRU
S1	RNP APCH
S2	RNP APCH with BARO-VNAV
T1	RNP AR APCH with RF (special authorization required)
T2	RNP AR APCH without RF (special authorization required)

NOTE:

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

- 1. PBN Codes B1-B6 indicates RNAV 5 capability. The FAA considers these B codes to be synonymous and qualifying for point-to-point routing but not for assignment to the PBN routes shown in the table.*
 - 2. Combinations of alphanumeric characters not included above are reserved.*
 - 3. The PBN/ specifications are allowed per ICAO Doc. 4444. The FAA makes use of a subset of these codes as described in the section on filing navigation capability.*
- (c) The following sections detail what capabilities need to be provided to obtain services from the FAA for:
- IFR flights (general).
 - Assignment of Performance-Based Navigation (PBN) routes.
 - Automated Departure clearance (via Datacom DCL or PDC).
 - Reduced Vertical Separation Minima (if requesting FL 290 or above).
 - Reduced Separation in Oceanic Airspace.
- (d) Capabilities such as voice communications, required communications performance, approach aids, and ADS-C, are not required in a flight plan that remains entirely within domestic airspace.
- (e) Flights that leave domestic United States airspace may be required to include additional capabilities, per requirements for the FIRs being overflown. Consult the appropriate State Aeronautical Information Publications for requirements.
- (f) Include the capability only if:
- The requisite equipment is installed and operational;
 - The crew is trained as required; and
 - Any required Operations Specification, Letter of Authorization, or other approvals are in hand.

NOTE: *Do not include a capability solely based on the installed equipment if an operational approval is required.*

5. Filing equipment and capability in an IFR Flight Plan. This section details the minimum requirements to identify capabilities in an IFR flight plan for flights in the domestic United States. Other requirements to file a capability are associated with obtaining specific services as described in subsequent sections. The basic capabilities that must be addressed include Navigation, Transponder, Voice, and ADS-B Out as described below. A designator for "Standard" capability is also allowed to cover a suite of commonly carried voice, navigation, and approach equipment with one code.

(a) **Standard Capability and No Capability (Item 10a)**

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

- Use “S” if VHF radio, VOR, and ILS equipment for the route to be flown are carried and serviceable. Use of the ‘S’ removes the need to list these three capabilities separately.
- Use “N” if no communications, navigation, or approach aid equipment for the route to be flown are carried or the equipment is unserviceable.
- When there is no transponder, ADS-B, or ADS-C capability then file only the letter ‘N’ in Item 10b.

(b) Navigation Capabilities (Item 10a, Item 18 NAV/)

- Indicate radio navigation capability by filing one or more of the codes in TBL 4-6.
- Indicate Area Navigation (RNAV) capability by filing one or more of the codes in TBL 4-7.

Table 4-6 Radio Navigation Capabilities

Capability	Item 10a	Item 18 NAV/
VOR	O	
DME	D	
TACAN	T	

Table 4-7 Area Navigation Capabilities

Capability	Item 10a	Item 18 NAV/
GNSS	G	SBAS (if WAAS equipped) GBAS (if LAAS equipped)
INS	I	
DME / DME	DR	
VOR / DME	DOR	

NOTE:

1. *SBAS – Space-Based Augmentation System*
GBAS – Ground-Based Augmentation System
2. *No PBN/ code needs to be filed to indicate the ability to fly point-to-point routes using GNSS or INS.*
3. *Filing one of these four area navigation capabilities as shown does not indicate performance based navigation sufficient for flying Q-Routes, T-Routes, or RNAV SIDs or STARs. To qualify for these routes, see the section on Performance Based Navigation Routes.*

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN
(c) Transponder Capabilities (Item 10b)

- For domestic flights, it is not necessary to indicate Mode S capability. It is acceptable to simply file one of the following codes in TBL 4-8.

Table 4-8 Mode C

Capability	Item 10b
Transponder with no Mode C	A
Transponder with Mode C	C

- International flights must file in accordance with relevant AIPs and regional supplements. Include one of the Mode S codes in TBL 4-9, if appropriate.

NOTE: File only one transponder code.

Table 4-9 Mode S

Capability	Aircraft ID	Altitude Encoding	Item 10b
Mode S Transponder	No	No	X
Mode S Transponder	No	Yes	P
Mode S Transponder	Yes	No	I
Mode S Transponder	Yes	Yes	S
Mode S Transponder with Extended Squitter	Yes	Yes	E
Enhanced Mode S Transponder	Yes	Yes	H
Enhanced Mode S Transponder with Extended Squitter	Yes	Yes	L

(d) ADS-B Capabilities (Item 10b, Item 18 SUR/ and Item 18 CODE/)

- Indicate ADS-B capability as shown in TBL 4-10. The accompanying entry in Item 18 indicates that the equipment is compliant with 14 CFR §91.227. Some ADS-B equipment used in other countries is based on an earlier standard and does not meet U.S. requirements.
- Do not file an ADS-B code for “in” capability only. There is currently no way to indicate that an aircraft has “in” capability but no “out” capability.
- For aircraft with ADS-B “out” on one frequency and “in” on another, include only the ADS-B “out” code. For example, B1 or U1, (See TBL 4-10).

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

Table 4-10 ADS-B Capabilities

Capability	Item 10a	Item 18 SUR/
1090 ES Out Capability	B1	260B
1090 ES Out and In Capability	B2	260B
UAT Out Capability	U1	282B
UAT Out and In Capability	U2	282B

(e) Voice Communication Capabilities (Item 10a)

The FAA does not require indication of voice communication capabilities in a flight plan for domestic flights, but it is permissible. For flights outside the domestic United States, all relevant capabilities must be indicated as follows (See TBL 4-11):

Table 4-11 Voice Communication Capabilities

Capability	Item 10b
VHF Radio	V
UHF Radio	U
HF Radio	H
VHF Radio (8.33 kHz Spacing)	Y
ATC SATVOICE (INMARSAT)	M1
ATC SATVOICE (Iridium)	M3

(f) Approach Aid Capabilities (Item 10a).

The FAA does not require filing of approach aid capability in order to request a specific type of approach, however any of the codes indicated in TBL 4-12 in 10a are permissible.

- International flights may be required to indicate approach capability, based on instructions from relevant service providers.

Table 4-12 Approach Aid Capabilities

Capability	Item 10a
ILS	L
MLS	K
LPV Approach (APV with SBAS) (WAAS)	B
GBAS Landing System (LAAS)	A

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

6. Performance-Based Navigation Routes (Item 10a, Item 18 PBN/, Item 18 NAV/)-
When planning to fly routes that require PBN capability, file the appropriate capability as shown in TBL 4-13.

Table 4-13 Filing for Performance Based Navigation (PBN) Routes

Type of Routing	Capability Required	Item 10a	Item 18 PBN/ See NOTE 2	Item 18 NAV/ See NOTE 3	Notes
RNAV SID or STAR (See NOTE 1)	RNAV 1	GR	D2		If GNSS
		DIR	D4		If DME/DME/I RU
RNP SID or STAR (See NOTE 2)	RNP 1 GNSS	GR	O2		If GNSS only
	RNP 1 GNSS	DGIR	O1		If GNSS primary and DME/DME/I RU backup
RNP SID or STAR with RF required (See NOTE 2)	RNP 1 GNSS	GRZ	O2	Z1	If GNSS only
	RNP 1 GNSS	DGIRZ	O1	Z1	If GNSS primary and DME/DME/I RU backup
Domestic Q-Route (see separate requirements for Gulf of Mexico Q-Routes)	RNAV 2	GR	C2		If GNSS
		DIR	C4		If DME/DME/I RU
T-Route	RNAV 2	GR	C2		GNSS is required for T-Routes
RNAV (GPS) Approach	RNAV Approach, GPS	GR	S1		<i>Domestic arrivals do not need to file PBN approach capabilities to request the approach.</i>
RNAV (GPS) Approach	RNAV Approach, GPS Baro-VNAV	GR	S2		
RNAV (GPS) Approach with RF required	RNP Approach, GPS RF Capability	GRZ	S2	Z1	

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN
Table 4-13 Filing for Performance Based Navigation (PBN) Routes (continued)

Type of Routing	Capability Required	Item 10a	Item 18 PBN/ See NOTE 2	Item 18 NAV/ See NOTE 3	Notes
RNP AR Approach with RF	RNP (Special Authorization Required) RF Leg Capability	GR	T1		
RNP AR Approach without RF	RNP (Special Authorization Required)	GR	T2		

NOTE:

1. If the flight is requesting an RNAV SID only (no RNAV STAR) or RNAV STAR only (no RNAV SID) then consult guidance on the FAA website at https://www.faa.gov/about/office_org/headquarters_offices/ato/service_units/air_traffic_services/flight_plan_filing.
2. PBN descriptor D1 includes the capabilities of D2, D3, and D4. PBN descriptor B1 includes the capabilities of B2, B3, B4, and B5. PBN descriptor C1 includes the capabilities of C2, C3, and C4.
3. In NAV/, descriptors for advanced capabilities (Z1, P1, R1, M1, and M2) should be entered as a single character string with no intervening spaces, and separated from any other entries in NAV/ by a space.

EXAMPLE: NAV/Z1P1M2 SBAS

7. Automated Departure Clearance Delivery (DCL or PDC). When planning to use automated pre-departure clearance delivery capability, file as indicated below.
 - (a) PDC provides pre-departure clearances from the FAA to the operator's designated flight operations center, which then delivers the clearance to the pilot by various means. Use of PDC does not require any special flight plan entry.
 - (b) DCL provides pre-departure clearances from the FAA directly to the cockpit/FMS via Controller Pilot Datalink Communications (CPDLC). Use of DCL requires flight plan entries as follows:
 - Include CPDLC codes in Item 10a only if the flight is capable of en route/oceanic CPDLC, the codes are not required for DCL.
 - Include Z in Item 10a to indicate there is information provided in Item 18 DAT/.
 - Include the clearance delivery methods of which the flight is capable, and order of preference in Item 18 DAT/. (See AIM 5-2-2)
 - VOICE – deliver clearance via Voice
 - PDC – deliver clearance via PDC

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

- FANS – deliver clearance via FANS 1/A
- FANSP – deliver clearance via FANS 1/A+

EXAMPLE: *DAT/1FANS2PDC*

DAT/1FANSP2VOICE

8. Operating in Reduced Vertical Separation Minima (RVSM) Airspace (Item 10a). When planning to fly in RVSM airspace (FL 290 up to and including FL 410) then file as indicated below.
- (a) If capable and approved for RVSM operations, per AIM 4-6-1, Applicability and RVSM Mandate (Date/Time and Area), file a W in Item 10a. Include the aircraft registration mark in Item 18 REG/, which is used to post-operationally monitor the safety of RVSM operations.
 - Do not file a “W” in Item 10a if the aircraft is capable of RVSM operations, but is not approved to operate in RVSM airspace.
 - If RVSM capability is lost after the flight plan is filed, request that ATC remove the ‘W’ from Item 10a.
 - (b) When requesting to operate non-RVSM in RVSM airspace, using one of the exceptions identified in AIM 4-6-10, do not include a “W” in Item 10a. Include STS/ NONRVSM in Item 18. STS/NONRVSM is used only as part of a request to operate non-RVSM in RVSM airspace.
9. Eligibility for Reduced Oceanic Separation. Indicate eligibility for the listed reduced separation minima as indicated in the tables below. Full Operational Requirements for these services are found in the U.S. Aeronautical Information Publication (AIP) ENR 7, Oceanic Operations, available at

http://www.faa.gov/air_traffic/publications/atpubs/aip_html/index.html.

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

Table 4-14 Filing for Gulf of Mexico CTA

Dimension of Separation	Separation Minimum	ADS-C Surveillance Requirements	Comm. Requirement	PBN Requirement	Flight Plan Entries			
					ADS-C in Item 10b	CPDLC in Item 10a	PBN in Item 18 PBN/ (also File 'R' in Item 10a)	PBN in Item 18 NAV/
Lateral	50 NM	N/A (ADS-C not required)	Voice comm-HF or VHF as required to maintain contact over the entire route to be flown.	RNP10 or RNP4	N/A	N/A	A1 or L1	N/A

NOTE: If not RNAV10/RNP10 capable and planning to operate in the Gulf of Mexico CTA, then put the notation NONRNP10 in Item 18 RMK/, preferably first.

Table 4-15 Filing for 50 NM Lateral Separation in Anchorage Arctic FIR

Dimension of Separation	Separation Minimum	ADS-C Surveillance Requirements	Comm. Requirement	PBN Requirement	Flight Plan Entries			
					ADS-C in Item 10b	CPDLC in Item 10a	PBN in Item 18 PBN/ (also File 'R' in Item 10a)	PBN in Item 18 NAV/
Lateral	50 NM	N/A (ADS-C not required)	None beyond normal requirements for the airspace	RNP10 or RNP4	N/A	N/A	A1 or L1	N/A

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN
Table 4-16 Filing for 30 NM Lateral, 30 NM Longitudinal, and 50 NM Longitudinal Oceanic Separation in Anchorage, Oakland, and New York Oceanic CTAs

Dimension of Separation	Separation Minima	ADS-C Surveillance Requirements	Comm. Requirement	PBN Requirement	Flight Plan Entries			
					ADS-C in Item 10b	CPDLC in Item 10a	PBN in Item 18 PBN/ (also File 'R' in Item 10a)	PBN in Item 18 NAV/
Longitudinal	50 NM	Position report at least every 27 minutes (at least every 32 minutes if both aircraft are approved for RNP-4 operations)	CPDLC	RNP10	D1	J5 and/or J7	A1	N/A
Longitudinal	30 NM	ADS-C position report at least every 10 minutes	CPDLC	RNP4	D1	J5 and/or J7	L1	N/A
Lateral	30 NM	ADS-C-based lateral deviation event contract with 5NM lateral deviation from planned routing set as threshold for triggering ADS report of lateral deviation event	CPDLC	RNP4	D1	J5 and/or J7	L1	N/A

**US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN**

Table 4-17 Filing for Reduced Oceanic Separation when RSP/RCP Required on March 29, 2018

Di- men- sion of Sepa- ration	Sepa- ration Mini- ma	RSP Re- quirement	RCP Re- quirement	PBN Re- quirement	Flight Plan Entries				
					RSP in Item 18 SUR/	RCP in Item 10a	CDPLC in Item10a	PBN in Item 18 PBN/ (also File 'R' in Item 10a)	PBN in Item 18 NAV/
Later- al	55.5 km 30 NM	180	240	RNP 2 or RNP4	RSP180	P2	J5, and/or J6, and/or J7	L1	
Per- form- ance- based Longi- tudinal	5 Mi- nutes	180	240	RNAV 10 (RNP10) RNP4, or RNP2 oceanic/ remote	RSP180	P2	J5, and/or J6, and/or J7	A1 or L1	M2
Per- form- ance- based Longi- tudinal	55.5 km 30 NM	180	240	RNP4 or RNP2 oceanic/ remote	RSP180	P2	J5, and/or J6, and/or J7	L1	M2
Per- form- ance- based Longi- tudinal	93 km 50 NM	180	240	RNAV 10 (RNP10) or RNP4,	RSP180	P2	J5, and/or J6, and/or J7	A1 or L1	

NOTE 1: Filing of RNP 2 alone is not supported in FAA controlled airspace; PBN/L1 (for RNP 4) or PBN/A1 (for RNP 10) must be filed to obtain the indicated separation.

NOTE 2: Use of "RNP2" in NAV/ signifies continental RNP 2 (and means the same as M1). Continental RNP 2 is not adequate for reduced oceanic separation. Descriptor M2 indicates RNP 2 global/oceanic RNP 2 capability.

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN
10. Date of Flight (Item 18 DOF/)

Flights planned more than 23 hours after the time the flight plan is filed, must include the date of flight in DOF/ expressed in a six-digit format YYMMDD, where YY equals the year (Y), MM equals the month, and DD equals the day.

NOTE: *FAA ATC systems will not accept flight plans more than 23 hours prior to their proposed departure time. FAA Flight Service and commercial flight planning services generally accept flight plans earlier and forward to ATC at an appropriate time, typically 2 to 4 hours before the flight.*

EXAMPLE: *DOF/171130*

11. Reasons for Special Handling (Item 18 STS/)

(a) Indicate the applicable Special Handling in Item 18 STS/ as shown in TBL 4-18.

NOTE: *Priority for a flight is not automatically granted based on filing one of these codes but is based on documented procedures. In some cases, additional information may also be required in remarks; follow all such instructions as well.*

Table 4-18 Special Handling

Special Handling	Item 18 STS/
Flight operating in accordance with an altitude reservation	ALTRV
Flight approved for exemption from ATFM measures by the appropriate ATS authority	ATFMX
Fire Fighting	FFR
Flight check for calibration of NAVAIDS	FLTCK
Flight carrying hazardous material(s)	HAZMAT
Flight with Head of State status	HEAD
Medical flight declared by medical authorities	HOSP
Flight operating on a humanitarian mission	HUM
Flight for which a military entity assumes responsibility for separation of military aircraft	MARSA
Life critical medical emergency evacuation	MEDEVAC
Non-RVSM capable flight intending to operate in RVSM airspace	NONRVSM
Flight engaged in a search and rescue mission	SAR
Flight engaged in military, customs, or police services	STATE

(b) Any other requests for special handling must be made in Item 18 RMK/.

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

- (c) Include plain-language remarks when required by ATC or deemed necessary. Do not use special characters, for example; / * – = +.

EXAMPLE: *RMK/NRP*

RMK/DVRSN

12. Remarks

Include when necessary.

13. Operator (Item 18 OPR/)

When the operator is not obvious from the aircraft identification, the operator may be indicated.

EXAMPLE: *OPR/NETJETS*

14. Flight Plan Originator (Item 18 ORGN/)

- (a) VFR flight plans originating outside of FAA FSS or FAA contracted flight plan filing services must enter the 8-letter AFTN address of the service where the flight plan was originally filed. Alternately, enter the name of the service where the FPL was originally filed. This information is critical to locating the FPL originator in the event additional information is needed.
- (b) For IFR flight plans, the original filers AFTN address may be indicated, which is helpful in cases where a flight plan has been forwarded.

EXAMPLE:

ORGN/Acme Flight Plans

ORGN/KDENX LDS

Table 4-19 Aircraft Specific Information

Item	International Flight Plan (FAA Form 7233-4)	Domestic U.S. Requirements	Equivalent Item on Domestic Flight Plan (FAA Form 7233-1)
Number of Aircraft	Item 9	Included when more than one a/c in flight	Item 3
Type of Aircraft	Item 9	Required	Item 3
Wake Turbulence Category	Item 9	Required	N/A
Aircraft Registration	Item 18 REG/	Include when planning to operate in RVSM airspace	N/A

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

Table 4-19 Aircraft Specific Information (continued)

Item	International Flight Plan (FAA Form 7233-4)	Domestic U.S. Requirements	Equivalent Item on Domestic Flight Plan (FAA Form 7233-1)
Mode S Address	Item 18 CODE/	Not required within U.S. controlled airspace	N/A
SELCAL Codes	Item 18 SEL/	Include when SELCAL equipped	N/A
Performance Category	Item 18 PER/	Not required for domestic flights	N/A

e. Instructions for Aircraft-Specific Information.

1. **Number of Aircraft (Item 9)** when there is more than one aircraft in the flight; indicate the number of aircraft up to 99.

2. **Type of Aircraft (Item 9)**

(a) Provide the appropriate 2-4-character aircraft type designator listed in FAA Order 7360.1, Aircraft Type Designators at: https://www.faa.gov/regulations_policies/orders_notices/index.cfm/go/document.information/documentID/1036757

(b) When there is no designator for the aircraft type use 'ZZZZ', and provide a description in Item 18 TYP/.

3. **Wake Turbulence Category (Item 9)**

A Wake Turbulence Category is required for all aircraft types. Provide the appropriate wake turbulence category for the aircraft type as listed in FAA Order 7360.1. The categories include:

(a) **J – SUPER**, aircraft types specified as such in FAA Order JO 7360.1, Aircraft Type Designators.

(b) **H – HEAVY**, to indicate an aircraft type with a maximum certificated take-off mass of 300,000 lbs. or more, with the exception of aircraft types listed in FAA Order JO 7360.1 in the SUPER (J) category.

(c) **M – MEDIUM**, to indicate an aircraft type with a maximum certificated take-off mass of less than 300,000 lbs. but more than 15,500 lbs.

(d) **L – LIGHT**, to indicate an aircraft type with a maximum certificated take-off mass of 15,500 lbs. or less.

4. **Aircraft Registration (Item 18 REG/)**

The aircraft registration must be provided here if different from the Item 7 entry. The registration mark must not include any spaces or hyphens. Additionally, the actual air-

US A4
APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

craft registration must also be included if Item 7 would have contained a leading numeric and was modified to be prefixed with the appropriate alphabetic character for U.S.ATC acceptance.

EXAMPLE:

U.S. aircraft with registration N789AK

REG/N789AK

Belgian aircraft with registration OO-FAH

REG/OOFAH

5. Mode S Address (Item 18 CODE/)

There is no U.S. requirement to file the aircraft Mode S Code in Item 18.

6. SELCAL code (Item 18 SEL/)

(a) Flights with HF radio and Selective Calling capability should include their 4-letter SELCAL code. Per the U.S. AIP, GEN 3.4, Paragraph 9, Selective Calling System (SELCAL) Facilities Available.

(b) The SELCAL is a communication system that permits the selective calling of individual aircraft over radio-telephone channels from the ground station to properly equipped aircraft, to eliminate the need for the flight crew to constantly monitor the frequency in use.

EXAMPLE: *SEL/CLEF*

7. Performance Category (Item 18 PER/)

Include the appropriate single-letter Aircraft Approach Category as defined in the Pilot/Controller Glossary.

EXAMPLE: *PER/A*

Estimated Elapsed Times	Item 18 EET/	Include when filing flight plan with center other than departure center	N/A

f. Instructions for Flight Routing Items
1. Departure Airport (Item 13, Item 18 DEP/)

- (a) Enter the departure airport. The airport should be identified using the four-letter location identifier from FAA Order JO 7350.9, Location Identifiers, or from ICAO Document 7910. FSS and FAA contracted flight plan filing services will allow up to 11 characters in the departure field. This will permit entry of non-ICAO identifier airports, and other fixes such as an intersection, fix/radial/distance, and latitude/longitude coordinates. Other electronic filing services may require a different format.

NOTE: While user interfaces for flight plan filing are not specified, all flight plan filing services must adhere to the appropriate Interface Control Document upon transmission of the flight plan to the control facility.

- (b) When the intended departure airport (Item 13) is outside of domestic U.S. airspace, or if using the paper version of FAA Form 7233-4, or DOD equivalent, if the chosen flight plan filing service does not allow non-ICAO airport identifiers in Item 13 or Item 16, use the following ICAO procedure. Enter four Z's (ZZZZ) in Item 13 and include the non-ICAO airport location identifier, fix, or waypoint loca-

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

tion in Item 18 DEP/. A text description following the location identifier is permissible in Item 18 DEP/.

NOTE: Use of non-ICAO identifiers in Item 13 and Item 16 is only permissible when flight destination is within U.S. airspace. If the destination is outside of the U.S., then both Item 13 and Item 16 must contain either a valid ICAO airport identifier or ZZZZ. Use of non-ICAO departure point is not permitted in Item 13 if destination in Item 16 is outside of U.S.

EXAMPLE: DEP/MD21

DEP/W29 BAY BRIDGE AIRPORT

DEP/EMI211017

DEP/3925N07722W

2. Departure Time (Item 13)

Indicate the expected departure time using 4 digits, 2 digits for hours and 2 digits for minutes. Time is to be entered as Coordinated Universal Time (UTC).

3. Requested Cruising Speed (Item 15)

- (a) Include the requested cruising speed as True Airspeed in knots using an N followed by four digits.

EXAMPLE: N0450

- (b) Indicate the requested cruising speed in Mach using an M followed by three digits.

EXAMPLE: M081

4. Requested Cruising Altitude or Flight Level (Item 15)

- (a) Indicate a Requested Flight Level using the letter F followed by 3 digits.

EXAMPLE: F350

- (b) Indicate a Requested Altitude in hundreds of feet using the letter A followed by 3 digits.

EXAMPLE: A080

5. Route (Item 15)

Provide the requested route of flight using a combination of published routes, latitude/longitude, and/or fixes in the following formats.

- (a) Consecutive fixes, lat/long points, NAVAIDs, and waypoints should be separated by the characters "DCT", meaning direct.

EXAMPLE:

FLACK DCT IRW DCT IRW12503

4020N07205W DCT MONEY

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

- (b) A published route should be preceded by a fix that is published on the route, indicating where the route will be joined. The published route should be followed by a fix that is published as part of the route, indicating where the route will be exited.

EXAMPLE:

DALL3 EIC V18 MEI LGC4

- (c) It is acceptable to specify intended speed and altitude changes along the route by appending an oblique stroke followed by the next speed and altitude. However, note that FAA ATC systems will neither process this information nor display it to ATC personnel. Pilots are expected to maintain the last assigned altitude and request revised altitude clearances from ATC.

EXAMPLE: *DCT APN J177 LEXOR/N0467F380 J177 TAM/N0464F390 J177*

NOTE: *Further guidance on route construction can be found at <http://www.faa.gov/ato?k=fpl>.*

6. Delay En Route (Item 15, Item 18 DLE/)

- (a) ICAO defines Item 18 DLE/ to provide information about a delay en route. International flights with a delay outside U.S. domestic airspace should indicate the place and duration of the delay in Item 18 DLE/. The delay is expressed by a fix identifier followed by the duration in hours (H) and minutes (M), HHMM.

EXAMPLE: *DLE/EMI0140*

- (b) U.S. ATC systems will accept but not process information in DLE/. Therefore, for flights in the lower 48 states, it is preferable to include the delay as part of the route (Item 15). Delay in this format is specified by an oblique stroke (/) followed by the letter D, followed by 2 digits for hours (H) of delay, followed by a plus sign (+), followed by 2 digits for minutes (M) of delay: /DHH+MM.

EXAMPLE: *DCT EMI/D01+40 DCT MAPEL/D00+30 V143 DELRO DCT*

7. Destination Airport (Item 16, Item 18 DEST/)

- (a) Enter the destination airport. The airport should be identified using the four-letter location identifier from FAA Order JO 7350.9, Location Identifiers, or from ICAO Document 7910. FSS and FAA contracted flight plan filing services will allow up to 11 characters in the destination field. This will permit entry of non-ICAO identifier airports, and other fixes such as an intersection, fix/radial/distance, and latitude/longitude coordinates. Other electronic filing services may require a different format.

NOTE: *While user interfaces for flight plan filing are not specified, all flight plan filing services must adhere to the appropriate Interface Control Document upon transmission of the flight plan to the control facility.*

- (b) When the intended destination (Item 16) is outside of domestic U.S. airspace, or if using the paper version of FAA Form 7233-4, or if the chosen flight plan filing

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

service does not allow non-ICAO airport identifiers in Item 13 or Item 16, use the following ICAO procedure. Enter four Z's (ZZZZ) in Item 13 and include the non-ICAO airport location identifier, fix, or waypoint location in Item 18 DEP/. A text description following the location identifier is permissible in Item 18 DEP/.

EXAMPLE:

DEST/06A MOTON FIELD

DEST/4AK6

DEST/MONTK

DEST /3925N07722W

8. Total Estimated Elapsed Time (Item 16)

All flight plans must include the total estimated elapsed time from departure to destination in hours (H) and minutes (M), format HHMM.

9. Alternate Airport (Item 16, Item 18 ALTN/)

- (a) When necessary, specify an alternate airport in Item 16 using the four-letter location identifier from FAA Order 7350.9 or ICAO Document 7910. When the airport does not have a four-letter location identifier, include ZZZZ in Item 16c and file the non-standard identifier in Item 18 ALTN/.
- (b) While the FAA does not require filing of alternate airports in the flight plan provided to ATC, rules for establishing alternate airports must be followed.
- (c) Adding an alternate may assist during Search and Rescue by identifying additional areas to search.
- (d) Although alternate airport information filed in a flight plan will be accepted by air traffic computer systems, it will not be presented to controllers. If diversion to an alternate airport becomes necessary, pilots are expected to notify ATC and request an amended clearance.

EXAMPLE: *ALTN/W50 2W2*

10. Estimated Elapsed Times (EET) at boundaries or reporting points (Item 18 EET/)

EETs are required for international or oceanic flights when crossing a Flight Information Region (FIR) boundary. The EET will include the ICAO four-letter location identifier for the FIR followed by the elapsed time to the FIR boundary (e.g., KZNY0245 indicates 2 hours, 45 minutes from departure until the New York FIR boundary).

EXAMPLE:

EET/MMFR0011 MMTY0039 KZAB0105

11. Remarks (Item 18 RMK/)

Enter only those remarks pertinent to ATC or to the clarification of other flight plan information. Items of a personal nature are not accepted.

US A4

APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN

NOTE:

1. "DVRSN" should be placed in Item 11 only if the pilot/company is requesting priority handling to their original destination from ATC as a result of a diversion as defined in the Pilot/Controller Glossary.
2. Do not assume that remarks will be automatically transmitted to every controller. Specific ATC or en route requests should be made directly to the appropriate controller.

g. Flight Specific Supplemental Information (Item 19)

1. Item 19 data must be included when completing FAA Form 7233-4. This information will be retained by the facility/organization that transmits the flight plan to Air Traffic Control (ATC), for Search and Rescue purposes, but it will not be transmitted to ATC as part of the flight plan.
2. Do not include Supplemental Information as part of Item 18. The information in Item 19 is retained with the flight plan filing service for retrieval only if necessary.

NOTE: Supplemental Information within Item 19 will be transmitted as a separate message to the destination FSS for VFR flight plans filed with a FSS or FAA contracted flight plan filing service. This will reduce the time necessary to conduct SAR actions should the flight become overdue, as this information will be readily available to the destination Flight Service Station.

3. Minimum required Item 19 entries for a domestic flight are Endurance, Persons on Board, Pilot Name and Contact Information, and Color of Aircraft. Additional entries may be required by foreign air traffic services, or at pilot discretion.
 - (a) After E/ Enter fuel endurance time in hours and minutes.
 - (b) After P/ Enter total number of persons on board using up to 30 alphanumeric characters. Enter TBN (to be notified) if the total number of persons is not known at the time of filing.

EXAMPLE: P/005

P/TBN

P/ON FILE CAPEAIR OPERATIONS

- (c) R/ (Radio) Cross out items not carried
- (d) S/ (Survival Equipment) Cross out items not carried.
- (e) J/ (Jackets) Cross out items not carried.
- (f) D/ (Life Raft/Dinghies) Enter number carried and total capacity. Indicate if covered and color.
- (g) A/ (Aircraft Color and Markings) Enter aircraft color(s).

EXAMPLE: White Yellow Blue

US A4**APPENDIX 4 FAA FORM 7233-4 - INTERNATIONAL FLIGHT PLAN**

4. N/ (Remarks. Not for ATC) select N if no remarks. Enter comments concerning survival equipment and information concerning personal GPS locating service, if utilized. Enter name and contact information for responsible party to verify VFR arrival/closure, if desired. Ensure party will be available for contact at ETA. (for example; FBO is open at ETA)
5. C/ (Pilot) Enter name and contact information, including telephone number, of pilot-in-command. Ensure contact information will be valid at ETA in case SAR is necessary.

US 8-1

SECTION 1. FITNESS FOR FLIGHT

8-1-1 FITNESS FOR FLIGHT

a. Medical Certification.

1. All pilots except those flying gliders and free air balloons must possess valid medical certificates in order to exercise the privileges of their airman certificates. The periodic medical examinations required for medical certification are conducted by designated Aviation Medical Examiners, who are physicians with a special interest in aviation safety and training in aviation medicine.
2. The standards for medical certification are contained in 14 CFR Part 67. Pilots who have a history of certain medical conditions described in these standards are mandatorily disqualified from flying. These medical conditions include a personality disorder manifested by overt acts, a psychosis, alcoholism, drug dependence, epilepsy, an unexplained disturbance of consciousness, myocardial infarction, angina pectoris and diabetes requiring medication for its control. Other medical conditions may be temporarily disqualifying, such as acute infections, anemia, and peptic ulcer. Pilots who do not meet medical standards may still be qualified under special issuance provisions or the exemption process. This may require that either additional medical information be provided or practical flight tests be conducted.
3. Student pilots should visit an Aviation Medical Examiner as soon as possible in their flight training in order to avoid unnecessary training expenses should they not meet the medical standards. For the same reason, the student pilot who plans to enter commercial aviation should apply for the highest class of medical certificate that might be necessary in the pilot's career.

CAUTION: *The CFRs prohibit a pilot who possesses a current medical certificate from performing crewmember duties while the pilot has a known medical condition or increase of a known medical condition that would make the pilot unable to meet the standards for the medical certificate.*

b. Illness.

1. Even a minor illness suffered in day-to-day living can seriously degrade performance of many piloting tasks vital to safe flight. Illness can produce fever and distracting symptoms that can impair judgment, memory, alertness, and the ability to make calculations. Although symptoms from an illness may be under adequate control with a medication, the medication itself may decrease pilot performance.
2. The safest rule is not to fly while suffering from any illness. If this rule is considered too stringent for a particular illness, the pilot should contact an Aviation Medical Examiner for advice.

c. Medication.

1. Pilot performance can be seriously degraded by both prescribed and over-the-counter medications, as well as by the medical conditions for which they are taken. Many medications, such as tranquilizers, sedatives, strong pain relievers, and cough-suppressant preparations, have primary effects that may impair judgment, memory, alertness, coor-

US 8-1

SECTION 1. FITNESS FOR FLIGHT

dination, vision, and the ability to make calculations. Others, such as antihistamines, blood pressure drugs, muscle relaxants, and agents to control diarrhea and motion sickness, have side effects that may impair the same critical functions. Any medication that depresses the nervous system, such as a sedative, tranquilizer or antihistamine, can make a pilot much more susceptible to hypoxia.

2. The CFRs prohibit pilots from performing crewmember duties while using any medication that affects the faculties in any way contrary to safety. The safest rule is not to fly as a crewmember while taking any medication, unless approved to do so by the FAA.

d. Alcohol.

1. Extensive research has provided a number of facts about the hazards of alcohol consumption and flying. As little as one ounce of liquor, one bottle of beer or four ounces of wine can impair flying skills, with the alcohol consumed in these drinks being detectable in the breath and blood for at least 3 hours. Even after the body completely destroys a moderate amount of alcohol, a pilot can still be severely impaired for many hours by hangover. There is simply no way of increasing the destruction of alcohol or alleviating a hangover. Alcohol also renders a pilot much more susceptible to disorientation and hypoxia.
2. A consistently high alcohol related fatal aircraft accident rate serves to emphasize that alcohol and flying are a potentially lethal combination. The CFRs prohibit pilots from performing crewmember duties within 8 hours after drinking any alcoholic beverage or while under the influence of alcohol. However, due to the slow destruction of alcohol, a pilot may still be under influence 8 hours after drinking a moderate amount of alcohol. Therefore, an excellent rule is to allow at least 12 to 24 hours between "bottle and throttle," depending on the amount of alcoholic beverage consumed.

e. Fatigue.

1. Fatigue continues to be one of the most treacherous hazards to flight safety, as it may not be apparent to a pilot until serious errors are made. Fatigue is best described as either acute (short-term) or chronic (long-term).
2. A normal occurrence of everyday living, acute fatigue is the tiredness felt after long periods of physical and mental strain, including strenuous muscular effort, immobility, heavy mental workload, strong emotional pressure, monotony, and lack of sleep. Consequently, coordination and alertness, so vital to safe pilot performance, can be reduced. Acute fatigue is prevented by adequate rest and sleep, as well as by regular exercise and proper nutrition.
3. Chronic fatigue occurs when there is not enough time for full recovery between episodes of acute fatigue. Performance continues to fall off, and judgment becomes impaired so that unwarranted risks may be taken. Recovery from chronic fatigue requires a prolonged period of rest.
4. OBSTRUCTIVE SLEEP APNEA (OSA). OSA is now recognized as an important preventable factor identified in transportation accidents. OSA interrupts the normal restora-

US 8-1

SECTION 1. FITNESS FOR FLIGHT

tive sleep necessary for normal functioning and is associated with chronic illnesses such as hypertension, heart attack, stroke, obesity, and diabetes. Symptoms include snoring, excessive daytime sleepiness, intermittent prolonged breathing pauses while sleeping, memory impairment and lack of concentration. There are many available treatments which can reverse the day time symptoms and reduce the chance of an accident. OSA can be easily treated. Most treatments are acceptable for medical certification upon demonstrating effective treatment. If you have any symptoms described above, or neck size over 17 inches in men or 16 inches in women, or a body mass index greater than 30 you should be evaluated for sleep apnea by a sleep medicine specialist.

(https://www.cdc.gov/healthyweight/assessing/bmi/adult_bmi/english_bmi_calculator/bmi_calculator.html) With treatment you can avoid or delay the onset of these chronic illnesses and prolong a quality life.

f. Stress.

1. Stress from the pressures of everyday living can impair pilot performance, often in very subtle ways. Difficulties, particularly at work, can occupy thought processes enough to markedly decrease alertness. Distraction can so interfere with judgment that unwarranted risks are taken, such as flying into deteriorating weather conditions to keep on schedule. Stress and fatigue (see above) can be an extremely hazardous combination.
2. Most pilots do not leave stress “on the ground.” Therefore, when more than usual difficulties are being experienced, a pilot should consider delaying flight until these difficulties are satisfactorily resolved.

g. Emotion.

Certain emotionally upsetting events, including a serious argument, death of a family member, separation or divorce, loss of job, and financial catastrophe, can render a pilot unable to fly an aircraft safely. The emotions of anger, depression, and anxiety from such events not only decrease alertness but also may lead to taking risks that border on self-destruction. Any pilot who experiences an emotionally upsetting event should not fly until satisfactorily recovered from it.

- h. Personal Checklist.** Aircraft accident statistics show that pilots should be conducting pre-flight checklists on themselves as well as their aircraft for pilot impairment contributes to many more accidents than failures of aircraft systems. A personal checklist, which includes all of the categories of pilot impairment as discussed in this section, that can be easily committed to memory is being distributed by the FAA in the form of a wallet-sized card.
- i. PERSONAL CHECKLIST.** *I'm physically and mentally safe to fly; not being impaired by:*

Illness

Medication

US 8-1

SECTION 1. FITNESS FOR FLIGHT

Stress

Alcohol

Fatigue

Emotion

8-1-2 EFFECTS OF ALTITUDE

a. Hypoxia.

1. Hypoxia is a state of oxygen deficiency in the body sufficient to impair functions of the brain and other organs. Hypoxia from exposure to altitude is due only to the reduced barometric pressures encountered at altitude, for the concentration of oxygen in the atmosphere remains about 21 percent from the ground out to space.
2. Although a deterioration in night vision occurs at a cabin pressure altitude as low as 5,000 feet, other significant effects of altitude hypoxia usually do not occur in the normal healthy pilot below 12,000 feet. From 12,000 to 15,000 feet of altitude, judgment, memory, alertness, coordination and ability to make calculations are impaired, and headache, drowsiness, dizziness and either a sense of well-being (euphoria) or belligerence occur. The effects appear following increasingly shorter periods of exposure to increasing altitude. In fact, pilot performance can seriously deteriorate within 15 minutes at 15,000 feet.
3. At cabin pressure altitudes above 15,000 feet, the periphery of the visual field grays out to a point where only central vision remains (tunnel vision). A blue coloration (cyanosis) of the fingernails and lips develops. The ability to take corrective and protective action is lost in 20 to 30 minutes at 18,000 feet and 5 to 12 minutes at 20,000 feet, followed soon thereafter by unconsciousness.
4. The altitude at which significant effects of hypoxia occur can be lowered by a number of factors. Carbon monoxide inhaled in smoking or from exhaust fumes, lowered hemoglobin (anemia), and certain medications can reduce the oxygen-carrying capacity of the blood to the degree that the amount of oxygen provided to body tissues will already be equivalent to the oxygen provided to the tissues when exposed to a cabin pressure altitude of several thousand feet. Small amounts of alcohol and low doses of certain drugs, such as antihistamines, tranquilizers, sedatives and analgesics can, through their depressant action, render the brain much more susceptible to hypoxia. Extreme heat and cold, fever, and anxiety increase the body's demand for oxygen, and hence its susceptibility to hypoxia.
5. The effects of hypoxia are usually quite difficult to recognize, especially when they occur gradually. Since symptoms of hypoxia do not vary in an individual, the ability to recognize hypoxia can be greatly improved by experiencing and witnessing the effects of hypoxia during an altitude chamber "flight." The FAA provides this opportunity through aviation physiology training, which is conducted at the FAA Civil Aeromedical Institute and at many military facilities across the U.S. To attend the Physiological Train-

US 8-1

SECTION 1. FITNESS FOR FLIGHT

ing Program at the Civil Aeromedical Institute, Mike Monroney Aeronautical Center, Oklahoma City, OK, contact by telephone (405) 954-6212, or by writing:

Aerospace Medical Education Division

AAM-400

CAMI

Mike Monroney Aeronautical Center

Address: P.O. Box 25082,
Oklahoma City,
OK
73125

NOTE: *To attend the physiological training program at one of the military installations having the training capability, an application form and a fee must be submitted. Full particulars about location, fees, scheduling procedures, course content, individual requirements, etc., are contained in the Physiological Training Application, Form Number AC 3150-7, which is obtained by contacting the accident prevention specialist or the office forms manager in the nearest FAA office.*

6. Hypoxia is prevented by heeding factors that reduce tolerance to altitude, by enriching the inspired air with oxygen from an appropriate oxygen system, and by maintaining a comfortable, safe cabin pressure altitude. For optimum protection, pilots are encouraged to use supplemental oxygen above 10,000 feet during the day, and above 5,000 feet at night. The CFRs require that at the minimum, flight crew be provided with and use supplemental oxygen after 30 minutes of exposure to cabin pressure altitudes between 12,500 and 14,000 feet and immediately on exposure to cabin pressure altitudes above 14,000 feet. Every occupant of the aircraft must be provided with supplemental oxygen at cabin pressure altitudes above 15,000 feet.

b. Ear Block.

1. As the aircraft cabin pressure decreases during ascent, the expanding air in the middle ear pushes the eustachian tube open, and by escaping down it to the nasal passages, equalizes in pressure with the cabin pressure. But during descent, the pilot must periodically open the eustachian tube to equalize pressure. This can be accomplished by swallowing, yawning, tensing muscles in the throat, or if these do not work, by a combination of closing the mouth, pinching the nose closed, and attempting to blow through the nostrils (Valsalva maneuver).
2. Either an upper respiratory infection, such as a cold or sore throat, or a nasal allergic condition can produce enough congestion around the eustachian tube to make equalization difficult. Consequently, the difference in pressure between the middle ear and aircraft cabin can build up to a level that will hold the eustachian tube closed, making equalization difficult if not impossible. The problem is commonly referred to as an "ear block."

US 8-1

SECTION 1. FITNESS FOR FLIGHT

3. An ear block produces severe ear pain and loss of hearing that can last from several hours to several days. Rupture of the ear drum can occur in flight or after landing. Fluid can accumulate in the middle ear and become infected.
4. An ear block is prevented by not flying with an upper respiratory infection or nasal allergic condition. Adequate protection is usually not provided by decongestant sprays or drops to reduce congestion around the eustachian tubes. Oral decongestants have side effects that can significantly impair pilot performance.
5. If an ear block does not clear shortly after landing, a physician should be consulted.

c. Sinus Block.

1. During ascent and descent, air pressure in the sinuses equalizes with the aircraft cabin pressure through small openings that connect the sinuses to the nasal passages. Either an upper respiratory infection, such as a cold or sinusitis, or a nasal allergic condition can produce enough congestion around an opening to slow equalization, and as the difference in pressure between the sinus and cabin mounts, eventually plug the opening. This "sinus block" occurs most frequently during descent.
2. A sinus block can occur in the frontal sinuses, located above each eyebrow, or in the maxillary sinuses, located in each upper cheek. It will usually produce excruciating pain over the sinus area. A maxillary sinus block can also make the upper teeth ache. Bloody mucus may discharge from the nasal passages.
3. A sinus block is prevented by not flying with an upper respiratory infection or nasal allergic condition. Adequate protection is usually not provided by decongestant sprays or drops to reduce congestion around the sinus openings. Oral decongestants have side effects that can impair pilot performance.
4. If a sinus block does not clear shortly after landing, a physician should be consulted.

d. Decompression Sickness After Scuba Diving.

1. A pilot or passenger who intends to fly after scuba diving should allow the body sufficient time to rid itself of excess nitrogen absorbed during diving. If not, decompression sickness due to evolved gas can occur during exposure to low altitude and create a serious inflight emergency.
2. The recommended waiting time before going to flight altitudes of up to 8,000 feet is at least 12 hours after diving which has not required controlled ascent (nondecompression stop diving), and at least 24 hours after diving which has required controlled ascent (decompression stop diving). The waiting time before going to flight altitudes above 8,000 feet should be at least 24 hours after any SCUBA dive. These recommended altitudes are actual flight altitudes above mean sea level (AMSL) and not pressurized cabin altitudes. This takes into consideration the risk of decompression of the aircraft during flight.

US 8-1

SECTION 1. FITNESS FOR FLIGHT

8-1-3 HYPERVENTILATION IN FLIGHT

- a. Hyperventilation, or an abnormal increase in the volume of air breathed in and out of the lungs, can occur subconsciously when a stressful situation is encountered in flight. As hyperventilation “blows off” excessive carbon dioxide from the body, a pilot can experience symptoms of lightheadedness, suffocation, drowsiness, tingling in the extremities, and coolness and react to them with even greater hyperventilation. Incapacitation can eventually result from incoordination, disorientation, and painful muscle spasms. Finally, unconsciousness can occur.
- b. The symptoms of hyperventilation subside within a few minutes after the rate and depth of breathing are consciously brought back under control. The buildup of carbon dioxide in the body can be hastened by controlled breathing in and out of a paper bag held over the nose and mouth.
- c. Early symptoms of hyperventilation and hypoxia are similar. Moreover, hyperventilation and hypoxia can occur at the same time. Therefore, if a pilot is using an oxygen system when symptoms are experienced, the oxygen regulator should immediately be set to deliver 100 percent oxygen, and then the system checked to assure that it has been functioning effectively before giving attention to rate and depth of breathing.

8-1-4 CARBON MONOXIDE POISONING IN FLIGHT

- a. Carbon monoxide is a colorless, odorless, and tasteless gas contained in exhaust fumes. When breathed even in minute quantities over a period of time, it can significantly reduce the ability of the blood to carry oxygen. Consequently, effects of hypoxia occur.
- b. Most heaters in light aircraft work by air flowing over the manifold. Use of these heaters while exhaust fumes are escaping through manifold cracks and seals is responsible every year for several nonfatal and fatal aircraft accidents from carbon monoxide poisoning.
- c. A pilot who detects the odor of exhaust or experiences symptoms of headache, drowsiness, or dizziness while using the heater should suspect carbon monoxide poisoning, and immediately shut off the heater and open air vents. If symptoms are severe or continue after landing, medical treatment should be sought.

8-1-5 ILLUSIONS IN FLIGHT

- a. **Introduction.** Many different illusions can be experienced in flight. Some can lead to spatial disorientation. Others can lead to landing errors. Illusions rank among the most common factors cited as contributing to fatal aircraft accidents.
- b. **Illusions Leading to Spatial Disorientation.**
 1. Various complex motions and forces and certain visual scenes encountered in flight can create illusions of motion and position. Spatial disorientation from these illusions can be prevented only by visual reference to reliable, fixed points on the ground or to flight instruments.

US 8-1

SECTION 1. FITNESS FOR FLIGHT

2. **The leans.** An abrupt correction of a banked attitude, which has been entered too slowly to stimulate the motion sensing system in the inner ear, can create the illusion of banking in the opposite direction. The disoriented pilot will roll the aircraft back into its original dangerous attitude, or if level flight is maintained, will feel compelled to lean in the perceived vertical plane until this illusion subsides.
- (a) **Coriolis illusion.** An abrupt head movement in a prolonged constant-rate turn that has ceased stimulating the motion sensing system can create the illusion of rotation or movement in an entirely different axis. The disoriented pilot will maneuver the aircraft into a dangerous attitude in an attempt to stop rotation. This most overwhelming of all illusions in flight may be prevented by not making sudden, extreme head movements, particularly while making prolonged constant-rate turns under IFR conditions.
 - (b) **Graveyard spin.** A proper recovery from a spin that has ceased stimulating the motion sensing system can create the illusion of spinning in the opposite direction. The disoriented pilot will return the aircraft to its original spin.
 - (c) **Graveyard spiral.** An observed loss of altitude during a coordinated constant-rate turn that has ceased stimulating the motion sensing system can create the illusion of being in a descent with the wings level. The disoriented pilot will pull back on the controls, tightening the spiral and increasing the loss of altitude.
 - (d) **Somatogravic illusion.** A rapid acceleration during takeoff can create the illusion of being in a nose up attitude. The disoriented pilot will push the aircraft into a nose low, or dive attitude. A rapid deceleration by a quick reduction of the throttles can have the opposite effect, with the disoriented pilot pulling the aircraft into a nose up, or stall attitude.
 - (e) **Inversion illusion.** An abrupt change from climb to straight and level flight can create the illusion of tumbling backwards. The disoriented pilot will push the aircraft abruptly into a nose low attitude, possibly intensifying this illusion.
 - (f) **Elevator illusion.** An abrupt upward vertical acceleration, usually by an updraft, can create the illusion of being in a climb. The disoriented pilot will push the aircraft into a nose low attitude. An abrupt downward vertical acceleration, usually by a downdraft, has the opposite effect, with the disoriented pilot pulling the aircraft into a nose up attitude.
 - (g) **False horizon.** Sloping cloud formations, an obscured horizon, a dark scene spread with ground lights and stars, and certain geometric patterns of ground light can create illusions of not being aligned correctly with the actual horizon. The disoriented pilot will place the aircraft in a dangerous attitude.
 - (h) **Autokinesis.** In the dark, a static light will appear to move about when stared at for many seconds. The disoriented pilot will lose control of the aircraft in attempting to align it with the light.

3. Illusions Leading to Landing Errors.

US 8-1

SECTION 1. FITNESS FOR FLIGHT

- (a) Various surface features and atmospheric conditions encountered in landing can create illusions of incorrect height above and distance from the runway threshold. Landing errors from these illusions can be prevented by anticipating them during approaches, aerial visual inspection of unfamiliar airports before landing, using electronic glide slope or VASI systems when available, and maintaining optimum proficiency in landing procedures.
- (b) **Runway width illusion.** A narrower- than-usual runway can create the illusion that the aircraft is at a higher altitude than it actually is. The pilot who does not recognize this illusion will fly a lower approach, with the risk of striking objects along the approach path or landing short. A wider-than-usual runway can have the opposite effect, with the risk of leveling out high and landing hard or overshooting the runway.
- (c) **Runway and terrain slopes illusion.** An upsloping runway, upsloping terrain, or both, can create the illusion that the aircraft is at a higher altitude than it actually is. The pilot who does not recognize this illusion will fly a lower approach. A downsloping runway, downsloping approach terrain, or both, can have the opposite effect.
- (d) **Featureless terrain illusion.** An absence of ground features, as when landing over water, darkened areas, and terrain made featureless by snow, can create the illusion that the aircraft is at a higher altitude than it actually is. The pilot who does not recognize this illusion will fly a lower approach.
- (e) **Atmospheric illusions.** Rain on the windscreen can create the illusion of greater height, and atmospheric haze the illusion of being at a greater distance from the runway. The pilot who does not recognize these illusions will fly a lower approach. Penetration of fog can create the illusion of pitching up. The pilot who does not recognize this illusion will steepen the approach, often quite abruptly.
- (f) **Ground lighting illusions.** Lights along a straight path, such as a road, and even lights on moving trains can be mistaken for runway and approach lights. Bright runway and approach lighting systems, especially where few lights illuminate the surrounding terrain, may create the illusion of less distance to the runway. The pilot who does not recognize this illusion will fly a higher approach. Conversely, the pilot overflying terrain which has few lights to provide height cues may make a lower than normal approach.

8-1-6 VISION IN FLIGHT

- a. **Introduction.** Of the body senses, vision is the most important for safe flight. Major factors that determine how effectively vision can be used are the level of illumination and the technique of scanning the sky for other aircraft.
- b. **Vision Under Dim and Bright Illumination.**
 - 1. Under conditions of dim illumination, small print and colors on aeronautical charts and aircraft instruments become unreadable unless adequate cockpit lighting is available.

US 8-1

SECTION 1. FITNESS FOR FLIGHT

Moreover, another aircraft must be much closer to be seen unless its navigation lights are on.

2. In darkness, vision becomes more sensitive to light, a process called dark adaptation. Although exposure to total darkness for at least 30 minutes is required for complete dark adaptation, a pilot can achieve a moderate degree of dark adaptation within 20 minutes under dim red cockpit lighting. Since red light severely distorts colors, especially on aeronautical charts, and can cause serious difficulty in focusing the eyes on objects inside the aircraft, its use is advisable only where optimum outside night vision capability is necessary. Even so, white cockpit lighting must be available when needed for map and instrument reading, especially under IFR conditions. Dark adaptation is impaired by exposure to cabin pressure altitudes above 5,000 feet, carbon monoxide inhaled in smoking and from exhaust fumes, deficiency of Vitamin A in the diet, and by prolonged exposure to bright sunlight. Since any degree of dark adaptation is lost within a few seconds of viewing a bright light, a pilot should close one eye when using a light to preserve some degree of night vision.
3. Excessive illumination, especially from light reflected off the canopy, surfaces inside the aircraft, clouds, water, snow, and desert terrain, can produce glare, with uncomfortable squinting, watering of the eyes, and even temporary blindness. Sunglasses for protection from glare should absorb at least 85 percent of visible light (15 percent transmittance) and all colors equally (neutral transmittance), with negligible image distortion from refractive and prismatic errors.

c. Scanning for Other Aircraft.

1. Scanning the sky for other aircraft is a key factor in collision avoidance. It should be used continuously by the pilot and copilot (or right seat passenger) to cover all areas of the sky visible from the cockpit. Although pilots must meet specific visual acuity requirements, the ability to read an eye chart does not ensure that one will be able to efficiently spot other aircraft. Pilots must develop an effective scanning technique which maximizes one's visual capabilities. The probability of spotting a potential collision threat obviously increases with the time spent looking outside the cockpit. Thus, one must use timesharing techniques to efficiently scan the surrounding airspace while monitoring instruments as well.
2. While the eyes can observe an approximate 200 degree arc of the horizon at one glance, only a very small center area called the fovea, in the rear of the eye, has the ability to send clear, sharply focused messages to the brain. All other visual information that is not processed directly through the fovea will be of less detail. An aircraft at a distance of 7 miles which appears in sharp focus within the foveal center of vision would have to be as close as $\frac{7}{10}$ of a mile in order to be recognized if it were outside of foveal vision. Because the eyes can focus only on this narrow viewing area, effective scanning is accomplished with a series of short, regularly spaced eye movements that bring successive areas of the sky into the central visual field. Each movement should not exceed 10 degrees, and each area should be observed for at least 1 second to enable detection. Although horizontal back-and-forth eye movements seem preferred by

US 8-1

SECTION 1. FITNESS FOR FLIGHT

most pilots, each pilot should develop a scanning pattern that is most comfortable and then adhere to it to assure optimum scanning.

3. Studies show that the time a pilot spends on visual tasks inside the cabin should represent no more than $\frac{1}{4}$ to $\frac{1}{3}$ of the scan time outside, or no more than 4 to 5 seconds on the instrument panel for every 16 seconds outside. Since the brain is already trained to process sight information that is presented from left to right, one may find it easier to start scanning over the left shoulder and proceed across the windshield to the right.
4. Pilots should realize that their eyes may require several seconds to refocus when switching views between items in the cockpit and distant objects. The eyes will also tire more quickly when forced to adjust to distances immediately after close-up focus, as required for scanning the instrument panel. Eye fatigue can be reduced by looking from the instrument panel to the left wing past the wing tip to the center of the first scan quadrant when beginning the exterior scan. After having scanned from left to right, allow the eyes to return to the cabin along the right wing from its tip inward. Once back inside, one should automatically commence the panel scan.
5. Effective scanning also helps avoid "empty-field myopia." This condition usually occurs when flying above the clouds or in a haze layer that provides nothing specific to focus on outside the aircraft. This causes the eyes to relax and seek a comfortable focal distance which may range from 10 to 30 feet. For the pilot, this means looking without seeing, which is dangerous.

8-1-7 AEROBATIC FLIGHT

- a. Pilots planning to engage in aerobatics should be aware of the physiological stresses associated with accelerative forces during aerobatic maneuvers. Many prospective aerobatic trainees enthusiastically enter aerobatic instruction but find their first experiences with G forces to be unanticipated and very uncomfortable. To minimize or avoid potential adverse effects, the aerobatic instructor and trainee must have a basic understanding of the physiology of G force adaptation.
- b. Forces experienced with a rapid push-over maneuver result in the blood and body organs being displaced toward the head. Depending on forces involved and individual tolerance, a pilot may experience discomfort, headache, "red-out," and even unconsciousness.
- c. Forces experienced with a rapid pull-up maneuver result in the blood and body organ displacement toward the lower part of the body away from the head. Since the brain requires continuous blood circulation for an adequate oxygen supply, there is a physiologic limit to the time the pilot can tolerate higher forces before losing consciousness. As the blood circulation to the brain decreases as a result of forces involved, a pilot will experience "narrowing" of visual fields, "gray-out," "black-out," and unconsciousness. Even a brief loss of consciousness in a maneuver can lead to improper control movement causing structural failure of the aircraft or collision with another object or terrain.

US 8-1

SECTION 1. FITNESS FOR FLIGHT

- d. In steep turns, the centrifugal forces tend to push the pilot into the seat, thereby resulting in blood and body organ displacement toward the lower part of the body as in the case of rapid pull-up maneuvers and with the same physiologic effects and symptoms.
- e. Physiologically, humans progressively adapt to imposed strains and stress, and with practice, any maneuver will have decreasing effect. Tolerance to G forces is dependent on human physiology and the individual pilot. These factors include the skeletal anatomy, the cardiovascular architecture, the nervous system, the quality of the blood, the general physical state, and experience and recency of exposure. The pilot should consult an Aviation Medical Examiner prior to aerobatic training and be aware that poor physical condition can reduce tolerance to accelerative forces.
- f. The above information provides pilots with a brief summary of the physiologic effects of G forces. It does not address methods of “counteracting” these effects. There are numerous references on the subject of G forces during aerobatics available to pilots. Among these are “G Effects on the Pilot During Aerobatics,”

FAA-AM-72-28, and “G Incapacitation in Aerobatic Pilots: A Flight Hazard” FAA-AM-82-13. These are available from the National Technical Information Service, Springfield, Virginia 22161.

REFERENCE—FAA AC 91-61, *A Hazard in Aerobatics: Effects of G-forces on Pilots*.

8-1-8 JUDGMENT ASPECTS OF COLLISION AVOIDANCE

- a. **Introduction.** The most important aspects of vision and the techniques to scan for other aircraft are described in paragraph 8-1-6, Vision in Flight. Pilots should also be familiar with the following information to reduce the possibility of mid-air collisions.
- b. **Determining Relative Altitude.** Use the horizon as a reference point. If the other aircraft is above the horizon, it is probably on a higher flight path. If the aircraft appears to be below the horizon, it is probably flying at a lower altitude.
- c. **Taking Appropriate Action.** Pilots should be familiar with rules on right-of-way, so if an aircraft is on an obvious collision course, one can take immediate evasive action, preferably in compliance with applicable Federal Aviation Regulations.
- d. **Consider Multiple Threats.** The decision to climb, descend, or turn is a matter of personal judgment, but one should anticipate that the other pilot may also be making a quick maneuver. Watch the other aircraft during the maneuver and begin your scanning again immediately since there may be other aircraft in the area.
- e. **Collision Course Targets.** Any aircraft that appears to have no relative motion and stays in one scan quadrant is likely to be on a collision course. Also, if a target shows no lateral or vertical motion, but increases in size, *take evasive action*.
- f. **Recognize High Hazard Areas.**
 - 1. Airways, especially near VORs, and Class B, Class C, Class D, and Class E surface areas are places where aircraft tend to cluster.

US 8-1

SECTION 1. FITNESS FOR FLIGHT

2. Remember, most collisions occur during days when the weather is good. Being in a “radar environment” still requires vigilance to avoid collisions.
- g. **Cockpit Management.** Studying maps, checklists, and manuals before flight, with other proper preflight planning; e.g., noting necessary radio frequencies and organizing cockpit materials, can reduce the amount of time required to look at these items during flight, permitting more scan time.
- h. **Windshield Conditions.** Dirty or bug- smeared windshields can greatly reduce the ability of pilots to see other aircraft. Keep a clean windshield.
- i. **Visibility Conditions.** Smoke, haze, dust, rain, and flying towards the sun can also greatly reduce the ability to detect targets.
- j. **Visual Obstructions in the Cockpit.**
1. Pilots need to move their heads to see around blind spots caused by fixed aircraft structures, such as door posts, wings, etc. It will be necessary at times to maneuver the aircraft; e.g., lift a wing, to facilitate seeing.
 2. Pilots must ensure curtains and other cockpit objects; e.g., maps on glare shield, are removed and stowed during flight.
- k. **Lights On.**
1. Day or night, use of exterior lights can greatly increase the conspicuity of any aircraft.
 2. Keep interior lights low at night.
- l. **ATC Support.** ATC facilities often provide radar traffic advisories on a workload-permitting basis. Flight through Class C and Class D airspace requires communication with ATC. Use this support whenever possible or when required.

PILOT/CONTROLLER GLOSSARY

A

PURPOSE

- a. This Glossary was compiled to promote a common understanding of the terms used in the Air Traffic Control system. It includes those terms which are intended for pilot/controller communications. Those terms most frequently used in pilot/controller communications are printed in ***bold italics***. The definitions are primarily defined in an operational sense applicable to both users and operators of the National Airspace System. Use of the Glossary will preclude any misunderstandings concerning the system's design, function, and purpose.
- b. Because of the international nature of flying, terms used in the Lexicon, published by the International Civil Aviation Organization (ICAO), are included when they differ from FAA definitions. These terms are followed by "[ICAO]." For the reader's convenience, there are also cross references to related terms in other parts of the Glossary and to other documents, such as the Code of Federal Regulations (CFR) and the Aeronautical Information Manual (AIM).
- c. This Glossary will be revised, as necessary, to maintain a common understanding of the system.

[The Jeppesen Airport Information Directory (J-AID) and other Jeppesen Publications. When Jeppesen uses specifications differently than those found in this glossary, the Jeppesen description is included in brackets [].]

[Most of the definitions included in this glossary are printed verbatim from the Pilot/Controller Glossary issued by the FAA. In a few cases Jeppesen has edited the original text to show its applicability to Jeppesen services. Many of the references included in the original FAA Pilot/Controller Glossary have been modified to enable the Jeppesen subscriber to find the applicable reference in his/her subscription. When reference is made to a specific section, this indicates that more detailed information may be found, but not necessarily under the same exact titles.]

AAR — (See AIRPORT ARRIVAL RATE.)

(See ADAPTED ROUTES.)

ABBREVIATED IFR FLIGHT PLANS — An authorization by ATC requiring pilots to submit only that information needed for the purpose of ATC. It includes only a small portion of the usual IFR flight plan information. In certain instances, this may be only aircraft identification, location, and pilot request. Other information may be requested if needed by ATC for separation/control purposes. It is frequently used by aircraft which are airborne and desire an instrument approach or by aircraft which are on the ground and desire a climb to VFR-on-top.

(See VFR-ON-TOP.)

(Refer to AIM.)

ABEAM — An aircraft is "abeam" a fix, point, or object when that fix, point, or object is approximately 90 degrees to the right or left of the aircraft track. Abeam indicates a general position rather than a precise point.

ABORT — To terminate a preplanned aircraft maneuver; e.g., an aborted takeoff.

ABRR — (See AIRBORNE REROUTE.)

PILOT/CONTROLLER GLOSSARY

A

ACC [ICAO] — (See ICAO term AREA CONTROL CENTER.)

ACCELERATE-STOP DISTANCE AVAILABLE — The runway plus stopway length declared available and suitable for the acceleration and deceleration of an airplane aborting a takeoff.

ACCELERATE-STOP DISTANCE AVAILABLE [ICAO] — The length of the take-off run available plus the length of the stopway if provided.

ACDO — (See AIR CARRIER DISTRICT OFFICE.)

ACKNOWLEDGE — Let me know that you have received and understood this message.

ACL — (See AIRCRAFT LIST.)

ACLS — (See AUTOMATIC CARRIER LANDING SYSTEM.)

ACROBATIC FLIGHT — An intentional maneuver involving an abrupt change in an aircraft's attitude, an abnormal attitude, or abnormal acceleration not necessary for normal flight.

(See ICAO term ACROBATIC FLIGHT.)

(Refer to 14 CFR Part 91.)

ACROBATIC FLIGHT [ICAO] — Maneuvers intentionally performed by an aircraft involving an abrupt change in its attitude, an abnormal attitude, or an abnormal variation in speed.

ACTIVE RUNWAY — (See RUNWAY IN USE/ACTIVE RUNWAY/DUTY RUNWAY.)

ACTUAL NAVIGATION PERFORMANCE (ANP) — (See REQUIRED NAVIGATION PERFORMANCE.)

ADAPTED ROUTES — Departure and/or arrival routes that are adapted in ARTCC ERAM computers to accomplish inter/intrafacility controller coordination and to ensure that flight data is posted at the proper control positions. Adapted routes are automatically applied to flight plans where appropriate. When the workload or traffic situation permits, controllers may provide radar vectors or assign requested routes to minimize circuitous routing. Adapted routes are usually confined to one ARTCC's area and are referred to by the following names or abbreviations:

- Adapted Arrival Route (AAR). A specific arrival route from an appropriate en route point to an airport or terminal area. It may be included in a Standard Terminal Arrival (STAR) or a Preferred IFR Route.
- Adapted Departure Route (ADR). A specific departure route from an airport or terminal area to an en route point where there is no further need for flow control. It may be included in an Instrument Departure Procedure (DP) or a Preferred IFR Route.
- Adapted Departure and Arrival Route (ADAR). A route between two terminals which are within or immediately adjacent to one ARTCC's area. ADARs are similar to Preferred IFR Routes and may share components, but they are not synonymous.

(See PREFERRED IFR ROUTES.)

ADAR — (See ADAPTED ROUTES.)

PILOT/CONTROLLER GLOSSARY

A

ADDITIONAL SERVICES — Advisory information provided by ATC which includes but is not limited to the following:

- a. Traffic advisories.
- b. Vectors, when requested by the pilot, to assist aircraft receiving traffic advisories to avoid observed traffic.
- c. Altitude deviation information of 300 feet or more from an assigned altitude as observed on a verified (reading correctly) automatic altitude readout (Mode C).
- d. Advisories that traffic is no longer a factor.
- e. Weather and chaff information.
- f. Weather assistance.
- g. Bird activity information.
- h. Holding pattern surveillance. Additional services are provided to the extent possible contingent only upon the controller's capability to fit them into the performance of higher priority duties and on the basis of limitations of the radar, volume of traffic, frequency congestion, and controller workload. The controller has complete discretion for determining if he/she is able to provide or continue to provide a service in a particular case. The controller's reason not to provide or continue to provide a service in a particular case is not subject to question by the pilot and need not be made known to him/her.

(See TRAFFIC ADVISORIES.)

(Refer to AIM.)

ADF — (See AUTOMATIC DIRECTION FINDER.)

ADIZ — (See AIR DEFENSE IDENTIFICATION ZONE.)

ADLY — (See ARRIVAL DELAY.)

ADMINISTRATOR — The Federal Aviation Administrator or any person to whom he/she has delegated his/her authority in the matter concerned.

ADR — (See ADAPTED ROUTES.)

(See AIRPORT DEPARTURE RATE.)

ADS [ICAO] — (See ICAO term AUTOMATIC DEPENDENT SURVEILLANCE.)

ADS-B — (See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST.)

ADS-C — (See AUTOMATIC DEPENDENT SURVEILLANCE-CONTRACT.)

ADVISE INTENTIONS — Tell me what you plan to do.

ADVISORY — Advice and information provided to assist pilots in the safe conduct of flight and aircraft movement.

(See ADVISORY SERVICE.)

PILOT/CONTROLLER GLOSSARY
A

ADVISORY FREQUENCY — The appropriate frequency to be used for Airport Advisory Service.

(See LOCAL AIRPORT ADVISORY.)

(See UNICOM.)

(Refer to ADVISORY CIRCULAR NO. 90-66.)

(Refer to AIM.)

ADVISORY SERVICE — Advice and information provided by a facility to assist pilots in the safe conduct of flight and aircraft movement.

(See ADDITIONAL SERVICES.)

(See LOCAL AIRPORT ADVISORY.)

(See RADAR ADVISORY.)

(See SAFETY ALERT.)

(See TRAFFIC ADVISORIES.)

(Refer to AIM.)

ADW — (See ARRIVAL DEPARTURE WINDOW.)

AERIAL REFUELING — A procedure used by the military to transfer fuel from one aircraft to another during flight.

(Refer to VFR/IFR Wall Planning Charts.)

AERODROME — A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure, and movement of aircraft.

AERODROME BEACON [ICAO] — Aeronautical beacon used to indicate the location of an aerodrome from the air.

AERODROME CONTROL SERVICE [ICAO] — Air traffic control service for aerodrome traffic.

AERODROME CONTROL TOWER [ICAO] — A unit established to provide air traffic control service to aerodrome traffic.

AERODROME ELEVATION [ICAO] — The elevation of the highest point of the landing area.

AERODROME TRAFFIC CIRCUIT [ICAO] — The specified path to be flown by aircraft operating in the vicinity of an aerodrome.

AERONAUTICAL BEACON — A visual NAVAID displaying flashes of white and/or colored light to indicate the location of an airport, a heliport, a landmark, a certain point of a Federal airway in mountainous terrain, or an obstruction.

(See AIRPORT ROTATING BEACON.)

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

A

AERONAUTICAL CHART — A map used in air navigation containing all or part of the following: topographic features, hazards and obstructions, navigation aids, navigation routes, designated airspace, and airports. Commonly used aeronautical charts are:

- a. Sectional Aeronautical Charts (1:500,000 — Designed for visual navigation of slow or medium speed aircraft. Topographic information on these charts features the portrayal of relief and a judicious selection of visual check points for VFR flight. Aeronautical information includes visual and radio aids to navigation, airports, controlled airspace, permanent special use airspace (SUA), obstructions, and related data.
- b. VFR Terminal Area Charts (1:250,000) — Depict Class B airspace which provides for the control or segregation of all the aircraft within Class B airspace. The chart depicts topographic information and aeronautical information which includes visual and radio aids to navigation, airports, controlled airspace, permanent SUA, obstructions, and related data.

[Jeppesen Class B Airspace Charts — Provide aeronautical information for orientation purposes by depicting airways and nav aids used to assist in determining the aircraft's position relative to the vertical and lateral limits of the Class B airspace. Also include flight procedures and VFR approach control frequencies for each Class B airspace. Charts are identified by the principal city and state using an index number of 10-1B.]

- c. En Route Low Altitude Charts — Provide aeronautical information for en route instrument navigation (IFR) in the low altitude stratum. Information includes the portrayal of airways, limits of controlled airspace, position identification and frequencies of radio aids, selected airports, minimum en route and minimum obstruction clearance altitudes, airway distances, reporting points, permanent SUA, and related data. Area charts, which are a part of this series, furnish terminal data at a larger scale in congested areas.
- d. En Route High Altitude Charts — Provide aeronautical information for en route instrument navigation (IFR) in the high altitude stratum. Information includes the portrayal of jet routes, identification and frequencies of radio aids, selected airports, distances, time zones, special use airspace, and related information.
- e. Instrument Approach Procedure (IAP) Charts — Portray the aeronautical data which is required to execute an instrument approach to an airport. These charts depict the procedures, including all related data, and the airport diagram. Each procedure is designated for use with a specific type of electronic navigation system including NDB, TACAN, VOR, ILS RNAV and GLS. These charts are identified by the type of navigational aid(s)/equipment required to provide final approach guidance.
- f. Instrument Departure Procedure (DP) Charts — Designed to expedite clearance delivery and to facilitate transition between takeoff and en route operations. Each DP is presented as a separate chart and may serve a single airport or more than one airport in a given geographical location.
- g. Standard Terminal Arrival (STAR) Charts — Designed to expedite air traffic control arrival procedures and to facilitate transition between en route and instrument approach operations. Each STAR procedure is presented as a separate chart and may serve a single airport or more than one airport in a given geographical location.

PILOT/CONTROLLER GLOSSARY

A

h. Airport Taxi Charts — Designed to expedite the efficient and safe flow of ground traffic at an airport. These charts are identified by the official airport name; e.g., Ronald Reagan Washington National Airport.

(See ICAO term AERONAUTICAL CHART.)

AERONAUTICAL CHART [ICAO] — A representation of a portion of the earth, its culture and relief, specifically designated to meet the requirements of air navigation.

AERONAUTICAL INFORMATION MANUAL (AIM) — A primary FAA publication whose purpose is to instruct airmen about operating in the National Airspace System of the U.S. It provides basic flight information, ATC Procedures and general instructional information concerning health, medical facts, factors affecting flight safety, accident and hazard reporting, and types of aeronautical charts and their use.

AERONAUTICAL INFORMATION PUBLICATION (AIP) [ICAO] — A publication issued by or with the authority of a State and containing aeronautical information of a lasting character essential to air navigation.

(See CHART SUPPLEMENT U.S.)

AERONAUTICAL INFORMATION SERVICES (AIS) — A facility in Silver Spring, MD, established by FAA to operate a central aeronautical information service for the collection, validation, and dissemination of aeronautical data in support of the activities of government, industry, and the aviation community. The information is published in the National Flight Data Digest.

(See NATIONAL FLIGHT DATA DIGEST.)

AFFIRMATIVE — Yes.

AFIS — (see AUTOMATIC FLIGHT INFORMATION SERVICE — ALASKA FSSs ONLY.)

AFP — (See AIRSPACE FLOW PROGRAM.)

AHA — (See AIRCRAFT HAZARD AREA.)

AIM — (See AERONAUTICAL INFORMATION MANUAL.)

AIP [ICAO] — (See ICAO term AERONAUTICAL INFORMATION PUBLICATION.)

AIR CARRIER DISTRICT OFFICE — An FAA field office serving an assigned geographical area, staffed with Flight Standards personnel serving the aviation industry and the general public on matters related to the certification and operation of scheduled air carriers and other large aircraft operations.

AIR DEFENSE EMERGENCY — A military emergency condition declared by a designated authority. This condition exists when an attack upon the continental U.S., Alaska, Canada, or U.S. installations in Greenland by hostile aircraft or missiles is considered probable, is imminent, or is taking place.

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

A

AIR DEFENSE IDENTIFICATION ZONE (ADIZ) — An area of airspace over land or water in which the ready identification, location, and control of all aircraft (except for Department of Defense and law enforcement aircraft) is required in the interest of national security.

NOTE: *ADIZ locations and operating and flight plan requirements for civil aircraft operations are specified in 14 CFR Part 99.*

(Refer to AIM/[Jeppesen Enroute pages].)

AIR NAVIGATION FACILITY — Any facility used in, available for use in, or designed for use in, aid of air navigation, including landing areas, lights, any apparatus or equipment for disseminating weather information, for signaling, for radio-directional finding, or for radio or other electrical communication, and any other structure or mechanism having a similar purpose for guiding or controlling flight in the air or the landing and takeoff of aircraft.

(See NAVIGATIONAL AID.)

AIR ROUTE SURVEILLANCE RADAR — Air route traffic control center (ARTCC) radar used primarily to detect and display an aircraft's position while en route between terminal areas. The ARSR enables controllers to provide radar air traffic control service when aircraft are within the ARSR coverage. In some instances, ARSR may enable an ARTCC to provide terminal radar services similar to but usually more limited than those provided by a radar approach control.

AIR ROUTE TRAFFIC CONTROL CENTER (ARTCC) — A facility established to provide air traffic control service to aircraft operating on IFR flight plans within controlled airspace and principally during the en route phase of flight. When equipment capabilities and controller workload permit, certain advisory/assistance services may be provided to VFR aircraft.

(See EN ROUTE AIR TRAFFIC CONTROL SERVICES.)

(Refer to AIM.)

AIR TAXI — Used to describe a helicopter/VTOL aircraft movement conducted above the surface but normally not above 100 feet AGL. The aircraft may proceed either via hover taxi or flight at speeds more than 20 knots. The pilot is solely responsible for selecting a safe airspeed/altitude for the operation being conducted.

(See HOVER TAXI.)

(Refer to AIM.)

AIR TRAFFIC — Aircraft operating in the air or on an airport surface, exclusive of loading ramps and parking areas.

(See ICAO term AIR TRAFFIC.)

AIR TRAFFIC [ICAO] — All aircraft in flight or operating on the maneuvering area of an aerodrome.

AIR TRAFFIC CLEARANCE — An authorization by air traffic control for the purpose of preventing collision between known aircraft, for an aircraft to proceed under specified traffic conditions within controlled airspace. The pilot-in-command of an aircraft may not deviate from the provisions of a visual flight rules (VFR) or instrument flight rules (IFR) air traffic clearance except in an

PILOT/CONTROLLER GLOSSARY

A

emergency or unless an amended clearance has been obtained. Additionally, the pilot may request a different clearance from that which has been issued by air traffic control (ATC) if information available to the pilot makes another course of action more practicable or if aircraft equipment limitations or company procedures forbid compliance with the clearance issued. Pilots may also request clarification or amendment, as appropriate, any time a clearance is not fully understood, or considered unacceptable because of safety of flight. Controllers should, in such instances and to the extent of operational practicality and safety, honor the pilot's request. 14 CFR Part 91.3(a) states: "The pilot in command of an aircraft is directly responsible for, and is the final authority as to, the operation of that aircraft." THE PILOT IS RESPONSIBLE TO REQUEST AN AMENDED CLEARANCE if ATC issues a clearance that would cause a pilot to deviate from a rule or regulation, or in the pilot's opinion, would place the aircraft in jeopardy.

(See ATC INSTRUCTIONS.)

(See ICAO term AIR TRAFFIC CONTROL CLEARANCE.)

AIR TRAFFIC CONTROL — A service operated by appropriate authority to promote the safe, orderly and expeditious flow of air traffic.

(See ICAO term AIR TRAFFIC CONTROL SERVICE.)

AIR TRAFFIC CONTROL CLEARANCE [ICAO] — Authorization for an aircraft to proceed under conditions specified by an air traffic control unit.

NOTE 1: For convenience, the term air traffic control clearance is frequently abbreviated to clearance when used in appropriate contexts.

NOTE 2: The abbreviated term clearance may be prefixed by the words taxi, takeoff, departure, en route, approach or landing to indicate the particular portion of flight to which the air traffic control clearance relates.

AIR TRAFFIC CONTROL SERVICE — (See AIR TRAFFIC CONTROL.)

AIR TRAFFIC CONTROL SERVICE [ICAO] — A service provided for the purpose of:

- a. Preventing collisions:
 1. Between aircraft; and
 2. On the maneuvering area between aircraft and obstructions.
- b. Expediting and maintaining an orderly flow of air traffic.

AIR TRAFFIC CONTROL SPECIALIST — A person authorized to provide air traffic control service.

(See AIR TRAFFIC CONTROL.)

(See FLIGHT SERVICE STATION.)

(See ICAO term CONTROLLER.)

AIR TRAFFIC CONTROL SYSTEM COMMAND CENTER (ATCSCC) — An Air Traffic Tactical Operations facility responsible for monitoring and managing the flow of air traffic throughout the

PILOT/CONTROLLER GLOSSARY

A

NAS, producing a safe, orderly, and expeditious flow of traffic while minimizing delays. The following functions are located at the ATCSCC:

- a. Central Altitude Reservation Function (CARF). Responsible for coordinating, planning, and approving special user requirements under the Altitude Reservation (ALTRV) concept.

(See ALTITUDE RESERVATION.)

- b. Airport Reservation Office (ARO). Monitors the operation and allocation of reservations for unscheduled operations at airports designated by the Administrator as High Density Airports. These airports are generally known as slot controlled airports. The ARO allocates reservations on a first come, first served basis determined by the time the request is received at the ARO.

(Refer to 14 CFR Part 93.)

(See CHART SUPPLEMENT U.S.)

[See Jeppesen Enroute pages.]

- c. U.S. Notice to Air Missions (NOTAM) Office. Responsible for collecting, maintaining, and distributing NOTAMs for the U.S. civilian and military, as well as international aviation communities.

(See NOTICE TO AIR MISSIONS.)

- d. Weather Unit. Monitor all aspects of weather for the U.S. that might affect aviation including cloud cover, visibility, winds, precipitation, thunderstorms, icing, turbulence, and more. Provide forecasts based on observations and on discussions with meteorologists from various National Weather Service offices, FAA facilities, airlines, and private weather services.
- e. Air Traffic Organization (ATO) Space Operations and Unmanned Aircraft System (UAS); the Office of Primary Responsibility (OPR) for all space and upper class E tactical operations in the National Airspace System (NAS).

AIR TRAFFIC SERVICE — A generic term meaning:

- a. Flight Information Service.
- b. Alerting Service.
- c. Air Traffic Advisory Service.
- d. Air Traffic Control Service:
 - 1. Area Control Service,
 - 2. Approach Control Service, or
 - 3. Airport Control Service.

AIR TRAFFIC SERVICE (ATS) ROUTES — The term “ATS Route” is a generic term that includes “VOR Federal airways,” “colored Federal airways,” “jet routes,” and “RNAV routes.” The term “ATS route” does not replace these more familiar route names, but serves only as an overall title when listing the types of routes that comprise the United States route structure.

PILOT/CONTROLLER GLOSSARY

A

AIRBORNE — An aircraft is considered airborne when all parts of the aircraft are off the ground.

AIRBORNE DELAY — Amount of delay to be encountered in airborne holding.

AIRBORNE REROUTE (ABRR) — A capability within the Traffic Flow Management System used for the timely development and implementation of tactical reroutes for airborne aircraft. This capability defines a set of aircraft-specific reroutes that address a certain traffic flow problem and then electronically transmits them to En Route Automation Modernization (ERAM) for execution by the appropriate sector controllers.

AIRCRAFT — Device(s) that are used or intended to be used for flight in the air, and when used in air traffic control terminology, may include the flight crew.

(See ICAO term AIRCRAFT.)

AIRCRAFT [ICAO] — Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

AIRCRAFT APPROACH CATEGORY — A grouping of aircraft based on a speed of 1.3 times the stall speed in the landing configuration at maximum gross landing weight. An aircraft must fit in only one category. If it is necessary to maneuver at speeds in excess of the upper limit of a speed range for the category, the minimums for the category for that speed must be used. For example, an aircraft which falls in Category A, but is circling to land at a speed in excess of 91 knots, should use the approach Category B minimums when circling to land. The categories are as follows:

- a. Category A — Speed less than 91 knots.
- b. Category B — Speed 91 knots or more but less than 121 knots.
- c. Category C — Speed 121 knots or more but less than 141 knots.
- d. Category D — Speed 141 knots or more but less than 166 knots.
- e. Category E — Speed 166 knots or more.

(Refer to 14 CFR Part 97.)

AIRCRAFT CLASSES — For the purposes of Wake Turbulence Separation Minima, ATC classifies aircraft as Super, Heavy, Large, and Small as follows:

- a. Super — The Airbus A-380-800 (A388) and the Antonov An-225 (A225) are classified as super.
- b. Heavy — Aircraft capable of takeoff weights of 300,000 pounds or more whether or not they are operating at this weight during a particular phase of flight.
- c. Large — Aircraft of more than 41,000 pounds, maximum certificated takeoff weight, up to but not including 300,000 pounds.
- d. Small — Aircraft of 41,000 pounds or less maximum certificated takeoff weight.

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

A

AIRCRAFT CONFLICT — Predicted conflict, within EDST of two aircraft, or between aircraft and airspace. A Red alert is used for conflicts when the predicted minimum separation is 5 nautical miles or less. A Yellow alert is used when the predicted minimum separation is between 5 and approximately 12 nautical miles. A Blue alert is used for conflicts between an aircraft and predefined airspace.

(See EN ROUTE DECISION SUPPORT TOOL.)

AIRCRAFT LIST (ACL) — A view available with EDST that lists aircraft currently in or predicted to be in a particular sector's airspace. The view contains textual flight data information in line format and may be sorted into various orders based on the specific needs of the sector team.

(See EN ROUTE DECISION SUPPORT TOOL.)

AIRCRAFT SURGE LAUNCH AND RECOVERY — Procedures used at USAF bases to provide increased launch and recovery rates in instrument flight rules conditions. ASLAR is based on:

- a. Reduced separation between aircraft which is based on time or distance. Standard arrival separation applies between participants including multiple flights until the DRAG point. The DRAG point is a published location on an ASLAR approach where aircraft landing second in a formation slows to a predetermined airspeed. The DRAG point is the reference point at which MARSA applies as expanding elements effect separation within a flight or between subsequent participating flights.
- b. ASLAR procedures shall be covered in a Letter of Agreement between the responsible USAF military ATC facility and the concerned Federal Aviation Administration facility. Initial Approach Fix spacing requirements are normally addressed as a minimum.

AIRCRAFT HAZARD AREA (AHA) — Used by ATC to segregate air traffic from a launch vehicle, reentry vehicle, amateur rocket, jettisoned stages, hardware, or falling debris generated by failures associated with any of these activities. An AHA is designated via NOTAM as either a TFR or stationary ALTRV. Unless otherwise specified, the vertical limits of an AHA are from the surface to unlimited.

(See CONTINGENCY HAZARD AREA.)

(See REFINED HAZARD AREA.)

(See TRANSITIONAL HAZARD AREA.)

AIRCRAFT WAKE TURBULENCE CATEGORIES — For the purpose of Wake Turbulence Recategorization (RECAT) Separation Minima, ATC groups aircraft into categories ranging from Category A through Category I, dependent upon the version of RECAT that is applied. Specific category assignments vary and are listed in the RECAT Orders.

AIRMEN'S METEOROLOGICAL INFORMATION (AIRMET) — In-flight weather advisories issued only to amend the Aviation Surface Forecast, Aviation Cloud Forecast, or area forecast concerning weather phenomena which are of operational interest to all aircraft and potentially hazardous to aircraft having limited capability because of lack of equipment, instrumentation, or pilot qualifications. AIRMETs concern weather of less severity than that covered by SIGMETs or Convective SIGMETs. AIRMETs cover moderate icing, moderate turbulence, sustained winds of

PILOT/CONTROLLER GLOSSARY

A

30 knots or more at the surface, widespread areas of ceilings less than 1,000 feet and/or visibility less than 3 miles, and extensive mountain obscurement.

(See AWW.)

(See CONVECTIVE SIGMET.)

(See CWA.)

(See SAW.)

(See SIGMET.)

(Refer to AIM.)

AIRPORT — An area on land or water that is used or intended to be used for the landing and takeoff of aircraft and includes its buildings and facilities, if any.

AIRPORT ADVISORY AREA — The area within ten miles of an airport without a control tower or where the tower is not in operation, and on which a Flight Service Station is located.

(See LOCAL AIRPORT ADVISORY.)

(Refer to AIM.)

AIRPORT ARRIVAL RATE (AAR) — A dynamic input parameter specifying the number of arriving aircraft which an airport or airspace can accept from the ARTCC per hour. The AAR is used to calculate the desired interval between successive arrival aircraft.

AIRPORT DEPARTURE RATE (ADR) — A dynamic parameter specifying the number of aircraft which can depart an airport and the airspace can accept per hour.

AIRPORT ELEVATION — The highest point of an airport's usable runways measured in feet from mean sea level.

(See TOUCHDOWN ZONE ELEVATION.)

(See ICAO term AERODROME ELEVATION.)

AIRPORT LIGHTING — Various lighting aids that may be installed on an airport. Types of airport lighting include:

- a. **Approach Light System (ALS)** — An airport lighting facility which provides visual guidance to landing aircraft by radiating light beams in a directional pattern by which the pilot aligns the aircraft with the extended centerline of the runway on his/her final approach for landing. Condenser-Discharge Sequential Flashing Lights/Sequenced Flashing Lights may be installed in conjunction with the ALS at some airports.

Types of Approach Light Systems are:

1. **ALSF-1** — Approach Light System with Sequenced Flashing Lights in ILS Cat-I configuration.
2. **ALSF-2** — Approach Light System with Sequenced Flashing Lights in ILS Cat-II configuration. The ALSF-2 may operate as an SSALR when weather conditions permit.

PILOT/CONTROLLER GLOSSARY

A

3. SSALF — Simplified Short Approach Light System with Sequenced Flashing Lights.
4. SSALR — Simplified Short Approach Light System with Runway Alignment Indicator Lights.
5. MALSF — Medium Intensity Approach Light System with Sequenced Flashing Lights.
6. MALSR — Medium Intensity Approach Light System with Runway Alignment Indicator Lights.
7. RLLS — Runway Lead-in Light System — Consists of one or more series of flashing lights installed at or near ground level that provides positive visual guidance along an approach path, either curving or straight, where special problems exist with hazardous terrain, obstructions, or noise abatement procedures.
8. RAIL — Runway Alignment Indicator Lights — Sequenced Flashing Lights which are installed only in combination with other light systems.
9. ODALS — Omnidirectional Approach Lighting System consists of seven omnidirectional flashing lights located in the approach area of a nonprecision runway. Five lights are located on the runway centerline extended with the first light located 300 feet from the threshold and extending at equal intervals up to 1,500 feet from the threshold. The other two lights are located, one on each side of the runway threshold, at a lateral distance of 40 feet from the runway edge, or 75 feet from the runway edge when installed on a runway equipped with a VASI.

(Refer to FAA Order JO 6850.2, VISUAL GUIDANCE LIGHTING SYSTEMS.)

- b. Runway Lights/Runway Edge Lights — Lights having a prescribed angle of emission used to define the lateral limits of a runway. Runway lights are uniformly spaced at intervals of approximately 200 feet, and the intensity may be controlled or preset.
- c. Touchdown Zone Lighting — Two rows of transverse light bars located symmetrically about the runway centerline normally at 100 foot intervals. The basic system extends 3,000 feet along the runway.
- d. Runway Centerline Lighting — Flush centerline lights spaced at 50-foot intervals beginning 75 feet from the landing threshold and extending to within 75 feet of the opposite end of the runway.
- e. Threshold Lights — Fixed green lights arranged symmetrically left and right of the runway centerline, identifying the runway threshold.
- f. Runway End Identifier Lights (REIL) — Two synchronized flashing lights, one on each side of the runway threshold, which provide rapid and positive identification of the approach end of a particular runway.
- g. Visual Approach Slope Indicator (VASI) — An airport lighting facility providing vertical visual approach slope guidance to aircraft during approach to landing by radiating a directional pattern of high intensity red and white focused light beams which indicate to the pilot that he/she is “on path” if he/she sees red/white, “above path” if white/white, and “below path” if red/red.

PILOT/CONTROLLER GLOSSARY

A

Some airports serving large aircraft have three-bar Basis which provide two visual glide paths to the same runway.

- h. Precision Approach Path Indicator (PAPI) — An airport lighting facility, similar to VASI, providing vertical approach slope guidance to aircraft during approach to landing. PAPIs consist of a single row of either two or four lights, normally installed on the left side of the runway, and have an effective visual range of about 5 miles during the day and up to 20 miles at night. PAPIs radiate a directional pattern of high intensity red and white focused light beams which indicate that the pilot is “on path” if the pilot sees an equal number of white lights and red lights, with white to the left of the red; “above path” if the pilot sees more white than red lights; and “below path” if the pilot sees more red than white lights.

- i. Boundary Lights — Lights defining the perimeter of an airport or landing area.

(Refer to AIM.)

AIRPORT MARKING AIDS — Markings used on runway and taxiway surfaces to identify a specific runway, a runway threshold, a centerline, a hold line, etc. A runway should be marked in accordance with its present usage such as:

- a. Visual.
- b. Nonprecision instrument.
- c. Precision instrument.

(Refer to AIM.)

AIRPORT REFERENCE POINT (ARP) — The approximate geometric center of all usable runway surfaces.

AIRPORT RESERVATION OFFICE — Office responsible for monitoring the operation of slot controlled airports. It receives and processes requests for unscheduled operations at slot controlled airports.

AIRPORT ROTATING BEACON — A visual NAVAID operated at many airports. At civil airports, alternating white and green flashes indicate the location of the airport. At military airports, the beacons flash alternately white and green, but are differentiated from civil beacons by duplexed (two quick) white flashes between the green flashes.

(See INSTRUMENT FLIGHT RULES.)

(See SPECIAL VFR OPERATIONS.)

(See ICAO term AERODROME BEACON.)

(Refer to AIM.)

AIRPORT SURFACE DETECTION EQUIPMENT (ASDE) — Surveillance equipment specifically designed to detect aircraft, vehicular traffic, and other objects, on the surface of an airport, and to present the image on a tower display. Used to augment visual observation by tower personnel of aircraft and/or vehicular movements on runways and taxiways. There are three ASDE systems deployed in the NAS:

PILOT/CONTROLLER GLOSSARY

A

- a. ASDE-3 — A Surface Movement Radar.
- b. ASDE-X — A system that uses an X-band Surface Movement Radar, multilateration, and ADS-B.
- c. Airport Surface Surveillance Capability (ASSC) — A system that uses Surface Movement Radar, multilateration, and ADS-B.

AIRPORT SURVEILLANCE RADAR — Approach control radar used to detect and display an aircraft's position in the terminal area. ASR provides range and azimuth information but does not provide elevation data. Coverage of the ASR can extend up to 60 miles.

AIRPORT TAXI CHARTS — (See AERONAUTICAL CHART.)

AIRPORT TRAFFIC CONTROL SERVICE — A service provided by a control tower for aircraft operating on the movement area and in the vicinity of an airport.

(See MOVEMENT AREA.)

(See TOWER.)

(See ICAO term AERODROME CONTROL SERVICE.)

AIRPORT TRAFFIC CONTROL TOWER — (See TOWER.)

AIRSPACE CONFLICT — Predicted conflict of an aircraft and active Special Activity Airspace (SAA).

AIRSPACE FLOW PROGRAM (AFP) — AFP is a Traffic Management (TM) process administered by the Air Traffic Control System Command Center (ATCSCC) where aircraft are assigned an Expect Departure Clearance Time (EDCT) in order to manage capacity and demand for a specific area of the National Airspace System (NAS). The purpose of the program is to mitigate the effects of enroute constraints. It is a flexible program and may be implemented in various forms depending upon the needs of the air traffic system.

AIRSPACE HIERARCHY — Within the airspace classes, there is a hierarchy and, in the event of an overlap of airspace: Class A preempts Class B, Class B preempts Class C, Class C preempts Class D, Class D preempts Class E, and Class E preempts Class G.

AIRSPEED — The speed of an aircraft relative to its surrounding air mass. The unqualified term “airspeed” means one of the following:

- a. Indicated Airspeed — The speed shown on the aircraft airspeed indicator. This is the speed used in pilot/controller communications under the general term “airspeed.”

(Refer to 14 CFR Part 1.)

- b. True Airspeed — The airspeed of an aircraft relative to undisturbed air. Used primarily in flight planning and en route portion of flight. When used in pilot/controller communications, it is referred to as “true airspeed” and not shortened to “airspeed.”

AIRSPACE RESERVATION — The term used in oceanic ATC for airspace utilization under prescribed conditions normally employed for the mass movement of aircraft or other special user

PILOT/CONTROLLER GLOSSARY

A

requirements which cannot otherwise be accomplished. Airspace reservations must be classified as either “moving” or “stationary.”

(See MOVING AIRSPACE RESERVATION.)

(See STATIONARY AIRSPACE RESERVATION.)

(See ALTITUDE RESERVATION.)

AIRSTART — The starting of an aircraft engine while the aircraft is airborne, preceded by engine shutdown during training flights or by actual engine failure.

AIRWAY — A Class E airspace area established in the form of a corridor, the centerline of which is defined by radio navigational aids.

(See FEDERAL AIRWAYS.)

(See ICAO term AIRWAY.)

(Refer to 14 CFR Part 71, [published in graphic form on Jeppesen Enroute charts].)

(Refer to AIM.)

AIRWAY [ICAO] — A control area or portion thereof established in the form of corridor equipped with radio navigational aids.

AIRWAY BEACON — Used to mark airway segments in remote mountain areas. The light flashes Morse Code to identify the beacon site.

(Refer to AIM.)

AIS — (See AERONAUTICAL INFORMATION SERVICES.)

AIT — (See AUTOMATED INFORMATION TRANSFER.)

ALERFA (Alert Phase) [ICAO] — A situation wherein apprehension exists as to the safety of an aircraft and its occupants.

ALERT — A notification to a position that there is an aircraft-to-aircraft or aircraft-to-airspace conflict, as detected by Automated Problem Detection (APD).

ALERT AREA — (See SPECIAL USE AIRSPACE.)

ALERT NOTICE (ALNOT) — A request originated by a flight service station (FSS) or an air route traffic control center (ARTCC) for an extensive communication search for overdue, unreported, or missing aircraft.

ALERTING SERVICE — A service provided to notify appropriate organizations regarding aircraft in need of search and rescue aid and assist such organizations as required.

ALNOT — (See ALERT NOTICE.)

ALONG-TRACK DISTANCE (ATD) — The horizontal distance between the aircraft's current position and a fix measured by an area navigation system that is not subject to slant range errors.

ALPHANUMERIC DISPLAY — Letters and numerals used to show identification, altitude, beacon code, and other information concerning a target on a radar display.

PILOT/CONTROLLER GLOSSARY
A

(See AUTOMATED RADAR TERMINAL SYSTEMS.)

ALTERNATE AERODROME [ICAO] — An aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or to land at the aerodrome of intended landing.

NOTE: *The aerodrome from which a flight departs may also be an en route or a destination alternate aerodrome for the flight.*

ALTERNATE AIRPORT — An airport at which an aircraft may land if a landing at the intended airport becomes inadvisable.

(See ICAO term ALTERNATE AERODROME.)

ALTIMETER SETTING — The barometric pressure reading used to adjust a pressure altimeter for variations in existing atmospheric pressure or to the standard altimeter setting (29.92).

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

ALTITUDE — The height of a level, point, or object measured in feet Above Ground Level (AGL) or from Mean Sea Level (MSL).

(See FLIGHT LEVEL.)

- a. MSL Altitude — Altitude expressed in feet measured from mean sea level.
- b. AGL Altitude — Altitude expressed in feet measured above ground level.
- c. Indicated Altitude — The altitude as shown by an altimeter. On a pressure or barometric altimeter it is altitude as shown uncorrected for instrument error and uncompensated for variation from standard atmospheric conditions.

(See ICAO term ALTITUDE.)

ALTITUDE [ICAO] — The vertical distance of a level, a point or an object considered as a point, measured from mean sea level (MSL).

ALTITUDE READOUT — An aircraft's altitude, transmitted via the Mode C transponder feature, that is visually displayed in 100-foot increments on a radar scope having readout capability.

(See ALPHANUMERIC DISPLAY.)

(See AUTOMATED RADAR TERMINAL SYSTEMS.)

(Refer to AIM.)

ALTITUDE RESERVATION (ALTRV) — Airspace utilization under prescribed conditions normally employed for the mass movement of aircraft or other special user requirements which cannot otherwise be accomplished. ALTRVs are approved by the appropriate FAA facility. ALTRVs must be classified as either "moving" or "stationary."

(See MOVING ALTITUDE RESERVATION.)

(See STATIONARY ALTITUDE RESERVATION.)

PILOT/CONTROLLER GLOSSARY
A

(See AIR TRAFFIC CONTROL SYSTEM COMMAND CENTER.)

ALTITUDE RESTRICTION — An altitude or altitudes, stated in the order flown, which are to be maintained until reaching a specific point or time. Altitude restrictions may be issued by ATC due to traffic, terrain, or other airspace considerations.

ALTITUDE RESTRICTIONS ARE CANCELED — Adherence to previously imposed altitude restrictions is no longer required during a climb or descent.

ALTRV — (See ALTITUDE RESERVATION.)

AMVER — (See AUTOMATED MUTUAL-ASSISTANCE VESSEL RESCUE SYSTEM.)

APB — (See AUTOMATED PROBLEM DETECTION BOUNDARY.)

APD — (See AUTOMATED PROBLEM DETECTION.)

APDIA — (See AUTOMATED PROBLEM DETECTION INHIBITED AREA.)

APPROACH CLEARANCE — Authorization by ATC for a pilot to conduct an instrument approach. The type of instrument approach for which a clearance and other pertinent information is provided in the approach clearance when required.

(See CLEARED APPROACH.)

(See INSTRUMENT APPROACH PROCEDURE.)

(Refer to AIM.)

(Refer to 14 CFR Part 91.)

APPROACH CONTROL FACILITY — A terminal ATC facility that provides approach control service in a terminal area.

(See APPROACH CONTROL SERVICE.)

(See RADAR APPROACH CONTROL FACILITY.)

APPROACH CONTROL SERVICE — Air traffic control service provided by an approach control facility for arriving and departing VFR/IFR aircraft and, on occasion, en route aircraft. At some airports not served by an approach control facility, the ARTCC provides limited approach control service.

(See ICAO term APPROACH CONTROL SERVICE.)

(Refer to AIM.)

APPROACH CONTROL SERVICE [ICAO] — Air traffic control service for arriving or departing controlled flights.

APPROACH GATE — An imaginary point used within ATC as a basis for vectoring aircraft to the final approach course. The gate will be established along the final approach course 1 mile from the final approach fix on the side away from the airport and will be no closer than 5 miles from the landing threshold.

PILOT/CONTROLLER GLOSSARY

A

APPROACH/DEPARTURE HOLD AREA — The locations on taxiways in the approach or departure areas of a runway designated to protect landing or departing aircraft. These locations are identified by signs and markings.

APPROACH LIGHT SYSTEM — (See AIRPORT LIGHTING.)

APPROACH SEQUENCE — The order in which aircraft are positioned while on approach or awaiting approach clearance.

(See LANDING SEQUENCE.)

(See ICAO term APPROACH SEQUENCE.)

APPROACH SEQUENCE [ICAO] — The order in which two or more aircraft are cleared to approach to land at the aerodrome.

APPROACH SPEED — The recommended speed contained in aircraft manuals used by pilots when making an approach to landing. This speed will vary for different segments of an approach as well as for aircraft weight and configuration.

APPROACH WITH VERTICAL GUIDANCE (APV) — A term used to describe RNAV approach procedures that provide lateral and vertical guidance but do not meet the requirements to be considered a precision approach.

APPROPRIATE ATS AUTHORITY [ICAO] — The relevant authority designated by the State responsible for providing air traffic services in the airspace concerned. In the United States, the “appropriate ATS authority” is the Program Director for Air Traffic Planning and Procedures, ATP-1.

APPROPRIATE AUTHORITY —

- a. Regarding flight over the high seas: the relevant authority is the State of Registry.
- b. Regarding flight over other than the high seas: the relevant authority is the State having sovereignty over the territory being overflown.

APPROPRIATE OBSTACLE CLEARANCE MINIMUM ALTITUDE — Any of the following:

(See MINIMUM EN ROUTE ALTITUDE.)

(See MINIMUM IFR ALTITUDE.)

(See MINIMUM OBSTRUCTION CLEARANCE ALTITUDE.)

(See MINIMUM VECTORING ALTITUDE.)

APPROPRIATE TERRAIN CLEARANCE MINIMUM ALTITUDE — Any of the following:

(See MINIMUM EN ROUTE ALTITUDE.)

(See MINIMUM IFR ALTITUDE.)

(See MINIMUM OBSTRUCTION CLEARANCE ALTITUDE.)

(See MINIMUM VECTORING ALTITUDE.)

PILOT/CONTROLLER GLOSSARY

A

APRON — A defined area on an airport or heliport intended to accommodate aircraft for purposes of loading or unloading passengers or cargo, refueling, parking, or maintenance. With regard to seaplanes, a ramp is used for access to the apron from the water.

(See ICAO term APRON.)

APRON [ICAO] — A defined area, on a land aerodrome, intended to accommodate aircraft for purposes of loading or unloading passengers, mail or cargo, refueling, parking or maintenance.

ARC — The track over the ground of an aircraft flying at a constant distance from a navigational aid by reference to distance measuring equipment (DME).

AREA CONTROL CENTER [ICAO] — An air traffic control facility primarily responsible for ATC services being provided IFR aircraft during the en route phase of flight. The U.S. equivalent facility is an air route traffic control center (ARTCC).

AREA NAVIGATION (RNAV) — A method of navigation which permits aircraft operation on any desired flight path within the coverage of ground- or space-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

NOTE: *Area navigation includes performance-based navigation as well as other operations that do not meet the definition of performance-based navigation.*

AREA NAVIGATION (RNAV) APPROACH CONFIGURATION —

- a. **STANDARD T** — An RNAV approach whose design allows direct flight to any one of three initial approach fixes (IAF) and eliminates the need for procedure turns. The standard design is to align the procedure on the extended centerline with the missed approach point (MAP) at the runway threshold, the final approach fix (FAF), and the initial approach/intermediate fix (IAF/IF). The other two IAFs will be established perpendicular to the IF.
- b. **MODIFIED T** — An RNAV approach design for single or multiple runways where terrain or operational constraints do not allow for the standard T. The “T” may be modified by increasing or decreasing the angle from the corner IAF(s) to the IF or by eliminating one or both corner IAFs.
- c. **STANDARD I** — An RNAV approach design for a single runway with both corner IAFs eliminated. Course reversal or radar vectoring may be required at busy terminals with multiple runways.
- d. **TERMINAL ARRIVAL AREA (TAA)** — The TAA is controlled airspace established in conjunction with the Standard or Modified T and I RNAV approach configurations. In the standard TAA, there are three areas: straight-in, left base, and right base. The arc boundaries of the three areas of the TAA are published portions of the approach and allow aircraft to transition from the en route structure direct to the nearest IAF. TAAs will also eliminate or reduce feeder routes, departure extensions, and procedure turns or course reversal.

1. **STRAIGHT-IN AREA** — A 30 NM arc centered on the IF bounded by a straight line extending through the IF perpendicular to the intermediate course.

PILOT/CONTROLLER GLOSSARY

A

2. **LEFT BASE AREA** — A 30 NM arc centered on the right corner IAF. The area shares a boundary with the straight-in area except that it extends out for 30 NM from the IAF and is bounded on the other side by a line extending from the IF through the FAF to the arc.
3. **RIGHT BASE AREA** — A 30 NM arc centered on the left corner IAF. The area shares a boundary with the straight-in area except that it extends out for 30 NM from the IAF and is bounded on the other side by a line extending from the IF through the FAF to the arc.

AREA NAVIGATION (RNAV) GLOBAL POSITIONING SYSTEM (GPS) PRECISION RUNWAY MONITORING (PRM) APPROACH — A GPS approach, which requires vertical guidance, used in lieu of another type of PRM approach to conduct approaches to parallel runways whose extended centerlines are separated by less than 4,300 feet and at least 3,000 feet, where simultaneous close parallel approaches are permitted. Also used in lieu of an ILS PRM and/or LDA PRM approach to conduct Simultaneous Offset Instrument Approach (SOIA) operations.

ARMY AVIATION FLIGHT INFORMATION BULLETIN — A bulletin that provides air operation data covering Army, National Guard, and Army Reserve aviation activities.

ARO — (See AIRPORT RESERVATION OFFICE.)

ARRESTING SYSTEM — A safety device consisting of two major components, namely, engaging or catching devices and energy absorption devices for the purpose of arresting both tailhook and/or nontailhook-equipped aircraft. It is used to prevent aircraft from overrunning runways when the aircraft cannot be stopped after landing or during aborted takeoff. Arresting systems have various names; e.g., arresting gear, hook device, wire barrier cable.

(See ABORT.)

(Refer to AIM.)

ARRIVAL CENTER — The ARTCC having jurisdiction for the impacted airport.

ARRIVAL DELAY — A parameter which specifies a period of time in which no aircraft will be metered for arrival at the specified airport.

ARRIVAL/DEPARTURE WINDOW (ADW) — A depiction presented on an air traffic control display, used by the controller to prevent possible conflicts between arrivals to, and departures from, a runway. The ADW identifies that point on the final approach course by which a departing aircraft must have begun takeoff.

ARRIVAL SECTOR (En Route) — An operational control sector containing one or more meter fixes on or near the TRACON boundary.

ARRIVAL TIME — The time an aircraft touches down on arrival.

ARSR — (See AIR ROUTE SURVEILLANCE RADAR.)

ARTCC — (See AIR ROUTE TRAFFIC CONTROL CENTER.)

ASDA — (See ACCELERATE-STOP DISTANCE AVAILABLE.)

ASDA [ICAO] — (See ICAO Term ACCELERATE-STOP DISTANCE AVAILABLE.)

ASDE — (See AIRPORT SURFACE DETECTION EQUIPMENT.)

PILOT/CONTROLLER GLOSSARY

A

ASLAR — (See AIRCRAFT SURGE LAUNCH AND RECOVERY.)

ASR — (See AIRPORT SURVEILLANCE RADAR.)

ASR APPROACH — (See SURVEILLANCE APPROACH.)

ASSOCIATED — A radar target displaying a data block with flight identification and altitude information.

(See UNASSOCIATED.)

ATC — (See AIR TRAFFIC CONTROL.)

ATC ADVISES — Used to prefix a message of noncontrol information when it is relayed to an aircraft by other than an air traffic controller.

(See ADVISORY.)

ATC ASSIGNED AIRSPACE — Airspace of defined vertical/lateral limits, assigned by ATC, for the purpose of providing air traffic segregation between the specified activities being conducted within the assigned airspace and other IFR air traffic.

(See SPECIAL USE AIRSPACE.)

ATC CLEARANCE — (See AIR TRAFFIC CLEARANCE.)

ATC CLEARS — Used to prefix an ATC clearance when it is relayed to an aircraft by other than an air traffic controller.

ATC INSTRUCTIONS — Directives issued by air traffic control for the purpose of requiring a pilot to take specific actions; e.g., "Turn left heading two five zero," "Go around," "Clear the runway."

(Refer to 14 CFR Part 91.)

ATC PREFERRED ROUTE NOTIFICATION — EDST notification to the appropriate controller of the need to determine if an ATC preferred route needs to be applied, based on destination airport.

(See ROUTE ACTION NOTIFICATION.)

(See EN ROUTE DECISION SUPPORT TOOL.)

ATC PREFERRED ROUTES — Preferred routes that are not automatically applied by Host.

ATC REQUESTS — Used to prefix an ATC request when it is relayed to an aircraft by other than an air traffic controller.

ATC SECURITY SERVICES — Communications and security tracking provided by an ATC facility in support of the DHS, the DOD, or other Federal security elements in the interest of national security. Such security services are only applicable within designated areas. ATC security services do not include ATC basic radar services or flight following.

ATC SECURITY SERVICES POSITION — The position responsible for providing ATC security services as defined. This position does not provide ATC, IFR separation, or VFR flight following services, but is responsible for providing security services in an area comprising airspace assigned to one or more ATC operating sectors. This position may be combined with control positions.

PILOT/CONTROLLER GLOSSARY

A

ATC SECURITY TRACKING — The continuous tracking of aircraft movement by an ATC facility in support of the DHS, the DOD, or other security elements for national security using radar (i.e., radar tracking) or other means (e.g., manual tracking) without providing basic radar services (including traffic advisories) or other ATC services not defined in this section.

ATC SURVEILLANCE SOURCE — Used by ATC for establishing identification, control and separation using a target depicted on an air traffic control facility's video display that has met the relevant safety standards for operational use and received from one, or a combination, of the following surveillance sources:

- a. Radar (See RADAR.)
- b. ADS-B (See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST.)
- c. WAM (See WIDE AREA MULTILATERATION.)
(See INTERROGATOR.)
(See TRANSPONDER.)
(See ICAO term RADAR.)
(Refer to AIM.)

ATS SURVEILLANCE SERVICE [ICAO] — A term used to indicate a service provided directly by means of an ATS surveillance system.

ATS SURVEILLANCE SYSTEM [ICAO] — A generic term meaning variously, ADS-B, PSR, SSR or any comparable ground-based system that enables the identification of aircraft.

NOTE: *A comparable ground-based system is one that has been demonstrated, by comparative assessment or other methodology, to have a level of safety and performance equal to or better than monopulse SSR.*

ATCAA — (See ATC ASSIGNED AIRSPACE.)

ATCRBS — (See RADAR.)

ATCSCC — (See AIR TRAFFIC CONTROL SYSTEM COMMAND CENTER.)

ATCT — (See TOWER.)

ATD — (See ALONG-TRACK DISTANCE.)

ATIS — (See AUTOMATIC TERMINAL INFORMATION SERVICE.)

ATIS [ICAO] — (See ICAO Term AUTOMATIC TERMINAL INFORMATION SERVICE.)

ATPA — (See AUTOMATED TERMINAL PROXIMITY ALERT.)

ATS ROUTE [ICAO] — A specified route designed for channeling the flow of traffic as necessary for the provision of air traffic services.

NOTE: *The term "ATS Route" is used to mean variously, airway, advisory route, controlled or uncontrolled route, arrival or departure, etc.*

PILOT/CONTROLLER GLOSSARY

A

ATTENTION ALL USERS PAGE (AAUP) — The AAUP provides the pilot with additional information relative to conducting a specific operation, for example, PRM approaches and RNAV departures.

AUTOLAND APPROACH — An autoland system aids by providing control of aircraft systems during a precision instrument approach to at least decision altitude and possibly all the way to touchdown, as well as in some cases, through the landing rollout. The autoland system is a subsystem of the autopilot system from which control surface management occurs. The aircraft autopilot sends instructions to the autoland system and monitors the autoland system performance and integrity during its execution.

AUTOMATED EMERGENCY DESCENT — (See EMERGENCY DESCENT MODE.)

AUTOMATED INFORMATION TRANSFER (AIT) — A precoordinated process, specifically defined in facility directives, during which a transfer of altitude control and/or radar identification is accomplished without verbal coordination between controllers using information communicated in a full data block.

AUTOMATED MUTUAL-ASSISTANCE VESSEL RESCUE SYSTEM — A facility which can deliver, in a matter of minutes, a surface picture (SURPIC) of vessels in the area of a potential or actual search and rescue incident, including their predicted positions and their characteristics.

(See FAA Order JO 7110.65, Para 10-6-4, INFLIGHT CONTINGENCIES.)

AUTOMATED PROBLEM DETECTION (APD) — An Automation Processing capability that compares trajectories in order to predict conflicts.

AUTOMATED PROBLEM DETECTION BOUNDARY (APB) — The adapted distance beyond a facilities boundary defining the airspace within which EDST performs conflict detection.

(See EN ROUTE DECISION SUPPORT TOOL.)

AUTOMATED PROBLEM DETECTION INHIBITED AREA (APDIA) — Airspace surrounding a terminal area within which APD is inhibited for all flights within that airspace.

AUTOMATED TERMINAL PROXIMITY ALERT (ATPA) — Monitors the separation of aircraft on the Final Approach Course (FAC), displaying a graphical notification (cone and/or mileage) when a potential loss of separation is detected. The warning cone (Yellow) will display at 45 seconds and the alert cone (Red) will display at 24 seconds prior to predicted loss of separation. Current distance between two aircraft on final will be displayed in line 3 of the full data block of the trailing aircraft in corresponding colors.

AUTOMATED WEATHER SYSTEM — Any of the automated weather sensor platforms that collect weather data at airports and disseminate the weather information via radio and/or landline. The systems currently consist of the Automated Surface Observing System (ASOS) and Automated Weather Observation System (AWOS).

AUTOMATED UNICOM — Provides completely automated weather, radio check capability and airport advisory information on an Automated UNICOM system. These systems offer a variety of features, typically selectable by microphone clicks, on the UNICOM frequency. Availability will be published in the Chart Supplement U.S. and approach charts.

PILOT/CONTROLLER GLOSSARY
A

AUTOMATIC ALTITUDE REPORT — (See ALTITUDE READOUT.)

AUTOMATIC ALTITUDE REPORTING — That function of a transponder which responds to Mode C interrogations by transmitting the aircraft's altitude in 100-foot increments.

AUTOMATIC CARRIER LANDING SYSTEM — U.S. Navy final approach equipment consisting of precision tracking radar coupled to a computer data link to provide continuous information to the aircraft, monitoring capability to the pilot, and a backup approach system.

AUTOMATIC DEPENDENT SURVEILLANCE (ADS) [ICAO] — A surveillance technique in which aircraft automatically provide, via a data link, data derived from on-board navigation and position fixing systems, including aircraft identification, four dimensional position and additional data as appropriate

AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST (ADS-B) — A surveillance system in which an aircraft or vehicle to be detected is fitted with cooperative equipment in the form of a data link transmitter. The aircraft or vehicle periodically broadcasts its GNSS-derived position and other required information such as identity and velocity, which is then received by a ground-based or space-based receiver for processing and display at an air traffic control facility, as well as by suitably equipped aircraft.

(See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST IN.)

(See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST OUT.)

(See COOPERATIVE SURVEILLANCE.)

(See GLOBAL POSITIONING SYSTEM.)

(See SPACE-BASED ADS-B.)

AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST IN (ADS-B In) — Aircraft avionics capable of receiving ADS-B Out transmissions directly from other aircraft, as well as traffic or weather information transmitted from ground stations.

(See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST OUT.)

(See AUTOMATIC DEPENDENT SURVEILLANCE-REBROADCAST.)

(See FLIGHT INFORMATION SERVICE-BROADCAST.)

(See TRAFFIC INFORMATION SERVICE-BROADCAST.)

AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST OUT (ADS-B Out) — The transmitter onboard an aircraft or ground vehicle that periodically broadcasts its GNSS-derived position along with other required information, such as identity, altitude, and velocity.

(See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST.)

(See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST IN.)

AUTOMATIC DEPENDENT SURVEILLANCE-CONTRACT (ADS-C) — A data link position reporting system, controlled by a ground station, that establishes contracts with an aircraft's

PILOT/CONTROLLER GLOSSARY

A

avionics that occur automatically whenever specific events occur, or specific time intervals are reached.

AUTOMATIC DEPENDENT SURVEILLANCE-REBROADCAST (ADS-R) — A datalink translation function of the ADS-B ground system required to accommodate the two separate operating frequencies (978 MHz and 1090 MHz). The ADS-B system receives the ADS-B messages transmitted on one frequency and ADS-R translates and reformats the information for rebroadcast and use on the other frequency. This allows ADS-B In equipped aircraft to see nearby ADS-B Out traffic regardless of the operating link of the other aircraft. Aircraft operating on the same ADS-B frequency exchange information directly and do not require the ADS-R translation function.

AUTOMATIC DIRECTION FINDER — An aircraft radio navigation system which senses and indicates the direction to a L/MF nondirectional radio beacon (NDB) ground transmitter. Direction is indicated to the pilot as a magnetic bearing or as a relative bearing to the longitudinal axis of the aircraft depending on the type of indicator installed in the aircraft. In certain applications, such as military, ADF operations may be based on airborne and ground transmitters in the VHF/UHF frequency spectrum.

(See BEARING.)

(See NONDIRECTIONAL BEACON.)

AUTOMATIC FLIGHT INFORMATION SERVICE (AFIS) — ALASKA FSSs ONLY — The continuous broadcast of recorded non-control information at airports in Alaska where a FSS provides local airport advisory service. The AFIS broadcast automates the repetitive transmission of essential but routine information such as weather, wind, altimeter, favored runway, braking action, airport NOTAMs, and other applicable information. The information is continuously broadcast over a discrete VHF radio frequency (usually the ASOS/AWOS frequency).

AUTOMATIC TERMINAL INFORMATION SERVICE — The continuous broadcast of recorded noncontrol information in selected terminal areas. Its purpose is to improve controller effectiveness and to relieve frequency congestion by automating the repetitive transmission of essential but routine information; e.g., “Los Angeles information Alfa. One three zero zero Coordinated Universal Time. Weather, measured ceiling two thousand overcast, visibility three, haze, smoke, temperature seven one, dew point five seven, wind two five zero at five, altimeter two niner six. I-L-S Runway Two Five Left approach in use, Runway Two Five Right closed, advise you have Alfa.”

(See ICAO term AUTOMATIC TERMINAL INFORMATION SERVICE.)

(Refer to AIM.)

AUTOMATIC TERMINAL INFORMATION SERVICE [ICAO] — The provision of current, routine information to arriving and departing aircraft by means of continuous and repetitive broadcasts throughout the day or a specified portion of the day.

AUTOROTATION — A rotorcraft flight condition in which the lifting rotor is driven entirely by action of the air when the rotorcraft is in motion.

- a. Autorotative Landing/Touchdown Autorotation. Used by a pilot to indicate that the landing will be made without applying power to the rotor.

PILOT/CONTROLLER GLOSSARY

A

- b. Low Level Autorotation. Commences at an altitude well below the traffic pattern, usually below 100 feet AGL and is used primarily for tactical military training.
- c. 180 degrees Autorotation. Initiated from a downwind heading and is commenced well inside the normal traffic pattern. "Go around" may not be possible during the latter part of this maneuver.

AVAILABLE LANDING DISTANCE (ALD) — The portion of a runway available for landing and roll-out for aircraft cleared for LAHSO. This distance is measured from the landing threshold to the hold-short point.

AVIATION WATCH NOTIFICATION MESSAGE — The Storm Prediction Center (SPC) issues Aviation Watch Notification Messages (SAW) to provide an area threat alert for the aviation meteorology community to forecast organized severe thunderstorms that may produce tornadoes, large hail, and/or convective damaging winds as indicated in Public Watch Notification Messages within the Continental U.S. A SAW message provides a description of the type of watch issued by SPC, a valid time, an approximation of the area in a watch, and primary hazard(s).

AVIATION WEATHER SERVICE — A service provided by the National Weather Service (NWS) and FAA which collects and disseminates pertinent weather information for pilots, aircraft operators, and ATC. Available aviation weather reports and forecasts are displayed at each NWS office and FAA FSS.

(See TRANSCRIBED WEATHER BROADCAST.)

(See WEATHER ADVISORY.)

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

B

BACK-TAXI — A term used by air traffic controllers to taxi an aircraft on the runway opposite to the traffic flow. The aircraft may be instructed to back-taxi to the beginning of the runway or at some point before reaching the runway end for the purpose of departure or to exit the runway.

BASE LEG —

(See TRAFFIC PATTERN.)

BEACON —

(See AERONAUTICAL BEACON.)

(See AIRPORT ROTATING BEACON.)

(See AIRWAY BEACON.)

(See MARKER BEACON.)

(See NONDIRECTIONAL BEACON.)

(See RADAR.)

BEARING — The horizontal direction to or from any point, usually measured clockwise from true north, magnetic north, or some other reference point through 360 degrees.

(See NONDIRECTIONAL BEACON.)

BELOW MINIMUMS — Weather conditions below the minimums prescribed by regulation for the particular action involved; e.g., landing minimums, takeoff minimums.

BLAST FENCE — A barrier that is used to divert or dissipate jet or propeller blast.

BLAST PAD — A surface adjacent to the ends of a runway provided to reduce the erosive effect of jet blast and propeller wash.

BLIND SPEED — The rate of departure or closing of a target relative to the radar antenna at which cancellation of the primary radar target by moving target indicator (MTI) circuits in the radar equipment causes a reduction or complete loss of signal.

(See ICAO term BLIND VELOCITY.)

BLIND SPOT — An area from which radio transmissions and/or radar echoes cannot be received. The term is also used to describe portions of the airport not visible from the control tower.

BLIND TRANSMISSION —

(See TRANSMITTING IN THE BLIND.)

BLIND VELOCITY [ICAO] — The radial velocity of a moving target such that the target is not seen on primary radars fitted with certain forms of fixed echo suppression.

BLIND ZONE —

(See BLIND SPOT.)

PILOT/CONTROLLER GLOSSARY

B

BLOCKED — Phraseology used to indicate that a radio transmission has been distorted or interrupted due to multiple simultaneous radio transmissions.

BOTTOM ALTITUDE — In reference to published altitude restrictions on a STAR or STAR runway transition, the lowest altitude authorized.

BOUNDARY LIGHTS —

(See AIRPORT LIGHTING.)

BRAKING ACTION (GOOD, GOOD TO MEDIUM, MEDIUM, MEDIUM TO POOR, POOR, OR NIL) — A report of conditions on the airport movement area providing a pilot with a degree/quality of braking to expect. Braking action is reported in terms of good, good to medium, medium, medium to poor, poor, or nil.

(See RUNWAY CONDITION READING.)

(See RUNWAY CONDITION REPORT.)

(See RUNWAY CONDITION CODES.)

BRAKING ACTION ADVISORIES — When tower controllers receive runway braking action reports which include the terms “medium,” “poor,” or “nil,” or whenever weather conditions are conducive to deteriorating or rapidly changing runway braking conditions, the tower will include on the ATIS broadcast the statement, “Braking Action Advisories are in Effect.” During the time braking action advisories are in effect, ATC will issue the most current braking action report for the runway in use to each arriving and departing aircraft. Pilots should be prepared for deteriorating braking conditions and should request current runway condition information if not issued by controllers. Pilots should also be prepared to provide a descriptive runway condition report to controllers after landing.

BREAKOUT — A technique to direct aircraft out of the approach stream. In the context of simultaneous (independent) parallel operations, a breakout is used to direct threatened aircraft away from a deviating aircraft.

BROADCAST — Transmission of information for which an acknowledgement is not expected.

(See ICAO term BROADCAST.)

BROADCAST [ICAO] — A transmission of information relating to air navigation that is not addressed to a specific station or stations.

BUFFER AREA — As applied to an MVA or MIA chart, a depicted 3 NM or 5 NM radius MVA/MIA sector isolating a displayed obstacle for which the sector is established. A portion of a buffer area can also be inclusive of a MVA/MIA sector polygon boundary.

PILOT/CONTROLLER GLOSSARY

C

CALCULATED LANDING TIME — A term that may be used in place of tentative or actual calculated landing time, whichever applies.

CALIBRATED AIRSPEED (CAS) — The indicated airspeed of an aircraft, corrected for position and instrument error. Calibrated airspeed is equal to true airspeed in standard atmosphere at sea level.

CALL FOR RELEASE — Wherein the overlying ARTCC requires a terminal facility to initiate verbal coordination to secure ARTCC approval for release of a departure into the en route environment.

CALL UP — Initial voice contact between a facility and an aircraft, using the identification of the unit being called and the unit initiating the call.

(Refer to AIM.)

CANADIAN MINIMUM NAVIGATION PERFORMANCE SPECIFICATION AIRSPACE — That portion of Canadian domestic airspace within which MNPS separation may be applied.

CARDINAL ALTITUDES — “Odd” or “Even” thousand-foot altitudes or flight levels; e.g., 5,000, 6,000, 7,000, FL 250, FL 260, FL 270.

(See ALTITUDE.)

(See FLIGHT LEVEL.)

CARDINAL FLIGHT LEVELS — (See CARDINAL ALTITUDES.)

CAT — (See CLEAR-AIR TURBULENCE.)

CATCH POINT — A fix/waypoint that serves as a transition point from the high altitude waypoint navigation structure to an arrival procedure (STAR) or the low altitude ground-based navigation structure.

CEILING — The heights above the earth's surface of the lowest layer of clouds or obscuring phenomena that is reported as “broken,” “overcast,” or “obscuration,” and not classified as “thin” or “partial.”

(See ICAO term CEILING.)

CEILING [ICAO] — The height above the ground or water of the base of the lowest layer of cloud below 6,000 meters (20,000 feet) covering more than half the sky.

CENTER — (See AIR ROUTE TRAFFIC CONTROL CENTER.)

CENTER'S AREA — The specified airspace within which an air route traffic control center (ARTCC) provides air traffic control and advisory service.

(See AIR ROUTE TRAFFIC CONTROL CENTER.)

(Refer to AIM.)

CENTER WEATHER ADVISORY — An unscheduled weather advisory issued by Center Weather Service Unit meteorologists for ATC use to alert pilots of existing or anticipated adverse weather conditions within the next 2 hours. A CWA may modify or redefine a SIGMET.

PILOT/CONTROLLER GLOSSARY

C

(See AWW.)

(See AIRMET.)

(See CONVECTIVE SIGMET.)

(See SAW.)

(See SIGMET.)

(Refer to AIM.)

CENTRAL EAST PACIFIC — An organized route system between the U.S. West Coast and Hawaii.

CEP — (See CENTRAL EAST PACIFIC.)

CERAP — (See COMBINED CENTER-RAPCON.)

CERTIFICATE OF WAIVER OR AUTHORIZATION (COA) — An FAA grant of approval for a specific flight operation or airspace authorization or waiver.

CERTIFIED TOWER RADAR DISPLAY (CTRD) — An FAA radar display certified for use in the NAS.

CFR — (See CALL FOR RELEASE.)

CHA — (See CONTINGENCY HAZARD AREA.)

CHAFF — Thin, narrow metallic reflectors of various lengths and frequency responses, used to reflect radar energy. These reflectors, when dropped from aircraft and allowed to drift downward, result in large targets on the radar display.

CHART SUPPLEMENT U.S. — A publication designed primarily as a pilot's operational manual containing all airports, seaplane bases, and heliports open to the public including communications data, navigational facilities, and certain special notices and procedures. This publication is issued in seven volumes according to geographical area.

CHARTED VFR FLYWAYS — Charted VFR Flyways are flight paths recommended for use to bypass areas heavily traversed by large turbine-powered aircraft. Pilot compliance with recommended flyways and associated altitudes is strictly voluntary. VFR Flyway Planning charts are published on the back of existing VFR Terminal Area charts.

CHARTED VISUAL FLIGHT PROCEDURE APPROACH — An approach conducted while operating on an instrument flight rules (IFR) flight plan which authorizes the pilot of an aircraft to proceed visually and clear of clouds to the airport via visual landmarks and other information depicted on a charted visual flight procedure. This approach must be authorized and under the control of the appropriate air traffic control facility. Weather minimums required are depicted on the chart.

CHASE — An aircraft flown in proximity to another aircraft normally to observe its performance during training or testing.

CHASE AIRCRAFT — (See CHASE.)

CHOP — A form of turbulence.

PILOT/CONTROLLER GLOSSARY

C

- a. Light Chop — Turbulence that causes slight, rapid and somewhat rhythmic bumpiness without appreciable changes in altitude or attitude.
- b. Moderate Chop — Turbulence similar to Light Chop but of greater intensity. It causes rapid bumps or jolts without appreciable changes in aircraft altitude or attitude.

(See TURBULENCE.)

CIRCLE-TO-LAND MANEUVER — A maneuver initiated by the pilot to align the aircraft with a runway for landing when a straight-in landing from an instrument approach is not possible or is not desirable. At tower controlled airports, this maneuver is made only after ATC authorization has been obtained and the pilot has established required visual reference to the airport.

(See CIRCLE TO RUNWAY.)

(See LANDING MINIMUMS.)

(Refer to AIM.)

CIRCLE TO RUNWAY (RUNWAY NUMBER) — Used by ATC to inform the pilot that he/she must circle to land because the runway in use is other than the runway aligned with the instrument approach procedure. When the direction of the circling maneuver in relation to the airport/runway is required, the controller will state the direction (eight cardinal compass points) and specify a left or right downwind or base leg as appropriate; e.g., "Cleared VOR Runway Three Six Approach circle to Runway Two Two," or "Circle northwest of the airport for a right downwind to Runway Two Two."

(See CIRCLE-TO-LAND MANEUVER.)

(See LANDING MINIMUMS.)

(Refer to AIM.)

CIRCLING APPROACH — (See CIRCLE-TO-LAND MANEUVER.)

CIRCLING MANEUVER — (See CIRCLE-TO-LAND MANEUVER.)

CIRCLING MINIMA — (See LANDING MINIMUMS.)

CLASS A AIRSPACE — (See CONTROLLED AIRSPACE.)

CLASS B AIRSPACE — (See CONTROLLED AIRSPACE.)

CLASS C AIRSPACE — (See CONTROLLED AIRSPACE.)

CLASS D AIRSPACE — (See CONTROLLED AIRSPACE.)

CLASS E AIRSPACE — (See CONTROLLED AIRSPACE.)

CLASS G AIRSPACE — Airspace that is not designated in 14 CFR Part 71 as Class A, Class B, Class C, Class D, or Class E controlled airspace is Class G (uncontrolled) airspace.

(See UNCONTROLLED AIRSPACE.)

PILOT/CONTROLLER GLOSSARY

C

CLEAR AIR TURBULENCE (CAT) — Turbulence encountered in air where no clouds are present. This term is commonly applied to high-level turbulence associated with wind shear. CAT is often encountered in the vicinity of the jet stream.

(See WIND SHEAR.)

(See JET STREAM.)

CLEAR OF THE RUNWAY —

- a. Taxiing aircraft, which is approaching a runway, is clear of the runway when all parts of the aircraft are held short of the applicable runway holding position marking.
- b. A pilot or controller may consider an aircraft, which is exiting or crossing a runway, to be clear of the runway when all parts of the aircraft are beyond the runway edge and there are no restrictions to its continued movement beyond the applicable runway holding position marking.
- c. Pilots and controllers shall exercise good judgement to ensure that adequate separation exists between all aircraft on runways and taxiways at airports with inadequate runway edge lines or holding position markings.

CLEARANCE — (See AIR TRAFFIC CLEARANCE.)

CLEARANCE LIMIT — The fix, point, or location to which an aircraft is cleared when issued an air traffic clearance.

(See ICAO term CLEARANCE LIMIT.)

CLEARANCE LIMIT [ICAO] — The point to which an aircraft is granted an air traffic control clearance.

CLEARANCE VOID IF NOT OFF BY (TIME) — Used by ATC to advise an aircraft that the departure clearance is automatically canceled if takeoff is not made prior to a specified time. The pilot must obtain a new clearance or cancel his/her IFR flight plan if not off by the specified time.

(See ICAO term CLEARANCE VOID TIME.)

CLEARANCE VOID TIME [ICAO] — A time specified by an air traffic control unit at which a clearance ceases to be valid unless the aircraft concerned has already taken action to comply therewith.

CLEARED APPROACH — ATC authorization for an aircraft to execute any standard or special instrument approach procedure for that airport. Normally, an aircraft will be cleared for a specific instrument approach procedure.

(See CLEARED (Type of) APPROACH.)

(See INSTRUMENT APPROACH PROCEDURE.)

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

C

CLEARED (Type of) APPROACH — ATC authorization for an aircraft to execute a specific instrument approach procedure to an airport; e.g., "Cleared ILS Runway Three Six Approach."

(See APPROACH CLEARANCE.)

(See INSTRUMENT APPROACH PROCEDURE.)

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

CLEARED AS FILED — Means the aircraft is cleared to proceed in accordance with the route of flight filed in the flight plan. This clearance does not include the altitude, DP, or DP Transition.

(See REQUEST FULL ROUTE CLEARANCE.)

(Refer to AIM.)

CLEARED FOR TAKEOFF — ATC authorization for an aircraft to depart. It is predicated on known traffic and known physical airport conditions.

CLEARED FOR THE OPTION — ATC authorization for an aircraft to make a touch-and-go, low approach, missed approach, stop and go, or full stop landing at the discretion of the pilot. It is normally used in training so that an instructor can evaluate a student's performance under changing situations. Pilots should advise ATC if they decide to remain on the runway, of any delay in their stop and go, delay clearing the runway, or are unable to comply with the instruction(s).

(See OPTION APPROACH.)

(Refer to AIM.)

CLEARED THROUGH — ATC authorization for an aircraft to make intermediate stops at specified airports without refiling a flight plan while en route to the clearance limit.

CLEARED TO LAND — ATC authorization for an aircraft to land. It is predicated on known traffic and known physical airport conditions.

CLEARWAY — An area beyond the takeoff runway under the control of airport authorities within which terrain or fixed obstacles may not extend above specified limits. These areas may be required for certain turbine-powered operations and the size and upward slope of the clearway will differ depending on when the aircraft was certificated.

(Refer to 14 CFR Part 1.)

CLIMB TO VFR — ATC authorization for an aircraft to climb to VFR conditions within Class B, C, D, and E surface areas when the only weather limitation is restricted visibility. The aircraft must remain clear of clouds while climbing to VFR.

(See SPECIAL VFR CONDITIONS.)

(Refer to AIM.)

CLIMBOUT — That portion of flight operation between takeoff and the initial cruising altitude.

CLIMB VIA — An abbreviated ATC clearance that requires compliance with the procedure lateral path, associated speed restrictions, and altitude restrictions along the cleared route or procedure.

PILOT/CONTROLLER GLOSSARY

C

CLOSE PARALLEL RUNWAYS — Two parallel runways whose extended centerlines are separated by less than 4,300 feet, and at least 3000 feet (750 feet for SOIA operations) for which ATC is authorized to conduct simultaneous independent approach operations. PRM and simultaneous close parallel appear in approach title. Dual communications, special pilot training, an Attention All Users Page (AAUP), NTZ monitoring by displays that have aural and visual alerting algorithms are required. A high update rate surveillance sensor is required for certain runway or approach course spacing.

CLOSED LOOP CLEARANCE — A vector or reroute clearance that includes a return to route point and updates ERAM to accurately reflect the anticipated route (e.g., a QU route pick that anticipates length of vector and includes the next fix that ties into the route of flight.)

CLOSED RUNWAY — A runway that is unusable for aircraft operations. Only the airport management/military operations office can close a runway.

CLOSED TRAFFIC — Successive operations involving takeoffs and landings or low approaches where the aircraft does not exit the traffic pattern.

CLOUD — A cloud is a visible accumulation of minute water droplets and/or ice particles in the atmosphere above the Earth's surface. Cloud differs from ground fog, fog, or ice fog only in that the latter are, by definition, in contact with the Earth's surface.

CLT — (See CALCULATED LANDING TIME.)

CLUTTER — In radar operations, clutter refers to the reception and visual display of radar returns caused by precipitation, chaff, terrain, numerous aircraft targets, or other phenomena. Such returns may limit or preclude ATC from providing services based on radar.

(See CHAFF.)

(See GROUND CLUTTER.)

(See PRECIPITATION.)

(See TARGET.)

(See ICAO term RADAR CLUTTER.)

CMNPS — (See CANADIAN MINIMUM NAVIGATION PERFORMANCE SPECIFICATION AIRSPACE.)

COA — (See CERTIFICATE OF WAIVER OR AUTHORIZATION.)

COASTAL FIX — A navigation aid or intersection where an aircraft transitions between the domestic route structure and the oceanic route structure.

CODES — The number assigned to a particular multiple pulse reply signal transmitted by a transponder.

(See DISCRETE CODE.)

COLD TEMPERATURE CORRECTION — A correction in feet, based on height above airport and temperature, that is added to the aircraft's indicated altitude to offset the effect of cold temperature on true altitude.

PILOT/CONTROLLER GLOSSARY

C

COLLABORATIVE TRAJECTORY OPTIONS PROGRAM (CTOP) — CTOP is a traffic management program administered by the Air Traffic Control System Command Center (ATCSCC) that manages demand through constrained airspace, while considering operator preference with regard to both route and delay as defined in a Trajectory Options Set (TOS).

COMBINED CENTER-RAPCON — An air traffic facility which combines the functions of an ARTCC and a radar approach control facility.

(See AIR ROUTE TRAFFIC CONTROL CENTER.)

(See RADAR APPROACH CONTROL FACILITY.)

COMMON POINT — A significant point over which two or more aircraft will report passing or have reported passing before proceeding on the same or diverging tracks. To establish/maintain longitudinal separation, a controller may determine a common point not originally in the aircraft's flight plan and then clear the aircraft to fly over the point.

(See SIGNIFICANT POINT.)

COMMON PORTION — (See COMMON ROUTE.)

COMMON ROUTE — That segment of a North American Route between the inland navigation facility and the coastal fix.

OR

COMMON ROUTE — (See SEGMENTS OF A SID/STAR.)

COMMON TRAFFIC ADVISORY FREQUENCY (CTAF) — A frequency designed for the purpose of carrying out airport advisory practices while operating to or from an airport without an operating control tower. The CTAF may be a UNICOM, Multicom, FSS, or tower frequency and is identified in appropriate aeronautical publications.

(See DESIGNATED COMMON TRAFFIC ADVISORY FREQUENCY (CTAF) AREA.)

(Refer to AC 90-66, Non-Towered Airport Flight Operations.)

COMPASS LOCATOR — A low power, low or medium frequency (L/MF) radio beacon installed at the site of the outer or middle marker of an instrument landing system (ILS). It can be used for navigation at distances of approximately 15 miles or as authorized in the approach procedure.

- a. Outer Compass Locator (LOM) — A compass locator installed at the site of the outer marker of an instrument landing system.

(See OUTER MARKER.)

- b. Middle Compass Locator (LMM) — A compass locator installed at the site of the middle marker of an instrument landing system.

(See MIDDLE MARKER.)

(See ICAO term LOCATOR.)

COMPASS ROSE — A circle, graduated in degrees, printed on some charts or marked on the ground at an airport. It is used as a reference to either true or magnetic direction.

PILOT/CONTROLLER GLOSSARY

C

COMPLY WITH RESTRICTIONS — An ATC instruction that requires an aircraft being vectored back onto an arrival or departure procedure to comply with all altitude and/or speed restrictions depicted on the procedure. This term may be used in lieu of repeating each remaining restriction that appears on the procedure.

COMPOSITE FLIGHT PLAN — A flight plan which specifies VFR operation for one portion of flight and IFR for another portion. It is used primarily in military operations.

(Refer to AIM.)

COMPULSORY REPORTING POINTS — Reporting points which must be reported to ATC. They are designated on aeronautical charts by solid triangles or filed in a flight plan as fixes selected to define direct routes. These points are geographical locations which are defined by navigation aids/fixes. Pilots should discontinue position reporting over compulsory reporting points when informed by ATC that their aircraft is in “radar contact.”

COMPUTER NAVIGATION FIX (CNF) — A Computer Navigation Fix is a point defined by a latitude/longitude coordinate and is required to support Performance-Based Navigation (PBN) operations. A five-letter identifier denoting a CNF can be found next to an “x” on en route charts and on some approach charts. Eventually, all CNFs will be labeled and begin with the letters “CF” followed by three consonants (e.g., ‘CFWBG’). CNFs are not recognized by ATC, are not contained in ATC fix or automation databases, and are not used for ATC purposes. Pilots should not use CNFs for point-to-point navigation (e.g., proceed direct), filing a flight plan, or in aircraft/ATC communications. Use of CNFs has not been adopted or recognized by the International Civil Aviation Organization (ICAO).

(REFER to AIM 1-1-17b5(i)(2), Global Positioning System (GPS).

CONDITIONS NOT MONITORED — When an airport operator cannot monitor the condition of the movement area or airfield surface area, this information is issued as a NOTAM. Usually necessitated due to staffing, operating hours or other mitigating factors associated with airport operations.

CONFIDENCE MANEUVER — A confidence maneuver consists of one or more turns, a climb or descent, or other maneuver to determine if the pilot in command (PIC) is able to receive and comply with ATC instructions.

CONFLICT ALERT — A function of certain air traffic control automated systems designed to alert radar controllers to existing or pending situations between tracked targets (known IFR or VFR aircraft) that require his/her immediate attention/action.

(See MODE C INTRUDER ALERT.)

CONFLICT RESOLUTION — The resolution of potential conflicts between aircraft that are radar identified and in communication with ATC by ensuring that radar targets do not touch. Pertinent traffic advisories shall be issued when this procedure is applied.

NOTE: *This procedure shall not be provided utilizing mosaic radar systems.*

PILOT/CONTROLLER GLOSSARY

C

CONFORMANCE — The condition established when an aircraft's actual position is within the conformance region constructed around that aircraft at its position, according to the trajectory associated with the aircraft's Current Plan.

CONFORMANCE REGION — A volume, bounded laterally, vertically, and longitudinally, within which an aircraft must be at a given time in order to be in conformance with the Current Plan Trajectory for that aircraft. At a given time, the conformance region is determined by the simultaneous application of the lateral, vertical, and longitudinal conformance bounds for the aircraft at the position defined by time and aircraft's trajectory.

CONSOLAN — A low frequency, long-distance NAVAID used principally for transoceanic navigations.

CONSOLIDATED WAKE TURBULENCE (CWT) — A version of RECAT that has nine categories, A through I, that refines the grouping of aircraft while optimizing wake turbulence separation.

CONSTRAINT SATISFACTION POINT (CSP) — Meter Reference Elements (MREs) that are actively scheduled by TBFM. Constraint satisfaction occurs when the Scheduled Time of Arrival generated for each metered flight conforms to all the scheduling constraints specified at all the applicable CSPs.

CONTACT —

- a. Establish communication with (followed by the name of the facility and, if appropriate, the frequency to be used).
- b. A flight condition wherein the pilot ascertains the attitude of his/her aircraft and navigates by visual reference to the surface.

(See CONTACT APPROACH.)

(See RADAR CONTACT.)

CONTACT APPROACH — An approach wherein an aircraft on an IFR flight plan, having an air traffic control authorization, operating clear of clouds with at least 1 mile flight visibility and a reasonable expectation of continuing to the destination airport in those conditions, may deviate from the instrument approach procedure and proceed to the destination airport by visual reference to the surface. This approach will only be authorized when requested by the pilot and the reported ground visibility at the destination airport is at least 1 statute mile.

(Refer to AIM.)

CONTAMINATED RUNWAY — A runway is considered contaminated whenever standing water, ice, snow, slush, frost in any form, heavy rubber, or other substances are present. A runway is contaminated with respect to rubber deposits or other friction-degrading substances when the average friction value for any 500-foot segment of the runway within the ALD fails below the recommended minimum friction level and the average friction value in the adjacent 500-foot segments falls below the maintenance planning friction level.

CONTERMINOUS U.S. — The 48 adjoining States and the District of Columbia.

PILOT/CONTROLLER GLOSSARY

C

CONTINENTAL UNITED STATES — The 49 States located on the continent of North America and the District of Columbia.

CONTINGENCY HAZARD AREA (CHA) — Used by ATC. Areas of airspace that are defined and distributed in advance of a launch or reentry operation and are activated in response to a failure.

(See AIRCRAFT HAZARD AREA.)

(See REFINED HAZARD AREA.)

(See TRANSITIONAL HAZARD AREA.)

CONTINUE — When used as a control instruction should be followed by another word or words clarifying what is expected of the pilot. Example: “continue taxi,” “continue descent,” “continue inbound,” etc.

CONTROL AREA [ICAO] — A controlled airspace extending upwards from a specified limit above the earth.

CONTROL SECTOR — An airspace area of defined horizontal and vertical dimensions for which a controller or group of controllers has air traffic control responsibility, normally within an air route traffic control center or an approach control facility. Sectors are established based on predominant traffic flows, altitude strata, and controller workload. Pilot communications during operations within a sector are normally maintained on discrete frequencies assigned to the sector.

(See DISCRETE FREQUENCY.)

CONTROL SLASH — A radar beacon slash representing the actual position of the associated aircraft. Normally, the control slash is the one closest to the interrogating radar beacon site. When ARTCC radar is operating in narrowband (digitized) mode, the control slash is converted to a target symbol.

CONTROLLED AIRSPACE — An airspace of defined dimensions within which air traffic control service is provided to IFR flights and to VFR flights in accordance with the airspace classification.

- a. Controlled airspace is a generic term that covers Class A, Class B, Class C, Class D, and Class E airspace.
- b. Controlled airspace is also that airspace within which all aircraft operators are subject to certain pilot qualifications, operating rules, and equipment requirements in 14 CFR Part 91 (for specific operating requirements, please refer to 14 CFR Part 91). For IFR operations in any class of controlled airspace, a pilot must file an IFR flight plan and receive an appropriate ATC clearance. Each Class B, Class C, and Class D airspace area designated for an airport contains at least one primary airport around which the airspace is designated (for specific designations and descriptions of the airspace classes, please refer to 14 CFR Part 71).
- c. Controlled airspace in the United States is designated as follows:
 1. **CLASS A** — Generally, that airspace from 18,000 feet MSL up to and including FL 600, including the airspace overlying the waters within 12 nautical miles of the coast of the 48 contiguous States and Alaska. Unless otherwise authorized, all persons must operate their aircraft under IFR.

PILOT/CONTROLLER GLOSSARY
C

2. **CLASS B** — Generally, that airspace from the surface to 10,000 feet MSL surrounding the nation's busiest airports in terms of airport operations or passenger enplanements. The configuration of each Class B airspace area is individually tailored and consists of a surface area and two or more layers (some Class B airspace areas resemble upside-down wedding cakes), and is designed to contain all published instrument procedures once an aircraft enters the airspace. An ATC clearance is required for all aircraft to operate in the area, and all aircraft that are so cleared receive separation services within the airspace. The cloud clearance requirement for VFR operations is "clear of clouds."
3. **CLASS C** — Generally, that airspace from the surface to 4,000 feet above the airport elevation (charted in MSL) surrounding those airports that have an operational control tower, are serviced by a radar approach control, and that have a certain number of IFR operations or passenger enplanements. Although the configuration of each Class C area is individually tailored, the airspace usually consists of a surface area with a 5 NM radius, a circle with a 10 NM radius that extends no lower than 1,200 feet up to 4,000 feet above the airport elevation, and an outer area that is not charted. Each person must establish two-way radio communications with the ATC facility providing air traffic services prior to entering the airspace and thereafter maintain those communications while within the airspace. VFR aircraft are only separated from IFR aircraft within the airspace.
(See OUTER AREA.)
4. **CLASS D** — Generally, that airspace from the surface to 2,500 feet above the airport elevation (charted in MSL) surrounding those airports that have an operational control tower. The configuration of each Class D airspace area is individually tailored and when instrument procedures are published, the airspace will normally be designed to contain the procedures. Arrival extensions for instrument approach procedures may be Class D or Class E airspace. Unless otherwise authorized, each person must establish two-way radio communications with the ATC facility providing air traffic services prior to entering the airspace and thereafter maintain those communications while in the airspace. No separation services are provided to VFR aircraft.
5. **CLASS E** — Generally, if the airspace is not Class A, Class B, Class C, or Class D, and it is controlled airspace, it is Class E airspace. Class E airspace extends upward from either the surface or a designated altitude to the overlying or adjacent controlled airspace. When designated as a surface area, the airspace will be configured to contain all instrument procedures. Also in this class are Federal airways, airspace beginning at either 700 or 1,200 feet AGL used to transition to/from the terminal or en route environment, en route domestic, and offshore airspace areas designated below 18,000 feet MSL. Unless designated at a lower altitude, Class E airspace begins at 14,500 MSL over the United States, including that airspace overlying the waters within 12 nautical miles of the coast of the 48 contiguous States and Alaska, up to, but not including 18,000 feet MSL, and the airspace above FL 600.

PILOT/CONTROLLER GLOSSARY

C

CONTROLLED AIRSPACE [ICAO] — An airspace of defined dimensions within which air traffic control service is provided to IFR flights and to VFR flights in accordance with the airspace classification.

NOTE: *Controlled airspace is a generic term which covers ATS airspace Classes A, B, C, D, and E.*

CONTROLLED TIME OF ARRIVAL — Arrival time assigned during a Traffic Management Program. This time may be modified due to adjustments or user options.

CONTROLLER — (See AIR TRAFFIC CONTROL SPECIALIST.)

CONTROLLER [ICAO] — A person authorized to provide air traffic control services.

CONTROLLER PILOT DATA LINK COMMUNICATIONS (CPDLC) — A two-way digital communications system that conveys textual air traffic control messages between controllers and pilots using ground or satellite-based radio relay stations.

CONVECTIVE SIGMET — A weather advisory concerning convective weather significant to the safety of all aircraft. Convective SIGMETs are issued for tornadoes, lines of thunderstorms, embedded thunderstorms of any intensity level, areas of thunderstorms greater than or equal to VIP level 4 with an area coverage of $\frac{4}{10}$ (40%) or more, and hail $\frac{3}{4}$ inch or greater.

(See AIRMET.)

(See AWW.)

(See CWA.)

(See SAW.)

(See SIGMET.)

(Refer to AIM.)

CONVECTIVE SIGNIFICANT METEOROLOGICAL INFORMATION — (See CONVECTIVE SIGMET.)

COOPERATIVE SURVEILLANCE — Any surveillance system, such as secondary surveillance radar (SSR), wide-area multilateration (WAM), or ADS-B, that is dependent upon the presence of certain equipment onboard the aircraft or vehicle to be detected.

(See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST.)

(See NON-COOPERATIVE SURVEILLANCE.)

(See RADAR.)

(See WIDE AREA MULTILATERATION.)

COORDINATES — The intersection of lines of reference, usually expressed in degrees/minutes/seconds of latitude and longitude, used to determine position or location.

PILOT/CONTROLLER GLOSSARY

C

COORDINATION FIX — The fix in relation to which facilities will handoff, transfer control of an aircraft, or coordinate flight progress data. For terminal facilities, it may also serve as a clearance for arriving aircraft.

COPTER — (See HELICOPTER.)

CORRECTION — An error has been made in the transmission and the correct version follows.

COUPLED APPROACH — An instrument approach performed by the aircraft autopilot, and/or visually depicted on the flight director, which is receiving position information and/or steering commands from onboard navigational equipment. In general, coupled non-precision approaches must be flown manually (autopilot disengaged) at altitudes lower than 50 feet AGL below the minimum descent altitude, and coupled precision approaches must be flown manually (autopilot disengaged) below 50 feet AGL unless authorized to conduct autoland operations. Coupled instrument approaches are commonly flown to the allowable IFR weather minima established by the operator or PIC, or flown VFR for training and safety.

COUPLED SCHEDULING (CS)/ EXTENDED METERING (XM) — Adds additional Constraint Satisfaction Points for metered aircraft along their route. This provides the ability to merge flows upstream from the meter fix and results in a more optimal distribution of delays over a greater distance from the airport, increased meter list accuracy, and more accurate delivery to the meter fix.

COURSE —

- a. The intended direction of flight in the horizontal plane measured in degrees from north.
- b. The ILS localizer signal pattern usually specified as the front course or the back course.

(See BEARING.)

(See INSTRUMENT LANDING SYSTEM.)

(See RADIAL.)

CPDLC — (See CONTROLLER PILOT DATA LINK COMMUNICATIONS.)

CPL [ICAO] — (See ICAO term CURRENT FLIGHT PLAN.)

CRITICAL ENGINE — The engine which, upon failure, would most adversely affect the performance or handling qualities of an aircraft.

CROSS (FIX) AT (ALTITUDE) — Used by ATC when a specific altitude restriction at a specified fix is required.

CROSS (FIX) AT OR ABOVE (ALTITUDE) — Used by ATC when an altitude restriction at a specified fix is required. It does not prohibit the aircraft from crossing the fix at a higher altitude than specified; however, the higher altitude may not be one that will violate a succeeding altitude restriction or altitude assignment.

(See ALTITUDE RESTRICTION.)

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

C

CROSS (FIX) AT OR BELOW (ALTITUDE) — Used by ATC when a maximum crossing altitude at a specific fix is required. It does not prohibit the aircraft from crossing the fix at a lower altitude; however, it must be at or above the minimum IFR altitude.

(See ALTITUDE RESTRICTION.)

(See MINIMUM IFR ALTITUDES.)

(Refer to 14 CFR Part 91.)

CROSSWIND —

- a. When used concerning the traffic pattern, the word means “crosswind leg.”

(See TRAFFIC PATTERN.)

- b. When used concerning wind conditions, the word means a wind not parallel to the runway or the path of an aircraft.

(See CROSSWIND COMPONENT.)

CROSSWIND COMPONENT — The wind component measured in knots at 90 degrees to the longitudinal axis of the runway.

CRUISE — Used in an ATC clearance to authorize a pilot to conduct flight at any altitude from the minimum IFR altitude up to and including the altitude specified in the clearance. The pilot may level off at any intermediate altitude within this block of airspace. Climb/descent within the block is to be made at the discretion of the pilot. However, once the pilot starts descent and verbally reports leaving an altitude in the block, he/she may not return to that altitude without additional ATC clearance. Further, it is approval for the pilot to proceed to and make an approach at destination airport and can be used in conjunction with:

- a. An airport clearance limit at locations with a standard/special instrument approach procedure. The CFRs require that if an instrument letdown to an airport is necessary, the pilot shall make the letdown in accordance with a standard/special instrument approach procedure for that airport, or
- b. An airport clearance limit at locations that are within/below/outside controlled airspace and without a standard/special instrument approach procedure. Such a clearance is NOT AUTHORIZATION for the pilot to descend under IFR conditions below the applicable minimum IFR altitude nor does it imply that ATC is exercising control over aircraft in Class G airspace; however, it provides a means for the aircraft to proceed to destination airport, descend, and land in accordance with applicable CFRs governing VFR flight operations. Also, this provides search and rescue protection until such time as the IFR flight plan is closed.

(See INSTRUMENT APPROACH PROCEDURE.)

CRUISE CLIMB — A climb technique employed by aircraft, usually at a constant power setting, resulting in an increase of altitude as the aircraft weight decreases.

CRUISING ALTITUDE — An altitude or flight level maintained during en route level flight. This is a constant altitude and should not be confused with a cruise clearance.

PILOT/CONTROLLER GLOSSARY

C

(See ALTITUDE.)

(See ICAO term CRUISING LEVEL.)

CRUISING LEVEL — (See CRUISING ALTITUDE.)

CRUISING LEVEL [ICAO] — A level maintained during a significant portion of a flight.

CSP — (See CONSTRAINT SATISFACTION POINT.)

CT MESSAGE — An EDCT time generated by the ATCSCC to regulate traffic at arrival airports. Normally, a CT message is automatically transferred from the traffic management system computer to the NAS en route computer and appears as an EDCT. In the event of a communication failure between the traffic management system and the NAS, the CT message can be manually entered by the TMC at the en route facility.

CTA — (See CONTROLLED TIME OF ARRIVAL.)

(See ICAO term CONTROL AREA.)

CTAF — (See COMMON TRAFFIC ADVISORY FREQUENCY.)

CTOP — (See COLLABORATIVE TRAJECTORY OPTIONS PROGRAM.)

CTRD — (See CERTIFIED TOWER RADAR DISPLAY.)

CURRENT FLIGHT PLAN [ICAO] — The flight plan, including changes, if any, brought about by subsequent clearances.

CURRENT PLAN — The ATC clearance the aircraft has received and is expected to fly.

CVFP APPROACH — (See CHARTED VISUAL FLIGHT PROCEDURE APPROACH.)

CWA — (See CENTER WEATHER ADVISORY and WEATHER ADVISORY.)

CWT — (See CONSOLIDATED WAKE TURBULENCE.)

PILOT/CONTROLLER GLOSSARY

D

D-ATIS — (See DIGITAL-AUTOMATIC TERMINAL INFORMATION SERVICE.)

D-ATIS [ICAO] — (See ICAO Term DATA LINK AUTOMATIC TERMINAL INFORMATION SERVICE.)

DA [ICAO] — (See ICAO Term DECISION ALTITUDE/DECISION HEIGHT.)

DAIR — (See DIRECT ALTITUDE AND IDENTITY READOUT.)

DANGER AREA [ICAO] — An airspace of defined dimensions within which activities dangerous to the flight of aircraft may exist at specified times.

NOTE: The term “Danger Area” is not used in reference to areas within the United States or any of its possessions or territories.

DAS — (See DELAY ASSIGNMENT.)

DATA BLOCK — (See ALPHANUMERIC DISPLAY.)

DATA LINK AUTOMATIC TERMINAL INFORMATION SERVICE (D-ATIS) [ICAO] — The provision of ATIS via data link.

DCT — (See DELAY COUNTDOWN TIMER.)

DEAD RECKONING — Dead reckoning, as applied to flying, is the navigation of an airplane solely by means of computations based on airspeed, course, heading, wind direction, and speed, groundspeed, and elapsed time.

DEBRIS RESPONSE AREA (DRA) — Used by ATC. Areas of airspace that may be activated in response to unplanned falling debris in the NAS.

DECISION ALTITUDE/DECISION HEIGHT [ICAO Annex 6] — A specified altitude or height (A/H) in the precision approach at which a missed approach must be initiated if the required visual reference to continue the approach has not been established.

1. Decision altitude (DA) is referenced to mean sea level and decision height (DH) is referenced to the threshold elevation.
2. Category II and III minima are expressed as a DH and not a DA. Minima is assessed by reference to a radio altimeter and not a barometric altimeter, which makes the minima a DH.
3. The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path.

DECISION ALTITUDE (DA) — A specified altitude (mean sea level (MSL)) on an instrument approach procedure (ILS, GLS, vertically guided RNAV) at which the pilot must decide whether to continue the approach or initiate an immediate missed approach if the pilot does not see the required visual references.

DECISION HEIGHT (DH) — With respect to the operation of aircraft, means the height at which a decision must be made during an ILS or PAR instrument approach to either continue the approach or to execute a missed approach.

PILOT/CONTROLLER GLOSSARY

D

(See ICAO term DECISION ALTITUDE/DECISION HEIGHT.)

DECODER — The device used to decipher signals received from ATCRBS transponders to effect their display as select codes.

(See CODES.)

(See RADAR.)

DEFENSE AREA — Any airspace of the contiguous United States that is not an ADIZ in which the control of aircraft is required for reasons of national security.

DEFENSE VISUAL FLIGHT RULES — Rules applicable to flights within an ADIZ conducted under the visual flight rules in 14 CFR Part 91.

(See AIR DEFENSE IDENTIFICATION ZONE.)

(Refer to 14 CFR Part 91.)

(Refer to 14 CFR Part 99.)

DELAY ASSIGNMENT (DAS) — Delays are distributed to aircraft based on the traffic management program parameters. The delay assignment is calculated in 15-minute increments and appears as a table in Traffic Flow Management System (TFMS).

DELAY COUNTDOWN TIMER (DCT) — The display of the delay that must be absorbed by a flight prior to crossing a Meter Reference Element (MRE) to meet the TBFM Scheduled Time of Arrival (STA). It is calculated by taking the difference between the frozen STA and the Estimated Time of Arrival (ETA).

DELAY INDEFINITE (REASON IF KNOWN) EXPECT FURTHER CLEARANCE (TIME) — Used by ATC to inform a pilot when an accurate estimate of the delay time and the reason for the delay cannot immediately be determined; e.g., a disabled aircraft on the runway, terminal or center area saturation, weather below landing minimums, etc.

(See EXPECT FURTHER CLEARANCE (TIME).)

DEPARTURE CENTER — The ARTCC having jurisdiction for the airspace that generates a flight to the impacted airport.

DEPARTURE CONTROL — A function of an approach control facility providing air traffic control service for departing IFR and, under certain conditions, VFR aircraft.

(See APPROACH CONTROL FACILITY.)

(Refer to AIM.)

DEPARTURE SEQUENCING PROGRAM — A program designed to assist in achieving a specified interval over a common point for departures.

DEPARTURE TIME — The time an aircraft becomes airborne.

DEPARTURE VIEWER — A capability within the Traffic Flow Management System (TFMS) that provides combined displays for monitoring departure by fixes and departure airports. Traffic management personnel can customize the displays by selecting the departure airports and fixes of

PILOT/CONTROLLER GLOSSARY

D

interest. The information displayed is the demand for the resource (fix or departure airport) in time bins with the flight list and a flight history for one flight at a time. From the display, flights can be selected for route amendment, one or more at a time, and the Route Amendment Dialogue (RAD) screen automatically opens for easy route selection and execution. Reroute options are based on Coded Departure Route (CDR) database and Trajectory Options Set (TOS) (when available).

DESCEND VIA — An abbreviated ATC clearance that requires compliance with a published procedure lateral path and associated speed restrictions and provides a pilot-discretion descent to comply with published altitude restrictions.

DESCENT SPEED ADJUSTMENTS — Speed deceleration calculations made to determine an accurate VTA. These calculations start at the transition point and use arrival speed segments to the vertex.

DESIGNATED COMMON TRAFFIC ADVISORY FREQUENCY (CTAF) AREA — In Alaska, in addition to being designated for the purpose of carrying out airport advisory practices while operating to or from an airport without an operating airport traffic control tower, a CTAF may also be designated for the purpose of carrying out advisory practices for operations in and through areas with a high volume of VFR traffic.

DESIRED COURSE —

- True — A predetermined desired course direction to be followed (measured in degrees from true north).
- Magnetic — A predetermined desired course direction to be followed (measured in degrees from local magnetic north).

DESIRED TRACK — The planned or intended track between two waypoints. It is measured in degrees from either magnetic or true north. The instantaneous angle may change from point to point along the great circle track between waypoints.

DETRESFA (DISTRESS PHASE) [ICAO] — The code word used to designate an emergency phase wherein there is reasonable certainty that an aircraft and its occupants are threatened by grave and imminent danger or require immediate assistance.

DEVIATIONS —

- A departure from a current clearance, such as an off course maneuver to avoid weather or turbulence.
- Where specifically authorized in the CFRs and requested by the pilot, ATC may permit pilots to deviate from certain regulations.

DH — (See DECISION HEIGHT.)

DH [ICAO] — (See ICAO Term DECISION ALTITUDE/DECISION HEIGHT.)

DIGITAL-AUTOMATIC TERMINAL INFORMATION SERVICE (D-ATIS) — The service provides text messages to aircraft, airlines, and other users outside the standard reception range of conventional ATIS via landline and data link communications to the cockpit. Also, the service provides a computer-synthesized voice message that can be transmitted to all aircraft within range of

PILOT/CONTROLLER GLOSSARY

D

existing transmitters. The Terminal Data Link System (TDLS) D-ATIS application uses weather inputs from local automated weather sources or manually entered meteorological data together with preprogrammed menus to provide standard information to users. Airports with D-ATIS capability are listed in the Chart Supplement U.S.

DIGITAL TARGET — A computer-generated symbol representing an aircraft's position, based on a primary return or radar beacon reply, shown on a digital display.

DIGITAL TERMINAL AUTOMATION SYSTEM (DTAS) — A system where digital radar and beacon data is presented on digital displays and the operational program monitors the system performance on a real-time basis.

DIGITIZED TARGET — A computer-generated indication shown on an analog radar display resulting from a primary radar return or a radar beacon reply.

DIRECT — Straight line flight between two navigational aids, fixes, points, or any combination thereof. When used by pilots in describing off-airway routes, points defining direct route segments become compulsory reporting points unless the aircraft is under radar contact.

DIRECTLY BEHIND — An aircraft is considered to be operating directly behind when it is following the actual flight path of the lead aircraft over the surface of the earth except when applying wake turbulence separation criteria.

DISCRETE BEACON CODE — (See DISCRETE CODE.)

DISCRETE CODE — As used in the Air Traffic Control Radar Beacon System (ATCRBS), any one of the 4096 selectable Mode 3/A aircraft transponder codes except those ending in zero zero; e.g., discrete codes: 0010, 1201, 2317, 7777; nondiscrete codes: 0100, 1200, 7700. Nondiscrete codes are normally reserved for radar facilities that are not equipped with discrete decoding capability and for other purposes such as emergencies (7700), VFR aircraft (1200), etc.

(See RADAR.)

(Refer to AIM.)

DISCRETE FREQUENCY — A separate radio frequency for use in direct pilot-controller communications in air traffic control which reduces frequency congestion by controlling the number of aircraft operating on a particular frequency at one time. Discrete frequencies are normally designated for each control sector in en route/terminal ATC facilities. Discrete frequencies are listed in the Chart Supplement U.S. and the DOD FLIP IFR En Route Supplement [and on Jeppesen charts].

(See CONTROL SECTOR.)

DISPLACED THRESHOLD — A threshold that is located at a point on the runway other than the designated beginning of the runway.

(See THRESHOLD.)

(Refer to AIM.)

DISTANCE MEASURING EQUIPMENT (DME) — Equipment (airborne and ground) used to measure, in nautical miles, the slant range distance of an aircraft from the DME navigational aid.

PILOT/CONTROLLER GLOSSARY

D

(See TACAN.)

(See VORTAC.)

DISTRESS — A condition of being threatened by serious and/or imminent danger and of requiring immediate assistance.

DIVE BRAKES — (See SPEED BRAKES.)

DIVERSE VECTOR AREA — In a radar environment, that area in which a prescribed departure route is not required as the only suitable route to avoid obstacles. The area in which random radar vectors below the MVA/MIA, established in accordance with the TERPS criteria for diverse departures, obstacles and terrain avoidance, may be issued to departing aircraft.

DIVERSION (DVRSN) — Flights that are required to land at other than their original destination for reasons beyond the control of the pilot/company, e.g. periods of significant weather.

DME — (See DISTANCE MEASURING EQUIPMENT.)

DME FIX — A geographical position determined by reference to a navigational aid which provides distance and azimuth information. It is defined by a specific distance in nautical miles and a radial, azimuth, or course (i.e., localizer) in degrees magnetic from that aid.

(See DISTANCE MEASURING EQUIPMENT.)

(See FIX.)

DME SEPARATION — Spacing of aircraft in terms of distances (nautical miles) determined by reference to distance measuring equipment (DME).

(See DISTANCE MEASURING EQUIPMENT.)

DOD FLIP — Department of Defense Flight Information Publications used for flight planning, en route, and terminal operations. FLIP is produced by the National Geospatial-Intelligence Agency (NGA) for world-wide use. United States Government Flight Information Publications (en route charts and instrument approach procedure charts) are incorporated in DOD FLIP for use in the National Airspace System (NAS).

DOMESTIC AIRSPACE — Airspace which overlies the continental land mass of the United States plus Hawaii and U.S. possessions. Domestic airspace extends to 12 miles offshore.

DOMESTIC NOTICE — A special notice or notice containing graphics or plain language text pertaining to almost every aspect of aviation, such as military training areas, large scale sporting events, air show information, Special Traffic Management Programs (STMPs), and airport-specific information. These notices are applicable to operations within the United States and can be found on the Domestic Notices website.

DOWNBURST — A strong downdraft which induces an outburst of damaging winds on or near the ground. Damaging winds, either straight or curved, are highly divergent. The sizes of downbursts vary from 1/2 mile or less to more than 10 miles. An intense downburst often causes widespread damage. Damaging winds, lasting 5 to 30 minutes, could reach speeds as high as 120 knots.

PILOT/CONTROLLER GLOSSARY

D

DOWNWIND LEG — (See TRAFFIC PATTERN.)

DP — (See INSTRUMENT DEPARTURE PROCEDURE.)

DRA — (See DEBRIS RESPONSE AREA.)

DRAG CHUTE — A parachute device installed on certain aircraft which is deployed on landing roll to assist in deceleration of the aircraft.

DROP ZONE — Any pre-determined area upon which parachutists or objects land after making an intentional parachute jump or drop.

(Refer to 14 CFR §105.3, Definitions.)

DSP — (See DEPARTURE SEQUENCING PROGRAM.)

DTAS — (See DIGITAL TERMINAL AUTOMATION SYSTEM.)

DUE REGARD — A phase of flight wherein an aircraft commander of a State-operated aircraft assumes responsibility to separate his/her aircraft from all other aircraft.

(See also FAA Order JO 7110.65, Para 1-2-1, WORD MEANINGS.)

DUTY RUNWAY — (See RUNWAY IN USE/ACTIVE RUNWAY/DUTY RUNWAY.)

DVA — (See DIVERSE VECTOR AREA.)

DVFR — (See DEFENSE VISUAL FLIGHT RULES.)

DVFR FLIGHT PLAN — A flight plan filed for a VFR aircraft which intends to operate in airspace within which the ready identification, location, and control of aircraft are required in the interest of national security.

DVRSN — (See DIVERSION.)

DYNAMIC — Continuous review, evaluation, and change to meet demands.

DYNAMIC RESTRICTIONS — Those restrictions imposed by the local facility on an “as needed” basis to manage unpredictable fluctuations in traffic demands.

PILOT/CONTROLLER GLOSSARY
E

EAS — (See EN ROUTE AUTOMATION SYSTEM.)

EDCT — (See EXPECT DEPARTURE CLEARANCE TIME.)

EDST — (See EN ROUTE DECISION SUPPORT TOOL.)

EFC — (See EXPECT FURTHER CLEARANCE (TIME).)

ELT — (See EMERGENCY LOCATOR TRANSMITTER.)

EMBEDDED ROUTE TEXT — An EDST notification that an ADR/ADAR/AAR has been applied to the flight plan. Within the route field, sub-fields consisting of an adapted route or an embedded change in the route are color-coded in cyan with cyan brackets around the sub-field.

(See EN ROUTE DECISION SUPPORT TOOL.)

EMERGENCY — A distress or an urgency condition.

EMERGENCY AUTOLAND SYSTEM — This system, if activated, will determine an optimal airport, plot a course, broadcast the aircraft's intentions, fly to the airport, land, and (depending on the model) shut down the engines. Though the system will broadcast the aircraft's intentions, the controller should assume that transmissions to the aircraft will not be acknowledged.

EMERGENCY DESCENT MODE — This automated system senses conditions conducive to hypoxia (cabin depressurization). If an aircraft is equipped and the system is activated, it is designed to turn the aircraft up to 90 degrees, then descend to a lower altitude and level off, giving the pilot(s) time to recover.

EMERGENCY LOCATOR TRANSMITTER (ELT) — A radio transmitter attached to the aircraft structure which operates from its own power source on 121.5 MHz and 243.0 MHz. It aids in locating downed aircraft by radiating a downward sweeping audio tone, 2-4 times per second. It is designed to function without human action after an accident.

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

E-MSAW — (See EN ROUTE MINIMUM SAFE ALTITUDE WARNING.)

ENHANCED FLIGHT VISION SYSTEM (EFVS) — An EFVS is an installed aircraft system which uses an electronic means to provide a display of the forward external scene topography (the natural or man-made features of a place or region especially in a way to show their relative positions and elevation) through the use of imaging sensors, including but not limited to forward-looking infrared, millimeter wave radiometry, millimeter wave radar, or low-light level image intensification. An EFVS includes the display element, sensors, computers and power supplies, indications, and controls. An operator's authorization to conduct an EFVS operation may have provisions which allow pilots to conduct IAPs when the reported weather is below minimums prescribed on the IAP to be flown.

EN ROUTE AIR TRAFFIC CONTROL SERVICES — Air traffic control service provided aircraft on IFR flight plans, generally by centers, when these aircraft are operating between departure and destination terminal areas. When equipment, capabilities, and controller workload permit, certain advisory/assistance services may be provided to VFR aircraft.

PILOT/CONTROLLER GLOSSARY
E

(See AIR ROUTE TRAFFIC CONTROL CENTER.)

(Refer to AIM.)

EN ROUTE AUTOMATION SYSTEM (EAS) — The complex integrated environment consisting of situation display systems, surveillance systems and flight data processing, remote devices, decision support tools, and the related communications equipment that form the heart of the automated IFR air traffic control system. It interfaces with automated terminal systems and is used in the control of en route IFR aircraft.

(Refer to AIM.)

EN ROUTE CHARTS — (See AERONAUTICAL CHART.)

EN ROUTE DECISION SUPPORT TOOL (EDST) — An automated tool provided at each Radar Associate position in selected En Route facilities. This tool utilizes flight and radar data to determine present and future trajectories for all active and proposal aircraft and provides enhanced automated flight data management.

EN ROUTE DESCENT — Descent from the en route cruising altitude which takes place along the route of flight.

EN ROUTE HIGH ALTITUDE CHARTS — (See AERONAUTICAL CHART.)

EN ROUTE LOW ALTITUDE CHARTS — (See AERONAUTICAL CHART.)

EN ROUTE MINIMUM SAFE ALTITUDE WARNING (E-MSAW) — A function of the EAS that aids the controller by providing an alert when a tracked aircraft is below or predicted by the computer to go below a predetermined minimum IFR altitude (MIA).

EN ROUTE TRANSITION — (See SEGMENTS OF A SID/STAR.)

EN ROUTE TRANSITION WAYPOINT — (See SEGMENTS OF A SID/STAR.)

EST — (See ESTIMATED.)

ESTABLISHED — To be stable or fixed at an altitude or on a course, route, route segment, heading, instrument approach or departure procedure, etc.

ESTABLISHED ON RNP (EOR) CONCEPT — A system of authorized instrument approaches, ATC procedures, surveillance, and communication requirements that allow aircraft operations to be safely conducted with approved reduced separation criteria once aircraft are established on a PBN segment of a published instrument flight procedure.

ESTIMATED (EST) — When used in NOTAMs “EST” is a contraction that is used by the issuing authority only when the condition is expected to return to service prior to the expiration time. Using “EST” lets the user know that this NOTAM has the possibility of returning to service earlier than the expiration time. Any NOTAM which includes an “EST” will be auto-expired at the designated expiration time.

ESTIMATED ELAPSED TIME [ICAO] — The estimated time required to proceed from one significant point to another.

(See ICAO Term TOTAL ESTIMATED ELAPSED TIME.)

PILOT/CONTROLLER GLOSSARY

E

ESTIMATED OFF-BLOCK TIME [ICAO] — The estimated time at which the aircraft will commence movement associated with departure.

ESTIMATED POSITION ERROR (EPE) — (See Required Navigation Performance)

ESTIMATED TIME OF ARRIVAL — The time the flight is estimated to arrive at the gate (scheduled operators) or the actual runway on times for nonscheduled operators.

ESTIMATED TIME EN ROUTE — The estimated flying time from departure point to destination (lift-off to touchdown).

ETA — (See ESTIMATED TIME OF ARRIVAL.)

ETE — (See ESTIMATED TIME EN ROUTE.)

EXECUTE MISSED APPROACH — Instructions issued to a pilot making an instrument approach which means continue inbound to the missed approach point and execute the missed approach procedure as described on the Instrument Approach Procedure Chart or as previously assigned by ATC. The pilot may climb immediately to the altitude specified in the missed approach procedure upon making a missed approach. No turns should be initiated prior to reaching the missed approach point. When conducting an ASR or PAR approach, execute the assigned missed approach procedure immediately upon receiving instructions to “execute missed approach.”

(Refer to AIM.)

EXPECT (ALTITUDE) AT (TIME) or (FIX) — Used under certain conditions to provide a pilot with an altitude to be used in the event of two-way communications failure. It also provides altitude information to assist the pilot in planning.

(Refer to AIM.)

EXPECT DEPARTURE CLEARANCE TIME (EDCT) — The runway release time assigned to an aircraft in a traffic management program and shown on the flight progress strip as an EDCT.

(See GROUND DELAY PROGRAM.)

EXPECT FURTHER CLEARANCE (TIME) — The time a pilot can expect to receive clearance beyond a clearance limit.

EXPECT FURTHER CLEARANCE VIA (AIRWAYS, ROUTES OR FIXES) — Used to inform a pilot of the routing he/she can expect if any part of the route beyond a short range clearance limit differs from that filed.

EXPEDITE — Used by ATC when prompt compliance is required to avoid the development of an imminent situation. Expedite climb/descent normally indicates to a pilot that the approximate best rate of climb/descent should be used without requiring an exceptional change in aircraft handling characteristics.

PILOT/CONTROLLER GLOSSARY

F

FAF — (See FINAL APPROACH FIX.)

FALLEN HERO — Remains of fallen members of the United States military are often returned home by aircraft. These flights may be identified with the phrase “FALLEN HERO” added to the remarks section of the flight plan, or they may be transmitted via air/ground communications. If able, these flights will receive priority handling.

FAST FILE — An FSS system whereby a pilot files a flight plan via telephone that is recorded and later transcribed for transmission to the appropriate air traffic facility. (Alaska only.)

FAWP — Final Approach Waypoint

FEATHERED PROPELLER — A propeller whose blades have been rotated so that the leading and trailing edges are nearly parallel with the aircraft flight path to stop or minimize drag and engine rotation. Normally used to indicate shutdown of a reciprocating or turboprop engine due to malfunction.

FEDERAL AIRWAYS — (See LOW ALTITUDE AIRWAY STRUCTURE.)

FEEDER FIX — The fix depicted on Instrument Approach Procedure Charts which establishes the starting point of the feeder route.

FEEDER ROUTE — A route depicted on instrument approach procedure charts to designate routes for aircraft to proceed from the en route structure to the initial approach fix (IAF).

(See INSTRUMENT APPROACH PROCEDURE.)

FERRY FLIGHT — A flight for the purpose of:

- a. Returning an aircraft to base.
- b. Delivering an aircraft from one location to another.
- c. Moving an aircraft to and from a maintenance base. Ferry flights, under certain conditions, may be conducted under terms of a special flight permit.

FIELD ELEVATION — (See AIRPORT ELEVATION.)

FILED — Normally used in conjunction with flight plans, meaning a flight plan has been submitted to ATC.

FILED EN ROUTE DELAY — Any of the following preplanned delays at points/areas along the route of flight which require special flight plan filing and handling techniques.

- a. Terminal Area Delay. A delay within a terminal area for touch-and-go, low approach, or other terminal area activity.
- b. Special Use Airspace Delay. A delay within a Military Operations Area, Restricted Area, Warning Area, or ATC Assigned Airspace.
- c. Aerial Refueling Delay. A delay within an Aerial Refueling Track or Anchor.

FILED FLIGHT PLAN — The flight plan as filed with an ATS unit by the pilot or his/her designated representative without any subsequent changes or clearances.

PILOT/CONTROLLER GLOSSARY

F

FINAL — Commonly used to mean that an aircraft is on the final approach course or is aligned with a landing area.

(See FINAL APPROACH COURSE.)

(See FINAL APPROACH-IFR.)

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

FINAL APPROACH [ICAO] — That part of an instrument approach procedure which commences at the specified final approach fix or point, or where such a fix or point is not specified.

- a. At the end of the last procedure turn, base turn or inbound turn of a racetrack procedure, if specified; or
- b. At the point of interception of the last track specified in the approach procedure; and ends at a point in the vicinity of an aerodrome from which:
 1. A landing can be made; or
 2. A missed approach procedure is initiated.

FINAL APPROACH COURSE — A bearing/radial/track of an instrument approach leading to a runway or an extended runway centerline all without regard to distance.

FINAL APPROACH FIX — The fix from which the final approach (IFR) to an airport is executed and which identifies the beginning of the final approach segment. It is designated on Government charts [and in the profile view of Jeppesen Terminal charts] by the Maltese Cross symbol for non-precision approaches and the lightning bolt symbol [or on Jeppesen charts, the glideslope/path intercept point], designating the PFAF, for precision approaches; or when ATC directs a lower-than-published glideslope/path or vertical path intercept altitude, it is the resultant actual point of the glideslope/path or vertical path intercept.

(See FINAL APPROACH POINT.)

(See GLIDESLOPE INTERCEPT ALTITUDE.)

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

FINAL APPROACH-IFR — The flight path of an aircraft which is inbound to an airport on a final instrument approach course, beginning at the final approach fix or point and extending to the airport or the point where a circle-to-land maneuver or a missed approach is executed.

(See FINAL APPROACH COURSE.)

(See FINAL APPROACH FIX.)

(See FINAL APPROACH POINT.)

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

(See ICAO term FINAL APPROACH.)

FINAL APPROACH POINT — The point, applicable only to a nonprecision approach with no depicted FAF (such as an on airport VOR), where the aircraft is established inbound on the final

PILOT/CONTROLLER GLOSSARY

F

approach course from the procedure turn and where the final approach descent may be commenced. The FAP serves as the FAF and identifies the beginning of the final approach segment.

(See FINAL APPROACH FIX.)

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

FINAL APPROACH SEGMENT — (See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

FINAL APPROACH SEGMENT [ICAO] — That segment of an instrument approach procedure in which alignment and descent for landing are accomplished.

FINAL CONTROLLER — The controller providing information and final approach guidance during PAR and ASR approaches utilizing radar equipment.

(See RADAR APPROACH.)

FINAL GUARD SERVICE — A value added service provided in conjunction with LAA/RAA only during periods of significant and fast changing weather conditions that may affect landing and takeoff operations.

FINAL MONITOR AID — A high resolution color display that is equipped with the controller alert system hardware/software used to monitor the no transgression zone (NTZ) during simultaneous parallel approach operations. The display includes alert algorithms providing the target predictors, a color change alert when a target penetrates or is predicted to penetrate the no transgression zone (NTZ), synthesized voice alerts, and digital mapping.

(See RADAR APPROACH.)

FINAL MONITOR CONTROLLER — Air Traffic Control Specialist assigned to radar monitor the flight path of aircraft during simultaneous parallel (approach courses spaced less than 9000 feet/9200 feet above 5000 feet) and simultaneous close parallel approach operations. Each runway is assigned a final monitor controller during simultaneous parallel and simultaneous close parallel ILS approaches.

FIR — (See FLIGHT INFORMATION REGION.)

FIRST TIER CENTER — An ARTCC immediately adjacent to the impacted center.

FIS-B — (See FLIGHT INFORMATION SERVICE-BROADCAST.)

FIX — A geographical position determined by visual reference to the surface, by reference to one or more radio NAVAIDs, by celestial plotting, or by another navigational device.

FIX BALANCING — A process whereby aircraft are evenly distributed over several available arrival fixes reducing delays and controller workload.

FLAG — A warning device incorporated in certain airborne navigation and flight instruments indicating that:

- a. Instruments are inoperative or otherwise not operating satisfactorily, or
- b. Signal strength or quality of the received signal falls below acceptable values.

PILOT/CONTROLLER GLOSSARY

F

FLAG ALARM — (See FLAG.)

FLAMEOUT — An emergency condition caused by a loss of engine power.

FLAMEOUT PATTERN — An approach normally conducted by a single-engine military aircraft experiencing loss or anticipating loss of engine power or control. The standard overhead approach starts at a relatively high altitude over a runway (“high key”) followed by a continuous 180 degree turn to a high, wide position (“low key”) followed by a continuous 180 degree turn final. The standard straight-in pattern starts at a point that results in a straight-in approach with a high rate of descent to the runway. Flameout approaches terminate in the type approach requested by the pilot (normally fullstop).

FLIGHT CHECK — A call sign prefix used by FAA aircraft engaged in flight inspection/certification of navigational aids and flight procedures. The word “recorded” may be added as a suffix; e.g., “Flight Check 320 recorded” to indicate that an automated flight inspection is in progress in terminal areas.

(See FLIGHT INSPECTION.)

(Refer to AIM.)

FLIGHT FOLLOWING — (See TRAFFIC ADVISORIES.)

FLIGHT INFORMATION REGION — An airspace of defined dimensions within which Flight Information Service and Alerting Service are provided.

- a. Flight Information Service. A service provided for the purpose of giving advice and information useful for the safe and efficient conduct of flights.
- b. Alerting Service. A service provided to notify appropriate organizations regarding aircraft in need of search and rescue aid and to assist such organizations as required.

FLIGHT INFORMATION SERVICE — A service provided for the purpose of giving advice and information useful for the safe and efficient conduct of flights.

FLIGHT INFORMATION SERVICE-BROADCAST (FIS-B) — A ground broadcast service provided through the ADS-B Broadcast Services network of the UAT data link that operates on 978 MHz. The FIS-B system provides pilots and flight crews of properly equipped aircraft with a cockpit display of certain aviation weather and aeronautical information.

FLIGHT INSPECTION — Inflight investigation and evaluation of a navigational aid to determine whether it meets established tolerances.

(See FLIGHT CHECK.)

(See NAVIGATIONAL AID.)

FLIGHT LEVEL — A level of constant atmospheric pressure related to a reference datum of 29.92 inches of mercury. Each is stated in three digits that represent hundreds of feet. For example, flight level (FL) 250 represents a barometric altimeter indication of 25,000 feet; FL 255, an indication of 25,500 feet.

(See ICAO term FLIGHT LEVEL.)

PILOT/CONTROLLER GLOSSARY

F

FLIGHT LEVEL [ICAO] — A surface of constant atmospheric pressure which is related to a specific pressure datum, 1013.2 hPa (1013.2 mb), and is separated from other such surfaces by specific pressure intervals.

NOTE 1: *A pressure type altimeter calibrated in accordance with the standard atmosphere:*

- a. When set to a QNH altimeter setting, will indicate altitude;*
- b. When set to a QFE altimeter setting, will indicate height above the QFE reference datum; and*
- c. When set to a pressure of 1013.2 hPa (1013.2 mb), may be used to indicate flight levels.*

NOTE 2: *The terms 'height' and 'altitude', used in Note 1 above, indicate altimetric rather than geometric heights and altitudes.*

FLIGHT LINE — A term used to describe the precise movement of a civil photogrammetric aircraft along a predetermined course(s) at a predetermined altitude during the actual photographic run.

FLIGHT MANAGEMENT SYSTEMS — A computer system that uses a large data base to allow routes to be preprogrammed and fed into the system by means of a data loader. The system is constantly updated with respect to position accuracy by reference to conventional navigation aids. The sophisticated program and its associated data base ensures that the most appropriate aids are automatically selected during the information update cycle.

FLIGHT PATH — A line, course, or track along which an aircraft is flying or intended to be flown.

(See COURSE.)

(See TRACK.)

FLIGHT PLAN — Specified information relating to the intended flight of an aircraft that is filed electronically, orally, or in writing with an FSS, third-party vendor, or an ATC facility.

(See FAST FILE.)

(See FILED.)

(Refer to AIM.)

FLIGHT PLAN AREA (FPA) — The geographical area assigned to a flight service station (FSS) for the purpose of establishing primary responsibility for services that may include search and rescue for VFR aircraft, issuance of NOTAMs, pilot briefings, inflight services, broadcast services, emergency services, flight data processing, international operations, and aviation weather services. Large consolidated FSS facilities may combine FPAs into larger areas of responsibility (AOR).

(See FLIGHT SERVICE STATION.)

(See TIE-IN FACILITY.)

FLIGHT RECORDER — A general term applied to any instrument or device that records information about the performance of an aircraft in flight or about conditions encountered in flight. Flight

PILOT/CONTROLLER GLOSSARY

F

recorders may make records of airspeed, outside air temperature, vertical acceleration, engine RPM, manifold pressure, and other pertinent variables for a given flight.

(See ICAO term FLIGHT RECORDER.)

FLIGHT RECORDER [ICAO] — Any type of recorder installed in the aircraft for the purpose of complementing accident/incident investigation.

NOTE: See Annex 6 Part I, for specifications relating to flight recorders.

FLIGHT SERVICE STATION (FSS) — An air traffic facility which provides pilot briefings, flight plan processing, en route flight advisories, search and rescue services, and assistance to lost aircraft and aircraft in emergency situations. FSS also relay ATC clearances, process Notices to Air Missions and broadcast aviation weather and aeronautical information. In Alaska, FSS provide Airport Advisory Services.

(See FLIGHT PLAN AREA.)

(See TIE-IN FACILITY.)

FLIGHT STANDARDS DISTRICT OFFICE — An FAA field office serving an assigned geographical area and staffed with Flight Standards personnel who serve the aviation industry and the general public on matters relating to the certification and operation of air carrier and general aviation aircraft. Activities include general surveillance of operational safety, certification of airmen and aircraft, accident prevention, investigation, enforcement, etc.

FLIGHT TERMINATION — The intentional and deliberate process of terminating the flight of a UA in the event of an unrecoverable lost link, loss of control, or other failure that compromises the safety of flight.

FLIGHT TEST — A flight for the purpose of:

- a. Investigating the operation/flight characteristics of an aircraft or aircraft component.
- b. Evaluating an applicant for a pilot certificate or rating.

FLIGHT VISIBILITY — (See VISIBILITY.)

FLIP — (See DOD FLIP.)

FLY HEADING (DEGREES) — Informs the pilot of the heading he/she should fly. The pilot may have to turn to, or continue on, a specific compass direction in order to comply with the instructions. The pilot is expected to turn in the shorter direction to the heading unless otherwise instructed by ATC.

FLY-BY WAYPOINT — A fly-by waypoint requires the use of turn anticipation to avoid overshoot of the next flight segment.

FLY-OVER WAYPOINT — A fly-over waypoint precludes any turn until the waypoint is overflown and is followed by an intercept maneuver of the next flight segment.

FLY VISUAL TO AIRPORT — (See PUBLISHED INSTRUMENT APPROACH PROCEDURE VISUAL SEGMENT.)

PILOT/CONTROLLER GLOSSARY

F

FLYAWAY — When the pilot is unable to effect control of the aircraft and, as a result, the UA is not operating in a predictable or planned manner.

FMA — (See FINAL MONITOR AID.)

FMS — (See FLIGHT MANAGEMENT SYSTEM.)

FORMATION FLIGHT — More than one aircraft which, by prior arrangement between the pilots, operate as a single aircraft with regard to navigation and position reporting. Separation between aircraft within the formation is the responsibility of the flight leader and the pilots of the other aircraft in the flight. This includes transition periods when aircraft within the formation are maneuvering to attain separation from each other to effect individual control and during join-up and break-away.

- a. A standard formation is one in which a proximity of no more than 1 mile laterally or longitudinally and within 100 feet vertically from the flight leader is maintained by each wingman.
- b. Nonstandard formations are those operating under any of the following conditions:
 1. When the flight leader has requested and ATC has approved other than standard formation dimensions.
 2. When operating within an authorized altitude reservation (ALTRV) or under the provisions of a letter of agreement.
 3. When the operations are conducted in airspace specifically designed for a special activity.

(See ALTITUDE RESERVATION.)

(Refer to 14 CFR Part 91.)

FRC — (See REQUEST FULL ROUTE CLEARANCE.)

FREEZE/FROZEN — Terms used in referring to arrivals which have been assigned ACLTs and to the lists in which they are displayed.

FREEZE HORIZON — The time or point at which an aircraft's STA becomes fixed and no longer fluctuates with each radar update. This setting ensures a constant time for each aircraft, necessary for the metering controller to plan his/her delay technique. This setting can be either in distance from the meter fix or a prescribed flying time to the meter fix.

FREEZE SPEED PARAMETER — A speed adapted for each aircraft to determine fast and slow aircraft. Fast aircraft freeze on parameter FCLT and slow aircraft freeze on parameter MLDI.

FRICTION MEASUREMENT — A measurement of the friction characteristics of the runway pavement surface using continuous self-watering friction measurement equipment in accordance with the specifications, procedures and schedules contained in AC 150/5320-12, Measurement, Construction, and Maintenance of Skid Resistant Airport Pavement Surfaces.

FSDO — (See FLIGHT STANDARDS DISTRICT OFFICE.)

FSPD — (See FREEZE SPEED PARAMETER.)

PILOT/CONTROLLER GLOSSARY

F

FSS — (See FLIGHT SERVICE STATION.)

FUEL DUMPING — Airborne release of usable fuel. This does not include the dropping of fuel tanks.

(See JETTISONING OF EXTERNAL STORES.)

FUEL REMAINING — A phrase used by either pilots or controllers when relating to the fuel remaining on board until actual fuel exhaustion. When transmitting such information in response to either a controller question or pilot initiated cautionary advisory to air traffic control, pilots will state the APPROXIMATE NUMBER OF MINUTES the flight can continue with the fuel remaining. All reserve fuel SHOULD BE INCLUDED in the time stated, as should an allowance for established fuel gauge system error.

FUEL SIPHONING — Unintentional release of fuel caused by overflow, puncture, loose cap, etc.

FUEL VENTING — (See FUEL SIPHONING.)

FUSED TARGET — (See DIGITAL TARGET.)

FUSION [STARS] — The combination of all available surveillance sources (airport surveillance radar [ASR], air route surveillance radar [ARSR], ADS-B, etc.) into the display of a single tracked target for air traffic control separation services. FUSION is the equivalent of the current single-sensor radar display. FUSION performance is characteristic of a single-sensor radar display system. Terminal areas use mono-pulse secondary surveillance radar (ASR 9, Mode S or ASR 11, MSSR).

PILOT/CONTROLLER GLOSSARY

G

GATE HOLD PROCEDURES — Procedures at selected airports to hold aircraft at the gate or other ground location whenever departure delays exceed or are anticipated to exceed 15 minutes. The sequence for departure will be maintained in accordance with initial call-up unless modified by flow control restrictions. Pilots should monitor the ground control/clearance delivery frequency for engine start/taxi advisories or new proposed start/taxi time if the delay changes.

GCA — (See GROUND CONTROLLED APPROACH.)

GDP — (See GROUND DELAY PROGRAM.)

GENERAL AVIATION — That portion of civil aviation that does not include scheduled or unscheduled air carriers or commercial space operations.

(See ICAO term GENERAL AVIATION.)

GENERAL AVIATION [ICAO] — All civil aviation operations other than scheduled air services and nonscheduled air transport operations for remuneration or hire.

GEO MAP — The digitized map markings associated with the ASR-9 Radar System.

GLIDEPATH — (See GLIDESLOPE.)

GLIDEPATH [ICAO] — A descent profile determined for vertical guidance during a final approach.

GLIDEPATH INTERCEPT ALTITUDE — (See GLIDESLOPE INTERCEPT ALTITUDE.)

GLIDESLOPE — Provides vertical guidance for aircraft during approach and landing. The glide-slope/glidepath is based on the following:

- Electronic components emitting signals which provide vertical guidance by reference to airborne instruments during instrument approaches such as ILS; or,
- Visual ground aids, such as VASI, which provide vertical guidance for a VFR approach or for the visual portion of an instrument approach and landing.
- PAR. Used by ATC to inform an aircraft making a PAR approach of its vertical position (elevation) relative to the descent profile.

(See ICAO term GLIDEPATH.)

GLIDESLOPE INTERCEPT ALTITUDE — The published minimum altitude to intercept the glide-slope in the intermediate segment of an instrument approach. Government charts use the lightning bolt symbol to identify this intercept point. This intersection is called the Precise Final Approach fix (PFAF). ATC directs a higher altitude, the resultant intercept becomes the PFAF.

(See FINAL APPROACH FIX.)

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

GLOBAL NAVIGATION SATELLITE SYSTEM (GNSS) — GNSS refers collectively to the worldwide positioning, navigation, and timing determination capability available from one or more satellite constellations. A GNSS constellation may be augmented by ground stations and/or geostationary satellites to improve integrity and position accuracy.

(See GROUND-BASED AUGMENTATION SYSTEM.)

PILOT/CONTROLLER GLOSSARY

G

(See SATELLITE-BASED AUGMENTATION SYSTEM.)

GLOBAL NAVIGATION SATELLITE SYSTEM MINIMUM EN ROUTE IFR ALTITUDE (GNSS MEA) — The minimum en route IFR altitude on a published ATS route or route segment which assures acceptable Global Navigation Satellite System reception and meets obstacle clearance requirements.

(Refer to 14 CFR Part 91.)

(Refer to 14 CFR Part 95.)

GLOBAL POSITIONING SYSTEM (GPS) — GPS refers to the worldwide positioning, navigation and timing determination capability available from the U.S. satellite constellation. The service provided by GPS for civil use is defined in the GPS Standard Positioning System Performance Standard. GPS is composed of space, control, and user elements.

GNSS [ICAO] — (See GLOBAL NAVIGATION SATELLITE SYSTEM.)

GNSS MEA — (See GLOBAL NAVIGATION SATELLITE SYSTEM MINIMUM EN ROUTE IFR ALTITUDE.)

GO AHEAD — Proceed with your message. Not to be used for any other purpose.

GO AROUND — Instructions for a pilot to abandon his/her approach to landing. Additional instructions may follow. Unless otherwise advised by ATC, a VFR aircraft or an aircraft conducting visual approach should overfly the runway while climbing to traffic pattern altitude and enter the traffic pattern via the crosswind leg. A pilot on an IFR flight plan making an instrument approach should execute the published missed approach procedure or proceed as instructed by ATC; e.g., "Go around" (additional instructions if required).

(See LOW APPROACH.)

(See MISSED APPROACH.)

GPD — (See GRAPHIC PLAN DISPLAY.)

GPS — (See GLOBAL POSITIONING SYSTEM.)

GRAPHIC PLAN DISPLAY (GPD) — A view available with EDST that provides a graphic display of aircraft, traffic, and notification of predicted conflicts. Graphic routes for Current Plans and Trial Plans are displayed upon controller request.

(See EN ROUTE DECISION SUPPORT TOOL.)

GROSS NAVIGATION ERROR (GNE) — A lateral deviation of 10 NM or more from the aircraft's cleared route.

GROUND BASED AUGMENTATION SYSTEM (GBAS) — A ground based GNSS station which provides local differential corrections, integrity parameters and approach data via VHF data broadcast to GNSS users to meet real-time performance requirements for CAT I precision approaches. The aircraft applies the broadcast data to improve the accuracy and integrity of its GNSS signals and computes the deviations to the selected approach. A single ground station can serve multiple runway ends up to an approximate radius of 23 NM.

PILOT/CONTROLLER GLOSSARY

G

GROUND BASED AUGMENTATION SYSTEM (GBAS) LANDING SYSTEM (GLS) — A type of precision IAP based on local augmentation of GNSS data using a single GBAS station to transmit locally corrected GNSS data, integrity parameters and approach information. This improves the accuracy of aircraft GNSS receivers' signal in space, enabling the pilot to fly a precision approach with much greater flexibility, reliability and complexity. The GLS procedure is published on standard IAP charts, features the title GLS with the designated runway and minima as low as 200 feet DA. Future plans are expected to support Cat II and CAT III operations.

GROUND-BASED INTERVAL MANAGEMENT-SPACING (GIM-S), SPEED ADVISORY — A calculated speed that will allow aircraft to meet the TBFM schedule at en route and TRACON boundary meter fixes.

GROUND CLUTTER — A pattern produced on the radar scope by ground returns which may degrade other radar returns in the affected area. The effect of ground clutter is minimized by the use of moving target indicator (MTI) circuits in the radar equipment resulting in a radar presentation which displays only targets which are in motion.

(See CLUTTER.)

GROUND COMMUNICATION OUTLET (GCO) — An unstaffed, remotely controlled, ground/ground communications facility. Pilots at uncontrolled airports may contact ATC and FSS via VHF radio to a telephone connection. If the connection goes to ATC, the pilot can obtain an IFR clearance or close an IFR flight plan. If the connection goes to Flight Service, the pilot can open or close a VFR flight plan; obtain an updated weather briefing prior to takeoff; close an IFR flight plan; or, for Alaska or MEDEVAC only, obtain an IFR clearance. Pilots will use four "key clicks" on the VHF radio to contact the appropriate ATC facility or six "key clicks" to contact the FSS. The GCO system is intended to be used only on the ground.

GROUND CONTROLLED APPROACH — A radar approach system operated from the ground by air traffic control personnel transmitting instructions to the pilot by radio. The approach may be conducted with surveillance radar (ASR) only or with both surveillance and precision approach radar (PAR). Usage of the term "GCA" by pilots is discouraged except when referring to a GCA facility. Pilots should specifically request a "PAR" approach when a precision radar approach is desired or request an "ASR" or "surveillance" approach when a nonprecision radar approach is desired.

(See RADAR APPROACH.)

GROUND DELAY PROGRAM (GDP) — A traffic management process administered by the ATCSCC, when aircraft are held on the ground. The purpose of the program is to support the TM mission and limit airborne holding. It is a flexible program and may be implemented in various forms depending upon the needs of the AT system. Ground delay programs provide for equitable assignment of delays to all system users.

GROUND SPEED — The speed of an aircraft relative to the surface of the earth.

GROUND STOP — The GS is a process that requires aircraft that meet a specific criteria to remain on the ground. The criteria may be airport specific, airspace specific, or equipment spe-

PILOT/CONTROLLER GLOSSARY**G**

cific; for example, all departures to San Francisco, or all departures entering Yorktown sector, or all Category I and II aircraft going to Charlotte. GSs normally occur with little or no warning.

GROUND VISIBILITY — (See VISIBILITY.)

GS — (See GROUND STOP.)

PILOT/CONTROLLER GLOSSARY

H

HAA — (See HEIGHT ABOVE AIRPORT.)

HAL — (See HEIGHT ABOVE LANDING.)

HANDOFF — An action taken to transfer the radar identification of an aircraft from one controller to another if the aircraft will enter the receiving controller's airspace and radio communications with the aircraft will be transferred.

HAT — (See HEIGHT ABOVE TOUCHDOWN.)

HAVE NUMBERS — Used by pilots to inform ATC that they have received runway, wind, and altimeter information only.

HAZARDOUS WEATHER INFORMATION — Summary of significant meteorological information (SIGMET/WS), convective significant meteorological information (convective SIGMET/WST), urgent pilot weather reports (urgent PIREP/UUA), center weather advisories (CWA), airmen's meteorological information (AIRMET/WA) and any other weather such as isolated thunderstorms that are rapidly developing and increasing in intensity, or low ceilings and visibilities that are becoming widespread which is considered significant and are not included in a current hazardous weather advisory.

HEAVY (AIRCRAFT) — (See AIRCRAFT CLASSES.)

HEIGHT ABOVE AIRPORT (HAA) — The height of the Minimum Descent Altitude above the published airport elevation. This is published in conjunction with circling minimums.

(See MINIMUM DESCENT ALTITUDE.)

HEIGHT ABOVE LANDING (HAL) — The height above a designated helicopter landing area used for helicopter instrument approach procedures.

(Refer to 14 CFR Part 97.)

HEIGHT ABOVE TOUCHDOWN (HAT) — The height of the Decision Height or Minimum Descent Altitude above the highest runway elevation in the touchdown zone (first 3,000 feet of the runway). HAT is published on instrument approach charts in conjunction with all straight-in minimums.

(See DECISION HEIGHT.)

(See MINIMUM DESCENT ALTITUDE.)

HELICOPTER — A heavier-than-air aircraft supported in flight chiefly by the reactions of the air on one or more power-driven rotors on substantially vertical axes.

HELIPAD — A small, designated area, usually with a prepared surface, on a heliport, airport, landing/takeoff area, apron/ramp, or movement area used for takeoff, landing, or parking of helicopters.

HELIPORT — An area of land, water, or structure used or intended to be used for the landing and takeoff of helicopters and includes its buildings and facilities if any.

HELIPORT REFERENCE POINT (HRP) — The geographic center of a heliport.

PILOT/CONTROLLER GLOSSARY

H

HERTZ — The standard radio equivalent of frequency in cycles per second of an electromagnetic wave. Kilohertz (kHz) is a frequency of one thousand cycles per second. Megahertz (MHz) is a frequency of one million cycles per second.

HF — (See HIGH FREQUENCY.)

HF COMMUNICATIONS — (See HIGH FREQUENCY COMMUNICATIONS.)

HIGH FREQUENCY — The frequency band between 3 and 30 MHz.

(See HIGH FREQUENCY COMMUNICATIONS.)

HIGH FREQUENCY COMMUNICATIONS — High radio frequencies (HF) between 3 and 30 MHz used for air-to-ground voice communication in overseas operations.

HIGH SPEED EXIT — (See HIGH SPEED TAXIWAY.)

HIGH SPEED TAXIWAY — A long radius taxiway designed and provided with lighting or marking to define the path of aircraft, traveling at high speed (up to 60 knots), from the runway center to a point on the center of a taxiway. Also referred to as long radius exit or turn-off taxiway. The high speed taxiway is designed to expedite aircraft turning off the runway after landing, thus reducing runway occupancy time.

HIGH SPEED TURNOFF — (See HIGH SPEED TAXIWAY.)

HIGH UPDATE RATE SURVEILLANCE — A surveillance system that provides a sensor update rate of less than 4.8 seconds.

HOLD FOR RELEASE — Used by ATC to delay an aircraft for traffic management reasons; i.e., weather, traffic volume, etc. Hold for release instructions (including departure delay information) are used to inform a pilot or a controller (either directly or through an authorized relay) that an IFR departure clearance is not valid until a release time or additional instructions have been received.

(See ICAO term HOLDING POINT.)

HOLD-IN-LIEU OF PROCEDURE TURN — A hold-in-lieu of procedure turn shall be established over a final or intermediate fix when an approach can be made from a properly aligned holding pattern. The hold-in-lieu of procedure turn permits the pilot to align with the final or intermediate segment of the approach and/or descend in the holding pattern to an altitude that will permit a normal descent to the final approach fix altitude. The hold-in-lieu of procedure turn is a required maneuver (the same as a procedure turn) unless the aircraft is being radar vectored to the final approach course, when “NoPT” is shown on the approach chart, or when the pilot requests or the controller advises the pilot to make a “straight-in” approach.

HOLD PROCEDURE — A predetermined maneuver which keeps aircraft within a specified airspace while awaiting further clearance from air traffic control. Also used during ground operations to keep aircraft within a specified area or at a specified point while awaiting further clearance from air traffic control.

(See HOLDING FIX.)

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

H

HOLDING FIX — A specified fix identifiable to a pilot by NAVAIDs or visual reference to the ground used as a reference point in establishing and maintaining the position of an aircraft while holding.

(See FIX.)

(See VISUAL HOLDING.)

(Refer to AIM.)

HOLDING POINT [ICAO] — A specified location, identified by visual or other means, in the vicinity of which the position of an aircraft in flight is maintained in accordance with air traffic control clearances.

HOLDING PROCEDURE — (See HOLD PROCEDURE.)

HOLD-SHORT POINT — A point on the runway beyond which a landing aircraft with a LAHSO clearance is not authorized to proceed. This point may be located prior to an intersecting runway, taxiway, predetermined point, or approach/departure flight path.

HOLD-SHORT POSITION LIGHTS — Flashing in-pavement white lights located at specified hold-short points.

HOLD-SHORT POSITION MARKING — The painted runway marking located at the hold-short point on all LAHSO runways.

HOLD-SHORT POSITION SIGNS — Red and white holding position signs located alongside the hold-short point.

HOMING — Flight toward a NAVAID, without correcting for wind, by adjusting the aircraft heading to maintain a relative bearing of zero degrees.

(See BEARING.)

(See ICAO term HOMING.)

HOMING [ICAO] — The procedure of using the direction-finding equipment of one radio station with the emission of another radio station, where at least one of the stations is mobile, and whereby the mobile station proceeds continuously towards the other station.

HOT SPOT — A location on an airport movement area with a history of potential risk of collision or runway incursion, and where heightened attention by pilots/drivers is necessary.

HOVER CHECK — Used to describe when a helicopter/VTOL aircraft requires a stabilized hover to conduct a performance/power check prior to hover taxi, air taxi, or takeoff. Altitude of the hover will vary based on the purpose of the check.

HOVER TAXI — Used to describe a helicopter/VTOL aircraft movement conducted above the surface and in ground effect at airspeeds less than approximately 20 knots. The actual height may vary, and some helicopters may require hover taxi above 25 feet AGL to reduce ground effect turbulence or provide clearance for cargo slingloads.

(See AIR TAXI.)

**PILOT/CONTROLLER GLOSSARY
H**

(See HOVER CHECK.)

(Refer to AIM.)

HOW DO YOU HEAR ME? — A question relating to the quality of the transmission or to determine how well the transmission is being received.

HZ — (See HERTZ.)

PILOT/CONTROLLER GLOSSARY

I

I SAY AGAIN — The message will be repeated.

IAF — (See INITIAL APPROACH FIX.)

IAP — (See INSTRUMENT APPROACH PROCEDURE.)

IAWP — Initial Approach Waypoint

ICAO — (See ICAO Term INTERNATIONAL CIVIL AVIATION ORGANIZATION.)

ICAO 3LD — (See ICAO Term ICAO Three-Letter Designator)

ICAO Three-Letter Designator (3LD) — An ICAO 3LD is an exclusive designator that, when used together with a flight number, becomes the aircraft call sign and provides distinct aircraft identification to air traffic control (ATC). ICAO approves 3LDs to enhance the safety and security of the air traffic system. An ICAO 3LD may be assigned to a company, agency, or organization and is used instead of the aircraft registration number for ATC operational and security purposes. An ICAO 3LD is also used for aircraft identification in the flight plan and associated messages and can be used for domestic and international flights. A telephony associated with an ICAO 3LD is used for radio communication.

ICING — The accumulation of airframe ice.

Types of icing are:

- Rime Ice — Rough, milky, opaque ice formed by the instantaneous freezing of small supercooled water droplets.
- Clear Ice — A glossy, clear, or translucent ice formed by the relatively slow freezing of large supercooled water droplets.
- Mixed — A mixture of clear ice and rime ice.

Intensity of icing:

- Trace — Ice becomes noticeable. The rate of accumulation is slightly greater than the rate of sublimation. A representative accretion rate for reference purposes is less than $\frac{1}{4}$ inch (6 mm) per hour on the outer wing. The pilot should consider exiting the icing conditions before they become worse.
- Light — The rate of ice accumulation requires occasional cycling of manual deicing systems to minimize ice accretions on the airframe. A representative accretion rate for reference purposes is $\frac{1}{4}$ inch to 1 inch (0.6 to 2.5 cm) per hour on the unprotected part of the outer wing. The pilot should consider exiting the icing condition.
- Moderate — The rate of accumulation requires frequent cycling of manual deicing systems to minimize ice accretions on the airframe. A representative accretion rate for reference purposes is 1 to 3 inches (2.5 to 7.5 cm) per hour on the unprotected part of the outer wing. The pilot should consider exiting the icing condition as soon as possible.
- Severe — The rate of ice accumulation is such that ice protection systems fail to remove the accumulation of ice and ice accumulates in locations not normally prone to icing, such as areas aft of protected surfaces and any other areas identified by the manufacturer. A repre-

PILOT/CONTROLLER GLOSSARY

I

sentative accretion rate for reference purposes is more than 3 inches (7.5 cm) per hour on the unprotected part of the outer wing. By regulation, immediate exit is required.

NOTE: *Severe icing is aircraft dependent, as are the other categories of icing intensity. Severe icing may occur at any ice accumulation rate when the icing rate or ice accumulations exceed the tolerance of the aircraft.*

IDAC — (See INTEGRATED DEPARTURE/ARRIVAL CAPABILITY.)

IDENT — A request for a pilot to activate the aircraft transponder identification feature. This will help the controller to confirm an aircraft identity or to identify an aircraft.

(Refer to AIM.)

IDENT FEATURE — The special feature in the Air Traffic Control Radar Beacon System (ATCRBS) equipment. It is used to immediately distinguish one displayed beacon target from other beacon targets.

(See IDENT.)

IDENTIFICATION [ICAO] — The situation which exists when the position indication of a particular aircraft is seen on a situation display and positively identified.

IF — (See INTERMEDIATE FIX.)

IF NO TRANSMISSION RECEIVED FOR (TIME) — Used by ATC in radar approaches to prefix procedures which should be followed by the pilot in event of lost communications.

(See LOST COMMUNICATIONS.)

IFR — (See INSTRUMENT FLIGHT RULES.)

IFR AIRCRAFT — An aircraft conducting flight in accordance with instrument flight rules.

IFR CONDITIONS — Weather conditions below the minimum for flight under visual flight rules.

(See INSTRUMENT METEOROLOGICAL CONDITIONS.)

IFR DEPARTURE PROCEDURE — (See IFR TAKEOFF MINIMUMS AND DEPARTURE PROCEDURES.)

(Refer to AIM.)

IFR FLIGHT — (See IFR AIRCRAFT.)

IFR LANDING MINIMUMS — (See LANDING MINIMUMS.)

IFR MILITARY TRAINING ROUTES (IR) — Routes used by the Department of Defense and associated Reserve and Air Guard units for the purpose of conducting low-altitude navigation and tactical training in both IFR and VFR weather conditions below 10,000 feet MSL at airspeeds in excess of 250 knots IAS.

IFR TAKEOFF MINIMUMS AND DEPARTURE PROCEDURES — Title 14 Code of Federal Regulations Part 91, prescribes standard takeoff rules for certain civil users. At some airports, obstructions or other factors require the establishment of nonstandard takeoff minimums, departure procedures, or both to assist pilots in avoiding obstacles during climb to the minimum en

PILOT/CONTROLLER GLOSSARY

I

route altitude. Those airports are listed in FAA/DOD Instrument Approach Procedures (IAPs) Charts under a section entitled "IFR Takeoff Minimums and Departure Procedures." The FAA/DOD IAP chart legend illustrates the symbol used to alert the pilot to nonstandard takeoff minimums and departure procedures. When departing IFR from such airports or from any airports where there are no departure procedures, DPs, or ATC facilities available, pilots should advise ATC of any departure limitations. Controllers may query a pilot to determine acceptable departure directions, turns, or headings after takeoff. Pilots should be familiar with the departure procedures and must assure that their aircraft can meet or exceed any specified climb gradients.

IF/IAWP — Intermediate Fix/Initial Approach Waypoint. The waypoint where the final approach course of a T approach meets the crossbar of the T. When designated (in conjunction with a TAA) this waypoint will be used as an IAWP when approaching the airport from certain directions, and as an IFWP when beginning the approach from another IAWP.

IFWP — Intermediate Fix Waypoint

ILS — (See INSTRUMENT LANDING SYSTEM.)

ILS CATEGORIES —

1. Category I. An ILS approach procedure which provides for approach to a height above touchdown of not less than 200 feet and with runway visual range of not less than 1,800 feet.
2. Special Authorization Category I. An ILS approach procedure which provides for approach to a height above touchdown of not less than 150 feet and with runway visual range of not less than 1,400 feet, HUD to DH.
3. Category II. An ILS approach procedure which provides for approach to a height above touchdown of not less than 100 feet and with runway visual range of not less than 1,200 feet (with autoland or HUD to touchdown and noted on authorization, RVR 1,000 feet).
4. Special Authorization Category II with Reduced Lighting. An ILS approach procedure which provides for approach to a height above touchdown of not less than 100 feet and with runway visual range of not less than 1,200 feet with autoland or HUD to touchdown and noted on authorization (no touchdown zone and centerline lighting are required).
5. Category III:
 - a. IIIA. An ILS approach procedure which provides for approach without a decision height minimum and with runway visual range of not less than 700 feet.
 - b. IIIB. An ILS approach procedure which provides for approach without a decision height minimum and with runway visual range of not less than 150 feet.
 - c. IIIC. An ILS approach procedure which provides for approach without a decision height minimum and without runway visual range minimum.

IM — (See INNER MARKER.)

IMC — (See INSTRUMENT METEOROLOGICAL CONDITIONS.)

IMMEDIATELY — Used by ATC or pilots when such action compliance is required to avoid an imminent situation.

PILOT/CONTROLLER GLOSSARY

I

INCERFA (Uncertainty Phase) [ICAO] — A situation wherein uncertainty exists as to the safety of an aircraft and its occupants.

INCREASED SEPARATION REQUIRED (ISR) — Indicates the confidence level of the track requires 5NM separation. 3NM separation, 1 1/2NM separation, and target resolution cannot be used.

INCREASE SPEED TO (SPEED) — (See SPEED ADJUSTMENT.)

INERTIAL NAVIGATION SYSTEM (INS) — An RNAV system which is a form of self-contained navigation.

(See Area Navigation/RNAV.)

INFLIGHT REFUELING — (See AERIAL REFUELING.)

INFLIGHT WEATHER ADVISORY — (See WEATHER ADVISORY.)

INFORMATION REQUEST (INREQ) — A request originated by an FSS for information concerning an overdue VFR aircraft.

INITIAL APPROACH FIX (IAF) — The fixes depicted on instrument approach procedure charts that identify the beginning of the initial approach segment(s).

(See FIX.)

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

INITIAL APPROACH SEGMENT — (See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

INITIAL APPROACH SEGMENT [ICAO] — That segment of an instrument approach procedure between the initial approach fix and the intermediate approach fix or, where applicable, the final approach fix or point.

INLAND NAVIGATION FACILITY — A navigation aid on a North American Route at which the common route and/or the noncommon route begins or ends.

INNER MARKER — A marker beacon used with an ILS (CAT II) precision approach located between the middle marker and the end of the ILS runway, transmitting a radiation pattern keyed at six dots per second and indicating to the pilot, both aurally and visually, that he/she is at the designated decision height (DH), normally 100 feet above the touchdown zone elevation, on the ILS CAT II approach. It also marks progress during a CAT III approach.

(See INSTRUMENT LANDING SYSTEM.)

(Refer to AIM.)

INNER MARKER BEACON — (See INNER MARKER.)

INREQ — (See INFORMATION REQUEST.)

INS — (See INERTIAL NAVIGATION SYSTEM.)

INSTRUMENT APPROACH — (See INSTRUMENT APPROACH PROCEDURE.)

PILOT/CONTROLLER GLOSSARY

I

INSTRUMENT APPROACH OPERATIONS [ICAO] — An approach and landing using instruments for navigation guidance based on an instrument approach procedure. There are two methods for executing instrument approach operations:

- a. A two-dimensional (2D) instrument approach operation, using lateral navigation guidance only; and
- b. A three-dimensional (3D) instrument approach operation, using both lateral and vertical navigation guidance.

NOTE: *Lateral and vertical navigation guidance refers to the guidance provided either by:*

- a) a ground-based radio navigation aid; or*
- b) computer-generated navigation data from ground-based, space-based, self-contained navigation aids or a combination of these.*

(See ICAO term INSTRUMENT APPROACH PROCEDURE.)

INSTRUMENT APPROACH PROCEDURE — A series of predetermined maneuvers for the orderly transfer of an aircraft under instrument flight conditions from the beginning of the initial approach to a landing or to a point from which a landing may be made visually. It is prescribed and approved for a specific airport by competent authority.

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

- a. U.S. civil standard instrument approach procedures are approved by the FAA as prescribed under 14 CFR Part 97 and are available for public use.
- b. U.S. military standard instrument approach procedures are approved and published by the Department of Defense.
- c. Special instrument approach procedures are approved by the FAA for individual operators but are not published in 14 CFR Part 97 for public use.

(See ICAO term INSTRUMENT APPROACH PROCEDURE.)

INSTRUMENT APPROACH PROCEDURE [ICAO] — A series of predetermined maneuvers by reference to flight instruments with specified protection from obstacles from the initial approach fix, or where applicable, from the beginning of a defined arrival route to a point from which a landing can be completed and thereafter, if a landing is not completed, to a position at which holding or en route obstacle clearance criteria apply.

(See ICAO term INSTRUMENT APPROACH OPERATIONS.)

INSTRUMENT APPROACH PROCEDURE CHARTS — (See AERONAUTICAL CHART.)

INSTRUMENT DEPARTURE PROCEDURE (DP) — A preplanned instrument flight rule (IFR) departure procedure published for pilot use, in graphic or textual format, that provides obstruction clearance from the terminal area to the appropriate en route structure. There are two types of DP,

PILOT/CONTROLLER GLOSSARY
I

Obstacle Departure Procedure (ODP), printed either textually or graphically, and, Standard Instrument Departure (SID), which is always printed graphically.

(See IFR TAKEOFF MINIMUMS AND DEPARTURE PROCEDURES.)

(See OBSTACLE DEPARTURE PROCEDURES.)

(See STANDARD INSTRUMENT DEPARTURES.)

(Refer to AIM.)

INSTRUMENT DEPARTURE PROCEDURE (DP) CHARTS — (See AERONAUTICAL CHART.)

INSTRUMENT FLIGHT RULES (IFR) — Rules governing the procedures for conducting instrument flight. Also a term used by pilots and controllers to indicate type of flight plan.

(See INSTRUMENT METEOROLOGICAL CONDITIONS.)

(See VISUAL FLIGHT RULES.)

(See VISUAL METEOROLOGICAL CONDITIONS.)

(See ICAO term INSTRUMENT FLIGHT RULES.)

(Refer to AIM.)

INSTRUMENT FLIGHT RULES [ICAO] — A set of rules governing the conduct of flight under instrument meteorological conditions.

INSTRUMENT LANDING SYSTEM (ILS) — A precision instrument approach system which normally consists of the following electronic components and visual aids:

- a. Localizer.

(See LOCALIZER.)

- b. Glideslope.

(See GLIDESLOPE.)

- c. Outer Marker.

(See OUTER MARKER.)

- d. Middle Marker.

(See MIDDLE MARKER.)

- e. Approach Lights.

(See AIRPORT LIGHTING.)

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

INSTRUMENT METEOROLOGICAL CONDITIONS (IMC) — Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling less than the minima specified for visual meteorological conditions.

PILOT/CONTROLLER GLOSSARY

I

(See INSTRUMENT FLIGHT RULES.)

(See VISUAL FLIGHT RULES.)

(See VISUAL METEOROLOGICAL CONDITIONS.)

INSTRUMENT RUNWAY — A runway equipped with electronic and visual navigation aids for which a precision or nonprecision approach procedure having straight-in landing minimums has been approved.

(See ICAO term INSTRUMENT RUNWAY.)

INSTRUMENT RUNWAY [ICAO] — One of the following types of runways intended for the operation of aircraft using instrument approach procedures:

- a. Nonprecision Approach Runway — An instrument runway served by visual aids and a nonvisual aid providing at least directional guidance adequate for a straight-in approach.
- b. Precision Approach Runway, Category I — An instrument runway served by ILS and visual aids intended for operations down to 60 m (200 feet) decision height and down to an RVR of the order of 800 m.
- c. Precision Approach Runway, Category II — An instrument runway served by ILS and visual aids intended for operations down to 30 m (100 feet) decision height and down to an RVR of the order of 400 m.
- d. Precision Approach Runway, Category III — An instrument runway served by ILS to and along the surface of the runway and:
 1. Intended for operations down to an RVR of the order of 200 m (no decision height being applicable) using visual aids during the final phase of landing;
 2. Intended for operations down to an RVR of the order of 50 m (no decision height being applicable) using visual aids for taxiing;
 3. Intended for operations without reliance on visual reference for landing or taxiing.

NOTE 1: See Annex 10 Volume I, Part I, Chapter 3, for related ILS specifications.

NOTE 2: Visual aids need not necessarily be matched to the scale of nonvisual aids provided. The criterion for the selection of visual aids is the conditions in which operations are intended to be conducted.

INTEGRATED DEPARTURE/ARRIVAL CAPABILITY (IDAC) — A Tower/TRACON departure scheduling capability within TBFM that allows departures to be scheduled into either an arrival flow or an en route flow. IDAC provides a mechanism for electronic coordination of departure release times.

INTEGRITY — The ability of a system to provide timely warnings to users when the system should not be used for navigation.

INTERMEDIATE APPROACH SEGMENT — (See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

PILOT/CONTROLLER GLOSSARY

I

INTERMEDIATE APPROACH SEGMENT [ICAO] — That segment of an instrument approach procedure between either the intermediate approach fix and the final approach fix or point, or between the end of a reversal, race track or dead reckoning track procedure and the final approach fix or point, as appropriate.

INTERMEDIATE FIX — The fix that identifies the beginning of the intermediate approach segment of an instrument approach procedure. The fix is not normally identified on the instrument approach chart as an intermediate fix (IF).

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

INTERMEDIATE LANDING — On the rare occasion that this option is requested, it should be approved. The departure center, however, must advise the ATCSCC so that the appropriate delay is carried over and assigned at the intermediate airport. An intermediate landing airport within the arrival center will not be accepted without coordination with and the approval of the ATCSCC.

INTERNATIONAL AIRPORT — Relating to international flight, it means:

- a. An airport of entry which has been designated by the Secretary of Treasury or Commissioner of Customs as an international airport for customs service.
- b. A landing rights airport at which specific permission to land must be obtained from customs authorities in advance of contemplated use.
- c. Airports designated under the Convention on International Civil Aviation as an airport for use by international commercial air transport and/or international general aviation.

(See ICAO term INTERNATIONAL AIRPORT.)

(Refer to Chart Supplement U.S.)

INTERNATIONAL AIRPORT [ICAO] — Any airport designated by the Contracting State in whose territory it is situated as an airport of entry and departure for international air traffic, where the formalities incident to customs, immigration, public health, animal and plant quarantine and similar procedures are carried out.

INTERNATIONAL CIVIL AVIATION ORGANIZATION [ICAO] — A specialized agency of the United Nations whose objective is to develop the principles and techniques of international air navigation and to foster planning and development of international civil air transport.

INTERNATIONAL NOTICE — A notice containing flight prohibitions, potential hostile situations, or other international/foreign oceanic airspace matters. These notices can be found on the International Notices website.

INTERROGATOR — The ground-based surveillance radar beacon transmitter-receiver, which normally scans in synchronism with a primary radar, transmitting discrete radio signals which repetitiously request all transponders on the mode being used to reply. The replies received are mixed with the primary radar returns and displayed on the same plan position indicator (radar scope). Also, applied to the airborne element of the TACAN/DME system.

(See TRANSPONDER.)

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

I

INTERSECTING RUNWAYS — Two or more runways which cross or meet within their lengths.

(See INTERSECTION.)

INTERSECTION —

- a. A point defined by any combination of courses, radials, or bearings of two or more navigational aids.
- b. Used to describe the point where two runways, a runway and a taxiway, or two taxiways cross or meet.

INTERSECTION DEPARTURE — A departure from any runway intersection except the end of the runway.

(See INTERSECTION.)

INTERSECTION TAKEOFF — (See INTERSECTION DEPARTURE.)

IR — (See IFR MILITARY TRAINING ROUTES.)

IRREGULAR SURFACE — A surface that is open for use but not per regulations.

ISR — (See INCREASED SEPARATION REQUIRED.)

PILOT/CONTROLLER GLOSSARY

J

JAMMING — Denotes emissions that do not mimic Global Navigation Satellite System (GNSS) signals (e.g., GPS and WAAS), but rather interfere with the civil receiver's ability to acquire and track GNSS signals. Jamming can result in denial of GNSS navigation, positioning, timing and aircraft dependent functions.

JET BLAST — The rapid air movement produced by exhaust from jet engines.

JET ROUTE — A route designed to serve aircraft operations from 18,000 feet MSL up to and including flight level 450. The routes are referred to as "J" routes with numbering to identify the designated route; e.g., J105.

(See Class A AIRSPACE.)

(Refer to 14 CFR Part 71 [published in graphic form on Jeppesen Enroute charts].)

JET STREAM — A migrating stream of high-speed winds present at high altitudes.

JETTISONING OF EXTERNAL STORES — Airborne release of external stores; e.g., tiptanks, ordnance.

(See FUEL DUMPING.)

(Refer to 14 CFR Part 91.)

JOINT USE RESTRICTED AREA — (See RESTRICTED AREA.)

JUMP ZONE — The airspace directly associated with a Drop Zone. Vertical and horizontal limits may be locally defined.

PILOT/CONTROLLER GLOSSARY
K

KNOWN TRAFFIC — With respect to ATC clearances, means aircraft whose altitude, position, and intentions are known to ATC.

PILOT/CONTROLLER GLOSSARY

L

LAA — (See LOCAL AIRPORT ADVISORY.)

LAHSO — An acronym for “Land and Hold Short Operation.” These operations include landing and holding short of an intersecting runway, a taxiway, a predetermined point, or an approach/departure flightpath.

LAHSO-DRY — Land and hold short operations on runways that are dry.

LAHSO-WET — Land and hold short operations on runways that are wet (but not contaminated).

LAND AND HOLD SHORT OPERATIONS — Operations which include simultaneous takeoffs and landings and/or simultaneous landings when a landing aircraft is able and is instructed by the controller to hold-short of the intersecting runway/taxiway or designated hold-short point. Pilots are expected to promptly inform the controller if the hold short clearance cannot be accepted.

(See PARALLEL RUNWAYS.)

(Refer to AIM.)

LAND-BASED AIR DEFENSE IDENTIFICATION ZONE (ADIZ) — An ADIZ over U.S. metropolitan areas, which is activated and deactivated as needed, with dimensions, activation dates, and other relevant information disseminated via NOTAM.

(See AIR DEFENSE IDENTIFICATION ZONE.)

LANDING AREA — Any locality either on land, water, or structures, including airports/heliports and intermediate landing fields, which is used, or intended to be used, for the landing and takeoff of aircraft whether or not facilities are provided for the shelter, servicing, or for receiving or discharging passengers or cargo.

(See ICAO term LANDING AREA.)

LANDING AREA [ICAO] — That part of a movement area intended for the landing or take-off of aircraft.

LANDING DIRECTION INDICATOR — A device which visually indicates the direction in which landings and takeoffs should be made.

(See TETRAHEDRON.)

(Refer to AIM.)

LANDING DISTANCE AVAILABLE (LDA) — The runway length declared available and suitable for a landing airplane.

(See ICAO term LANDING DISTANCE AVAILABLE.)

LANDING DISTANCE AVAILABLE [ICAO] — The length of runway which is declared available and suitable for the ground run of an aeroplane landing.

LANDING MINIMUMS — The minimum visibility prescribed for landing a civil aircraft while using an instrument approach procedure. The minimum applies with other limitations set forth in 14

PILOT/CONTROLLER GLOSSARY

L

CFR Part 91 with respect to the Minimum Descent Altitude (MDA) or Decision Height (DH) prescribed in the instrument approach procedures as follows:

- a. Straight-in landing minimums. A statement of MDA and visibility, or DH and visibility, required for a straight-in landing on a specified runway, or
- b. Circling minimums. A statement of MDA and visibility required for the circle-to-land maneuver.

NOTE: *Descent below the MDA or DH must meet the conditions stated in 14 CFR Section 91.175.*

(See CIRCLE-TO-LAND MANEUVER.)

(See DECISION HEIGHT.)

(See INSTRUMENT APPROACH PROCEDURE.)

(See MINIMUM DESCENT ALTITUDE.)

(See STRAIGHT-IN LANDING.)

(See VISIBILITY.)

(Refer to 14 CFR Part 91.)

LANDING ROLL — The distance from the point of touchdown to the point where the aircraft can be brought to a stop or exit the runway.

LANDING SEQUENCE — The order in which aircraft are positioned for landing.

(See APPROACH SEQUENCE.)

LAST ASSIGNED ALTITUDE — The last altitude/flight level assigned by ATC and acknowledged by the pilot.

(See MAINTAIN.)

(Refer to 14 CFR Part 91.)

LATERAL NAVIGATION (LNAV) — A function of area navigation (RNAV) equipment which calculates, displays, and provides lateral guidance to a profile or path.

LATERAL SEPARATION — The lateral spacing of aircraft at the same altitude by requiring operation on different routes or in different geographical locations.

(See SEPARATION.)

LDA — (See LOCALIZER TYPE DIRECTIONAL AID.)

(See LANDING DISTANCE AVAILABLE.)

(See ICAO Term LANDING DISTANCE AVAILABLE.)

LF — (See LOW FREQUENCY.)

LIGHTED AIRPORT — An airport where runway and obstruction lighting is available.

(See AIRPORT LIGHTING.)

PILOT/CONTROLLER GLOSSARY

L

(Refer to AIM.)

LIGHT GUN — A handheld directional light signaling device which emits a brilliant narrow beam of white, green, or red light as selected by the tower controller. The color and type of light transmitted can be used to approve or disapprove anticipated pilot actions where radio communication is not available. The light gun is used for controlling traffic operating in the vicinity of the airport and on the airport movement area.

(Refer to AIM.)

LIGHT-SPORT AIRCRAFT (LSA) — An FAA-registered aircraft, other than a helicopter or powered-lift, that meets certain weight and performance. Principally it is a single-engine aircraft with a maximum of two seats and weighing no more than 1,430 pounds if intended for operation on water, or 1,320 pounds if not. It must be of simple design (fixed landing gear (except if intended for operations on water or a glider), piston powered, nonpressurized, with a fixed or ground adjustable propeller). Performance is also limited to a maximum airspeed in level flight of not more than 120 knots calibrated airspeed (CAS), have a maximum never-exceed speed of not more than 120 knots CAS for a glider, and have a maximum stalling speed, without the use of lift-enhancing devices of not more than 45 knots CAS. It may be certificated as either Experimental LSA or as a Special LSA aircraft. A minimum of a sport pilot certificate is required to operate light-sport aircraft.

(Refer to 14 CFR Part 1, §1.1.)

LINE UP AND WAIT (LUAW) — Used by ATC to inform a pilot to taxi onto the departure runway to line up and wait. It is not authorization for takeoff. It is used when takeoff clearance cannot immediately be issued because of traffic or other reasons.

(See CLEARED FOR TAKEOFF.)

LOCAL AIRPORT ADVISORY (LAA) — A service available only in Alaska and provided by facilities that are located on the landing airport, have a discrete ground-to-air communication frequency or the tower frequency when the tower is closed, automated weather reporting with voice broadcasting, and a continuous ASOS/AWOS data display, other continuous direct reading instruments, or manual observations available to the specialist.

(See AIRPORT ADVISORY AREA.)

LOCAL TRAFFIC — Aircraft operating in the traffic pattern or within sight of the tower, or aircraft known to be departing or arriving from flight in local practice areas, or aircraft executing practice instrument approaches at the airport.

(See TRAFFIC PATTERN.)

LOCALIZER — The component of an ILS which provides course guidance to the runway.

(See INSTRUMENT LANDING SYSTEM.)

(See ICAO term LOCALIZER COURSE.)

(Refer to AIM/[Jeppesen Radio Aids Section].)

PILOT/CONTROLLER GLOSSARY

L

LOCALIZER COURSE [ICAO] — The locus of points, in any given horizontal plane, at which the DDM (difference in depth of modulation) is zero.

LOCALIZER OFFSET — An angular offset of the localizer aligned within 3° of the runway alignment.

LOCALIZER TYPE DIRECTIONAL AID (LDA) — A localizer with an angular offset that exceeds 3° of the runway alignment, used for nonprecision instrument approaches with utility and accuracy comparable to a localizer, but which are not part of a complete ILS.

(Refer to AIM.)

LOCALIZER TYPE DIRECTIONAL AID (LDA) PRECISION RUNWAY MONITOR (PRM) APPROACH — An approach, which includes a glideslope, used in conjunction with an ILS PRM, RNAV PRM or GLS PRM approach to an adjacent runway to conduct Simultaneous Offset Instrument Approaches (SOIA) to parallel runways whose centerlines are separated by less than 3,000 feet and at least 750 feet. NTZ monitoring is required to conduct these approaches.

(See SIMULTANEOUS OFFSET INSTRUMENT APPROACH (SOIA).)

(Refer to AIM.)

LOCALIZER USABLE DISTANCE — The maximum distance from the localizer transmitter at a specified altitude, as verified by flight inspection, at which reliable course information is continuously received.

(Refer to AIM.)

LOCATOR [ICAO] — An LM/MF NDB used as an aid to final approach.

NOTE: A locator usually has an average radius of rated coverage of between 18.5 and 46.3 km (10 and 25 NM).

LONG RANGE NAVIGATION — (See LORAN.)

LONGITUDINAL SEPARATION — The longitudinal spacing of aircraft at the same altitude by a minimum distance expressed in units of time or miles.

(See SEPARATION.)

(Refer to AIM.)

LORAN — An electronic navigational system by which hyperbolic lines of position are determined by measuring the difference in the time of reception of synchronized pulse signals from two fixed transmitters. Loran A operates in the 1750-1950 kHz frequency band. Loran C and D operate in the 100-110 kHz frequency band. In 2010, the U.S. Coast Guard terminated all U.S. LORAN-C transmissions.

(Refer to AIM.)

LOST COMMUNICATIONS — Loss of the ability to communicate by radio. Aircraft are sometimes referred to as NORDO (No Radio). Standard pilot procedures are specified in 14 CFR Part 91. Radar controllers issue procedures for pilots to follow in the event of lost communications

PILOT/CONTROLLER GLOSSARY

L

during a radar approach when weather reports indicate that an aircraft will likely encounter IFR weather conditions during the approach.

(Refer to 14 CFR Part 91.)

(Refer AIM.)

LOST LINK (LL) — An interruption or loss of the control link, or when the pilot is unable to effect control of the aircraft and, as a result, the UA will perform a predictable or planned maneuver. Loss of command and control link between the Control Station and the aircraft. There are two types of links:

- a. An uplink which transmits command instructions to the aircraft, and
- b. A downlink which transmits the status of the aircraft and provides situational awareness to the pilot.

LOST LINK PROCEDURE — Preprogrammed or predetermined mitigations to ensure the continued safe operation of the UA in the event of a lost link (LL). In the event positive link cannot be established, flight termination must be implemented.

LOW ALTITUDE AIRWAY STRUCTURE — The network of airways serving aircraft operations up to but not including 18,000 feet MSL.

(See AIRWAY.)

(Refer to AIM.)

LOW ALTITUDE ALERT, CHECK YOUR ALTITUDE IMMEDIATELY — (See SAFETY ALERT.)

LOW APPROACH — An approach over an airport or runway following an instrument approach or a VFR approach including the go-around maneuver where the pilot intentionally does not make contact with the runway.

(Refer to AIM.)

LOW FREQUENCY (LF) — The frequency band between 30 and 300 kHz.

(Refer to AIM.)

LOCALIZER PERFORMANCE WITH VERTICAL GUIDANCE (LPV) — A type of approach with vertical guidance (APV) based on WAAS, published on RNAV (GPS) approach charts. This procedure takes advantage of the precise lateral guidance available from WAAS. The minima is published as a decision altitude (DA).

LUAW — (See LINE UP AND WAIT.)

PILOT/CONTROLLER GLOSSARY

M

MAA — (See MAXIMUM AUTHORIZED ALTITUDE.)

MACH NUMBER — The ratio of true airspeed to the speed of sound; e.g., MACH .82, MACH 1.6.
(See AIRSPEED.)

MACH TECHNIQUE [ICAO] — Describes a control technique used by air traffic control whereby turbojet aircraft operating successively along suitable routes are cleared to maintain appropriate MACH numbers for a relevant portion of the en route phase of flight. The principle objective is to achieve improved utilization of the airspace and to ensure that separation between successive aircraft does not decrease below the established minima.

MAHWP — Missed Approach Holding Waypoint

MAINTAIN —

- a. Concerning altitude/flight level, the term means to remain at the altitude/flight level specified. The phrase “climb and” or “descend and” normally precedes “maintain” and the altitude assignment; e.g., “descend and maintain 5,000.”
- b. Concerning other ATC instructions, the term is used in its literal sense; e.g., maintain VFR.

MAINTENANCE PLANNING FRICTION LEVEL — The friction level specified in AC 150/5320-12, Measurement, Construction, and Maintenance of Skid Resistant Airport Pavement Surfaces, which represents the friction value below which the runway pavement surface remains acceptable for any category or class of aircraft operations but which is beginning to show signs of deterioration. This value will vary depending on the particular friction measurement equipment used.

MAKE SHORT APPROACH — Used by ATC to inform a pilot to alter his/her traffic pattern so as to make a short final approach.

(See TRAFFIC PATTERN.)

MAN PORTABLE AIR DEFENSE SYSTEMS (MANPADS) — MANPADS are lightweight, shoulder-launched, missile systems used to bring down aircraft and create mass casualties. The potential for MANPADS use against airborne aircraft is real and requires familiarity with the subject. Terrorists choose MANPADS because the weapons are low cost, highly mobile, require minimal set-up time, and are easy to use and maintain. Although the weapons have limited range, and their accuracy is affected by poor visibility and adverse weather, they can be fired from anywhere on land or from boats where there is unrestricted visibility to the target.

MANDATORY ALTITUDE — An altitude depicted on an instrument Approach Procedure Chart requiring the aircraft to maintain altitude at the depicted value.

MANPADS — (See MAN PORTABLE AIR DEFENSE SYSTEMS.)

MAP — (See MISSED APPROACH POINT.)

MARKER BEACON — An electronic navigation facility transmitting a 75 MHz vertical fan or boneshaped radiation pattern. Marker beacons are identified by their modulation frequency and keying code, and when received by compatible airborne equipment, indicate to the pilot, both aurally and visually, that he/she is passing over the facility.

PILOT/CONTROLLER GLOSSARY

M

(See INNER MARKER.)

(See MIDDLE MARKER.)

(See OUTER MARKER.)

(Refer to AIM.)

MARSA — (See MILITARY AUTHORITY ASSUMES RESPONSIBILITY FOR SEPARATION OF AIRCRAFT.)

MAWP — Missed Approach Waypoint

MAXIMUM AUTHORIZED ALTITUDE — A published altitude representing the maximum usable altitude or flight level for an airspace structure or route segment. It is the highest altitude on a Federal airway, jet route, area navigation low or high route, or other direct route for which an MEA is designated in 14 CFR Part 95 at which adequate reception of navigation aid signals is assured.

MAYDAY — The international radiotelephony distress signal. When repeated three times, it indicates imminent and grave danger and that immediate assistance is requested.

(See PAN-PAN.)

(Refer to AIM.)

MCA — (See MINIMUM CROSSING ALTITUDE.)

MDA — (See MINIMUM DESCENT ALTITUDE.)

MEA — (See MINIMUM EN ROUTE IFR ALTITUDE.)

MEARTS — (See MICRO-EN ROUTE AUTOMATED RADAR TRACKING SYSTEM.)

METEOROLOGICAL IMPACT STATEMENT — An unscheduled planning forecast describing conditions expected to begin within 4 to 12 hours which may impact the flow of air traffic in a specific center's (ARTCC) area.

METER FIX ARC — A semicircle, equidistant from a meter fix, usually in low altitude relatively close to the meter fix, used to help TBFM/ERAM calculate a meter time, and determine appropriate sector meter list assignments for aircraft not on an established arrival route or assigned a meter fix.

METER REFERENCE ELEMENT (MRE) — A constraint point through which traffic flows are managed. An MRE can be the runway threshold, a meter fix, or a meter arc.

METER REFERENCE POINT LIST (MRP) — A list of TBFM delay information conveyed to the controller on the situation display via the Meter Reference Point View, commonly known as the "Meter List."

METERING — A method of time-regulating traffic flows in the en route and terminal environments.

METERING AIRPORTS — Airports adapted for metering and for which optimum flight paths are defined. A maximum of 15 airports may be adapted.

PILOT/CONTROLLER GLOSSARY

M

METERING FIX — A fix along an established route from over which aircraft will be metered prior to entering terminal airspace. Normally, this fix should be established at a distance from the airport which will facilitate a profile descent 10,000 feet above airport elevation (AAE) or above.

MHA — (See MINIMUM HOLDING ALTITUDE.)

MIA — (See MINIMUM IFR ALTITUDES.)

MICROBURST — A small downburst with outbursts of damaging winds extending 2.5 miles or less. In spite of its small horizontal scale, an intense microburst could induce wind speeds as high as 150 knots

(Refer to AIM.)

MICRO-EN ROUTE AUTOMATED RADAR TRACKING SYSTEM (MEARTS) — An automated radar and radar beacon tracking system capable of employing both short-range (ASR) and long-range (ARSR) radars. This microcomputer driven system provides improved tracking, continuous data recording, and use of full digital radar displays.

MID RVR — (See VISIBILITY.)

MIDDLE COMPASS LOCATOR — (See COMPASS LOCATOR.)

MIDDLE MARKER — A marker beacon that defines a point along the glideslope of an ILS normally located at or near the point of decision height (ILS Category I). It is keyed to transmit alternate dots and dashes, with the alternate dots and dashes keyed at the rate of 95 dot/dash combinations per minute on a 1300 Hz tone, which is received aurally and visually by compatible airborne equipment.

(See INSTRUMENT LANDING SYSTEM.)

(See MARKER BEACON.)

(Refer to AIM.)

MILES-IN-TRAIL — A specified distance between aircraft, normally, in the same stratum associated with the same destination or route of flight.

MILITARY AUTHORITY ASSUMES RESPONSIBILITY FOR SEPARATION OF AIRCRAFT (MARSA) — A condition whereby the military services involved assume responsibility for separation between participating military aircraft in the ATC system. It is used only for required IFR operations which are specified in letters of agreement or other appropriate FAA or military documents.

MILITARY LANDING ZONE — A landing strip used exclusively by the military for training. A military landing zone does not carry a runway designation.

MILITARY OPERATIONS AREA — (See SPECIAL USE AIRSPACE.)

MILITARY TRAINING ROUTES — Airspace of defined vertical and lateral dimensions established for the conduct of military flight training at airspeeds in excess of 250 knots IAS.

(See IFR MILITARY TRAINING ROUTES.)

(See VFR MILITARY TRAINING ROUTES.)

PILOT/CONTROLLER GLOSSARY

M

MINIMA — (See MINIMUMS.)

MINIMUM CROSSING ALTITUDE (MCA) — The lowest altitude at certain fixes at which an aircraft must cross when proceeding in the direction of a higher minimum en route IFR altitude (MEA).

(See MINIMUM EN ROUTE IFR ALTITUDE.)

MINIMUM DESCENT ALTITUDE (MDA) — The lowest altitude, expressed in feet above mean sea level, to which descent is authorized on final approach or during circle-to-land maneuvering in execution of a standard instrument approach procedure where no electronic glideslope is provided.

(See NONPRECISION APPROACH PROCEDURE.)

MINIMUM EN ROUTE IFR ALTITUDE (MEA) — The lowest published altitude between radio fixes which assures acceptable navigational signal coverage and meets obstacle clearance requirements between those fixes. The MEA prescribed for a Federal airway or segment thereof, area navigation low or high route, or other direct route applies to the entire width of the airway, segment, or route between the radio fixes defining the airway, segment, or route.

(Refer to 14 CFR Part 91.)

(Refer to 14 CFR Part 95.)

(Refer to AIM [and Jeppesen Enroute Charts].)

MINIMUM FRICTION LEVEL — The friction level specified in AC 150/5320-12, Measurement, Construction, and Maintenance of Skid Resistant Airport Pavement Surfaces, that represents the minimum recommended wet pavement surface friction value for any turbojet aircraft engaged in LAHSO. This value will vary with the particular friction measurement equipment used.

MINIMUM FUEL — Indicates that an aircraft's fuel supply has reached a state where, upon reaching the destination, it can accept little or no delay. This is not an emergency situation but merely indicates an emergency situation is possible should any undue delay occur.

(Refer to AIM.)

MINIMUM HOLDING ALTITUDE — The lowest altitude prescribed for a holding pattern which assures navigational signal coverage, communications, and meets obstacle clearance requirements.

MINIMUM IFR ALTITUDES (MIA) — Minimum altitudes for IFR operations as prescribed in 14 CFR Part 91. These altitudes are published on aeronautical charts and prescribed in 14 CFR Part 95 for airways and routes, and in 14 CFR Part 97 for standard instrument approach procedures. If no applicable minimum altitude is prescribed in 14 CFR Part 95 or 14 CFR Part 97, the following minimum IFR altitude applies:

- a. In designated mountainous areas, 2,000 feet above the highest obstacle within a horizontal distance of 4 nautical miles from the course to be flown; or
- b. Other than mountainous areas, 1,000 feet above the highest obstacle within a horizontal distance of 4 nautical miles from the course to be flown; or

PILOT/CONTROLLER GLOSSARY

M

c. As otherwise authorized by the Administrator or assigned by ATC.

(See MINIMUM CROSSING ALTITUDE.)

(See MINIMUM EN ROUTE IFR ALTITUDE.)

(See MINIMUM OBSTRUCTION CLEARANCE ALTITUDE.)

(See MINIMUM SAFE ALTITUDE.)

(See MINIMUM VECTORING ALTITUDE.)

(Refer to 14 CFR Part 91.)

MINIMUM OBSTRUCTION CLEARANCE ALTITUDE (MOCA) — The lowest published altitude in effect between radio fixes on VOR airways, off-airway routes, or route segments which meets obstacle clearance requirements for the entire route segment and which assures acceptable navigational signal coverage only within 25 statute (22 nautical) miles of a VOR.

(Refer to 14 CFR Part 91.)

(Refer to 14 CFR Part 95.)

MINIMUM RECEPTION ALTITUDE (MRA) — The lowest altitude at which an intersection can be determined.

(Refer to 14 CFR Part 95.)

MINIMUM SAFE ALTITUDE (MSA) —

- a. The Minimum Safe Altitude (MSA) specified in 14 CFR Part 91 for various aircraft operations.
- b. Altitudes depicted on approach charts or departure procedure (DP) graphic charts which provide at least 1,000 feet of obstacle clearance for emergency use. These altitudes will be identified as Minimum Safe Altitudes or Emergency Safe Altitudes and are established as follows:
 1. Minimum Safe Altitude (MSA). Altitudes depicted on approach charts or on a DP graphic chart which provide at least 1,000 feet of obstacle clearance within a 25-mile radius of the navigation facility, waypoint, or airport reference point upon which the MSA is predicated. MSAs are for emergency use only and do not necessarily assure acceptable navigational signal coverage.

(See ICAO term Minimum Sector Altitude.)

2. Emergency Safe Altitude (ESA). Altitudes depicted on approach charts which provide at least 1,000 feet of obstacle clearance in nonmountainous areas and 2,000 feet of obstacle clearance in designated mountainous areas within a 100-mile radius of the navigation facility or waypoint used as the ESA center. These altitudes are normally used only in military procedures and are identified on published procedures as "Emergency Safe Altitudes."

PILOT/CONTROLLER GLOSSARY

M

MINIMUM SAFE ALTITUDE WARNING (MSAW) — A function of the EAS and STARS computer that aids the controller by alerting him/her when a tracked Mode C equipped aircraft is below or is predicted by the computer to go below a predetermined minimum safe altitude.

(Refer to AIM.)

MINIMUM SECTOR ALTITUDE [ICAO] — The lowest altitude which may be used under emergency conditions which will provide a minimum clearance of 300 m (1,000 feet) above all obstacles located in an area contained within a sector of a circle of 46 km (25 NM) radius centered on a radio aid to navigation.

MINIMUMS — Weather condition requirements established for a particular operation or type of operation; e.g., IFR takeoff or landing, alternate airport for IFR flight plans, VFR flight, etc.

(See IFR CONDITIONS.)

(See IFR TAKEOFF MINIMUMS AND DEPARTURE PROCEDURES.)

(See LANDING MINIMUMS.)

(See VFR CONDITIONS.)

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

MINIMUM VECTORING ALTITUDE (MVA) — The lowest MSL altitude at which an IFR aircraft will be vectored by a radar controller, except as otherwise authorized for radar approaches, departures, and missed approaches. The altitude meets IFR obstacle clearance criteria. It may be lower than the published MEA along an airway or J-route segment. It may be utilized for radar vectoring only upon the controller's determination that an adequate radar return is being received from the aircraft being controlled. Charts depicting minimum vectoring altitudes are normally available only to the controllers and not to pilots.

(Refer to AIM.)

MINUTES-IN-TRAIL — A specified interval between aircraft expressed in time. This method would more likely be utilized regardless of altitude.

MIS — (See METEOROLOGICAL IMPACT STATEMENT.)

MISSED APPROACH —

- a. A maneuver conducted by a pilot when an instrument approach cannot be completed to a landing. The route of flight and altitude are shown on instrument approach procedure charts. A pilot executing a missed approach prior to the Missed Approach Point (MAP) must continue along the final approach to the MAP.
- b. A term used by the pilot to inform ATC that he/she is executing the missed approach.
- c. At locations where ATC radar service is provided, the pilot should conform to radar vectors when provided by ATC in lieu of the published missed approach procedure.

(See MISSED APPROACH POINT.)

PILOT/CONTROLLER GLOSSARY

M

(Refer to AIM.)

MISSED APPROACH POINT (MAP) — A point prescribed in each instrument approach procedure at which a missed approach procedure shall be executed if the required visual reference does not exist.

(See MISSED APPROACH.)

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

MISSED APPROACH PROCEDURE [ICAO] — The procedure to be followed if the approach cannot be continued.

MISSED APPROACH SEGMENT — (See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

MM — (See MIDDLE MARKER.)

MOA — (See MILITARY OPERATIONS AREA.)

MOCA — (See MINIMUM OBSTRUCTION CLEARANCE ALTITUDE.)

MODE — The letter or number assigned to a specific pulse spacing of radio signals transmitted or received by ground interrogator or airborne transponder components of the Air Traffic Control Radar Beacon System (ATCRBS). Mode A (military Mode 3) and Mode C (altitude reporting) are used in air traffic control.

(See INTERROGATOR.)

(See RADAR.)

(See TRANSPONDER.)

(See ICAO term MODE.)

(Refer to AIM.)

MODE (SSR MODE) [ICAO] — The letter or number assigned to a specific pulse spacing of the interrogation signals transmitted by an interrogator. There are 4 modes, A, B, C and D specified in Annex 10, corresponding to four different interrogation pulse spacings.

MODE C INTRUDER ALERT — A function of certain air traffic control automated systems designed to alert radar controllers to existing or pending situations between a tracked target (known IFR or VFR aircraft) and an untracked target (unknown IFR or VFR aircraft) that requires immediate attention/action.

(See CONFLICT ALERT.)

MODEL AIRCRAFT — An unmanned aircraft that is: (1) capable of sustained flight in the atmosphere; (2) flown within visual line of sight of the person operating the aircraft; and (3) flown for hobby or recreational purposes.

MONITOR — (When used with communication transfer) listen on a specific frequency and stand by for instructions. Under normal circumstances do not establish communications.

PILOT/CONTROLLER GLOSSARY

M

MONITOR ALERT (MA) — A function of the TFMS that provides traffic management personnel with a tool for predicting potential capacity problems in individual operational sectors. The MA is an indication that traffic management personnel need to analyze a particular sector for actual activity and to determine the required action(s), if any, needed to control the demand.

MONITOR ALERT PARAMETER (MAP) — The number designated for use in monitor alert processing by the TFMS. The MAP is designated for each operational sector for increments of 15 minutes.

MOSAIC/MULTI-SENSOR MODE — Accepts positional data from multiple radar or ADS-B sites. Targets are displayed from a single source within a radar sort box according to the hierarchy of the sources assigned.

MOUNTAIN WAVE — Mountain waves occur when air is being blown over a mountain range or even the ridge of a sharp bluff area. As the air hits the upwind side of the range, it starts to climb, thus creating what is generally a smooth updraft which turns into a turbulent downdraft as the air passes the crest of the ridge. Mountain waves can cause significant fluctuations in airspeed and altitude with or without associated turbulence.

(Refer to AIM.)

MOVEMENT AREA — The runways, taxiways, and other areas of an airport/heliport which are utilized for taxiing/hover taxiing, air taxiing, takeoff, and landing of aircraft, exclusive of loading ramps and parking areas. At those airports/heliports with a tower, specific approval for entry onto the movement area must be obtained from ATC.

(See ICAO term MOVEMENT AREA.)

MOVEMENT AREA [ICAO] — That part of an aerodrome to be used for the takeoff, landing and taxiing of aircraft, consisting of the maneuvering area and the apron(s).

MOVING AIRSPACE RESERVATION — The term used in oceanic ATC for airspace that encompasses oceanic activities and advances with the mission progress; i.e., the reservation moves with the aircraft or flight.

(See MOVING ALTITUDE RESERVATION.)

MOVING ALTITUDE RESERVATION — An altitude reservation which encompasses en route activities and advances with the mission progress; i.e., the reservation moves with the aircraft or flight.

MOVING TARGET INDICATOR — An electronic device which will permit radar scope presentation only from targets which are in motion. A partial remedy for ground clutter.

MRA — (See MINIMUM RECEPTION ALTITUDE.)

MRE — (See METER REFERENCE ELEMENT.)

MPR — (See METER REFERENCE POINT LIST.)

MSA — (See MINIMUM SAFE ALTITUDE.)

MSAW — (See MINIMUM SAFE ALTITUDE WARNING.)

PILOT/CONTROLLER GLOSSARY**M**

MTI — (See MOVING TARGET INDICATOR.)

MTR — (See MILITARY TRAINING ROUTES.)

MULTICOM — A mobile service not open to public correspondence used to provide communications essential to conduct the activities being performed by or directed from private aircraft.

MULTIPLE RUNWAYS — The utilization of a dedicated arrival runway(s) for departures and a dedicated departure runway(s) for arrivals when feasible to reduce delays and enhance capacity.

MVA — (See MINIMUM VECTORING ALTITUDE.)

PILOT/CONTROLLER GLOSSARY

N

NAS — (See NATIONAL AIRSPACE SYSTEM.)

NAT HLA — (See NORTH ATLANTIC HIGH LEVEL AIRSPACE.)

NATIONAL AIRSPACE SYSTEM — The common network of U.S. airspace; air navigation facilities, equipment and services, airports or landing areas; aeronautical charts, information and services; rules, regulations and procedures, technical information, and manpower and material. Included are system components shared jointly with the military.

NATIONAL BEACON CODE ALLOCATION PLAN AIRSPACE (NBCAP) — Airspace over United States territory located within the North American continent between Canada and Mexico, including adjacent territorial waters outward to about boundaries of oceanic control areas (CTA)/Flight Information Regions (FIR).

(See FLIGHT INFORMATION REGION.)

NATIONAL FLIGHT DATA DIGEST (NFDD) — A daily (except weekends and Federal holidays) publication of flight information appropriate to aeronautical charts, aeronautical publications, Notices to Air Missions, or other media serving the purpose of providing operational flight data essential to safe and efficient aircraft operations.

NATIONAL SEARCH AND RESCUE PLAN — An interagency agreement which provides for the effective utilization of all available facilities in all types of search and rescue missions.

NATIONAL SECURITY AREA (NSA) — (See SPECIAL USE AIRSPACE.)

NAVAID — (See NAVIGATIONAL AID.)

NAVAID CLASSES — VOR, VORTAC, and TACAN aids are classed according to their operational use. The three classes of NAVAIDs are:

- a. T — Terminal.
- b. L — Low altitude.
- c. H — High altitude.

NOTE: *The normal service range for T, L, and H class aids is found in the AIM. Certain operational requirements make it necessary to use some of these aids at greater service ranges than specified. Extended range is made possible through flight inspection determinations. Some aids also have lesser service range due to location, terrain, frequency protection, etc. Restrictions to service range are listed in Chart Supplement U.S.*

NAVIGABLE AIRSPACE — Airspace at and above the minimum flight altitudes prescribed in the CFRs including airspace needed for safe takeoff and landing.

(Refer to 14 CFR Part 91.)

NAVIGATION REFERENCE SYSTEM (NRS) — The NRS is a system of waypoints developed for use within the United States for flight planning and navigation without reference to ground based navigational aids. The NRS waypoints are located in a grid pattern along defined latitude and longitude lines. The initial use of the NRS will be in the high altitude environment. The NRS waypoints are intended for use by aircraft capable of point-to-point navigation.

PILOT/CONTROLLER GLOSSARY
N

NAVIGATION SPECIFICATION [ICAO] — A set of aircraft and flight crew requirements needed to support performance-based navigation operations within a defined airspace. There are two kinds of navigation specifications:

- RNP specification. A navigation specification based on area navigation that includes the requirement for performance monitoring and alerting, designated by the prefix RNP; e.g., RNP 4, RNP APCH.
- RNAV specification. A navigation specification based on area navigation that does not include the requirement for performance monitoring and alerting, designated by the prefix RNAV; e.g., RNAV 5, RNAV 1.

NOTE: *The Performance-based Navigation Manual (Doc 9613), Volume II contains detailed guidance on navigation specifications.*

NAVIGATIONAL AID — Any visual or electronic device airborne or on the surface which provides point-to-point guidance information or position data to aircraft in flight.

(See AIR NAVIGATION FACILITY.)

NAVSPEC — (See NAVIGATION SPECIFICATION [ICAO].)

NBCAP AIRSPACE — (See NATIONAL BEACON CODE ALLOCATION PLAN AIRSPACE.)

NDB — (See NONDIRECTIONAL BEACON.)

NEGATIVE — “No,” or “permission not granted,” or “that is not correct.”

NEGATIVE CONTACT — Used by pilots to inform ATC that:

- Previously issued traffic is not in sight. It may be followed by the pilot's request for the controller to provide assistance in avoiding the traffic.
- They were unable to contact ATC on a particular frequency.

NFDD — (See NATIONAL FLIGHT DATA DIGEST.)

NIGHT — The time between the end of evening civil twilight and the beginning of morning civil twilight, as published in the Air Almanac, converted to local time.

(See ICAO term NIGHT.)

NIGHT [ICAO] — The hours between the end of evening civil twilight and the beginning of morning civil twilight or such other period between sunset and sunrise as may be specified by the appropriate authority.

NOTE: *Civil twilight ends in the evening when the center of the sun's disk is 6 degrees below the horizon and begins in the morning when the center of the sun's disk is 6 degrees below the horizon.*

NO GYRO APPROACH — A radar approach/vector provided in case of a malfunctioning gyrocompass or directional gyro. Instead of providing the pilot with headings to be flown, the controller observes the radar track and issues control instructions “turn right/left” or “stop turn” as appropriate.

PILOT/CONTROLLER GLOSSARY

N

(Refer to AIM.)

NO GYRO VECTOR — (See NO GYRO APPROACH.)

NO TRANSGRESSION ZONE (NTZ) — The NTZ is a 2,000 foot wide zone, located equidistant between parallel runway or SOIA final approach courses, in which flight is normally not allowed.

NONAPPROACH CONTROL TOWER — Authorizes aircraft to land or takeoff at the airport controlled by the tower or to transit the Class D airspace. The primary function of a nonapproach control tower is the sequencing of aircraft in the traffic pattern and on the landing area. Nonapproach control towers also separate aircraft operating under instrument flight rules clearances from approach controls and centers. They provide ground control services to aircraft, vehicles, personnel, and equipment on the airport movement area.

NONCOMMON ROUTE/PORTION — That segment of a North American Route between the inland navigation facility and a designated North American terminal.

NON-COOPERATIVE SURVEILLANCE — Any surveillance system, such as primary radar, that is not dependent upon the presence of any equipment on the aircraft or vehicle to be tracked.

(See COOPERATIVE SURVEILLANCE.)

(See RADAR.)

NONDIRECTIONAL BEACON — An L/MF or UHF radio beacon transmitting nondirectional signals whereby the pilot of an aircraft equipped with direction finding equipment can determine his/her bearing to or from the radio beacon and “home” on or track to or from the station. When the radio beacon is installed in conjunction with the Instrument Landing System marker, it is normally called a Compass Locator.

(See AUTOMATIC DIRECTION FINDER.)

(See COMPASS LOCATOR.)

NONMOVEMENT AREAS — Taxiways and apron (ramp) areas not under the control of air traffic.

NONPRECISION APPROACH — (See NONPRECISION APPROACH PROCEDURE.)

NONPRECISION APPROACH PROCEDURE — A standard instrument approach procedure in which no electronic glideslope is provided; e.g., VOR, TACAN, NDB, LOC, ASR, LDA, or SDF approaches.

NONRADAR — Precedes other terms and generally means without the use of radar, such as:

- a. Nonradar Approach. Used to describe instrument approaches for which course guidance on final approach is not provided by ground-based precision or surveillance radar. Radar vectors to the final approach course may or may not be provided by ATC. Examples of nonradar approaches are VOR, NDB, TACAN, ILS, RNAV, and GLS approaches.

(See FINAL APPROACH COURSE.)

(See FINAL APPROACH-IFR.)

(See INSTRUMENT APPROACH PROCEDURE.)

PILOT/CONTROLLER GLOSSARY

N

(See RADAR APPROACH.)

- b. Nonradar Approach Control. An ATC facility providing approach control service without the use of radar.

(See APPROACH CONTROL FACILITY.)

(See APPROACH CONTROL SERVICE.)

- c. Nonradar Arrival. An aircraft arriving at an airport without radar service or at an airport served by a radar facility and radar contact has not been established or has been terminated due to a lack of radar service to the airport.

(See RADAR ARRIVAL.)

(See RADAR SERVICE.)

- d. Nonradar Route. A flight path or route over which the pilot is performing his/her own navigation. The pilot may be receiving radar separation, radar monitoring, or other ATC services while on a nonradar route.

(See RADAR ROUTE.)

- e. Nonradar Separation. The spacing of aircraft in accordance with established minima without the use of radar; e.g., vertical, lateral, or longitudinal separation.

(See RADAR SEPARATION.)

NON-RESTRICTIVE ROUTING (NRR) — Portions of a proposed route of flight where a user can flight plan the most advantageous flight path with no requirement to make reference to ground-based NAVAIDs.

NOPAC — (See NORTH PACIFIC.)

NORDO (No Radio) — Aircraft that cannot or do not communicate by radio when radio communication is required are referred to as “NORDO.”

(See LOST COMMUNICATIONS.)

NORMAL OPERATING ZONE (NOZ) — The NOZ is the operating zone within which aircraft flight remains during normal independent simultaneous parallel ILS approaches.

NORTH AMERICAN ROUTE — A numerically coded route preplanned over existing airway and route systems to and from specific coastal fixes serving the North Atlantic. North American Routes consist of the following:

- Common Route/Portion — That segment of a North American Route between the inland navigation facility and the coastal fix.
- Noncommon Route/Portion — That segment of a North American Route between the inland navigation facility and a designated North American terminal.
- Inland Navigation Facility — A navigation aid on a North American Route at which the common route and/or the noncommon route begins or ends.

PILOT/CONTROLLER GLOSSARY

N

- d. Coastal Fix — A navigation aid or intersection where an aircraft transitions between the domestic route structure and the oceanic route structure.

NORTH AMERICAN ROUTE PROGRAM (NRP) — The NRP is a set of rules and procedures which are designed to increase the flexibility of user flight planning within published guidelines.

NORTH ATLANTIC HIGH LEVEL AIRSPACE (NAT HLA) — That volume of airspace (as defined in ICAO Document 7030) between FL 285 and FL 420 within the Oceanic Control Areas of Bodo Oceanic, Gander Oceanic, New York Oceanic East, Reykjavik, Santa Maria, and Shanwick, excluding the Shannon and Brest Ocean Transition Areas. ICAO Doc 007 *North Atlantic Operations and Airspace Manual* provides detailed information on related aircraft and operational requirements.

NORTH PACIFIC — An organized route system between the Alaskan west coast and Japan.

NOT STANDARD — Varying from what is expected or published. For use in NOTAMs only.

NOT STD — (See NOT STANDARD.)

NOTAM — (See NOTICE TO AIR MISSIONS.)

NOTAM [ICAO] — A notice containing information concerning the establishment, condition or change in any aeronautical facility, service, procedure or hazard, the timely knowledge of which is essential to personnel concerned with flight operations.

- a. I Distribution — Distribution by means of telecommunication.
- b. II Distribution — Distribution by means other than telecommunications.

NOTICE TO AIR MISSIONS (NOTAM) — A notice containing information (not known sufficiently in advance to publicize by other means) concerning the establishment, condition, or change in any component (facility, service, or procedure of, or hazard in the National Airspace System) the timely knowledge of which is essential to personnel concerned with flight operations.

- a. NOTAM(D) — A NOTAM given (in addition to local dissemination) distant dissemination beyond the area of responsibility of the Flight Service Station. These NOTAMs will be stored and available until canceled.
- b. FDC NOTAM — A NOTAM regulatory in nature, transmitted by USNOF and given system wide dissemination.

(See ICAO term NOTAM.)

NRR — (See NON-RESTRICTIVE ROUTING.)

NRS — (See NAVIGATION REFERENCE SYSTEM.)

NUMEROUS TARGETS VICINITY (LOCATION) — A traffic advisory issued by ATC to advise pilots that targets on the radar scope are too numerous to issue individually.

(See TRAFFIC ADVISORIES.)

PILOT/CONTROLLER GLOSSARY

O

OBSTACLE — An existing object, object of natural growth, or terrain at a fixed geographical location or which may be expected at a fixed location within a prescribed area with reference to which vertical clearance is or must be provided during flight operation.

OBSTACLE DEPARTURE PROCEDURE (ODP) — A preplanned instrument flight rule (IFR) departure procedure printed for pilot use in textual or graphic form to provide obstruction clearance via the least onerous route from the terminal area to the appropriate en route structure. ODPs are recommended for obstruction clearance and may be flown without ATC clearance unless an alternate departure procedure (SID or radar vector) has been specifically assigned by ATC.

(See IFR TAKEOFF MINIMUMS AND DEPARTURE PROCEDURES.)

(See STANDARD INSTRUMENT DEPARTURES.)

(Refer to AIM.)

OBSTACLE FREE ZONE — The OFZ is a three-dimensional volume of airspace which protects for the transition of aircraft to and from the runway. The OFZ clearing standard precludes taxiing and parked airplanes and object penetrations, except for frangible NAVAID locations that are fixed by function. Additionally, vehicles, equipment, and personnel may be authorized by air traffic control to enter the area using the provisions of FAA Order JO 7110.65, Paragraph 3-1-5, Vehicles/Equipment/Personnel Near/On Runways. The runway OFZ and when applicable, the inner-approach OFZ, and the inner-transitional OFZ, comprise the OFZ.

a. Runway OFZ — The runway OFZ is a defined volume of airspace centered above the runway. The runway OFZ is the airspace above a surface whose elevation at any point is the same as the elevation of the nearest point on the runway centerline. The runway OFZ extends 200 feet beyond each end of the runway. The width is as follows:

1. For runways serving large airplanes, the greater of:

(a) 400 feet, or

(b) 180 feet, plus the wingspan of the most demanding airplane, plus 20 feet per 1,000 feet of airport elevation.

2. For runways serving only small airplanes:

(a) 300 feet for precision instrument runways.

(b) 250 feet for other runways serving small airplanes with approach speeds of 50 knots, or more.

(c) 120 feet for other runways serving small airplanes with approach speeds of less than 50 knots.

b. Inner-approach OFZ — The inner-approach OFZ is a defined volume of airspace centered on the approach area. The inner-approach OFZ applies only to runways with an approach lighting system. The inner-approach OFZ begins 200 feet from the runway threshold at the same elevation as the runway threshold and extends 200 feet beyond the last light unit in the

PILOT/CONTROLLER GLOSSARY

O

approach lighting system. The width of the inner-approach OFZ is the same as the runway OFZ and rises at a slope of 50 (horizontal) to 1 (vertical) from the beginning.

- c. Inner-transitional OFZ — The inner transitional surface OFZ is a defined volume of airspace along the sides of the runway and inner-approach OFZ and applies only to precision instrument runways. The inner-transitional surface OFZ slopes 3 (horizontal) to 1 (vertical) out from the edges of the runway OFZ and inner-approach OFZ to a height of 150 feet above the established airport elevation.

(Refer to AC 150/5300-13, Chapter 3.)

(Refer to FAA Order JO 7110.65, Para 3-1-5, Vehicles/Equipment/Personnel Near/On Runways.)

OBSTRUCTION — Any object/obstacle exceeding the obstruction standards specified by 14 CFR Part 77, Subpart C.

OBSTRUCTION LIGHT — A light or one of a group of lights, usually red or white, frequently mounted on a surface structure or natural terrain to warn pilots of the presence of an obstruction.

OCEANIC AIRSPACE — Airspace over the oceans of the world, considered international airspace, where oceanic separation and procedures per the International Civil Aviation Organization are applied. Responsibility for the provisions of air traffic control service in this airspace is delegated to various countries, based generally upon geographic proximity and the availability of the required resources.

OCEANIC ERROR REPORT — A report filed when ATC observes an Oceanic Error as defined by FAA Order JO 7210.632, Air Traffic Organization Occurrence Reporting.

OCEANIC PUBLISHED ROUTE — A route established in international airspace and charted or described in flight information publications, such as Route Charts, DOD [and Jeppesen] En route Charts, Chart Supplements, NOTAMS, and Track Messages.

OCEANIC TRANSITION ROUTE — An ATS route established for the purpose of transitioning aircraft to/from an organized track system.

ODP — (See OBSTACLE DEPARTURE PROCEDURE.)

OFF COURSE — A term used to describe a situation where an aircraft has reported a position fix or is observed on radar at a point not on the ATC-approved route of flight.

OFF-ROUTE OBSTRUCTION CLEARANCE ALTITUDE (OROCA) — A published altitude which provides terrain and obstruction clearance with a 1,000 foot buffer in non-mountainous areas and a 2,000 foot buffer in designated mountainous areas within the United States, and a 3,000 foot buffer outside the US ADIZ. These altitudes are not assessed for NAVAID signal coverage, air traffic control surveillance, or communications coverage, and are published for general situational awareness, flight planning, and in-flight contingency use.

OFF-ROUTE VECTOR — A vector by ATC which takes an aircraft off a previously assigned route. Altitudes assigned by ATC during such vectors provide required obstacle clearance.

OFFSET PARALLEL RUNWAYS — Staggered runways having centerlines which are parallel.

PILOT/CONTROLLER GLOSSARY

O

OFFSHORE/CONTROL AIRSPACE AREA — That portion of airspace between the U.S. 12 NM limit and the oceanic CTA/FIR boundary within which air traffic control is exercised. These areas are established to provide air traffic control services. Offshore/Control Airspace Areas may be classified as either Class A airspace or Class E airspace.

OFT — (See OUTER FIX TIME.)

OM — (See OUTER MARKER.)

ON COURSE —

- a. Used to indicate that an aircraft is established on the route centerline.
- b. Used by ATC to advise a pilot making a radar approach that his/her aircraft is lined up on the final approach course.

(See ON-COURSE INDICATION.)

ON-COURSE INDICATION — An indication on an instrument, which provides the pilot a visual means of determining that the aircraft is located on the centerline of a given navigational track, or an indication on a radar scope that an aircraft is on a given track.

ONE-MINUTE WEATHER — The most recent one minute updated weather broadcast received by a pilot from an uncontrolled airport ASOS/AWOS.

ONER — (See OCEANIC NAVIGATIONAL ERROR REPORT.)

OPEN LOOP CLEARANCE — Provides a lateral vector solution that does not include a return to route point.

OPERATIONAL — (See DUE REGARD.)

OPERATIONS SPECIFICATIONS [ICAO] — The authorizations, conditions and limitations associated with the air operator certificate and subject to the conditions in the operations manual.

OPPOSITE DIRECTION AIRCRAFT — Aircraft are operating in opposite directions when:

- a. They are following the same track in reciprocal directions; or
- b. Their tracks are parallel and the aircraft are flying in reciprocal directions; or
- c. Their tracks intersect at an angle of more than 135°.

OPTION APPROACH — An approach requested and conducted by a pilot which will result in either a touch-and-go, missed approach, low approach, stop-and-go, or full stop landing. Pilots should advise ATC if they decide to remain on the runway, of any delay in their stop and go, delay clearing the runway, or are unable to comply with the instruction(s).

(See CLEARED FOR THE OPTION.)

(Refer to AIM.)

ORGANIZED TRACK SYSTEM — A series of ATS routes which are fixed and charted; i.e., CEP, NOPAC, or flexible and described by NOTAM; i.e., NAT TRACK MESSAGE.

OTR — (See OCEANIC TRANSITION ROUTE.)

PILOT/CONTROLLER GLOSSARY

O

OTS — (See ORGANIZED TRACK SYSTEM.)

OUT — The conversation is ended and no response is expected.

OUT OF SERVICE/UNSERVICEABLE (U/S) — When a piece of equipment, a NAVAID, a facility or a service is not operational, certified (if required) and immediately “available” for Air Traffic or public use.

OUTER AREA (associated with Class C airspace) — Non-regulatory airspace surrounding designated Class C airspace airports wherein ATC provides radar vectoring and sequencing on a full-time basis for all IFR and participating VFR aircraft. The service provided in the outer area is called Class C service which includes: IFR/IFR-IFR separation; IFR/VFR-traffic advisories and conflict resolution; and VFR/VFR-traffic advisories and, as appropriate, safety alerts. The normal radius will be 20 nautical miles with some variations based on site-specific requirements. The outer area extends outward from the primary Class C airspace airport and extends from the lower limits of radar/radio coverage up to the ceiling of the approach control's delegated airspace excluding the Class C charted area and other airspace as appropriate.

(See CONFLICT RESOLUTION.)

(See CONTROLLED AIRSPACE.)

OUTER COMPASS LOCATOR — (See COMPASS LOCATOR.)

OUTER FIX — A general term used within ATC to describe fixes in the terminal area, other than the final approach fix. Aircraft are normally cleared to these fixes by an Air Route Traffic Control Center or an Approach Control Facility. Aircraft are normally cleared from these fixes to the final approach fix or final approach course.

or

OUTER FIX — An adapted fix along the converted route of flight, prior to the meter fix, for which crossing times are calculated and displayed in the metering position list.

OUTER FIX ARC — A semicircle, usually about a 50-70 mile radius from a meter fix, usually in high altitude, which is used by CTAS/ERAM to calculate outer fix times and determine appropriate sector meter list assignments for aircraft on an established arrival route that will traverse the arc.

OUTER FIX TIME — A calculated time to depart the outer fix in order to cross the vertex at the ACLT. The time reflects descent speed adjustments and any applicable delay time that must be absorbed prior to crossing the meter fix.

OUTER MARKER — A marker beacon at or near the glideslope intercept altitude of an ILS approach. It is keyed to transmit two dashes per second on a 400 Hz tone, which is received aurally and visually by compatible airborne equipment. The OM is normally located four to seven miles from the runway threshold on the extended centerline of the runway.

(See INSTRUMENT LANDING SYSTEM.)

(See MARKER BEACON.)

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

O

OVER — My transmission is ended; I expect a response.

OVERHEAD MANEUVER — A series of predetermined maneuvers prescribed for aircraft (often in formation) for entry into the visual flight rules (VFR) traffic pattern and to proceed to a landing. An overhead maneuver is not an instrument flight rules (IFR) approach procedure. An aircraft executing an overhead maneuver is considered VFR and the IFR flight plan is canceled when the aircraft reaches the “initial point” on the initial approach portion of the maneuver. The pattern usually specifies the following:

- a. The radio contact required of the pilot.
- b. The speed to be maintained.
- c. An initial approach 3 to 5 miles in length.
- d. An elliptical pattern consisting of two 180 degree turns.
- e. A break point at which the first 180 degree turn is started.
- f. The direction of turns.
- g. Altitude (at least 500 feet above the conventional pattern).
- h. A “Roll-out” on final approach not less than 1/4 mile from the landing threshold and not less than 300 feet above the ground.

OVERLYING CENTER — The ARTCC facility that is responsible for arrival/departure operations at a specific terminal.

PILOT/CONTROLLER GLOSSARY

P

P TIME — (See PROPOSED DEPARTURE TIME.)

P-ACP — (See PREARRANGED COORDINATION PROCEDURES.)

PAN-PAN — The international radio-telephony urgency signal. When repeated three times, indicates uncertainty or alert followed by the nature of the urgency.

(See MAYDAY.)

(Refer to AIM.)

PAR — (See PRECISION APPROACH RADAR.)

PAR [ICAO] — (See ICAO Term PRECISION APPROACH RADAR.)

PARALLEL ILS APPROACHES — Approaches to parallel runways by IFR aircraft which, when established inbound toward the airport on the adjacent final approach courses, are radar-separated by at least 2 miles.

(See FINAL APPROACH COURSE.)

(See SIMULTANEOUS ILS APPROACHES.)

PARALLEL OFFSET ROUTE — A parallel track to the left or right of the designated or established airway/route. Normally associated with Area Navigation (RNAV) operations.

(See AREA NAVIGATION.)

PARALLEL RUNWAYS — Two or more runways at the same airport whose centerlines are parallel. In addition to runway number, parallel runways are designated as L (left) and R (right) or, if three parallel runways exist, L (left), C (center), and R (right).

PBCT — (See PROPOSED BOUNDARY CROSSING TIME.)

PBN — (See ICAO Term PERFORMANCE-BASED NAVIGATION.)

PDC — (See PRE-DEPARTURE CLEARANCE.)

PDRR — (See PRE-DEPARTURE REROUTE.)

PERFORMANCE-BASED NAVIGATION (PBN) [ICAO] — Area navigation based on performance requirements for aircraft operating along an ATS route, on an instrument approach procedure or in a designated airspace.

NOTE: *Performance requirements are expressed in navigation specifications (RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability, and functionality needed for the proposed operation in the context of a particular airspace concept.*

PERMANENT ECHO — Radar signals reflected from fixed objects on the earth's surface; e.g., buildings, towers, terrain. Permanent echoes are distinguished from "ground clutter" by being definable locations rather than large areas. Under certain conditions they may be used to check radar alignment.

PERTI — (See PLAN, EXECUTE, REVIEW, TRAIN, IMPROVE.)

PGUI — (See PLANVIEW GRAPHICAL USER INTERFACE.)

PILOT/CONTROLLER GLOSSARY

P

PHOTO RECONNAISSANCE — Military activity that requires locating individual photo targets and navigating to the targets at a preplanned angle and altitude. The activity normally requires a lateral route width of 16 NM and altitude range of 1,500 feet to 10,000 feet AGL.

PILOT BRIEFING — A service provided by the FSS to assist pilots in flight planning. Briefing items may include weather information, NOTAMS, military activities, flow control information, and other items as requested.

(Refer to AIM.)

PILOT IN COMMAND — The pilot responsible for the operation and safety of an aircraft during flight time.

(Refer to 14 CFR Part 91.)

PILOT WEATHER REPORT — A report of meteorological phenomena encountered by aircraft in flight.

(Refer to AIM.)

PILOT'S DISCRETION — When used in conjunction with altitude assignments, means that ATC has offered the pilot the option of starting climb or descent whenever he/she wishes and conducting the climb or descent at any rate he/she wishes. He/she may temporarily level off at any intermediate altitude. However, once he/she has vacated an altitude, he/she may not return to that altitude.

PIREP — (See PILOT WEATHER REPORT.)

PITCH POINT — A fix/waypoint that serves as a transition point from a departure procedure or the low altitude ground-based navigation structure into the high altitude waypoint system.

PLAN, EXECUTE, REVIEW, TRAIN, IMPROVE (PERTI) — A process that delivers a one-day detailed plan for NAS operations, and a two-day outlook, which sets NAS performance goals for high impact constraints. **PLAN:** Increase lead time for identifying aviation system constraint planning and goals while utilizing historical NAS performance data and constraints to derive successful and/or improved advance planning strategies. **EXECUTE:** Set goals and a strategy. The Air Traffic Control System Command Center (ATCSCC), FAA field facilities, and aviation stakeholders execute the strategy and work to achieve the desired/planned outcomes. **REVIEW:** Utilize post event analysis and lessons learned to define and implement future strategies and operational triggers based on past performance and outcomes, both positive and negative. **TRAIN:** Develop training that includes rapid and continuous feedback to operational personnel and provides increased data and weather knowledge and tools for analytical usage and planning. **IMPROVE:** Implement better information sharing processes, technologies, and procedures that improve the skills and technology needed to implement operational insights and improvements.

PLANS DISPLAY — A display available in EDST that provides detailed flight plan and predicted conflict information in textual format for requested Current Plans and all Trial Plans.

(See EN ROUTE DECISION SUPPORT TOOL.)

PLANVIEW GRAPHICAL USER INTERFACE (PGUI) — A TBFM display that provides a spatial display of individual aircraft track information.

PILOT/CONTROLLER GLOSSARY
P

POFZ — (See PRECISION OBSTACLE FREE ZONE.)

POINT OUT — (See RADAR POINT OUT.)

POINT-TO-POINT (PTP) — A level of NRR service for aircraft that is based on traditional way-points in their FMSs or RNAV equipage.

POLAR TRACK STRUCTURE — A system of organized routes between Iceland and Alaska which overlie Canadian MNPS Airspace.

POSITION REPORT — A report over a known location as transmitted by an aircraft to ATC.

(Refer to AIM.)

POSITION SYMBOL — A computer-generated indication shown on a radar display to indicate the mode of tracking.

POSITIVE CONTROL — The separation of all air traffic within designated airspace by air traffic control.

PRACTICE INSTRUMENT APPROACH — An instrument approach procedure conducted by a VFR or an IFR aircraft for the purpose of pilot training or proficiency demonstrations.

PRE-DEPARTURE CLEARANCE — An application with the Terminal Data Link System (TDLS) that provides clearance information to subscribers, through a service provider, in text to the cockpit or gate printer.

PRE-DEPARTURE REROUTE (PDRR) — A capability within the Traffic Flow Management System that enables ATC to quickly amend and execute revised departure clearances that mitigate en route constraints or balance en route traffic flows.

PREARRANGED COORDINATION — A standardized procedure which permits an air traffic controller to enter the airspace assigned to another air traffic controller without verbal coordination. The procedures are defined in a facility directive which ensures approved separation between aircraft.

PREARRANGED COORDINATION PROCEDURES — A facility's standardized procedure that describes the process by which one controller shall allow an aircraft to penetrate or transit another controller's airspace in a manner that assures approved separation without individual coordination for each aircraft.

PRECIPITATION — Any or all forms of water particles (rain, sleet, hail, or snow) that fall from the atmosphere and reach the surface.

PRECIPITATION RADAR WEATHER DESCRIPTIONS — Existing radar systems cannot detect turbulence. However, there is a direct correlation between the degree of turbulence and other weather features associated with thunderstorms and the weather radar precipitation intensity. Controllers will issue (where capable) precipitation intensity as observed by radar when using weather and radar processor (WARP) or NAS ground-based digital radars with weather capabilities. When precipitation intensity information is not available, the intensity will be described as UNKNOWN. When intensity levels can be determined, they shall be described as:

- a. LIGHT (< 26 dBZ)

PILOT/CONTROLLER GLOSSARY

P

- b. MODERATE (26 to 40 dBZ)
- c. HEAVY (> 40 TO 50 dBZ)
- d. EXTREME (> 50 dBZ)

(Refer to AC 00-45, Aviation Weather Services.)

PRECISION APPROACH — (See PRECISION APPROACH PROCEDURE.)

PRECISION APPROACH PROCEDURE — A standard instrument approach procedure in which an electronic glideslope or other type of glidepath is provided; e.g., ILS, PAR, and GLS.

(See INSTRUMENT LANDING SYSTEM.)

(See PRECISION APPROACH RADAR.)

PRECISION APPROACH RADAR — Radar equipment in some ATC facilities operated by the FAA and/or the military services at joint-use civil/military locations and separate military installations to detect and display azimuth, elevation, and range of aircraft on the final approach course to a runway. This equipment may be used to monitor certain non-radar approaches, but is primarily used to conduct a precision instrument approach (PAR) wherein the controller issues guidance instructions to the pilot based on the aircraft's position in relation to the final approach course (azimuth), the glidepath (elevation), and the distance (range) from the touchdown point on the runway as displayed on the radar scope.

(See GLIDEPATH.)

(See PAR.)

(See ICAO term PRECISION APPROACH RADAR.)

(Refer to AIM.)

PRECISION APPROACH RADAR [ICAO] — Primary radar equipment used to determine the position of an aircraft during final approach, in terms of lateral and vertical deviations relative to a nominal approach path, and in range relative to touchdown.

PRECISION OBSTACLE FREE ZONE (POFZ) — An 800 foot wide by 200 foot long area centered on the runway centerline adjacent to the threshold designed to protect aircraft flying precision approaches from ground vehicles and other aircraft when ceiling is less than 250 feet or visibility is less than 3/4 statute mile (or runway visual range below 4,000 feet.)

PRECISION RUNWAY MONITOR (PRM) SYSTEM — Provides air traffic controllers monitoring the NTZ during simultaneous close parallel PRM approaches with precision, high update rate secondary surveillance data. The high update rate surveillance sensor component of the PRM system is only required for specific runway or approach course separation. The high resolution color monitoring display, Final Monitor Aid (FMA) of the PRM system, or other FMA with the same capability, presents NTZ surveillance track data to controllers along with detailed maps depicting approaches and no transgression zone and is required for all simultaneous close parallel PRM NTZ monitoring operations.

(Refer to AIM)

PILOT/CONTROLLER GLOSSARY

P

PREDICTIVE WIND SHEAR ALERT SYSTEM (PWS) — A self-contained system used on board some aircraft to alert the flight crew to the presence of a potential wind shear. PWS systems typically monitor 3 miles ahead and 25 degrees left and right of the aircraft's heading at or below 1200' AGL. Departing flights may receive a wind shear alert after they start the takeoff roll and may elect to abort the takeoff. Aircraft on approach receiving an alert may elect to go around or perform a wind shear escape maneuver.

PREFERRED IFR ROUTES — Routes established between busier airports to increase system efficiency and capacity. They normally extend through one or more ARTCC areas and are designed to achieve balanced traffic flows among high density terminals. IFR clearances are issued on the basis of these routes except when severe weather avoidance procedures or other factors dictate otherwise. Preferred IFR Routes are listed in the Chart Supplement U.S., and are also available at https://www.fly.faa.gov/rmt/nfdc_preferred_routes_database.jsp. If a flight is planned to or from an area having such routes but the departure or arrival point is not listed in the Chart Supplement U.S., pilots may use that part of a Preferred IFR Route which is appropriate for the departure or arrival point that is listed. Preferred IFR Routes may be defined by DPs, SIDs, or STARs; NAVAIDs, Waypoints, etc.; high or low altitude airways; or any combinations thereof. Because they often share elements with adapted routes, pilots' use of preferred IFR routes can minimize flight plan route amendments.

(See ADAPTED ROUTES.)

(See CENTER'S AREA.)

(See INSTRUMENT APPROACH PROCEDURE.)

(See INSTRUMENT DEPARTURE PROCEDURE.)

(See STANDARD TERMINAL ARRIVAL.)

(Refer to CHART SUPPLEMENT U.S.)

PRE-FLIGHT PILOT BRIEFING — (See PILOT BRIEFING.)

PREVAILING VISIBILITY — (See VISIBILITY.)

PRIMARY RADAR TARGET — An analog or digital target, exclusive of a secondary radar target, presented on a radar display.

PRM — (See AREA NAVIGATION (RNAV) GLOBAL POSITIONING SYSTEM (GPS) PRECISION RUNWAY MONITORING (PRM) APPROACH.)

(See PRM APPROACH.)

(See PRECISION RUNWAY MONITOR SYSTEM.)

PRM APPROACH — An instrument approach procedure titled ILS PRM, RNAV PRM, LDA PRM, or GLS PRM conducted to parallel runways separated by less than 4,300 feet and at least 3,000 feet where independent closely spaced approaches are permitted. Use of an enhanced display with alerting, a No Transgression Zone (NTZ), secondary monitor frequency, pilot PRM training, and publication of an Attention All Users Page are required for all PRM approaches. Depending on the runway spacing, the approach courses may be parallel or one approach course must be

PILOT/CONTROLLER GLOSSARY

P

offset. PRM procedures are also used to conduct Simultaneous Offset Instrument Approach (SOIA) operations. In SOIA, one straight-in ILS PRM, RNAV PRM, GLS PRM, and one offset LDA PRM, RNAV PRM or GLS PRM approach are utilized. PRM procedures are terminated and a visual segment begins at the offset approach missed approach point where the minimum distance between the approach courses is 3000 feet. Runway spacing can be as close as 750 feet.

(Refer to AIM.)

PROCEDURAL CONTROL [ICAO] — Term used to indicate that information derived from an ATS surveillance system is not required for the provision of air traffic control service.

PROCEDURAL SEPARATION [ICAO] — The separation used when providing procedural control.

PROCEDURE TURN — The maneuver prescribed when it is necessary to reverse direction to establish an aircraft on the intermediate approach segment or final approach course. The outbound course, direction of turn, distance within which the turn must be completed, and minimum altitude are specified in the procedure. However, unless otherwise restricted, the point at which the turn may be commenced and the type and rate of turn are left to the discretion of the pilot.

(See ICAO term PROCEDURE TURN.)

PROCEDURE TURN [ICAO] — A maneuver in which a turn is made away from a designated track followed by a turn in the opposite direction to permit the aircraft to intercept and proceed along the reciprocal of the designated track.

NOTE 1: *Procedure turns are designated “left” or “right” according to the direction of the initial turn.*

NOTE 2: *Procedure turns may be designated as being made either in level flight or while descending, according to the circumstances of each individual approach procedure.*

PROCEDURE TURN INBOUND — That point of a procedure turn maneuver where course reversal has been completed and an aircraft is established inbound on the intermediate approach segment or final approach course. A report of “procedure turn inbound” is normally used by ATC as a position report for separation purposes.

(See FINAL APPROACH COURSE.)

(See PROCEDURE TURN.)

(See SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE.)

PROFILE DESCENT — An uninterrupted descent (except where level flight is required for speed adjustment; e.g., 250 knots at 10,000 feet MSL) from cruising altitude/level to interception of a glideslope or to a minimum altitude specified for the initial or intermediate approach segment of a nonprecision instrument approach. The profile descent normally terminates at the approach gate or where the glideslope or other appropriate minimum altitude is intercepted.

PROGRESS REPORT — (See POSITION REPORT.)

PROGRESSIVE TAXI — Precise taxi instructions given to a pilot unfamiliar with the airport or issued in stages as the aircraft proceeds along the taxi route.

PILOT/CONTROLLER GLOSSARY

P

PROHIBITED AREA — (See SPECIAL USE AIRSPACE.)

(See ICAO term PROHIBITED AREA.)

PROHIBITED AREA [ICAO] — An airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is prohibited.

PROMINENT OBSTACLE — An obstacle that meets one or more of the following conditions:

- a. An obstacle which stands out beyond the adjacent surface of surrounding terrain and immediately projects a noticeable hazard to aircraft in flight.
- b. An obstacle, not characterized as low and close in, whose height is no less than 300 feet above the departure end of takeoff runway (DER) elevation, is within 10NM from the DER, and that penetrates that airport/heliport's diverse departure obstacle clearance surface (OCS).
- c. An obstacle beyond 10NM from an airport/heliport that requires an obstacle departure procedure (ODP) to ensure obstacle avoidance.

(See OBSTACLE.)

(See OBSTRUCTION.)

PROPELLER (PROP) WASH (PROP BLAST) — The disturbed mass of air generated by the motion of a propeller.

PROPOSED BOUNDARY CROSSING TIME — Each center has a PBCT parameter for each internal airport. Proposed internal flight plans are transmitted to the adjacent center if the flight time along the proposed route from the departure airport to the center boundary is less than or equal to the value of PBCT or if airport adaptation specifies transmission regardless of PBCT.

PROPOSED DEPARTURE TIME — The time that the aircraft expects to become airborne.

PROTECTED AIRSPACE — The airspace on either side of an oceanic route/track that is equal to one-half the lateral separation minimum except where reduction of protected airspace has been authorized.

PROTECTED SEGMENT — The protected segment is a segment on the amended TFM route that is to be inhibited from automatic adapted route alteration by ERAM.

PT — (See PROCEDURE TURN.)

PTP — (See POINT-TO-POINT.)

PTS — (See POLAR TRACK STRUCTURE.)

PUBLISHED INSTRUMENT APPROACH PROCEDURE VISUAL SEGMENT — A segment on an IAP chart annotated as "Fly Visual to Airport" or "Fly Visual." A dashed arrow will indicate the visual flight path on the profile and plan view with an associated note on the approximate heading and distance. The visual segment should be flown as a dead reckoning course while maintaining visual conditions.

PILOT/CONTROLLER GLOSSARY**P**

PUBLISHED ROUTE — A route for which an IFR altitude has been established and published; e.g., Federal Airways, Jet Routes, Area Navigation Routes, Specified Direct Routes.

PWS — (See PREDICTIVE WIND SHEAR ALERT SYSTEM.)

PILOT/CONTROLLER GLOSSARY

Q

Q ROUTE — 'Q' is the designator assigned to published RNAV routes used by the United States.

QFE — The atmospheric pressure at aerodrome elevation (or at runway threshold).

QNE — The barometric pressure used for the standard altimeter setting (29.92 inches Hg.).

QNH — The barometric pressure as reported by a particular station.

QUADRANT — A quarter part of a circle, centered on a NAVAID, oriented clockwise from magnetic north as follows: NE quadrant 000-089, SE quadrant 090-179, SW quadrant 180-269, NW quadrant 270-359.

QUEUING — (See STAGING/QUEUING.)

QUICK LOOK — A feature of the EAS and STARS which provides the controller the capability to display full data blocks of tracked aircraft from other control positions.

PILOT/CONTROLLER GLOSSARY
R

RAD — (See ROUTE AMENDMENT DIALOG.)

RADAR — A device that provides information on range, azimuth, and/or elevation of objects by measuring the time interval between transmission and reception of directional radio pulses and correlating the angular orientation of the radiated antenna beam or beams in azimuth and/or elevation.

- a. Primary Radar — A radar system in which a minute portion of a radio pulse transmitted from a site is reflected by an object and then received back at that site for processing and display at an air traffic control facility.
- b. Secondary Radar/Radar Beacon (ATCRBS) — A radar system in which the object to be detected is fitted with cooperative equipment in the form of a radio receiver/transmitter (transponder). Radar pulses transmitted from the searching transmitter/receiver (interrogator) site are received in the cooperative equipment and used to trigger a distinctive transmission from the transponder. This reply transmission, rather than a reflected signal, is then received back at the transmitter/receiver site for processing and display at an air traffic control facility.

(See COOPERATIVE SURVEILLANCE.)

(See INTERROGATOR.)

(See NON-COOPERATIVE SURVEILLANCE.)

(See TRANSPONDER.)

(See ICAO term RADAR.)

(Refer to AIM.)

RADAR [ICAO] — A radio detection device which provides information on range, azimuth and/or elevation of objects.

- a. Primary Radar — Radar system which uses reflected radio signals.
- b. Secondary Radar — Radar system wherein a radio signal transmitted from a radar station initiates the transmission of a radio signal from another station.

RADAR ADVISORY — The provision of advice and information based on radar observations.

(See ADVISORY SERVICE.)

RADAR ALTIMETER — (See RADIO ALTIMETER.)

RADAR APPROACH — An instrument approach procedure which utilizes Precision Approach Radar (PAR) or Airport Surveillance Radar (ASR).

(See AIRPORT SURVEILLANCE RADAR.)

(See INSTRUMENT APPROACH PROCEDURE.)

(See PRECISION APPROACH RADAR.)

(See SURVEILLANCE APPROACH.)

(See ICAO term RADAR APPROACH.)

PILOT/CONTROLLER GLOSSARY
R

(Refer to AIM.)

RADAR APPROACH [ICAO] — An approach, executed by an aircraft, under the direction of a radar controller.

RADAR APPROACH CONTROL FACILITY — A terminal ATC facility that uses radar and nonradar capabilities to provide approach control services to aircraft arriving, departing, or transiting airspace controlled by the facility.

(See APPROACH CONTROL SERVICE.)

- a. Provides radar ATC services to aircraft operating in the vicinity of one or more civil and/or military airports in a terminal area. The facility may provide services of a ground controlled approach (GCA); i.e., ASR and PAR approaches. A radar approach control facility may be operated by FAA, USAF, US Army, USN, USMC, or jointly by FAA and a military service. Specific facility nomenclatures are used for administrative purposes only and are related to the physical location of the facility and the operating service generally as follows:
 1. Army Radar Approach Control (ARAC) (US Army).
 2. Radar Air Traffic Control Facility (RATCF) (USN/FAA and USMC/FAA).
 3. Radar Approach Control (RAPCON) (USAF/FAA, USN/FAA, and USMC/FAA).
 4. Terminal Radar Approach Control (TRACON) (FAA).
 5. Airport Traffic Control Tower (ATCT) (FAA). (Only those towers delegated approach control authority.)

RADAR ARRIVAL — An aircraft arriving at an airport served by a radar facility and in radar contact with the facility.

(See NONRADAR.)

RADAR BEACON — (See RADAR.)

RADAR CLUTTER [ICAO] — The visual indication on a radar display of unwanted signals.

RADAR CONTACT —

- a. Used by ATC to inform an aircraft that it is identified using an approved ATC surveillance source on an air traffic controller's display and that radar flight following will be provided until radar service is terminated. Radar service may also be provided within the limits of necessity and capability. When a pilot is informed of "radar contact," he/she automatically discontinues reporting over compulsory reporting points.

(See ATC SURVEILLANCE SOURCE.)

(See RADAR CONTACT LOST.)

(See RADAR FLIGHT FOLLOWING.)

(See RADAR SERVICE.)

(See RADAR SERVICE TERMINATED.)

PILOT/CONTROLLER GLOSSARY
R

(Refer to AIM.)

- b. The term used to inform the controller that the aircraft is identified and approval is granted for the aircraft to enter the receiving controllers airspace.

(See ICAO term RADAR CONTACT.)

RADAR CONTACT [ICAO] — The situation which exists when the radar blip or radar position symbol of a particular aircraft is seen and identified on a radar display.

RADAR CONTACT LOST — Used by ATC to inform a pilot that the surveillance data used to determine the aircraft's position is no longer being received, or is no longer reliable and radar service is no longer being provided. The loss may be attributed to several factors including the aircraft merging with weather or ground clutter, the aircraft operating below radar line of sight coverage, the aircraft entering an area of poor radar return, failure of the aircraft's equipment, or failure of the surveillance equipment.

(See CLUTTER.)

(See RADAR CONTACT.)

RADAR ENVIRONMENT — An area in which radar service may be provided.

(See ADDITIONAL SERVICES.)

(See RADAR CONTACT.)

(See RADAR SERVICE.)

(See TRAFFIC ADVISORIES.)

RADAR FLIGHT FOLLOWING — The observation of the progress of radar-identified aircraft, whose primary navigation is being provided by the pilot, wherein the controller retains and correlates the aircraft identity with the appropriate target or target symbol displayed on the radar scope.

(See RADAR CONTACT.)

(See RADAR SERVICE.)

(Refer to AIM.)

RADAR IDENTIFICATION — The process of ascertaining that an observed radar target is the radar return from a particular aircraft.

(See RADAR CONTACT.)

(See RADAR SERVICE.)

RADAR IDENTIFIED AIRCRAFT — An aircraft, the position of which has been correlated with an observed target or symbol on the radar display.

(See RADAR CONTACT.)

(See RADAR CONTACT LOST.)

RADAR MONITORING — (See RADAR SERVICE.)

PILOT/CONTROLLER GLOSSARY
R

RADAR NAVIGATIONAL GUIDANCE — (See RADAR SERVICE.)

RADAR POINT OUT — An action taken by a controller to transfer the radar identification of an aircraft to another controller if the aircraft will or may enter the airspace or protected airspace of another controller and radio communications will not be transferred.

RADAR REQUIRED — A term displayed on charts and approach plates and included in FDC NOTAMs to alert pilots that segments of either an instrument approach procedure or a route are not navigable because of either the absence or unusability of a NAVAID. The pilot can expect to be provided radar navigational guidance while transiting segments labeled with this term.

(See RADAR ROUTE.)

(See RADAR SERVICE.)

RADAR ROUTE — A flight path or route over which an aircraft is vectored. Navigational guidance and altitude assignments are provided by ATC.

(See FLIGHT PATH.)

(See ROUTE.)

RADAR SEPARATION — (See RADAR SERVICE.)

RADAR SERVICE — A term which encompasses one or more of the following services based on the use of radar which can be provided by a controller to a pilot of a radar identified aircraft.

- a. Radar Monitoring — The radar flight-following of aircraft, whose primary navigation is being performed by the pilot, to observe and note deviations from its authorized flight path, airway, or route. When being applied specifically to radar monitoring of instrument approaches; i.e., with precision approach radar (PAR) or radar monitoring of simultaneous ILS, RNAV and GLS approaches, it includes advice and instructions whenever an aircraft nears or exceeds the prescribed PAR safety limit or simultaneous ILS, RNAV and GLS no transgression zone.

(See ADDITIONAL SERVICES.)

(See TRAFFIC ADVISORIES.)

- b. Radar Navigational Guidance — Vectoring aircraft to provide course guidance.
- c. Radar Separation — Radar spacing of aircraft in accordance with established minima.

(See ICAO term RADAR SERVICE.)

RADAR SERVICE [ICAO] — Term used to indicate a service provided directly by means of radar.

- a. Monitoring — The use of radar for the purpose of providing aircraft with information and advice relative to significant deviations from nominal flight path.
- b. Separation — The separation used when aircraft position information is derived from radar sources.

RADAR SERVICE TERMINATED — Used by ATC to inform a pilot that he/she will no longer be provided any of the services that could be received while in radar contact. Radar service is automatically terminated, and the pilot is not advised in the following cases:

PILOT/CONTROLLER GLOSSARY

R

- a. An aircraft cancels its IFR flight plan, except within Class B airspace, Class C airspace, a TRSA, or where Basic Radar service is provided.
- b. An aircraft conducting an instrument, visual, or contact approach has landed or has been instructed to change to advisory frequency.
- c. An arriving VFR aircraft, receiving radar service to a tower-controlled airport within Class B airspace, Class C airspace, a TRSA, or where sequencing service is provided, has landed; or to all other airports, is instructed to change to tower or advisory frequency.
- d. An aircraft completes a radar approach.

RADAR SURVEILLANCE — The radar observation of a given geographical area for the purpose of performing some radar function.

RADAR TRAFFIC ADVISORIES — Advisories issued to alert pilots to known or observed radar traffic which may affect the intended route of flight of their aircraft.

(See TRAFFIC ADVISORIES.)

RADAR TRAFFIC INFORMATION SERVICE — (See TRAFFIC ADVISORIES.)

RADAR VECTORING [ICAO] — Provision of navigational guidance to aircraft in the form of specific headings, based on the use of radar.

RADIAL — A magnetic bearing extending from a VOR/VORTAC/TACAN navigation facility.

RADIO —

- a. A device used for communication.
- b. Used to refer to a flight service station; e.g., “Seattle Radio” is used to call Seattle FSS.

RADIO ALTIMETER — Aircraft equipment which makes use of the reflection of radio waves from the ground to determine the height of the aircraft above the surface.

RADIO BEACON — (See NONDIRECTIONAL BEACON.)

RADIO DETECTION AND RANGING — (See RADAR.)

RADIO MAGNETIC INDICATOR — An aircraft navigational instrument coupled with a gyro compass or similar compass that indicates the direction of a selected NAVAID and indicates bearing with respect to the heading of the aircraft.

RAIS — (See REMOTE AIRPORT INFORMATION SERVICE.)

RAMP — (See APRON.)

RANDOM ALTITUDE — An altitude inappropriate for direction of flight and/or not in accordance with FAA Order JO 7110.65, Paragraph 4-5-1, VERTICAL SEPARATION MINIMA.

RANDOM ROUTE — Any route not established or charted/published or not otherwise available to all users.

RC — (See ROAD RECONNAISSANCE.)

RCAG — (See REMOTE COMMUNICATIONS AIR/GROUND FACILITY.)

PILOT/CONTROLLER GLOSSARY
R

RCC — (See RESCUE COORDINATION CENTER.)

RCO — (See REMOTE COMMUNICATIONS OUTLET.)

RCR — (See RUNWAY CONDITION READING.)

READ BACK — Repeat my message back to me.

RECEIVER AUTONOMOUS INTEGRITY MONITORING (RAIM) — A technique whereby a civil GNSS receiver/processor determines the integrity of the GNSS navigation signals without reference to sensors or non-DoD integrity systems other than the receiver itself. This determination is achieved by a consistency check among redundant pseudorange measurements.

RECEIVING CONTROLLER — A controller/facility receiving control of an aircraft from another controller/facility.

RECEIVING FACILITY — (See RECEIVING CONTROLLER.)

RECONFORMANCE — The automated process of bringing an aircraft's Current Plan Trajectory into conformance with its track.

REDUCE SPEED TO (SPEED) — (See SPEED ADJUSTMENT.)

REFINED HAZARD AREA (RHA) — Used by ATC. Airspace that is defined and distributed after a failure of a launch or reentry operation to provide a more concise depiction of the hazard location than a Contingency Hazard Area.

(See AIRCRAFT HAZARD AREA.)

(See CONTINGENCY HAZARD AREA.)

(See TRANSITIONAL HAZARD AREA.)

REDUCED VERTICAL SEPARATION MINIMUM (RVSM) AIRSPACE — RVSM airspace is defined as any airspace between FL290 and FL410 inclusive, where eligible aircraft are separated vertically by 1000 feet. Authorization guidance for operations in this airspace is provided in Advisory Circular AC 91–85.

REIL — (See RUNWAY END IDENTIFIER LIGHTS.)

RELEASE TIME — A departure time restriction issued to a pilot by ATC (either directly or through an authorized relay) when necessary to separate a departing aircraft from other traffic.

(See ICAO term RELEASE TIME.)

RELEASE TIME [ICAO] — Time prior to which an aircraft should be given further clearance or prior to which it should not proceed in case of radio failure.

REMOTE AIRPORT INFORMATION SERVICE (RAIS) — A temporary service provided by facilities, which are not located on the landing airport, but have communication capability and automated weather reporting available to the pilot at the landing airport.

REMOTE COMMUNICATIONS AIR/GROUND FACILITY — An unmanned VHF/UHF transmitter/receiver facility which is used to expand ARTCC air/ground communications coverage and to

PILOT/CONTROLLER GLOSSARY
R

facilitate direct contact between pilots and controllers. RCAG facilities are sometimes not equipped with emergency frequencies 121.5 MHz and 243.0 MHz.

(Refer to AIM.)

REMOTE COMMUNICATIONS OUTLET (RCO) — An unmanned communications facility remotely controlled by air traffic personnel. RCOs serve FSSs. Remote Transmitter/Receivers (RTR) serve terminal ATC facilities. An RCO or RTR may be UHF or VHF and will extend the communication range of the air traffic facility. There are several classes of RCOs and RTRs. The class is determined by the number of transmitters or receivers. Classes A through G are used primarily for air/ground purposes. RCO and RTR class O facilities are nonprotected outlets subject to undetected and prolonged outages. RCO (O's) and RTR (O's) were established for the express purpose of providing ground-to-ground communications between air traffic control specialists and pilots located at a satellite airport for delivering en route clearances, issuing departure authorizations, and acknowledging instrument flight rules cancellations or departure/landing times. As a secondary function, they may be used for advisory purposes whenever the aircraft is below the coverage of the primary air/ground frequency.

REMOTE PILOT IN COMMAND (RPIC) — The RPIC is directly responsible for and is the final authority as to the operation of the unmanned aircraft system.

REMOTE TRANSMITTER/RECEIVER (RTR) — (See REMOTE COMMUNICATIONS OUTLET.)

REPORT — Used to instruct pilots to advise ATC of specified information; e.g., "Report passing Hamilton VOR."

REPORTING POINT — A geographical location in relation to which the position of an aircraft is reported.

(See COMPULSORY REPORTING POINTS.)

(See ICAO term REPORTING POINT.)

(Refer to AIM.)

REPORTING POINT [ICAO] — A specified geographical location in relation to which the position of an aircraft can be reported.

REQUEST FULL ROUTE CLEARANCE — Used by pilots to request that the entire route of flight be read verbatim in an ATC clearance. Such request should be made to preclude receiving an ATC clearance based on the original filed flight plan when a filed IFR flight plan has been revised by the pilot, company, or operations prior to departure.

REQUIRED NAVIGATION PERFORMANCE (RNP) — A statement of the navigational performance necessary for operation within a defined airspace. The following terms are commonly associated with RNP:

- a. Required Navigation Performance Level or Type (RNP-X). A value, in nautical miles (NM), from the intended horizontal position within which an aircraft would be at least 95-percent of the total flying time.

PILOT/CONTROLLER GLOSSARY

R

- b. Advanced-Required Navigation Performance (A-RNP). A navigation specification based on RNP that requires advanced functions such as scalable RNP, radius-to-fix (RF) legs, and tactical parallel offsets. This sophisticated Navigation Specification (NavSpec) is designated by the abbreviation “A-RNP”.
- c. Required Navigation Performance (RNP) Airspace. A generic term designating airspace, route(s), leg(s), operation(s), or procedure(s) where minimum required navigational performance (RNP) have been established.
- d. Actual Navigation Performance (ANP). A measure of the current estimated navigational performance. Also referred to as Estimated Position Error (EPE).
- e. Estimated Position Error (EPE). A measure of the current estimated navigational performance. Also referred to as Actual Navigation Performance (ANP).
- f. Lateral Navigation (LNAV). A function of area navigation (RNAV) equipment which calculates, displays, and provides lateral guidance to a profile or path.
- g. Vertical Navigation (VNAV). A function of area navigation (RNAV) equipment which calculates, displays, and provides vertical guidance to a profile or path.

REROUTE IMPACT ASSESSMENT (RRIA) — A capability within the Traffic Flow Management System that is used to define and evaluate a potential reroute prior to implementation, with or without miles-in-trail (MIT) restrictions. RRIA functions estimate the impact on demand (e.g., sector loads) and performance (e.g., flight delay). Using RRIA, traffic management personnel can determine whether the reroute will sufficiently reduce demand in the Flow Constraint Area and not create excessive “spill over” demand in the adjacent airspace on a specific route segment or point of interest (POI).

RESCUE COORDINATION CENTER (RCC) — A search and rescue (SAR) facility equipped and manned to coordinate and control SAR operations in an area designated by the SAR plan. The U.S. Coast Guard and the U.S. Air Force have responsibility for the operation of RCCs.

(See ICAO term RESCUE CO-ORDINATION CENTRE.)

RESCUE CO-ORDINATION CENTRE [ICAO] — A unit responsible for promoting efficient organization of search and rescue service and for coordinating the conduct of search and rescue operations within a search and rescue region.

RESOLUTION ADVISORY — A display indication given to the pilot by the Traffic alert and Collision Avoidance System (TCAS II) recommending a maneuver to increase vertical separation relative to an intruding aircraft. Positive, negative, and vertical speed limit (VSL) advisories constitute the resolution advisories. A resolution advisory is also classified as corrective or preventive.

RESTRICTED AREA — (See SPECIAL USE AIRSPACE.)

(See ICAO term RESTRICTED AREA.)

RESTRICTED AREA [ICAO] — An airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is restricted in accordance with certain specified conditions.

PILOT/CONTROLLER GLOSSARY

R

RESUME NORMAL SPEED — Used by ATC to advise a pilot to resume an aircraft's normal operating speed. It is issued to terminate a speed adjustment where no published speed restrictions apply. It does not delete speed restrictions in published procedures of upcoming segments of flight. This does not relieve the pilot of those speed restrictions that are applicable to 14 CFR Section 91.117.

RESUME OWN NAVIGATION — Used by ATC to advise a pilot to resume his/her own navigational responsibility. It is issued after completion of a radar vector or when radar contact is lost while the aircraft is being radar vectored.

(See RADAR CONTACT LOST.)

(See RADAR SERVICE TERMINATED.)

RESUME PUBLISHED SPEED — Used by ATC to advise a pilot to resume published speed restrictions that are applicable to a SID, STAR, or other instrument procedure. It is issued to terminate a speed adjustment where speed restrictions are published on a charted procedure.

RHA — (See REFINED HAZARD AREA.)

RMI — (See RADIO MAGNETIC INDICATOR.)

RNAV — (See AREA NAVIGATION (RNAV).)

RNAV APPROACH — An instrument approach procedure which relies on aircraft area navigation equipment for navigational guidance.

(See AREA NAVIGATION (RNAV).)

(See INSTRUMENT APPROACH PROCEDURE.)

ROAD RECONNAISSANCE (RC) — Military activity requiring navigation along roads, railroads, and rivers. Reconnaissance route/route segments are seldom along a straight line and normally require a lateral route width of 10 NM to 30 NM and an altitude range of 500 feet to 10,000 feet AGL.

ROGER — I have received all of your last transmission. It should not be used to answer a question requiring a yes or a no answer.

(See AFFIRMATIVE.)

(See NEGATIVE.)

ROLLOUT RVR — (See VISIBILITY.)

ROTOR WASH — A phenomenon resulting from the vertical down wash of air generated by the main rotor(s) of a helicopter.

ROUND-ROBIN FLIGHT PLAN — A single flight plan filed from the departure airport to an intermediary destination(s) and then returning to the original departure airport.

ROUTE — A defined path, consisting of one or more courses in a horizontal plane, which aircraft traverse over the surface of the earth.

(See AIRWAY.)

PILOT/CONTROLLER GLOSSARY
R

(See JET ROUTE.)

(See PUBLISHED ROUTE.)

(See UNPUBLISHED ROUTE.)

ROUTE ACTION NOTIFICATION — EDST notification that a PAR/PDR/PDAR has been applied to the flight plan.

(See ATC PREFERRED ROUTE NOTIFICATION.)

(See EN ROUTE DECISION SUPPORT TOOL.)

ROUTE AMENDMENT DIALOG (RAD) — A capability within the Traffic Flow Management System that allows traffic management personnel to submit or edit a route amendment for one or more flights.

ROUTE SEGMENT — As used in Air Traffic Control, a part of a route that can be defined by two navigational fixes, two NAVAIDs, or a fix and a NAVAID.

(See FIX.)

(See ROUTE.)

(See ICAO term ROUTE SEGMENT.)

ROUTE SEGMENT [ICAO] — A portion of a route to be flown, as defined by two consecutive significant points specified in a flight plan.

RPIC — (See REMOTE PILOT IN COMMAND.)

RRIA — (See REROUTE IMPACT ASSESSMENT.)

RSA — (See RUNWAY SAFETY AREA.)

RTR — (See REMOTE TRANSMITTER/RECEIVER.)

RUNWAY — A defined rectangular area on a land airport prepared for the landing and takeoff run of aircraft along its length. Runways are normally numbered in relation to their magnetic direction rounded off to the nearest 10 degrees; e.g., Runway 1, Runway 25.

(See PARALLEL RUNWAYS.)

(See ICAO term RUNWAY.)

RUNWAY [ICAO] — A defined rectangular area on a land aerodrome prepared for the landing and takeoff of aircraft.

RUNWAY CENTERLINE LIGHTING — (See AIRPORT LIGHTING.)

RUNWAY CONDITION CODES (RwyCC) — Numerical readings, provided by airport operators, that indicate runway surface contamination (for example, slush, ice, rain, etc.). These values range from “1” (poor) to “6” (dry) and must be included on the ATIS when the reportable condition is less than 6 in any one or more of the three runway zones (touchdown, midpoint, rollout).

PILOT/CONTROLLER GLOSSARY

R

RUNWAY CONDITION READING — Numerical decelerometer readings relayed by air traffic controllers at USAF and certain civil bases for use by the pilot in determining runway braking action. These readings are routinely relayed only to USAF and Air National Guard Aircraft.

(See BRAKING ACTION.)

RUNWAY CONDITION REPORT (RwyCR) — A data collection worksheet used by airport operators that correlates the runway percentage of coverage along with the depth and type of contaminant for the purpose of creating a FICON NOTAM.

(See RUNWAY CONDITION CODES.)

RUNWAY END IDENTIFIER LIGHTS (REIL) — (See AIRPORT LIGHTING.)

RUNWAY ENTRANCE LIGHTS (REL) — An array of red lights which include the first light at the hold line followed by a series of evenly spaced lights to the runway edge aligned with the taxiway centerline, and one additional light at the runway centerline in line with the last two lights before the runway edge.

RUNWAY GRADIENT — The average slope, measured in percent, between two ends or points on a runway. Runway gradient is depicted on Government aerodrome sketches when total runway gradient exceeds 0.3%.

RUNWAY HEADING — The magnetic direction that corresponds with the runway centerline extended, not the painted runway number. When cleared to “fly or maintain runway heading,” pilots are expected to fly or maintain the heading that corresponds with the extended centerline of the departure runway. Drift correction shall not be applied; e.g., Runway 4, actual magnetic heading of the runway centerline 044, fly 044.

RUNWAY IN USE/ACTIVE RUNWAY/DUTY RUNWAY — Any runway or runways currently being used for takeoff or landing. When multiple runways are used, they are all considered active runways. In the metering sense, a selectable adapted item which specifies the landing runway configuration or direction of traffic flow. The adapted optimum flight plan from each transition fix to the vertex is determined by the runway configuration for arrival metering processing purposes.

RUNWAY LIGHTS — (See AIRPORT LIGHTING.)

RUNWAY MARKINGS — (See AIRPORT MARKING AIDS.)

RUNWAY OVERRUN — In military aviation exclusively, a stabilized or paved area beyond the end of a runway, of the same width as the runway plus shoulders, centered on the extended runway centerline.

RUNWAY PROFILE DESCENT — An instrument flight rules (IFR) air traffic control arrival procedure to a runway published for pilot use in graphic and/or textual form and may be associated with a STAR. Runway Profile Descents provide routing and may depict crossing altitudes, speed restrictions, and headings to be flown from the en route structure to the point where the pilot will receive clearance for and execute an instrument approach procedure. A Runway Profile Descent may apply to more than one runway if so stated on the chart.

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY
R

RUNWAY SAFETY AREA — A defined surface surrounding the runway prepared, or suitable, for reducing the risk of damage to airplanes in the event of an undershoot, overshoot, or excursion from the runway. The dimensions of the RSA vary and can be determined by using the criteria contained within AC 150/5300-13, Airport Design, Chapter 3. Figure 3-1 in AC 150/5300-13 depicts the RSA. The design standards dictate that the RSA shall be:

- a. Cleared, graded, and have no potentially hazardous ruts, humps, depressions, or other surface variations;
- b. Drained by grading or storm sewers to prevent water accumulation;
- c. Capable, under dry conditions, of supporting snow removal equipment, aircraft rescue and firefighting equipment, and the occasional passage of aircraft without causing structural damage to the aircraft; and,
- d. Free of objects, except for objects that need to be located in the runway safety area because of their function. These objects shall be constructed on low impact resistant supports (frangible mounted structures) to the lowest practical height with the frangible point no higher than 3 inches above grade.

(Refer to AC 150/5300-13, Airport Design, Chapter 3.)

RUNWAY STATUS LIGHTS (RWSL) SYSTEM — The RWSL is a system of runway and taxiway lighting to provide pilots increased situational awareness by illuminating runway entry lights (REL) when the runway is unsafe for entry or crossing, and take-off hold lights (THL) when the runway is unsafe for departure.

RUNWAY TRANSITION — (See SEGMENTS OF A SID/STAR.)

RUNWAY TRANSITION WAYPOINT — (See SEGMENTS OF A SID/STAR.)

RUNWAY USE PROGRAM — A noise abatement runway selection plan designed to enhance noise abatement efforts with regard to airport communities for arriving and departing aircraft. These plans are developed into runway use programs and apply to all turbojet aircraft 12,500 pounds or heavier; turbojet aircraft less than 12,500 pounds are included only if the airport proprietor determines that the aircraft creates a noise problem. Runway use programs are coordinated with FAA offices, and safety criteria used in these programs are developed by the Office of Flight Operations. Runway use programs are administered by the Air Traffic Service as “Formal” or “Informal” programs.

- a. Formal Runway Use Program — An approved noise abatement program which is defined and acknowledged in a Letter of Understanding between Flight Operations, Air Traffic Service, the airport proprietor, and the users. Once established, participation in the program is mandatory for aircraft operators and pilots as provided for in 14 CFR Section 91.129.
- b. Informal Runway Use Program — An approved noise abatement program which does not require a Letter of Understanding, and participation in the program is voluntary for aircraft operators/pilots.

RUNWAY VISUAL RANGE (RVR) — (See VISIBILITY.)

RwyCC — (See RUNWAY CONDITION CODES.)

**PILOT/CONTROLLER GLOSSARY
R**

RwyCR — (See RUNWAY CONDITION REPORT.)

PILOT/CONTROLLER GLOSSARY

S

SAA — (See SPECIAL ACTIVITY AIRSPACE.)

SAFETY ALERT — A safety alert issued by ATC to aircraft under their control if ATC is aware the aircraft is at an altitude which, in the controller's judgment, places the aircraft in unsafe proximity to terrain, obstructions, or other aircraft. The controller may discontinue the issuance of further alerts if the pilot advises he/she is taking action to correct the situation or has the other aircraft in sight.

- a. **Terrain/Obstruction Alert** — A safety alert issued by ATC to aircraft under their control if ATC is aware the aircraft is at an altitude which, in the controller's judgment, places the aircraft in unsafe proximity to terrain/obstructions; e.g., "Low Altitude Alert, check your altitude immediately."
- b. **Aircraft Conflict Alert** — A safety alert issued by ATC to aircraft under their control if ATC is aware of an aircraft that is not under their control at an altitude which, in the controller's judgment, places both aircraft in unsafe proximity to each other. With the alert, ATC will offer the pilot an alternate course of action when feasible; e.g., "Traffic Alert, advise you turn right heading zero niner zero or climb to eight thousand immediately."

NOTE: *The issuance of a safety alert is contingent upon the capability of the controller to have an awareness of an unsafe condition. The course of action provided will be predicated on other traffic under ATC control. Once the alert is issued, it is solely the pilot's prerogative to determine what course of action, if any, he/she will take.*

SAFETY LOGIC SYSTEM — A software enhancement to ASDE-3, ASDE-X, and ASSC, that predicts the path of aircraft landing and/or departing, and/or vehicular movements on runways. Visual and aural alarms are activated when the safety logic projects a potential collision. The Airport Movement Area Safety System (AMASS) is a safety logic system enhancement to the ASDE-3. The Safety Logic System for ASDE-X and ASSC is an integral part of the software program.

SAFETY LOGIC SYSTEM ALERTS —

- a. **ALERT** — An actual situation involving two real safety logic tracks (aircraft/aircraft, aircraft/vehicle, or aircraft/other tangible object) that safety logic has predicted will result in an imminent collision, based upon the current set of Safety Logic parameters.
- b. **FALSE ALERT** —
 1. Alerts generated by one or more false surface-radar targets that the system has interpreted as real tracks and placed into safety logic.
 2. Alerts in which the safety logic software did not perform correctly, based upon the design specifications and the current set of Safety Logic parameters.
 3. The alert is generated by surface radar targets caused by moderate or greater precipitation.
- c. **NUISANCE ALERT** — An alert in which one or more of the following is true:
 1. The alert is generated by a known situation that is not considered an unsafe operation, such as LAHSO or other approved operations.

PILOT/CONTROLLER GLOSSARY
S

2. The alert is generated by inaccurate secondary radar data received by the Safety Logic System.
3. One or more of the aircraft involved in the alert is not intending to use a runway (for example, helicopter, pipeline patrol, non-Mode C overflight, etc.).
- d. **VALID NON-ALERT** — A situation in which the safety logic software correctly determines that an alert is not required, based upon the design specifications and the current set of Safety Logic parameters.
- e. **INVALID NON-ALERT** — A situation in which the safety logic software did not issue an alert when an alert was required, based upon the design specifications.

SAIL BACK — A maneuver during high wind conditions (usually with power off) where float plane movement is controlled by water rudders/opening and closing cabin doors.

SAME DIRECTION AIRCRAFT — Aircraft are operating in the same direction when:

- a. They are following the same track in the same direction; or
- b. Their tracks are parallel and the aircraft are flying in the same direction; or
- c. Their tracks intersect at an angle of less than 45 degrees.

SAR — (See SEARCH AND RESCUE.)

SATELLITE-BASED AUGMENTATION SYSTEM (SBAS) — A wide coverage augmentation system in which the user receives augmentation information from a satellite-based transmitter.

(See WIDE-AREA AUGMENTATION SYSTEM (WAAS).)

SAW — (See AVIATION WATCH NOTIFICATION MESSAGE.)

SAY AGAIN — Used to request a repeat of the last transmission. Usually specifies transmission or portion thereof not understood or received; e.g., "Say again all after ABRAM VOR."

SAY ALTITUDE — Used by ATC to ascertain an aircraft's specific altitude/flight level. When the aircraft is climbing or descending, the pilot should state the indicated altitude rounded to the nearest 100 feet.

SAY HEADING — Used by ATC to request an aircraft heading. The pilot should state the actual heading of the aircraft.

SCHEDULED TIME OF ARRIVAL (STA) — A STA is the desired time that an aircraft should cross a certain point (landing or metering fix). It takes other traffic and airspace configuration into account. A STA time shows the results of the TBFM scheduler that has calculated an arrival time according to parameters such as optimized spacing, aircraft performance, and weather.

SDF — (See SIMPLIFIED DIRECTIONAL FACILITY.)

SEA LANE — A designated portion of water outlined by visual surface markers for and intended to be used by aircraft designed to operate on water.

SEARCH AND RESCUE — A service which seeks missing aircraft and assists those found to be in need of assistance. It is a cooperative effort using the facilities and services of available Fed-

PILOT/CONTROLLER GLOSSARY

S

eral, state and local agencies. The U.S. Coast Guard is responsible for coordination of search and rescue for the Maritime Region, and the U.S. Air Force is responsible for search and rescue for the Inland Region. Information pertinent to search and rescue should be passed through any air traffic facility or be transmitted directly to the Rescue Coordination Center by telephone.

(See FLIGHT SERVICE STATION.)

(See RESCUE COORDINATION CENTER.)

(Refer to AIM.)

SEARCH AND RESCUE FACILITY — A facility responsible for maintaining and operating a search and rescue (SAR) service to render aid to persons and property in distress. It is any SAR unit, station, NET, or other operational activity which can be usefully employed during an SAR Mission; e.g., a Civil Air Patrol Wing, or a Coast Guard Station.

(See SEARCH AND RESCUE.)

SECNOT — (See SECURITY NOTICE.)

SECONDARY RADAR TARGET — A target derived from a transponder return presented on a radar display.

SECTIONAL AERONAUTICAL CHARTS — (See AERONAUTICAL CHART.)

SECTOR LIST DROP INTERVAL — A parameter number of minutes after the meter fix time when arrival aircraft will be deleted from the arrival sector list.

SECURITY NOTICE (SECNOT) — A SECNOT is a request originated by the Air Traffic Security Coordinator (ATSC) for an extensive communications search for aircraft involved, or suspected of being involved, in a security violation, or are considered a security risk. A SECNOT will include the aircraft identification, search area, and expiration time. The search area, as defined by the ATSC, could be a single airport, multiple airports, a radius of an airport or fix, or a route of flight. Once the expiration time has been reached, the SECNOT is considered to be canceled.

SECURITY SERVICES AIRSPACE — Areas established through the regulatory process or by NOTAM, issued by the Administrator under title 14, CFR, sections 99.7, 91.141, and 91.139, which specify that ATC security services are required; i.e., ADIZ or temporary flight rules areas.

SEE AND AVOID — When weather conditions permit, pilots operating IFR or VFR are required to observe and maneuver to avoid other aircraft. Right-of-way rules are contained in 14 CFR Part 91.

SEGMENTED CIRCLE — A system of visual indicators designed to provide traffic pattern information at airports without operating control towers.

(Refer to AIM.)

SEGMENTS OF A SID/STAR —

- a. En Route Transition — The segment(s) of a SID/STAR that connect to/from en route flight. Not all SIDs/STARs will contain an en route transition.

PILOT/CONTROLLER GLOSSARY

S

- b. En Route Transition Waypoint — The NAVAID/ fix/waypoint that defines the beginning of the SID/STAR en route transition.
- c. Common Route — The segment(s) of a SID/ STAR procedure that provides a single route serving an airport/runway or multiple airports/runways. The common route may consist of a single point. Not all conventional SIDs will contain a common route.
- d. Runway Transition — The segment(s) of a SID/STAR between the common route/point and the runway(s). Not all SIDs/STARs will contain a runway transition.
- e. Runway Transition Waypoint (RTW) — On a STAR, the NAVAID/fix/waypoint that defines the end of the common route or en route transition and the beginning of a runway transition (In the arrival route description found on the STAR chart, the last fix of the common route and the first fix of the runway transition(s)).

SEGMENTS OF AN INSTRUMENT APPROACH PROCEDURE — An instrument approach procedure may have as many as four separate segments depending on how the approach procedure is structured.

- a. Initial Approach — The segment between the initial approach fix and the intermediate fix or the point where the aircraft is established on the intermediate course or final approach course.

(See ICAO term INITIAL APPROACH SEGMENT.)

- b. Intermediate Approach — The segment between the intermediate fix or point and the final approach fix.

(See ICAO term INTERMEDIATE APPROACH SEGMENT.)

- c. Final Approach — The segment between the final approach fix or point and the runway, airport, or missed approach point.

(See ICAO term FINAL APPROACH SEGMENT.)

- d. Missed Approach — The segment between the missed approach point or the point of arrival at decision height and the missed approach fix at the prescribed altitude.

(Refer to 14 CFR Part 97.)

(See ICAO term MISSED APPROACH PROCEDURE.)

SELF-BRIEFING — A self-briefing is a review, using automated tools, of all meteorological and aeronautical information that may influence the pilot in planning, altering, or canceling a proposed route of flight.

SEPARATION — In air traffic control, the spacing of aircraft to achieve their safe and orderly movement in flight and while landing and taking off.

(See SEPARATION MINIMA.)

(See ICAO term SEPARATION.)

SEPARATION [ICAO] — Spacing between aircraft, levels or tracks.

PILOT/CONTROLLER GLOSSARY

S

SEPARATION MINIMA — The minimum longitudinal, lateral, or vertical distances by which aircraft are spaced through the application of air traffic control procedures.

(See SEPARATION.)

SERVICE — A generic term that designates functions or assistance available from or rendered by air traffic control. For example, Class C service would denote the ATC services provided within a Class C airspace area.

SEVERE WEATHER AVOIDANCE PLAN (SWAP) — An approved plan to minimize the affect of severe weather on traffic flows in impacted terminal and/or ARTCC areas. A SWAP is normally implemented to provide the least disruption to the ATC system when flight through portions of airspace is difficult or impossible due to severe weather.

SEVERE WEATHER FORECAST ALERTS — Preliminary messages issued in order to alert users that a Severe Weather Watch Bulletin (WW) is being issued. These messages define areas of possible severe thunderstorms or tornado activity. The messages are unscheduled and issued as required by the National Severe Storm Forecast Center at Norman, Oklahoma.

(See AIRMET.)

(See CONVECTIVE SIGMET.)

(See CWA.)

(See SIGMET.)

SFA — (See SINGLE FREQUENCY APPROACH.)

SFO — (See SIMULATED FLAMEOUT.)

SHF — (See SUPER HIGH FREQUENCY.)

SHORT RANGE CLEARANCE — A clearance issued to a departing IFR flight which authorizes IFR flight to a specific fix short of the destination while air traffic control facilities are coordinating and obtaining the complete clearance.

SHORT TAKEOFF AND LANDING AIRCRAFT (STOL) — An aircraft which, at some weight within its approved operating weight, is capable of operating from a runway in compliance with the applicable STOL characteristics, airworthiness, operations, noise, and pollution standards.

(See VERTICAL TAKEOFF AND LANDING AIRCRAFT.)

SIAP — (See STANDARD INSTRUMENT APPROACH PROCEDURE.)

SID — (See STANDARD INSTRUMENT DEPARTURE.)

SIDESTEP MANEUVER — A visual maneuver accomplished by a pilot at the completion of an instrument approach to permit a straight-in landing on a parallel runway not more than 1,200 feet to either side of the runway to which the instrument approach was conducted.

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY

S

SIGMET — A weather advisory issued concerning weather significant to the safety of all aircraft. SIGMET advisories cover severe and extreme turbulence, severe icing, and widespread dust or sandstorms that reduce visibility to less than 3 miles.

(See AIRMET.)

(See AWW.)

(See CONVECTIVE SIGMET.)

(See CWA.)

(See ICAO term SIGMET INFORMATION.)

(See SAW.)

(Refer to AIM.)

SIGMET INFORMATION [ICAO] — Information issued by a meteorological watch office concerning the occurrence or expected occurrence of specified en-route weather phenomena which may affect the safety of aircraft operations.

SIGNIFICANT METEOROLOGICAL INFORMATION — (See SIGMET.)

SIGNIFICANT POINT — A point, whether a named intersection, a NAVAID, a fix derived from a NAVAID(s), or geographical coordinate expressed in degrees of latitude and longitude, which is established for the purpose of providing separation, as a reporting point, or to delineate a route of flight.

SIMPLIFIED DIRECTIONAL FACILITY (SDF) — A NAVAID used for nonprecision instrument approaches. The final approach course is similar to that of an ILS localizer except that the SDF course may be offset from the runway, generally not more than 3 degrees, and the course may be wider than the localizer, resulting in a lower degree of accuracy.

(Refer to AIM.)

SIMULATED FLAMEOUT — A practice approach by a jet aircraft (normally military) at idle thrust to a runway. The approach may start at a runway (high key) and may continue on a relatively high and wide downwind leg with a continuous turn to final. It terminates in landing or low approach. The purpose of this approach is to simulate a flameout.

(See FLAMEOUT.)

SIMULTANEOUS CLOSE PARALLEL APPROACHES — A simultaneous, independent approach operation permitting ILS/RNAV/GLS approaches to airports having parallel runways separated by at least 3,000 feet and less than 4,300-feet between centerlines. Aircraft are permitted to pass each other during these simultaneous operations. Integral parts of a total system are radar, NTZ monitoring with enhanced FMA color displays that include aural and visual alerts and predictive aircraft position software, communications override, ATC procedures, an Attention All Users Page (AAUP), PRM in the approach name, and appropriate ground based and airborne equipment. High update rate surveillance sensor required for certain runway or approach course separations.

PILOT/CONTROLLER GLOSSARY

S

SIMULTANEOUS (CONVERGING) DEPENDENT APPROACHES — An approach operation permitting ILS/RNAV/GLS approaches to runways or missed approach courses that intersect where required minimum spacing between the aircraft on each final approach course is required.

SIMULTANEOUS (CONVERGING) INDEPENDENT APPROACHES — An approach operation permitting ILS/RNAV/GLS approaches to non-parallel runways where approach procedure design maintains the required aircraft spacing throughout the approach and missed approach and hence the operations may be conducted independently.

SIMULTANEOUS ILS APPROACHES — An approach system permitting simultaneous ILS approaches to airports having parallel runways separated by at least 4,300 feet between centerlines. Integral parts of a total system are ILS, radar, communications, ATC procedures, and appropriate airborne equipment.

(See PARALLEL RUNWAYS.)

(Refer to AIM.)

SIMULTANEOUS OFFSET INSTRUMENT APPROACH (SOIA) — An instrument landing system comprised of an ILS PRM, RNAV PRM or GLS PRM approach to one runway and an offset LDA PRM with glideslope or an RNAV PRM or GLS PRM approach utilizing vertical guidance to another where parallel runway spaced less than 3,000 feet and at least 750 feet apart. The approach courses converge by 2.5 to 3 degrees. Simultaneous close parallel PRM approach procedures apply up to the point where the approach course separation becomes 3,000 feet, at the offset MAP. From the offset MAP to the runway threshold, visual separation by the aircraft conducting the offset approach is utilized.

(Refer to AIM)

SIMULTANEOUS (PARALLEL) DEPENDENT APPROACHES — An approach operation permitting ILS/RNAV/GLS approaches to adjacent parallel runways where prescribed diagonal spacing must be maintained. Aircraft are not permitted to pass each other during simultaneous dependent operations. Integral parts of a total system ATC procedures, and appropriate airborne and ground based equipment.

SINGLE DIRECTION ROUTES — Preferred IFR Routes which are sometimes depicted on high altitude en route charts and which are normally flown in one direction only.

(See PREFERRED IFR ROUTES.)

(Refer to CHART SUPPLEMENT U.S.)

SINGLE FREQUENCY APPROACH — A service provided under a letter of agreement to military single-piloted turbojet aircraft which permits use of a single UHF frequency during approach for landing. Pilots will not normally be required to change frequency from the beginning of the approach to touchdown except that pilots conducting an en route descent are required to change frequency when control is transferred from the air route traffic control center to the terminal facility. The abbreviation "SFA" in the DOD FLIP IFR Supplement under "Communications" indicates this service is available at an aerodrome.

PILOT/CONTROLLER GLOSSARY

S

SINGLE-PILOTED AIRCRAFT — A military turbojet aircraft possessing one set of flight controls, tandem cockpits, or two sets of flight controls but operated by one pilot is considered single-piloted by ATC when determining the appropriate air traffic service to be applied.

(See SINGLE FREQUENCY APPROACH.)

SKYSPOTTER — A pilot who has received specialized training in observing and reporting inflight weather phenomena.

SLASH — A radar beacon reply displayed as an elongated target.

SLDI — (See SECTOR LIST DROP INTERVAL.)

SLOW TAXI — To taxi a float plane at low power or low RPM.

SMALL UNMANNED AIRCRAFT SYSTEM (sUAS) — An unmanned aircraft weighing less than 55 pounds on takeoff, including everything that is on board or otherwise attached to the aircraft.

SN — (See SYSTEM STRATEGIC NAVIGATION.)

SPACE-BASED ADS-B (SBA) — A constellation of satellites that receives ADS-B Out broadcasts and relays that information to the appropriate surveillance facility. The currently deployed SBA system is only capable of receiving broadcasts from 1090ES-equipped aircraft, and not from those equipped with only a universal access transceiver (UAT). Also, aircraft with a top-of-fuselage-mounted transponder antenna (required for TCAS II installations) will be better received by SBA, especially at latitudes below 45 degrees.

(See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST.)

(See AUTOMATIC DEPENDENT SURVEILLANCE-BROADCAST OUT.)

SPACE LAUNCH AND REENTRY AREA — Locations where commercial space launch and/or reentry operations occur. For pilot awareness, a rocket-shaped symbol is used to depict space launch and reentry areas on sectional aeronautical charts.

SPEAK SLOWER — Used in verbal communications as a request to reduce speech rate.

SPECIAL ACTIVITY AIRSPACE (SAA) — Any airspace with defined dimensions within the National Airspace System wherein limitations may be imposed upon aircraft operations. This airspace may be restricted areas, prohibited areas, military operations areas, air ATC assigned airspace, and any other designated airspace areas. The dimensions of this airspace are programmed into EDST and can be designated as either active or inactive by screen entry. Aircraft trajectories are constantly tested against the dimensions of active areas and alerts issued to the applicable sectors when violations are predicted.

(See EN ROUTE DECISION SUPPORT TOOL.)

SPECIAL AIR TRAFFIC RULES (SATR) — Rules that govern procedures for conducting flights in certain areas listed in 14 CFR Part 93. The term "SATR" is used in the United States to describe the rules for operations in specific areas designated in the Code of Federal Regulations.

(Refer to 14 CFR Part 93.)

PILOT/CONTROLLER GLOSSARY

S

SPECIAL EMERGENCY — A condition of air piracy or other hostile act by a person(s) aboard an aircraft which threatens the safety of the aircraft or its passengers.

SPECIAL FLIGHT RULES AREA (SFRA) — An area in the NAS, described in 14 CFR Part 93, wherein the flight of aircraft is subject to special traffic rules, unless otherwise authorized by air traffic control. Not all areas listed in 14 CFR Part 93 are designated SFRA, but special air traffic rules apply to all areas described in 14 CFR Part 93.

SPECIAL INSTRUMENT APPROACH PROCEDURE — (See INSTRUMENT APPROACH PROCEDURE.)

SPECIAL USE AIRSPACE — Airspace of defined dimensions identified by an area on the surface of the earth wherein activities must be confined because of their nature and/or wherein limitations may be imposed upon aircraft operations that are not a part of those activities. Types of special use airspace are:

- a. **Alert Area** — Airspace which may contain a high volume of pilot training activities or an unusual type of aerial activity, neither of which is hazardous to aircraft. Alert Areas are depicted on aeronautical charts for the information of nonparticipating pilots. All activities within an Alert Area are conducted in accordance with Federal Aviation Regulations, and pilots of participating aircraft as well as pilots transiting the area are equally responsible for collision avoidance.
- b. **Controlled Firing Area** — Airspace wherein activities are conducted under conditions so controlled as to eliminate hazards to nonparticipating aircraft and to ensure the safety of persons and property on the ground.
- c. **Military Operations Area (MOA)** — Permanent and temporary MOAs are airspace established outside of Class A airspace area to separate or segregate certain nonhazardous military activities from IFR traffic and to identify for VFR traffic where these activities are conducted. Permanent MOAs are depicted on Sectional Aeronautical, VFR Terminal Area, and applicable En Route Low Altitude Charts.

NOTE: *Temporary MOAs are not charted.*

(Refer to AIM.)

- d. **National Security Area (NSA)** — Airspace of defined vertical and lateral dimensions established at locations where there is a requirement for increased security of ground facilities. Pilots are requested to voluntarily avoid flying through the depicted NSA. When a greater level of security is required, flight through an NSA may be temporarily prohibited by establishing a TFR under the provisions of 14 CFR Section 99.7. Such prohibitions will be issued by FAA Headquarters and disseminated via the U.S. NOTAM System.

(Refer to AIM)

- e. **Prohibited Area** — Airspace designated under 14 CFR Part 73 within which no person may operate an aircraft without the permission of the using agency.

(Refer to AIM.)

(Refer to En Route Charts.)

PILOT/CONTROLLER GLOSSARY

S

- f. **Restricted Area** — Permanent and temporary restricted areas are airspace designated under 14 CFR Part 73, within which the flight of aircraft, while not wholly prohibited, is subject to restriction. Most restricted areas are designated joint use and IFR/VFR operations in the area may be authorized by the controlling ATC facility when it is not being utilized by the using agency. Permanent restricted areas are depicted on Sectional Aeronautical, VFR Terminal Area, and applicable En Route charts. Where joint use is authorized, the name of the ATC controlling facility is also shown.

NOTE: *Temporary restricted areas are not charted.*

(Refer to 14 CFR Part 73.)

(Refer to AIM.)

- g. **Warning Area** — A warning area is airspace of defined dimensions extending from 3 nautical miles outward from the coast of the United States, that contains activity that may be hazardous to nonparticipating aircraft. The purpose of such warning area is to warn nonparticipating pilots of the potential danger. A warning area may be located over domestic or international waters or both.

SPECIAL VFR CONDITIONS — Meteorological conditions that are less than those required for basic VFR flight in Class B, C, D, or E surface areas and in which some aircraft are permitted flight under visual flight rules.

(See SPECIAL VFR OPERATIONS.)

(Refer to 14 CFR Part 91.)

SPECIAL VFR FLIGHT [ICAO] — A VFR flight cleared by air traffic control to operate within Class B, C, D, and E surface areas in meteorological conditions below VMC.

SPECIAL VFR OPERATIONS — Aircraft operating in accordance with clearances within Class B, C, D, and E surface areas in weather conditions less than the basic VFR weather minima. Such operations must be requested by the pilot and approved by ATC.

(See SPECIAL VFR CONDITIONS.)

(See ICAO term SPECIAL VFR FLIGHT.)

SPEED — (See AIRSPEED.)

(See GROUND SPEED.)

SPEED ADJUSTMENT — An ATC procedure used to request pilots to adjust aircraft speed to a specific value for the purpose of providing desired spacing. Pilots are expected to maintain a speed of plus or minus 10 knots or 0.02 Mach number of the specified speed. Examples of speed adjustments are:

- a. "Increase/reduce speed to Mach point (number)."
- b. "Increase/reduce speed to (speed in knots)" or "Increase/reduce speed (number of knots) knots."

PILOT/CONTROLLER GLOSSARY

S

SPEED BRAKES — Moveable aerodynamic devices on aircraft that reduce airspeed during descent and landing.

SPEED SEGMENTS — Portions of the arrival route between the transition point and the vertex along the optimum flight path for which speeds and altitudes are specified. There is one set of arrival speed segments adapted from each transition point to each vertex. Each set may contain up to six segments.

SPOOFING — Denotes emissions of GNSS-like signals that may be acquired and tracked in combination with or instead of the intended signals by civil receivers. The onset of spoofing effects can be instantaneous or delayed, and effects can persist after the spoofing has ended. Spoofing can result in false and potentially confusing, or hazardingly misleading, position, navigation, and/or date/time information in addition to loss of GNSS use.

SPEED ADVISORY — Speed advisories that are generated within Time-Based Flow Management to assist controllers to meet the Scheduled Time of Arrival (STA) at the meter fix/meter arc. See also Ground-Based Interval Management-Spacing (GIM-S) Speed Advisory.

SQUAWK (Mode, Code, Function) — Used by ATC to instruct a pilot to activate the aircraft transponder and ADS-B Out with altitude reporting enabled, or (military) to activate only specific modes, codes, or functions. Examples: "Squawk five seven zero seven;" "Squawk three/alpha, two one zero five."

(See TRANSPONDER.)

STA — (See SCHEDULED TIME OF ARRIVAL.)

STAGING/QUEUING — The placement, integration, and segregation of departure aircraft in designated movement areas of an airport by departure fix, EDCT, and/or restriction.

STAND BY — Means the controller or pilot must pause for a few seconds, usually to attend to other duties of a higher priority. Also means to wait as in "stand by for clearance." The caller should reestablish contact if a delay is lengthy. "Stand by" is not an approval or denial.

STANDARD INSTRUMENT APPROACH PROCEDURE (SIAP) — (See INSTRUMENT APPROACH PROCEDURE.)

STANDARD INSTRUMENT DEPARTURE (SID) — A preplanned instrument flight rule (IFR) air traffic control (ATC) departure procedure printed for pilot/controller use in graphic form to provide obstacle clearance and a transition from the terminal area to the appropriate en route structure. SIDs are primarily designed for system enhancement to expedite traffic flow and to reduce pilot/controller workload. ATC clearance must always be received prior to flying a SID.

(See IFR TAKEOFF MINIMUMS AND DEPARTURE PROCEDURES.)

(See OBSTACLE DEPARTURE PROCEDURE.)

(Refer to AIM.)

STANDARD RATE TURN — A turn of three degrees per second.

STANDARD TERMINAL ARRIVAL (STAR) — A preplanned instrument flight rule (IFR) air traffic control arrival procedure published for pilot use in graphic and/or textual form. STARs provide

PILOT/CONTROLLER GLOSSARY

S

transition from the en route structure to an outer fix or an instrument approach fix/arrival waypoint in the terminal area.

STANDARD TERMINAL ARRIVAL CHARTS — (See AERONAUTICAL CHART.)

STANDARD TERMINAL AUTOMATION REPLACEMENT SYSTEM (STARS) — (See DTAS.)

STAR — (See STANDARD TERMINAL ARRIVAL.)

STATE AIRCRAFT — Aircraft used in military, customs and police service, in the exclusive service of any government or of any political subdivision thereof, including the government of any state, territory, or possession of the United States or the District of Columbia, but not including any government-owned aircraft engaged in carrying persons or property for commercial purposes.

STATIC RESTRICTIONS — Those restrictions that are usually not subject to change, fixed, in place, and/or published.

STATIONARY AIRSPACE RESERVATION — The term used in oceanic ATC for airspace that encompasses activities in a fixed volume of airspace to be occupied for a specified time period. Stationary Airspace Reservations may include activities such as special tests of weapons systems or equipment; certain U.S. Navy carrier, fleet, and anti-submarine operations; rocket, missile, and drone operations; and certain aerial refueling or similar operations.

(See STATIONARY ALTITUDE RESERVATION.)

STATIONARY ALTITUDE RESERVATION (STATIONARY ALTRV) — An altitude reservation which encompasses activities in a fixed volume of airspace to be occupied for a specified time period. Stationary ALTRVs may include activities such as special tests of weapons systems or equipment; certain U.S. Navy carrier, fleet, and anti-submarine operations; rocket, missile, and drone operations; and certain aerial refueling or similar operations.

STEP TAXI — To taxi a float plane at full power or high RPM.

STEP TURN — A maneuver used to put a float plane in a planing configuration prior to entering an active sea lane for takeoff. The STEP TURN maneuver should only be used upon pilot request.

STEPDOWN FIX — A fix permitting additional descent within a segment of an instrument approach procedure by identifying a point at which a controlling obstacle has been safely overflown.

STEREO ROUTE — A routinely used route of flight established by users and ARTCCs identified by a coded name; e.g., ALPHA 2. These routes minimize flight plan handling and communication.

STNR ALT RESERVATION — An abbreviation for Stationary Altitude Reservation commonly used in NOTAMs.

(See STATIONARY ALTITUDE RESERVATION.)

STOL AIRCRAFT — (See SHORT TAKEOFF AND LANDING AIRCRAFT.)

PILOT/CONTROLLER GLOSSARY

S

STOP ALTITUDE SQUAWK — Used by ATC to instruct a pilot to turn off the automatic altitude reporting feature of the aircraft transponder and ADS-B Out. It is issued when a verbally reported altitude varies by 300 feet or more from the automatic altitude report.

(See ALTITUDE READOUT.)

(See TRANSPONDER.)

STOP AND GO — A procedure wherein an aircraft will land, make a complete stop on the runway, and then commence a takeoff from that point.

(See LOW APPROACH.)

(See OPTION APPROACH.)

STOP BURST — (See STOP STREAM.)

STOP BUZZER — (See STOP STREAM.)

STOP SQUAWK (Mode or Code) — Used by ATC to instruct a pilot to stop transponder and ADS-B transmissions, or to turn off only specified functions of the aircraft transponder (military).

(See STOP ALTITUDE SQUAWK.)

(See TRANSPONDER.)

STOP STREAM — Used by ATC to request a pilot to suspend electronic attack activity.

(See JAMMING.)

STOPOVER FLIGHT PLAN — A flight plan format which permits in a single submission the filing of a sequence of flight plans through interim full-stop destinations to a final destination.

STOPWAY — An area beyond the takeoff runway no less wide than the runway and centered upon the extended centerline of the runway, able to support the airplane during an aborted takeoff, without causing structural damage to the airplane, and designated by the airport authorities for use in decelerating the airplane during an aborted takeoff.

STRAIGHT-IN APPROACH IFR — An instrument approach wherein final approach is begun without first having executed a procedure turn, not necessarily completed with a straight-in landing or made to straight-in landing minimums.

(See LANDING MINIMUMS.)

(See STRAIGHT-IN APPROACH VFR.)

(See STRAIGHT-IN LANDING.)

STRAIGHT-IN APPROACH VFR — Entry into the traffic pattern by interception of the extended runway centerline (final approach course) without executing any other portion of the traffic pattern.

(See TRAFFIC PATTERN.)

STRAIGHT-IN LANDING — A landing made on a runway aligned within 30° of the final approach course following completion of an instrument approach.

(See STRAIGHT-IN APPROACH IFR.)

PILOT/CONTROLLER GLOSSARY
S

STRAIGHT-IN LANDING MINIMUMS — (See LANDING MINIMUMS.)

STRAIGHT-IN MINIMUMS — (See STRAIGHT-IN LANDING MINIMUMS.)

STRATEGIC PLANNING — Planning whereby solutions are sought to resolve potential conflicts.

sUAS — (See SMALL UNMANNED AIRCRAFT SYSTEM.)

SUBSTITUTE ROUTE — A route assigned to pilots when any part of an airway or route is unusable because of NAVAID status. These routes consist of:

- a. Substitute routes which are shown on U.S. Government charts.
- b. Routes defined by ATC as specific NAVAID radials or courses.
- c. Routes defined by ATC as direct to or between NAVAIDs.

SUNSET AND SUNRISE — The mean solar times of sunset and sunrise as published in the Nautical Almanac, converted to local standard time for the locality concerned. Within Alaska, the end of evening civil twilight and the beginning of morning civil twilight, as defined for each locality.

SUPPLEMENTAL WEATHER SERVICE LOCATION — Airport facilities staffed with contract personnel who take weather observations and provide current local weather to pilots via telephone or radio. (All other services are provided by the parent FSS.)

SUPPS — Refers to ICAO Document 7030 Regional Supplementary Procedures. SUPPS contain procedures for each ICAO Region which are unique to that Region and are not covered in the worldwide provisions identified in the ICAO Air Navigation Plan. Procedures contained in Chapter 8 are based in part on those published in SUPPS.

SURFACE AREA — The airspace contained by the lateral boundary of the Class B, C, D, or E airspace designated for an airport that begins at the surface and extends upward.

SURFACE METERING PROGRAM — A capability within Terminal Flight Data Manager that provides the user with the ability to tactically manage surface traffic flows through adjusting desired minimum and maximum departure queue lengths to balance surface demand with capacity. When a demand/capacity imbalance for a surface resource is predicted, a metering procedure is recommended.

SURFACE VIEWER — A capability within the Traffic Flow Management System that provides situational awareness for a user-selected airport. The Surface Viewer displays a top-down view of an airport depicting runways, taxiways, gate areas, ramps, and buildings. The display also includes icons representing aircraft and vehicles currently on the surface, with identifying information. In addition, the display includes current airport configuration information such as departure/arrival runways and airport departure/arrival rates.

SURPIC — A description of surface vessels in the area of a Search and Rescue incident including their predicted positions and their characteristics.

(Refer to FAA Order JO 7110.65, Para 10-6-4, INFLIGHT CONTINGENCIES.)

SURVEILLANCE APPROACH — An instrument approach wherein the air traffic controller issues instructions, for pilot compliance, based on aircraft position in relation to the final approach course

PILOT/CONTROLLER GLOSSARY

S

(azimuth), and the distance (range) from the end of the runway as displayed on the controller's radar scope. The controller will provide recommended altitudes on final approach if requested by the pilot.

(Refer to AIM.)

SUSPICIOUS UAS — Suspicious UAS operations may include operating without authorization, loitering in the vicinity of sensitive locations, (e.g., national security, law enforcement facilities, and critical infrastructure), or disrupting normal air traffic operations resulting in runway changes, ground stops, pilot evasive action, etc. The report of a UAS operation alone does not constitute suspicious activity. Development of a comprehensive list of suspicious activities is not possible due to the vast number of situations that could be considered suspicious. ATC must exercise sound judgment when identifying situations that could constitute or indicate a suspicious activity.

SWAP — (See SEVERE WEATHER AVOIDANCE PLAN.)

SWSL — (See SUPPLEMENTAL WEATHER SERVICE LOCATION.)

SYSTEM STRATEGIC NAVIGATION — Military activity accomplished by navigating along a pre-planned route using internal aircraft systems to maintain a desired track. This activity normally requires a lateral route width of 10 NM and altitude range of 1,000 feet to 6,000 feet AGL with some route segments that permit terrain following.

PILOT/CONTROLLER GLOSSARY

T

TACAN — (See TACTICAL AIR NAVIGATION.)

TACAN-ONLY AIRCRAFT — An aircraft, normally military, possessing TACAN with DME but no VOR navigational system capability. Clearances must specify TACAN or VORTAC fixes and approaches.

TACTICAL AIR NAVIGATION (TACAN) — An ultra-high frequency electronic rho-theta air navigation aid which provides suitably equipped aircraft a continuous indication of bearing and distance to the TACAN station.

(See VORTAC.)

(Refer to AIM.)

TAILWIND — Any wind more than 90 degrees to the longitudinal axis of the runway. The magnetic direction of the runway shall be used as the basis for determining the longitudinal axis.

TAKEOFF AREA — (See LANDING AREA.)

TAKEOFF DISTANCE AVAILABLE (TODA) — The takeoff run available plus the length of any remaining runway or clearway beyond the far end of the takeoff run available.

(See ICAO term TAKEOFF DISTANCE AVAILABLE.)

TAKEOFF DISTANCE AVAILABLE [ICAO] — The length of the takeoff run available plus the length of the clearway, if provided.

TAKEOFF HOLD LIGHTS (THL) — The THL system is composed of in-pavement lighting in a double, longitudinal row of lights aligned either side of the runway centerline. The lights are focused toward the arrival end of the runway at the “line up and wait” point, and they extend for 1,500 feet in front of the holding aircraft. Illuminated red lights indicate to an aircraft in position for takeoff or rolling that it is unsafe to takeoff because the runway is occupied or about to be occupied by an aircraft or vehicle.

TAKEOFF ROLL — The process whereby an aircraft is aligned with the runway centerline and the aircraft is moving with the intent to take off. For helicopters, this pertains to the act of becoming airborne after departing a takeoff area.

TAKEOFF RUN AVAILABLE (TORA) — The runway length declared available and suitable for the ground run of an airplane taking off.

(See ICAO term TAKEOFF RUN AVAILABLE.)

TAKEOFF RUN AVAILABLE [ICAO] — The length of runway declared available and suitable for the ground run of an aeroplane take-off.

TARGET — The indication shown on a display resulting from a primary radar return, a radar beacon reply, or an ADS-B report. The specific target symbol presented to ATC may vary based on the surveillance source and automation platform.

(See ASSOCIATED.)

(See DIGITAL TARGET.)

PILOT/CONTROLLER GLOSSARY
T

(See DIGITIZED RADAR TARGET.)

(See FUSED TARGET.)

(See PRIMARY RADAR TARGET.)

(See RADAR.)

(See SECONDARY RADAR TARGET.)

(See ICAO term TARGET.)

(See UNASSOCIATED.)

TARGET [ICAO] — In radar:

- a. Generally, any discrete object which reflects or retransmits energy back to the radar equipment.
- b. Specifically, an object of radar search or surveillance.

TARGET RESOLUTION — A process to ensure that correlated radar targets do not touch. Target resolution must be applied as follows:

- a. Between the edges of two primary targets or the edges of the ASR-9/11 primary target symbol.
- b. Between the end of the beacon control slash and the edge of a primary target.
- c. Between the ends of two beacon control slashes.

NOTE 1: *Mandatory traffic advisories and safety alerts must be issued when this procedure is used.*

NOTE 2: *This procedure must not be used when utilizing mosaic radar systems or multi-sensor mode.*

TARGET SYMBOL —

(See TARGET.)

(See ICAO term TARGET.)

TARMAC DELAY — The holding of an aircraft on the ground either before departure or after landing with no opportunity for its passengers to deplane.

TARMAC DELAY AIRCRAFT — An aircraft whose pilot-in-command has requested to taxi to the ramp, gate, or alternate deplaning area to comply with the Three-hour Tarmac Rule.

TARMAC DELAY REQUEST — A request by the pilot-in-command to taxi to the ramp, gate, or alternate deplaning location to comply with the Three-hour Tarmac Rule.

TAS — (See TERMINAL AUTOMATION SYSTEMS.)

TAWS — (See TERRAIN AWARENESS WARNING SYSTEM.)

PILOT/CONTROLLER GLOSSARY

T

TAXI — The movement of an airplane under its own power on the surface of an airport (14 CFR Section 135.100 [Note]). Also, it describes the surface movement of helicopters equipped with wheels.

(See AIR TAXI.)

(See HOVER TAXI.)

(Refer to 14 CFR Section 135.100.)

(Refer to AIM.)

TAXI PATTERNS — Patterns established to illustrate the desired flow of ground traffic for the different runways or airport areas available for use.

TBM — (See TIME-BASED MANAGEMENT.)

TBO — (See TRAJECTORY-BASED OPERATIONS.)

TCAS — (See TRAFFIC ALERT AND COLLISION AVOIDANCE SYSTEM.)

TCH — (See THRESHOLD CROSSING HEIGHT.)

TDLS — (See TERMINAL DATA LINK SYSTEM.)

TDZE — (See TOUCHDOWN ZONE ELEVATION.)

TEMPORARY FLIGHT RESTRICTION (TFR) — A TFR is a regulatory action issued by the FAA via the U.S. NOTAM System, under the authority of United States Code, Title 49. TFRs are issued within the sovereign airspace of the United States and its territories to restrict certain aircraft from operating within a defined area on a temporary basis to protect persons or property in the air or on the ground. While not all inclusive, TFRs may be issued for disaster or hazard situations such as: toxic gas leaks or spills, fumes from flammable agents, aircraft accident/incident sites, aviation or ground resources engaged in wildfire suppression, or aircraft relief activities following a disaster. TFRs may also be issued in support of VIP movements, for reasons of national security; or when determined necessary for the management of air traffic in the vicinity of aerial demonstrations or major sporting events. NAS users or other interested parties should contact a FSS for TFR information. Additionally, TFR information can be found in automated briefings, NOTAM publications, and on the internet at <http://www.faa.gov>. The FAA also distributes TFR information to aviation user groups for further dissemination.

TERMINAL AREA — A general term used to describe airspace in which approach control service or airport traffic control service is provided.

TERMINAL AREA FACILITY — A facility providing air traffic control service for arriving and departing IFR, VFR, Special VFR, and on occasion en route aircraft.

(See APPROACH CONTROL FACILITY.)

(See TOWER.)

TERMINAL AUTOMATION SYSTEMS (TAS) — TAS is used to identify the numerous automated tracking systems including STARS and MEARTS.

PILOT/CONTROLLER GLOSSARY

T

TERMINAL DATA LINK SYSTEM (TDLS) — A system that provides Digital Automatic Terminal Information Service (D-ATIS) both on a specified radio frequency and also, for subscribers, in a text message via data link to the cockpit or to a gate printer. TDLS also provides Pre-departure Clearances (PDC), at selected airports, to subscribers, through a service provider, in text to the cockpit or to a gate printer. In addition, TDLS will emulate the Flight Data Input/Output (FDIO) information within the control tower.

TERMINAL FLIGHT DATA MANAGER (TFDM) — An integrated tower flight data automation system to provide improved airport surface and terminal airspace management. TFDM enhances traffic flow management data integration with Time-Based Flow Management (TBFM) and Traffic Flow Management System (TFMS) to enable airlines, controllers, and airports to share and exchange real-time data. This improves surface traffic management and enhances capabilities of TFMS and TBFM. TFDM assists the Tower personnel with surface Traffic Flow Management (TFM) and Collaborative Decision Making (CDM) and enables a fundamental change in the Towers from a local airport-specific operation to a NAS-connected metering operation. The single platform consolidates multiple Tower automation systems, including: Departure Spacing Program (DSP), Airport Resource Management Tool (ARMT), Electronic Flight Strip Transfer System (EFSTS), and Surface Movement Advisor (SMA). TFDM data, integrated with other FAA systems such as TBFM and TFMS, allows airlines, controllers, and airports to manage the flow of aircraft more efficiently through all phases of flight from departure to arrival gate.

TERMINAL RADAR SERVICE AREA — Airspace surrounding designated airports wherein ATC provides radar vectoring, sequencing, and separation on a full-time basis for all IFR and participating VFR aircraft. The AIM [and Jeppesen ATC Section] contains an explanation of TRSA. TRSAs are depicted on VFR aeronautical charts. Pilot participation is urged but is not mandatory.

TERMINAL SEQUENCING AND SPACING (TSAS) — Extends scheduling and metering capabilities into the terminal area and provides metering automation tools to terminal controllers and terminal traffic management personnel. Those controllers and traffic management personnel become active participants in time-based metering operations as they work to deliver aircraft accurately to Constraint Satisfaction Points within terminal airspace to include the runway in accordance with scheduled times at those points. Terminal controllers are better able to utilize efficient flight paths, such as Standard Instrument Approach Procedures (SIAPs) that require a Navigational Specification (NavSpec) of RNP APCH with Radius-to-Fix (RF) legs, or Advanced RNP (A-RNP), through tools that support the merging of mixed-equipage traffic flows. For example, merging aircraft flying RNP APCH AR with RF, A-RNP, and non-RNP approach procedures. Additional fields in the flight plan will identify those flights capable of flying the RNP APCH with RF or A-RNP procedures, and those flights will be scheduled for those types of procedures when available. TSAS will schedule these and the non-RNP aircraft to a common merge point. Terminal traffic management personnel have improved situation awareness using displays that allow for the monitoring of terminal metering operations, similar to the displays used today by center traffic management personnel to monitor en route metering operations.

TERMINAL VFR RADAR SERVICE — A national program instituted to extend the terminal radar services provided instrument flight rules (IFR) aircraft to visual flight rules (VFR) aircraft. The program is divided into four types service referred to as basic radar service, terminal radar service

PILOT/CONTROLLER GLOSSARY
T

area (TRSA) service, Class B service and Class C service. The type of service provided at a particular location is contained in the Chart Supplement U.S. [Refer to AIM/Jeppesen Enroute Chart Communications Tabulations]

- a. **Basic Radar Service** — These services are provided for VFR aircraft by all commissioned terminal radar facilities. Basic radar service includes safety alerts, traffic advisories, limited radar vectoring when requested by the pilot, and sequencing at locations where procedures have been established for this purpose and/or when covered by a letter of agreement. The purpose of this service is to adjust the flow of arriving IFR and VFR aircraft into the traffic pattern in a safe and orderly manner and to provide traffic advisories to departing VFR aircraft.
- b. **TRSA Service** — This service provides, in addition to basic radar service, sequencing of all IFR and participating VFR aircraft to the primary airport and separation between all participating VFR aircraft. The purpose of this service is to provide separation between all participating VFR aircraft and all IFR aircraft operating within the area defined as a TRSA.
- c. **Class C Service** — This service provides, in addition to basic radar service, approved separation between IFR and VFR aircraft, and sequencing of VFR aircraft, and sequencing of VFR arrivals to the primary airport.
- d. **Class B Service** — This service provides, in addition to basic radar service, approved separation of aircraft based on IFR, VFR, and/or weight, and sequencing of VFR arrivals to the primary airport(s).

(See CONTROLLED AIRSPACE.)

(See TERMINAL RADAR SERVICE AREA.)

(Refer to AIM.)

(Refer to CHART SUPPLEMENT U.S.)

TERMINAL-VERY HIGH FREQUENCY OMNIDIRECTIONAL RANGE STATION (TVOR) — A very high frequency terminal omnirange station located on or near an airport and used as an approach aid.

(See NAVIGATIONAL AID.)

(See VOR.)

TERRAIN AWARENESS WARNING SYSTEM (TAWS) — An on-board, terrain proximity alerting system providing the aircrew 'Low Altitude warnings' to allow immediate pilot action.

TERRAIN FOLLOWING — The flight of a military aircraft maintaining a constant AGL altitude above the terrain or the highest obstruction. The altitude of the aircraft will constantly change with the varying terrain and/or obstruction.

TETRAHEDRON — A device normally located on uncontrolled airports and used as a landing direction indicator. The small end of a tetrahedron points in the direction of landing. At controlled airports, the tetrahedron, if installed, should be disregarded because tower instructions supersede the indicator.

PILOT/CONTROLLER GLOSSARY

T

(See SEGMENTED CIRCLE.)

(Refer to AIM.)

TF — (See TERRAIN FOLLOWING.)

TFDM — (See TERMINAL FLIGHT DATA MANAGER.)

TGUI — (See TIMELINE GRAPHICAL USER INTERFACE.)

THAT IS CORRECT — The understanding you have is right.

THA —

(See TRANSITIONAL HAZARD AREA.)

THREE-HOUR TARMAC RULE — Rule that relates to Department of Transportation (DOT) requirements placed on airlines when tarmac delays are anticipated to reach 3 hours.

360 OVERHEAD — (See OVERHEAD MANEUVER.)

THRESHOLD — The beginning of that portion of the runway usable for landing.

(See AIRPORT LIGHTING.)

(See DISPLACED THRESHOLD.)

THRESHOLD CROSSING HEIGHT — The theoretical height above the runway threshold at which the aircraft's glideslope antenna would be if the aircraft maintains the trajectory established by the mean ILS glideslope or the altitude at which the calculated glidepath of an RNAV or GPS approaches.

(See GLIDESLOPE.)

(See THRESHOLD.)

THRESHOLD LIGHTS — (See AIRPORT LIGHTING.)

TIE-IN FACILITY — The FSS primarily responsible for providing FSS services, including telecommunications services for landing facilities or navigational aids located within the boundaries of a flight plan area (FPA). Three-letter identifiers are assigned to each FSS/FPA and are annotated as tie-in facilities in the Chart Supplement U.S., the Alaska Supplement, the Pacific Supplement, and FAA Order JO 7350.9, Location Identifiers. Large consolidated FSS facilities may have many tie-in facilities or FSS sectors within one facility.

(See FLIGHT PLAN AREA.)

(See FLIGHT SERVICE STATION.)

TIME-BASED FLOW MANAGEMENT (TBFM) — A foundational Decision Support Tool for time-based management in the en route and terminal environments. TBFM's core function is the ability to schedule aircraft within a stream of traffic to reach a defined constraint point (e.g., meter fix/meter arc) at specified times, creating a time-ordered sequence of traffic. The scheduled times allow for merging of traffic flows, efficiently utilizing airport and airspace capacity while minimizing coordination and reducing the need for vectoring/holding. The TBFM schedule is calculated using current aircraft estimated time of arrival at key defined constraint points based on wind forecasts,

PILOT/CONTROLLER GLOSSARY

T

aircraft flight plan, the desired separation at the constraint point and other parameters. The schedule applies spacing only when needed to maintain the desired separation at one or more constraint points. This includes, but is not limited to, Single Center Metering (SCM), Adjacent Center Metering (ACM), En Route Departure Capability (EDC), Integrated Departure/Arrival Capability (IDAC), Ground-based Interval Management-Spacing (GIM-S), Departure Scheduling, and Extended/Coupled Metering.

TIME-BASED MANAGEMENT (TBM) — A methodology for managing the flow of air traffic through the assignment of time at specific points for an aircraft. TBM applies time to manage and condition air traffic flows to mitigate demand/capacity imbalances and enhance efficiency and predictability of the NAS. Where implemented, TBM tools will be used to manage traffic even during periods when demand does not exceed capacity. This will sustain operational predictability and assure the regional/national strategic plan is maintained. TBM uses capabilities within TFMS, TBFM, and TFDM. These programs are designed to achieve a specified interval between aircraft. Different types of programs accommodate different phases of flight.

TIME GROUP — Four digits representing the hour and minutes from the Coordinated Universal Time (UTC) clock. FAA uses UTC for all operations. The term “ZULU” may be used to denote UTC. The word “local” or the time zone equivalent shall be used to denote local when local time is given during radio and telephone communications. When written, a time zone designator is used to indicate local time; e.g., “0205M” (Mountain). The local time may be based on the 24-hour clock system. The day begins at 0000 and ends at 2359.

TIMELINE GRAPHICAL USER INTERFACE (TGUI) — A TBFM display that uses timelines to display the Estimated Time of Arrival and Scheduled Time of Arrival of each aircraft to specified constraint points. The TGUI can also display pre-departure and scheduled aircraft.

TIS-B — (See TRAFFIC INFORMATION SERVICE–BROADCAST.)

TMI — (See TRAFFIC MANAGEMENT INITIATIVE.)

TPMA — (See TRAFFIC MANAGEMENT PROGRAM ALERT.)

TMU — (See TRAFFIC MANAGEMENT UNIT.)

TOD — (See TOP OF DESCENT.)

TODA — (See TAKEOFF DISTANCE AVAILABLE.)

(See ICAO Term TAKEOFF DISTANCE AVAILABLE.)

TOI — (See TRACK OF INTEREST.)

TOP ALTITUDE — In reference to SID published altitude restrictions, the charted “maintain” altitude contained in the procedure description or assigned by ATC.

TOP OF DESCENT (TOD) — The point at which an aircraft begins the initial descent.

TORA — (See TAKEOFF RUN AVAILABLE.)

(See ICAO Term TAKEOFF RUN AVAILABLE.)

PILOT/CONTROLLER GLOSSARY

T

TORCHING — The burning of fuel at the end of an exhaust pipe or stack of a reciprocating aircraft engine, the result of an excessive richness in the fuel air mixture.

TOS — (See TRAJECTORY OPTIONS SET.)

TOTAL ESTIMATED ELAPSED TIME [ICAO] — For IFR flights, the estimated time required from takeoff to arrive over that designated point, defined by reference to navigation aids, from which it is intended that an instrument approach procedure will be commenced, or, if no navigation aid is associated with the destination aerodrome, to arrive over the destination aerodrome. For VFR flights, the estimated time required from takeoff to arrive over the destination aerodrome.

(See ICAO term ESTIMATED ELAPSED TIME.)

TOUCH-AND-GO — An operation by an aircraft that lands and departs on a runway without stopping or exiting the runway.

TOUCH-AND-GO LANDING — (See TOUCH-AND-GO.)

TOUCHDOWN —

- a. The point at which an aircraft first makes contact with the landing surface.
- b. Concerning a precision radar approach (PAR), it is the point where the glide path intercepts the landing surface.

(See ICAO term TOUCHDOWN.)

TOUCHDOWN [ICAO] — The point where the nominal glide path intercepts the runway.

NOTE: *Touchdown as defined above is only a datum and is not necessarily the actual point at which the aircraft will touch the runway.*

TOUCHDOWN RVR — (See VISIBILITY.)

TOUCHDOWN ZONE — The first 3,000 feet of the runway beginning at the threshold. The area is used for determination of Touchdown Zone Elevation in the development of straight-in landing minimums for instrument approaches.

(See ICAO term TOUCHDOWN ZONE.)

TOUCHDOWN ZONE [ICAO] — The portion of a runway, beyond the threshold, where it is intended landing aircraft first contact the runway.

TOUCHDOWN ZONE ELEVATION — The highest elevation in the first 3,000 feet of the landing surface. TDZE is indicated on the instrument approach procedure chart when straight-in landing minimums are authorized.

(See TOUCHDOWN ZONE.)

TOUCHDOWN ZONE LIGHTING — (See AIRPORT LIGHTING.)

TOWER — A terminal facility that uses air/ground communications, visual signaling, and other devices to provide ATC services to aircraft operating in the vicinity of an airport or on the movement area. Authorizes aircraft to land or takeoff at the airport controlled by the tower or to transit

PILOT/CONTROLLER GLOSSARY

T

the Class D airspace area regardless of flight plan or weather conditions (IFR or VFR). A tower may also provide approach control services (radar or nonradar).

(See AIRPORT TRAFFIC CONTROL SERVICE.)

(See APPROACH CONTROL FACILITY.)

(See APPROACH CONTROL SERVICE.)

(See MOVEMENT AREA.)

(See TOWER EN ROUTE CONTROL SERVICE.)

(See ICAO term AERODROME CONTROL TOWER.)

(Refer to AIM.)

TOWER EN ROUTE CONTROL SERVICE — The control of IFR en route traffic within delegated airspace between two or more adjacent approach control facilities. This service is designed to expedite traffic and reduce control and pilot communication requirements.

TOWER TO TOWER — (See TOWER EN ROUTE CONTROL SERVICE.)

TRACEABLE PRESSURE STANDARD — The facility station pressure instrument, with certification/calibration traceable to the National Institute of Standards and Technology. Traceable pressure standards may be mercurial barometers, commissioned ASOS or dual transducer AWOS, or portable pressure standards or DASI.

TRACK — The actual flight path of an aircraft over the surface of the earth.

(See COURSE.)

(See FLIGHT PATH.)

(See ROUTE.)

(See ICAO term TRACK.)

TRACK [ICAO] — The projection on the earth's surface of the path of an aircraft, the direction of which path at any point is usually expressed in degrees from North (True, Magnetic, or Grid).

TRACK OF INTEREST (TOI) — Displayed data representing an airborne object that threatens or has the potential to threaten North America or National Security. Indicators may include, but are not limited to: noncompliance with air traffic control instructions or aviation regulations; extended loss of communications; unusual transmissions or unusual flight behavior; unauthorized intrusion into controlled airspace or an ADIZ; noncompliance with issued flight restrictions/security procedures; or unlawful interference with airborne flight crews, up to and including hijack. In certain circumstances, an object may become a TOI based on specific and credible intelligence pertaining to that particular aircraft/object, its passengers, or its cargo.

TRACK OF INTEREST RESOLUTION — A TOI will normally be considered resolved when: the aircraft/object is no longer airborne; the aircraft complies with air traffic control instructions, aviation regulations, and/or issued flight restrictions/security procedures; radio contact is re-established and authorized control of the aircraft is verified; the aircraft is intercepted and intent is veri-

PILOT/CONTROLLER GLOSSARY

T

fied to be nonthreatening/nonhostile; TOI was identified based on specific and credible intelligence that was later determined to be invalid or unreliable; or displayed data is identified and characterized as invalid.

TRAFFIC —

- a. A term used by a controller to transfer radar identification of an aircraft to another controller for the purpose of coordinating separation action. Traffic is normally issued:
 1. In response to a handoff or point out,
 2. In anticipation of a handoff or point out, or
 3. In conjunction with a request for control of an aircraft.
- b. A term used by ATC to refer to one or more aircraft.

TRAFFIC ADVISORIES — Advisories issued to alert pilots to other known or observed air traffic which may be in such proximity to the position or intended route of flight of their aircraft to warrant their attention. Such advisories may be based on:

- a. Visual observation.
- b. Observation of radar identified and nonidentified aircraft targets on an ATC radar display, or
- c. Verbal reports from pilots or other facilities.

NOTE 1: The word “traffic” followed by additional information, if known, is used to provide such advisories; e.g., “Traffic, 2 o’clock, one zero miles, southbound, eight thousand.”

NOTE 2: Traffic advisory service will be provided to the extent possible depending on higher priority duties of the controller or other limitations; e.g., radar limitations, volume of traffic, frequency congestion, or controller workload. Radar/nonradar traffic advisories do not relieve the pilot of his/her responsibility to see and avoid other aircraft. Pilots are cautioned that there are many times when the controller is not able to give traffic advisories concerning all traffic in the aircraft's proximity; in other words, when a pilot requests or is receiving traffic advisories, he/she should not assume that all traffic will be issued.

(Refer to AIM.)

TRAFFIC ALERT (aircraft call sign), TURN (left/right) IMMEDIATELY, (climb/descend) AND MAINTAIN (altitude).

(See SAFETY ALERT.)

TRAFFIC ALERT AND COLLISION AVOIDANCE SYSTEM (TCAS) — An airborne collision avoidance system based on radar beacon signals which operates independent of ground-based equipment. TCAS-I generates traffic advisories only. TCAS-II generates traffic advisories, and resolution (collision avoidance) advisories in the vertical plane.

TRAFFIC INFORMATION — (See TRAFFIC ADVISORIES.)

TRAFFIC INFORMATION SERVICE–BROADCAST (TIS–B) — The broadcast of ATC derived traffic information to ADS–B equipped (1090ES or UAT) aircraft. The source of this traffic informa-

PILOT/CONTROLLER GLOSSARY

T

tion is derived from ground-based air traffic surveillance sensors, typically from radar targets. TIS-B service will be available throughout the NAS where there are both adequate surveillance coverage (radar) and adequate broadcast coverage from ADS-B ground stations. Loss of TIS-B will occur when an aircraft enters an area not covered by the GBT network. If this occurs in an area with adequate surveillance coverage (radar), nearby aircraft that remain within the adequate broadcast coverage (ADS-B) area will view the first aircraft. TIS-B may continue when an aircraft enters an area with inadequate surveillance coverage (radar); nearby aircraft that remain within the adequate broadcast coverage (ADS-B) area will not view the first aircraft.

TRAFFIC IN SIGHT — Used by pilots to inform a controller that previously issued traffic is in sight.

(See NEGATIVE CONTACT.)

(See TRAFFIC ADVISORIES.)

TRAFFIC MANAGEMENT INITIATIVE (TMI) — Tools used to manage demand with capacity in the National Airspace System (NAS.) TMIs can be used to manage NAS resources (e.g., airports, sectors, airspace) or to increase the efficiency of the operation. TMIs can be either tactical (i.e., short term) or strategic (i.e., long term), depending on the type of TMI and the operational need.

TRAFFIC MANAGEMENT PROGRAM ALERT — A term used in a Notice to Air Missions (NOTAM) issued in conjunction with a special traffic management program to alert pilots to the existence of the program and to refer them to a special traffic management program advisory message for program details. The contraction TMPA is used in NOTAM text.

TRAFFIC MANAGEMENT UNIT — The entity in ARTCCs and designated terminals directly involved in the active management of facility traffic. Usually under the direct supervision of an assistant manager for traffic management.

TRAFFIC NO FACTOR — Indicates that the traffic described in a previously issued traffic advisory is no factor.

TRAFFIC NO LONGER OBSERVED — Indicates that the traffic described in a previously issued traffic advisory is no longer depicted on radar, but may still be a factor.

TRAFFIC PATTERN — The traffic flow that is prescribed for aircraft landing at, taxiing on, or taking off from an airport. The components of a typical traffic pattern are upwind leg, crosswind leg, downwind leg, base leg, and final approach.

- a. Upwind Leg — A flight path parallel to the landing runway in the direction of landing.
- b. Crosswind Leg — A flight path at right angles to the landing runway off its upwind end.
- c. Downwind Leg — A flight path parallel to the landing runway in the direction opposite to landing. The downwind leg normally extends between the crosswind leg and the base leg.
- d. Base Leg — A flight path at right angles to the landing runway off its approach end. The base leg normally extends from the downwind leg to the intersection of the extended runway centerline.

PILOT/CONTROLLER GLOSSARY

T

- e. Final Approach — A flight path in the direction of landing along the extended runway center-line. The final approach normally extends from the base leg to the runway. An aircraft making a straight-in approach VFR is also considered to be on final approach.

(See STRAIGHT-IN APPROACH VFR.)

(See TAXI PATTERNS.)

(See ICAO term AERODROME TRAFFIC CIRCUIT.)

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

TRAFFIC SITUATION DISPLAY (TSD) — TSD is a computer system that receives radar track data from all 20 CONUS ARTCCs, organizes this data into a mosaic display, and presents it on a computer screen. The display allows the traffic management coordinator multiple methods of selection and highlighting of individual aircraft or groups of aircraft. The user has the option of superimposing these aircraft positions over any number of background displays. These background options include ARTCC boundaries, any stratum of en route sector boundaries, fixes, airways, military and other special use airspace, airports, and geopolitical boundaries. By using the TSD, a coordinator can monitor any number of traffic situations or the entire system-wide traffic flows.

TRAJECTORY — A EDST representation of the path an aircraft is predicted to fly based upon a Current Plan or Trial Plan.

(See EN ROUTE DECISION SUPPORT TOOL.)

TRAJECTORY-BASED OPERATIONS (TBO) — An Air Traffic Management method for strategically planning and managing flights throughout the operation by using Time-Based Management (TBM), information exchange between air and ground systems, and the aircraft's ability to fly trajectories in time and space. Aircraft trajectory is defined in four dimensions — latitude, longitude, altitude, and time.

TRAJECTORY MODELING — The automated process of calculating a trajectory.

TRAJECTORY OPTIONS SET (TOS) — A TOS is an electronic message, submitted by the operator, that is used by the Collaborative Trajectory Options Program (CTOP) to manage the airspace captured in the traffic management program. The TOS will allow the operator to express the route and delay trade-off options that they are willing to accept.

TRANSFER OF CONTROL — That action whereby the responsibility for the separation of an aircraft is transferred from one controller to another.

(See ICAO term TRANSFER OF CONTROL.)

TRANSFER OF CONTROL [ICAO] — Transfer of responsibility for providing air traffic control service.

TRANSFERRING CONTROLLER — A controller/facility transferring control of an aircraft to another controller/facility.

PILOT/CONTROLLER GLOSSARY

T

(See ICAO term TRANSFERRING UNIT/CONTROLLER.)

TRANSFERRING FACILITY — (See TRANSFERRING CONTROLLER.)

TRANSFERRING UNIT/CONTROLLER [ICAO] — Air traffic control unit/air traffic controller in the process of transferring the responsibility for providing air traffic control service to an aircraft to the next air traffic control unit/air traffic controller along the route of flight.

NOTE: See definition of *accepting unit/controller*.

TRANSITION — The general term that describes the change from one phase of flight or flight condition to another; e.g., transition from en route flight to the approach or transition from instrument flight to visual flight.

TRANSITION POINT — A point at an adapted number of miles from the vertex at which an arrival aircraft would normally commence descent from its en route altitude. This is the first fix adapted on the arrival speed segments.

TRANSITIONAL AIRSPACE — That portion of controlled airspace wherein aircraft change from one phase of flight or flight condition to another.

TRANSITIONAL HAZARD AREA (THA) — Used by ATC. Airspace normally associated with an Aircraft Hazard Area within which the flight of aircraft is subject to restrictions.

(See AIRCRAFT HAZARD AREA.)

(See CONTINGENCY HAZARD AREA.)

(See REFINED HAZARD AREA.)

TRANSMISSOMETER — An apparatus used to determine visibility by measuring the transmission of light through the atmosphere. It is the measurement source for determining runway visual range (RVR).

(See VISIBILITY.)

TRANSMITTING IN THE BLIND — A transmission from one station to other stations in circumstances where two-way communication cannot be established, but where it is believed that the called stations may be able to receive the transmission.

TRANSPONDER — The airborne radar beacon receiver/transmitter portion of the Air Traffic Control Radar Beacon System (ATCRBS) which automatically receives radio signals from interrogators on the ground, and selectively replies with a specific reply pulse or pulse group only to those interrogations being received on the mode to which it is set to respond.

(See INTERROGATOR.)

(See ICAO term TRANSPONDER.)

(Refer to AIM.)

TRANSPONDER [ICAO] — A receiver/transmitter which will generate a reply signal upon proper interrogation; the interrogation and reply being on different frequencies.

TRANSPONDER CODES — (See CODES.)

PILOT/CONTROLLER GLOSSARY

T

TRANSPONDER OBSERVED — Phraseology used to inform a VFR pilot the aircraft's assigned beacon code and position have been observed. Specifically, this term conveys to a VFR pilot the transponder reply has been observed and its position correlated for transit through the designated area.

TRIAL PLAN — A proposed amendment which utilizes automation to analyze and display potential conflicts along the predicted trajectory of the selected aircraft.

TRSA — (See TERMINAL RADAR SERVICE AREA.)

TSAS — (See TERMINAL SEQUENCING AND SPACING.)

TSO — (See TRAFFIC SITUATION DISPLAY.)

TURBOJET AIRCRAFT — An aircraft having a jet engine in which the energy of the jet operates a turbine which in turn operates the air compressor.

TURBOPROP AIRCRAFT — An aircraft having a jet engine in which the energy of the jet operates a turbine which drives the propeller.

TURBULENCE — An atmospheric phenomenon that causes changes in aircraft altitude, attitude, and or airspeed with aircraft reaction depending on intensity. Pilots report turbulence intensity according to aircraft's reaction as follows:

- a. Light — Causes slight, erratic changes in altitude and or attitude (pitch, roll, or yaw).
- b. Moderate — Similar to Light but of greater intensity. Changes in altitude and or attitude occur but the aircraft remains in positive control at all times. It usually causes variations in indicated airspeed.
- c. Severe — Causes large, abrupt changes in altitude and or attitude. It usually causes large variations in indicated airspeed. Aircraft may be momentarily out of control.
- d. Extreme — The aircraft is violently tossed about and is practically impossible to control. It may cause structural damage.

(See CHOP.)

(Refer to AIM.)

TURN ANTICIPATION — (maneuver anticipation).

TVOR — (See TERMINAL-VERY HIGH FREQUENCY OMNIDIRECTIONAL RANGE STATION.)

TWO-WAY RADIO COMMUNICATIONS FAILURE — (See LOST COMMUNICATIONS.)

PILOT/CONTROLLER GLOSSARY

U

UHF —

(See ULTRAHIGH FREQUENCY.)

ULTRAHIGH FREQUENCY (UHF) — The frequency band between 300 and 3,000 MHz. The bank of radio frequencies used for military air/ground voice communications. In some instances this may go as low as 225 MHz and still be referred to as UHF.

ULTRALIGHT VEHICLE — A single-occupant aeronautical vehicle operated for sport or recreational purposes which does not require FAA registration, an airworthiness certificate, or pilot certification. Operation of an ultralight vehicle in certain airspace requires authorization from ATC.

(Refer to 14 CFR Part 103.)

UNABLE — Indicates inability to comply with a specific instruction, request, or clearance.

UNASSOCIATED — A radar target that does not display a data block with flight identification and altitude information.

(See ASSOCIATED.)

UNCONTROLLED AIRSPACE — Airspace in which aircraft are not subject to controlled airspace (Class A, B, C, D, or E) separation criteria.

UNDER THE HOOD — Indicates that the pilot is using a hood to restrict visibility outside the cockpit while simulating instrument flight. An appropriately rated pilot is required in the other control seat while this operation is being conducted.

(Refer to 14 CFR Part 91.)

UNFROZEN — The Scheduled Time of Arrival (STA) tags, which are still being rescheduled by the time based flow management (TBFM) calculations. The aircraft will remain unfrozen until the time the corresponding estimated time of arrival (ETA) tag passes the preset freeze horizon for that aircraft's stream class. At this point the automatic rescheduling will stop, and the STA becomes "frozen."

UNICOM — A nongovernment communication facility which may provide airport information at certain airports. Locations and frequencies of UNICOMs are shown on aeronautical charts and publications.

(See CHART SUPPLEMENT U.S.)

(Refer to AIM.)

UNMANNED AIRCRAFT (UA) — A device used or intended to be used for flight that has no onboard pilot. This device can be any type of airplane, helicopter, airship, or powered-lift aircraft. Unmanned free balloons, moored balloons, tethered aircraft, gliders, and unmanned rockets are not considered to be a UA.

UNMANNED AIRCRAFT SYSTEM (UAS) — An unmanned aircraft and its associated elements related to safe operations, which may include control stations (ground, ship, or air based), control links, support equipment, payloads, flight termination systems, and launch/recovery equipment. It consists of three elements: unmanned aircraft, control station, and data link.

PILOT/CONTROLLER GLOSSARY

U

UNPUBLISHED ROUTE — A route for which no minimum altitude is published or charted for pilot use. It may include a direct route between NAVAIDs, a radial, a radar vector, or a final approach course beyond the segments of an instrument approach procedure.

(See PUBLISHED ROUTE.)

(See ROUTE.)

UNRELIABLE (GPS/WAAS) — An advisory to pilots indicating the expected level of service of the GPS and/or WAAS may not be available. Pilots must then determine the adequacy of the signal for desired use.

UNSERVICEABLE (U/S) —

(See OUT OF SERVICE/UNSERVICEABLE.)

UPWIND LEG — (See TRAFFIC PATTERN.)

URGENCY — A condition of being concerned about safety and of requiring timely but not immediate assistance; a potential distress condition.

(See ICAO term URGENCY.)

URGENCY [ICAO] — A condition concerning the safety of an aircraft or other vehicle, or of person on board or in sight, but which does not require immediate assistance.

USAFIB —

(See ARMY AVIATION FLIGHT INFORMATION BULLETIN.)

PILOT/CONTROLLER GLOSSARY

V

VASI — (See VISUAL APPROACH SLOPE INDICATOR.)

VCOA — (See VISUAL CLIMB OVER AIRPORT.)

VDP — (See VISUAL DESCENT POINT.)

VECTOR — A heading issued to an aircraft to provide navigational guidance by radar.

(See ICAO term RADAR VECTORING.)

VERIFY — Request confirmation of information; e.g., “verify assigned altitude.”

VERIFY SPECIFIC DIRECTION OF TAKEOFF (OR TURNS AFTER TAKEOFF) — Used by ATC to ascertain an aircraft's direction of takeoff and/or direction of turn after takeoff. It is normally used for IFR departures from an airport not having a control tower. When direct communication with the pilot is not possible, the request and information may be relayed through an FSS, dispatcher, or by other means.

(See IFR TAKEOFF MINIMUMS AND DEPARTURE PROCEDURES.)

VERTICAL NAVIGATION (VNAV) — A function of area navigation (RNAV) equipment which calculates, displays, and provides vertical guidance to a profile or path.

VERTICAL SEPARATION — Separation between aircraft expressed in units of vertical distance.

(See SEPARATION.)

VERTICAL TAKEOFF AND LANDING AIRCRAFT (VTOL) — Aircraft capable of vertical climbs and/or descents and of using very short runways or small areas for takeoff and landings. These aircraft include, but are not limited to, helicopters.

(See SHORT TAKEOFF AND LANDING AIRCRAFT.)

VERY HIGH FREQUENCY (VHF) — The frequency band between 30 and 300 MHz. Portions of this band, 108 to 118 MHz, are used for certain NAVAIDS; 118 to 136 MHz are used for civil air/ground voice communications. Other frequencies in this band are used for purposes not related to air traffic control.

VERY HIGH FREQUENCY OMNIDIRECTIONAL RANGE STATION — (See VOR.)

VERY LOW FREQUENCY (VLF) — The frequency band between 3 and 30 kHz.

VFR — (See VISUAL FLIGHT RULES.)

VFR AIRCRAFT — An aircraft conducting flight in accordance with visual flight rules.

(See VISUAL FLIGHT RULES.)

VFR CONDITIONS — Weather conditions equal to or better than the minimum for flight under visual flight rules. The term may be used as an ATC clearance/instruction only when:

- An IFR aircraft requests a climb/descent in VFR conditions.
- The clearance will result in noise abatement benefits where part of the IFR departure route does not conform to an FAA approved noise abatement route or altitude.
- A pilot has requested a practice instrument approach and is not on an IFR flight plan.

PILOT/CONTROLLER GLOSSARY

V

NOTE: All pilots receiving this authorization must comply with the VFR visibility and distance from cloud criteria in 14 CFR Part 91. Use of the term does not relieve controllers of their responsibility to separate aircraft in Class B and Class C airspace or TRSAs as required by FAA Order JO 7110.65. When used as an ATC clearance/instruction, the term may be abbreviated "VFR;" e.g., "MAINTAIN VFR," "CLIMB/DESCEND VFR," etc.

VFR FLIGHT — (See VFR AIRCRAFT.)

VFR MILITARY TRAINING ROUTES (VR) — Routes used by the Department of Defense and associated Reserve and Air Guard units for the purpose of conducting low-altitude navigation and tactical training under VFR below 10,000 feet MSL at airspeeds in excess of 250 knots IAS. [Jep-pesen does not chart these routes]

VFR NOT RECOMMENDED — An advisory provided by a flight service station to a pilot during a preflight or inflight weather briefing that flight under visual flight rules is not recommended. To be given when the current and/or forecast weather conditions are at or below VFR minimums. It does not abrogate the pilot's authority to make his/her own decision.

VFR-ON-TOP — ATC authorization for an IFR aircraft to operate in VFR conditions at any appropriate VFR altitude (as specified in 14 CFR and as restricted by ATC). A pilot receiving this authorization must comply with the VFR visibility, distance from cloud criteria, and the minimum IFR altitudes specified in 14 CFR Part 91. The use of this term does not relieve controllers of their responsibility to separate aircraft in Class B and Class C airspace or TRSAs as required by FAA Order JO 7110.65.

VFR TERMINAL AREA CHARTS — (See AERONAUTICAL CHART.)

VFR WAYPOINT — (See WAYPOINT.)

VHF — (See VERY HIGH FREQUENCY.)

VHF OMNIDIRECTIONAL RANGE/TACTICAL AIR NAVIGATION — (See VORTAC.)

VIDEO MAP — An electronically displayed map on the radar display that may depict data such as airports, heliports, runway centerline extensions, hospital emergency landing areas, NAVAIDS and fixes, reporting points, airway/route centerlines, boundaries, handoff points, special use tracks, obstructions, prominent geographic features, map alignment indicators, range accuracy marks, and/or minimum vectoring altitudes.

VISIBILITY — The ability, as determined by atmospheric conditions and expressed in units of distance, to see and identify prominent unlighted objects by day and prominent lighted objects by night. Visibility is reported as statute miles, hundreds of feet or meters.

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

- a. Flight Visibility — The average forward horizontal distance, from the cockpit of an aircraft in flight, at which prominent unlighted objects may be seen and identified by day and prominent lighted objects may be seen and identified by night.

PILOT/CONTROLLER GLOSSARY

V

- b. Ground Visibility — Prevailing horizontal visibility near the earth's surface as reported by the United States National Weather Service or an accredited observer.
- c. Prevailing Visibility — The greatest horizontal visibility equaled or exceeded throughout at least half the horizon circle which need not necessarily be continuous.
- d. Runway Visual Range (RVR) — An instrumentally derived value, based on standard calibrations, that represents the horizontal distance a pilot will see down the runway from the approach end. It is based on the sighting of either high intensity runway lights or on the visual contrast of other targets whichever yields the greater visual range. RVR, in contrast to prevailing or runway visibility, is based on what a pilot in a moving aircraft should see looking down the runway. RVR is horizontal visual range, not slant visual range. It is based on the measurement of a transmissometer made near the touchdown point of the instrument runway and is reported in hundreds of feet. RVR, where available, is used in lieu of prevailing visibility in determining minimums for a particular runway.
 - 1. *Touchdown RVR* — The RVR visibility readout values obtained from RVR equipment serving the runway touchdown zone.
 - 2. *Mid-RVR* — The RVR readout values obtained from RVR equipment located midfield of the runway.
 - 3. *Rollout RVR* — The RVR readout values obtained from RVR equipment located nearest the rollout end of the runway.

(See ICAO term FLIGHT VISIBILITY.)

(See ICAO term GROUND VISIBILITY.)

(See ICAO term RUNWAY VISUAL RANGE.)

(See ICAO term VISIBILITY.)

VISIBILITY [ICAO] — The ability, as determined by atmospheric conditions and expressed in units of distance, to see and identify prominent unlighted objects by day and prominent lighted objects by night.

- a. Flight Visibility — The visibility forward from the cockpit of an aircraft in flight.
- b. Ground Visibility — The visibility at an aerodrome as reported by an accredited observer.
- c. Runway Visual Range [RVR] — The range over which the pilot of an aircraft on the centerline of a runway can see the runway surface markings or the lights delineating the runway or identifying its centerline.

VISUAL APPROACH — An approach conducted on an instrument flight rules (IFR) flight plan which authorizes the pilot to proceed visually and clear of clouds to the airport. The pilot must, at all times, have either the airport or the preceding aircraft in sight. This approach must be authorized and under the control of the appropriate air traffic control facility. Reported weather at the airport must be: ceiling at or above 1,000 feet, and visibility of 3 miles or greater.

(See ICAO term VISUAL APPROACH.)

PILOT/CONTROLLER GLOSSARY

V

VISUAL APPROACH [ICAO] — An approach by an IFR flight when either part or all of an instrument approach procedure is not completed and the approach is executed in visual reference to terrain.

VISUAL APPROACH SLOPE INDICATOR (VASI) — (See AIRPORT LIGHTING.)

VISUAL CLIMB OVER AIRPORT (VCOA) — A departure option for an IFR aircraft, operating in visual meteorological conditions equal to or greater than the specified visibility and ceiling, to visually conduct climbing turns over the airport to the published “climb-to” altitude from which to proceed with the instrument portion of the departure. VCOA procedures are developed to avoid obstacles greater than 3 statute miles from the departure end of the runway as an alternative to complying with climb gradients greater than 200 feet per nautical mile. Pilots are responsible to advise ATC as early as possible of the intent to fly the VCOA option prior to departure. These textual procedures are published in the ‘Take-Off Minimums and (Obstacle) Departure Procedures’ section of the Terminal Procedures Publications and/or appear as an option on a Graphic ODP.

(See AIM.)

VISUAL DESCENT POINT — A defined point on the final approach course of a nonprecision straight-in approach procedure from which normal descent from the MDA to the runway touchdown point may be commenced, provided the approach threshold of that runway, or approach lights, or other markings identifiable with the approach end of that runway are clearly visible to the pilot.

VISUAL FLIGHT RULES — Rules that govern the procedures for conducting flight under visual conditions. The term “VFR” is also used in the United States to indicate weather conditions that are equal to or greater than minimum VFR requirements. In addition, it is used by pilots and controllers to indicate type of flight plan.

(See INSTRUMENT FLIGHT RULES.)

(See INSTRUMENT METEOROLOGICAL CONDITIONS.)

(See VISUAL METEOROLOGICAL CONDITIONS.)

(Refer to 14 CFR Part 91.)

(Refer to AIM.)

VISUAL HOLDING — The holding of aircraft at selected, prominent geographical fixes which can be easily recognized from the air.

(See HOLDING FIX.)

VISUAL METEOROLOGICAL CONDITIONS — Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling equal to or better than specified minima.

(See INSTRUMENT FLIGHT RULES.)

(See INSTRUMENT METEOROLOGICAL CONDITIONS.)

(See VISUAL FLIGHT RULES.)

PILOT/CONTROLLER GLOSSARY

V

VISUAL OBSERVER (VO) — A person who is designated by the remote pilot in command to assist the remote pilot in command and the person operating the flight controls of the small UAS (sUAS) to see and avoid other air traffic or objects aloft or on the ground.

VISUAL SEGMENT — (See PUBLISHED INSTRUMENT APPROACH PROCEDURE VISUAL SEGMENT.)

VISUAL SEPARATION — A means employed by ATC to separate aircraft in terminal areas and en route airspace in the NAS. There are two ways to effect this separation:

- a. The tower controller sees the aircraft involved and issues instructions, as necessary, to ensure that the aircraft avoid each other.
- b. A pilot sees the other aircraft involved and upon instructions from the controller provides his/her own separation by maneuvering his/her aircraft as necessary to avoid it. This may involve following another aircraft or keeping it in sight until it is no longer a factor.

(See SEE AND AVOID.)

(Refer to 14 CFR Part 91.)

VLF — (See VERY LOW FREQUENCY.)

VMC — (See VISUAL METEOROLOGICAL CONDITIONS.)

VOICE SWITCHING AND CONTROL SYSTEM (VSCS) — A computer controlled switching system that provides air traffic controllers with all voice circuits (air to ground and ground to ground) necessary for air traffic control.

(Refer to AIM.)

VOR — A ground-based electronic navigation aid transmitting very high frequency navigation signals, 360 degrees in azimuth, oriented from magnetic north. Used as the basis for navigation in the National Airspace System. The VOR periodically identifies itself by Morse Code and may have an additional voice identification feature. Voice features may be used by ATC or FSS for transmitting instructions/information to pilots.

(See NAVIGATIONAL AID.)

(Refer to AIM.)

VOR TEST SIGNAL — (See VOT.)

VORTAC — A navigation aid providing VOR azimuth, TACAN azimuth, and TACAN distance measuring equipment (DME) at one site.

(See DISTANCE MEASURING EQUIPMENT.)

(See NAVIGATIONAL AID.)

(See TACAN.)

(See VOR.)

(Refer to AIM.)

PILOT/CONTROLLER GLOSSARY**V**

VORTICES — Circular patterns of air created by the movement of an airfoil through the air when generating lift. As an airfoil moves through the atmosphere in sustained flight, an area of low pressure is created above it. The air flowing from the high pressure area to the low pressure area around and about the tips of the airfoil tends to roll up into two rapidly rotating vortices, cylindrical in shape. These vortices are the most predominant parts of aircraft wake turbulence and their rotational force is dependent upon the wing loading, gross weight, and speed of the generating aircraft. The vortices from medium to super aircraft can be of extremely high velocity and hazardous to smaller aircraft.

(See AIRCRAFT CLASSES.)

(See WAKE TURBULENCE.)

(Refer to AIM.)

VOT — A ground facility which emits a test signal to check VOR receiver accuracy. Some VOTs are available to the user while airborne, and others are limited to ground use only.

(See CHART SUPPLEMENT U.S.)

(Refer to 14 CFR Part 91.)

(Refer to AIM [Jeppesen Radio Aids Section].)

VR — (See VFR MILITARY TRAINING ROUTES.)

VSCS — (See VOICE SWITCHING AND CONTROL SYSTEM.)

VTOL AIRCRAFT — (See VERTICAL TAKEOFF AND LANDING AIRCRAFT.)

PILOT/CONTROLLER GLOSSARY
W

WA — (See AIRMET.)

(See WEATHER ADVISORY.)

WAAS — (See WIDE-AREA AUGMENTATION SYSTEM.)

WAKE RE-CATEGORIZATION (RECAT) — A set of optimized wake separation standards, featuring an increased number of aircraft wake categories, in use at select airports, which allows reduced wake intervals.

(See WAKE TURBULENCE.)

WAKE TURBULENCE — A phenomenon that occurs when an aircraft develops lift and forms a pair of counter-rotating vortices.

(See AIRCRAFT CLASSES.)

(See JET BLAST.)

(See VORTICES.)

(Refer to AIM.)

WARNING AREA — (See SPECIAL USE AIRSPACE.)

WAYPOINT — A predetermined geographical position used for route/instrument approach definition, progress reports, published VFR routes, visual reporting points or points for transitioning and/or circumnavigating controlled and/or special use airspace, that is defined relative to a VORTAC station or in terms of latitude/longitude coordinates.

WEATHER ADVISORY — In aviation weather forecast practice, an expression of hazardous weather conditions not predicted in the Aviation Surface Forecast, Aviation Cloud Forecast, or area forecast, as they affect the operation of air traffic and as prepared by the NWS.

(See AIRMET.)

(See SIGMET.)

WEATHER RECONNAISSANCE AREA (WRA) — A WRA is airspace with defined dimensions and published by Notice to Air Missions, which is established to support weather reconnaissance/research flights. Air traffic control services are not provided within WRAs. Only participating weather reconnaissance/research aircraft from the 53rd Weather Reconnaissance Squadron and National Oceanic and Atmospheric Administration Aircraft Operations Center are permitted to operate within a WRA. A WRA may only be established in airspace within U.S. Flight Information Regions outside of U.S. territorial airspace.

WHEN ABLE —

- a. In conjunction with ATC instructions, gives the pilot the latitude to delay compliance until a condition or event has been reconciled. Unlike “pilot discretion,” when instructions are prefaced “when able,” the pilot is expected to seek the first opportunity to comply.
- b. In conjunction with a weather deviation clearance, requires the pilot to determine when he/she is clear of weather, then execute ATC instructions.

PILOT/CONTROLLER GLOSSARY
W

- c. Once a maneuver has been initiated, the pilot is expected to continue until the specifications of the instructions have been met. "When able," should not be used when expeditious compliance is required.

WIDE-AREA AUGMENTATION SYSTEM (WAAS) — The WAAS is a satellite navigation system consisting of the equipment and software which augments the GPS Standard Positioning Service (SPS). The WAAS provides enhanced integrity, accuracy, availability, and continuity over and above GPS SPS. The differential correction function provides improved accuracy required for precision approach.

WIDE AREA MULTILATERATION (WAM) — A distributed surveillance technology which may utilize any combination of signals from Air Traffic Control Radar Beacon System (ATCRBS) (Modes A and C) and Mode S transponders, and ADS-B transmissions. Multiple geographically dispersed ground sensors measure the time-of-arrival of the transponder messages. Aircraft position is determined by joint processing of the time-difference-of-arrival (TDOA) measurements computed between a reference and the ground stations' measured time-of-arrival.

WILCO — I have received your message, understand it, and will comply with it.

WIND GRID DISPLAY — A display that presents the latest forecasted wind data overlaid on a map of the ARTCC area. Wind data is automatically entered and updated periodically by transmissions from the National Weather Service. Winds at specific altitudes, along with temperatures and air pressure can be viewed.

WIND SHEAR — A change in wind speed and/or wind direction in a short distance resulting in a tearing or shearing effect. It can exist in a horizontal or vertical direction and occasionally in both.

WIND SHEAR ESCAPE — An unplanned abortive maneuver initiated by the pilot in command (PIC) as a result of onboard cockpit systems. Wind shear escapes are characterized by maximum thrust climbs in the low altitude terminal environment until wind shear conditions are no longer detected.

WING TIP VORTICES — (See VORTICES.)

WORDS TWICE —

- a. As a request: "Communication is difficult. Please say every phrase twice."
- b. As information: "Since communications are difficult, every phrase in this message will be spoken twice."

WS — (See SIGMET.)

(See WEATHER ADVISORY.)

WST — (See CONVECTIVE SIGMET.)

(See WEATHER ADVISORY.)

UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**1 RVSM AIRSPACE: DATE, TIME AND AIRSPACE WHERE IMPLEMENTED**

1.1 As of January 20, 2005 at 0901 UTC, the following FAA controlled airspace has been designated as RVSM airspace between FL290-410 (inclusive):

- The entire San Juan FIR
- The New York Oceanic FIR South of 27 degrees North latitude
- All Atlantic High Offshore and Gulf of Mexico High Offshore Airspace
- The lower 48 states of the U.S. and Alaska

1.2 On the same date and time, RVSM has also been implemented in the following airspace where other authorities provide Air Traffic Services:

- Canadian Southern Domestic Airspace
- Mexican Airspace
- The airspace of the Caribbean and South American regions

1.3 RVSM was implemented between FL290-410 (inclusive) in the New York FIR portion of WATRS airspace in November 2001.

NOTE: RVSM airspace is “exclusionary” airspace. Prior to operating in designated RVSM airspace, with only limited exceptions, operators and aircraft must have received authorization from the responsible civil aviation authority. See 10.1 for policies on Non-RVSM aircraft.

2 FLIGHT LEVEL ALLOCATION SCHEME (FLAS)

Altitude assignments for direction of flight follows a scheme of odd altitude assignment for magnetic courses 000-179 degrees and even altitudes for magnetic courses 180-359 degrees for flights up to and including FL410.

3 ELIMINATION OF RVSM TRANSITION AREAS

Effective January 20, 2005 at 0901 UTC, airspace previously designated as “RVSM transition areas” has been designated as RVSM airspace. This includes the airspace within the San Juan CERAP and the Offshore airspace of the Miami, Jacksonville, Washington, and Boston ARTCCs directly adjacent to the New York Oceanic FIR.

4 SOURCES OF RVSM INFORMATION: FAA RVSM HOMEPAGE AND RVSM DOCUMENTATION WEBPAGE

4.1 The FAA maintains a Website containing documents and policy related to RVSM operations in various regions of the world. The FAA RVSM Homepage address is: www.faa.gov/ats/ato/rvsm1.htm. The RVSM Documentation Webpage is linked to the RVSM Homepage. The RVSM Documentation Webpage contains sections on RVSM Approval, Monitoring Requirements and Procedures, Registration on RVSM Approvals Databases and Area of Operations Specific Operational Policy and Procedures.

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

4.2 The FAA Webpage has links to Websites in other regions such as Europe, Caribbean and South America and Asia/Pacific.

5 AIRWORTHINESS AND OPERATIONAL APPROVAL, APPROVALS DATABASES, AND MONITORING

5.1 Approval Process. Operators must obtain operational approval from the State of Registry or State of the Operator, as appropriate, to conduct RVSM operations. The documents listed below are found on the RVSM Documentation Webpage.

- a. "RVSM Approval Checklist - US Operators" or "RVSM Approval Checklist - Non-US Operators" (as applicable). These are job aids or check lists found in the "Getting Started" section that show aircraft and operator approval process events with references to related information in RVSM documents published on the Webpage.
- b. "RVSM Area New to the Operator". This document provides a guide for operators that are conducting RVSM operations in one or more areas of operation, but are planning to conduct RVSM operations in an area where they have not previously conducted RVSM operations.

5.2 Registration On Approvals Database. In accordance with regional agreements, State civil aviation authorities must maintain a State database of RVSM approved operators and airframes for which they are responsible. In addition, they are responsible for providing database information to the appropriate regional central monitoring agency.

- a. **Registration Of U.S. Operators.** The Separation Standards Group at the FAA Technical Center maintains the U.S. database of RVSM approved airframes and operators. The Separation Standards Group obtains the required information on U.S. operators and airframes directly from the FAA Flight Standards (AFS) Program Tracking and Reporting Subsystem (PTRS). The "Registration on RVSM Approvals Databases" section of the RVSM Documentation Webpage explains this process for U.S. operators. Once an operator has completed the approval process with the appropriate AFS field office, no further action is required on the part of the operator.
- b. **Registration Of Non-U.S. Operators.** The "Registration on RVSM Approvals Databases" section of the RVSM Documentation Webpage provides contacts and information on various regional databases such as the Caribbean and South American Monitoring Agency (CAR-SAMMA) and the North Atlantic Central Monitoring Agency (NAT CMA).

5.3 Aircraft Monitoring. Operators are required to participate in the RVSM aircraft monitoring program. This is an essential element of the RVSM Implementation program in that it confirms that the aircraft altitude-keeping performance standard is being met. For information on RVSM monitoring, see the "Monitoring Requirements and Procedures" section of the RVSM Documentation Webpage.

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

6 TCAS II VERSION 7.0 (ACAS II)

6.1 U.S. OPERATORS

- a. TCAS requirements for U.S. operator flying in airspace where RVSM is applied are established in 14 CFR Part 91 Appendix G. Appendix G (Operations in RVSM Airspace) states that, unless otherwise authorized by the FAA, aircraft equipped with TCAS II and used in RVSM operations must incorporate Version 7.0 or a later version.
- b. For operations within other countries, U.S. operators are reminded that Part 91 Section 91.703 requires them to "...comply with the regulations relating to flight and maneuver of aircraft there in force".

6.2 NON U.S. OPERATORS

ICAO Annex 6, Part I (International Commercial Air Transport Airplanes). Operators should confirm ACAS II equipage requirements applicable to them with the responsible State authority. Regional groups for the North Atlantic, Caribbean and South America have advocated that States adopt the standards of ICAO Annex 6, part I. The Part I standard is: from 1 January 2005, turbine-engined airplanes with a maximum certificated take-off mass in excess of 5700 kg or authorized to carry more than 19 passengers shall be equipped with ACAS II.

7 PILOT-CONTROLLER PHRASEOLOGY

Pilot-controller phraseology is provided below. It is the same as that used in Domestic U.S. RVSM operations.

STANDARD PHRASEOLOGY FOR RVSM OPERATIONS

Message	Phraseology
For a controller to ascertain the RVSM approval status of an aircraft:	(call sign) confirm RVSM approved
Pilot indication that flight is RVSM approved	Affirm RVSM

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

STANDARD PHRASEOLOGY FOR RVSM OPERATIONS (continued)

Message	Phraseology
Pilot will report lack of RVSM approval (Non-RVSM status): a. On the initial call on any frequency in the RVSM airspace and; b. In all requests for flight level changes pertaining to flight levels within the RVSM airspace and; c. In all read-backs to flight level clearances pertaining to flight levels within the RVSM airspace and; d. In read back of flight level clearances involving climb and descent through RVSM airspace (FL290-410)	Negative RVSM, (supplementary information, e.g., "Certification flight").
Pilot report of one of the following after entry into RVSM airspace: all primary altimeters, automatic altitude control systems or altitude alerters have failed. (This phrase is to be used to convey both the initial indication of RVSM aircraft system failure and on initial contact on all frequencies in RVSM airspace until the problem ceases to exist or the aircraft has exited RVSM airspace).	Unable RVSM Due Equipment
ATC denial of clearance into RVSM airspace	Unable issue clearance into RVSM airspace, maintain FL____.
Pilot reporting inability to maintain cleared flight level due to weather encounter	Unable RVSM due (state reason) (e.g., turbulence, mountain wave)
ATC requesting pilot to confirm that an aircraft has regained RVSM-approved status or a pilot is ready to resume RVSM	Confirm able to resume RVSM
Pilot ready to resume RVSM after aircraft system or weather contingency	Ready to resume RVSM

8 FLIGHT PLANNING REQUIREMENTS

8.1 Unless special arrangement is made as detailed below, RVSM approval is required for aircraft to operate within designated RVSM airspace. The operator must determine that the appropri-

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

ate State authority has approved the aircraft and will meet the RVSM requirements for the filed route of flight and any planned alternate routes.

8.2 ICAO Flight Plan. The letter “W” shall be inserted in item 10 (Equipment) of the ICAO standard flight plan to indicate that the aircraft is RVSM approved.

8.3 FAA Flight Plan. The letter “W” or the letter “Q” shall be inserted in block 3 of the FAA Flight Plan for flight in RVSM airspace. Letter “W” indicates RVSM approval only. Letter “Q” indicates both RVSM and Advanced RNAV capabilities. See the FAA Notice, “Revised Aircraft Equipment Suffix Table For FAA Flight Plans”. It is posted in the North American RVSM section of the RVSM Documentation Webpage.

9 BASIC IN-FLIGHT PROCEDURES WITHIN RVSM AIRSPACE

9.1 Basic Pilot Procedures. Basic pilot procedures for operation in RVSM airspace are published in Appendix 4 of Guidance 91-RVSM. 91-RVSM is posted on the FAA RVSM Documentation Webpage. Some significant policies published in Appendix 4 are:

- a. Before entering RVSM airspace, the pilot should review the status of required equipment and the following equipment should be operating normally:
 1. Two primary altimetry systems.
 2. One automatic altitude-keeping device.
 3. One altitude-alerting device.
- b. The pilot must notify ATC whenever the aircraft:
 1. Is no longer RVSM compliant due to equipment failure.
 2. Experiences loss of redundancy of altimetry systems.
 3. Encounters turbulence that affects the capability to maintain flight level.

9.1.1 Guidance for Pilots and Controllers for Actions in the Event of Aircraft System Malfunctions or Turbulence Greater than Moderate

Contingency Scenarios

The following paragraphs summarize pilot action to mitigate the potential for conflict with other aircraft in certain contingency situations. They should be reviewed in conjunction with the expanded contingency scenarios which contain additional technical and operational details.

Scenario 1: The pilot is: (a) unsure of the vertical position of the aircraft due to the loss or degradation of all primary altimetry systems, or (b) unsure of the capability to maintain

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

cleared flight level (CFL) due to turbulence or loss of all automatic altitude control systems.

The Pilot should:	ATC can be expected to:
Maintain CFL while evaluating the situation;	
Watch for conflicting traffic both visually and by reference to ACAS, if equipped;	
If considered necessary, alert nearby aircraft by (a) making maximum use of exterior lights; (b) broadcasting position, FL, and intentions on 121.5 MHz (as a backup, the VHF inter-pilot air-to-air frequency, 123.45 MHz, may be used).	
Notify ATC of the situation and intended course of action. Possible courses of action include: (a) maintaining the CFL and route provided that ATC can provide lateral, longitudinal or conventional vertical separation.	Obtain the pilot's intentions and pass essential traffic information.
(b) requesting ATC clearance to climb above or descend below RVSM airspace if the aircraft cannot maintain CFL and ATC cannot establish adequate separation from other aircraft.	(a) If the pilot intends to continue in RVSM airspace, assess traffic situation to determine if the aircraft can be accommodated through the provision of lateral, longitudinal, or conventional vertical separation; and, if so, apply the appropriate minimum. (b) If the pilot requests clearance to exit RVSM airspace, accommodate expeditiously, if possible.
(c) executing the Doc 7030 contingency maneuver to offset from the assigned track and FL, if ATC clearance cannot be obtained and the aircraft cannot maintain CFL.	(c) If adequate separation cannot be established and it is not possible to comply with the pilot's request for clearance to exit RVSM airspace, advise the pilot of essential traffic information, notify other aircraft in the vicinity and continue to monitor the situation.
	Notify adjoining ATC facilities/sectors of the situation.

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

Scenario 2: There is a failure or loss of accuracy of one primary altimetry system (e.g., greater than 200 feet difference between primary altimeters).

The Pilot should:	
Cross check standby altimeter, confirm the accuracy of a primary altimeter system and notify ATC of the loss of redundancy. If unable to confirm primary altimeter system accuracy, follow pilot actions listed in the preceding scenario.	

Expanded Equipment Failure And Turbulence Encounter Scenarios

Operators may consider this material for use in training programs.

Scenario 1: All automatic altitude control systems fail (e.g., Automatic Altitude Hold)

The Pilot should:	ATC can be expected to:
Initially	
Maintain CFL	
Evaluate the aircraft's capability to maintain altitude through manual control.	
Subsequently	
Watch for conflicting traffic both visually and by reference to ACAS, if equipped.	
If considered necessary, alert nearby aircraft by (a) making maximum use of exterior lights; (b) broadcasting position, FL, and intentions on 121.5 MHz (as a backup, the VHF inter-pilot air-to-air frequency, 123.45 MHz, may be used).	
Notify ATC of the failure and intended course of action. Possible courses of action include:	
(a) maintaining the CFL and route provided that the aircraft can maintain level.	(a) If the pilot intends to continue in RVSM airspace, assess traffic situation to determine if the aircraft can be accommodated through the provision of lateral, longitudinal, or conventional vertical separation; and, if so, apply the appropriate minimum.

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

Scenario 1: All automatic altitude control systems fail (e.g., Automatic Altitude Hold) (continued)

The Pilot should:	ATC can be expected to:
(b) requesting ATC clearance to climb above or descend below RVSM airspace if the aircraft cannot maintain CFL and ATC cannot establish lateral, longitudinal or conventional vertical separation.	(b) If the pilot requests clearance to exit RVSM airspace, accommodate expeditiously, if possible.
(c) executing the Doc 7030 contingency maneuver to offset from the assigned track and FL, if ATC clearance cannot be obtained and the aircraft cannot maintain CFL.	(c) If adequate separation cannot be established and it is not possible to comply with the pilot's request for clearance to exit RVSM airspace, advise the pilot of essential traffic information, notify other aircraft in the vicinity and continue to monitor the situation.
	Notify adjoining ATC facilities/sectors of the situation.

Scenario 2: Loss of redundancy in primary altimetry systems

The Pilot should:	ATC can be expected to:
If the remaining altimetry system is functioning normally, couple that system to the automatic altitude control system, notify ATC of the loss of redundancy and maintain vigilance of altitude keeping.	Acknowledge the situation and continue to monitor progress.

Scenario 3: All primary altimetry systems are considered unreliable or fail

The Pilot should:	ATC can be expected to:
Maintain CFL by reference to the standby altimeter (if the aircraft is so equipped).	
Alert nearby aircraft by: (a) making maximum use of exterior lights; (b) broadcasting position, FL, and intentions on 121.5 MHz (as a backup, the VHF inter-pilot air-to-air frequency, 123.45 MHz, may be used).	

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

Scenario 3: All primary altimetry systems are considered unreliable or fail (continued)

The Pilot should:	ATC can be expected to:
Consider declaring an emergency. Notify ATC of the failure and intended course of action. Possible courses of action include:	Obtain pilot's intentions, and pass essential traffic information.
(a) maintaining CFL and route provided that ATC can provide lateral, longitudinal or conventional vertical separation.	(a) If the pilot intends to continue in RVSM airspace, assess traffic situation to determine if the aircraft can be accommodated through the provision of lateral, longitudinal, or conventional vertical separation; and, if so, apply the appropriate minimum.
(b) requesting ATC clearance to climb above or descend below RVSM airspace if ATC cannot establish adequate separation from other aircraft.	(b) If the pilot requests clearance to exit RVSM airspace, accommodate expeditiously, if possible.
(c) executing the Doc 7030 contingency maneuver to offset from the assigned track and FL, if ATC clearance cannot be obtained.	(c) If adequate separation cannot be established and it is not possible to comply with the pilot's request for clearance to exit RVSM airspace, advise the pilot of essential traffic information, notify other aircraft in the vicinity and continue to monitor the situation.
	Notify adjoining ATC facilities/sectors of the situation.

Scenario 4: The primary altimeters diverge by more than 200 ft (60 m)

The Pilot should:	
Attempt to determine the defective system through established trouble-shooting procedures and/or comparing the primary altimeter display to the standby altimeter (as corrected by the correction cards, if required).	
If the defective system can be determined, couple the functioning altimeter system to the altitude-keeping device.	
If the defective system cannot be determined, follow the guidance in Scenario 3 for failure or unreliable altimeter indications of all primary altimeters.	

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

Scenario 5: Turbulence (greater than moderate) which the pilot believes will impact the aircraft's capability to maintain flight level

The Pilot should:	ATC can be expected to:
Watch for conflicting traffic both visually and by reference to TCAS, if equipped.	
If considered necessary, alert nearby aircraft by (a) making maximum use of exterior lights; (b) broadcasting position, FL, and intentions on 121.5 MHz (as a backup, the VHF inter-pilot air-to-air frequency, 123.45 MHz, may be used).	
Notify ATC of the situation and intended course of action. Possible courses of action include:	
(a) maintaining CFL and route ATC can provide lateral, longitudinal or conventional vertical separation.	(a) Assess traffic situation to determine if the aircraft can be accommodated through the provision of lateral, longitudinal, or conventional vertical separation; and, if so, apply the appropriate minimum.
(b) requesting flight level change, if necessary.	(b) If unable to provide adequate separation, advise the pilot of essential traffic information and request pilot's intentions.
(c) executing the Doc 7030 contingency maneuver to offset from the assigned track and FL, if ATC clearance cannot be obtained and the aircraft cannot maintain CFL.	(c) Notify other aircraft in the vicinity and monitor the situation.
	Notify adjoining ATC facilities/sectors of the situation.

9.2 TRANSITION BETWEEN FLIGHT LEVELS

During cleared transition between levels, the aircraft should not overshoot or undershoot the assigned FL by more than 150 ft (45 m).

9.3 PILOT LEVEL CALL

Except in a radar environment, pilots shall report reaching any altitude assigned within RVSM airspace.

UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**10 PROCEDURES FOR OPERATION OF NON-RVSM AIRCRAFT
IN OCEANIC RVSM AIRSPACE IN WATRS AND THE SAN
JUAN FIR**

10.1 Non-RVSM Aircraft. If either the operator or aircraft or both have not been authorized to conduct RVSM operations, the aircraft will be referred to as a “Non-RVSM” aircraft. (Paragraph 10.5 below identifies categories of Non-RVSM aircraft that may be accommodated in RVSM airspace).

10.2 Flight Priority. It should be noted that RVSM approved aircraft will be given priority for level allocation over non-RVSM approved aircraft.

10.3 Vertical Separation Applied. The vertical separation minimum between non-RVSM aircraft operating in the RVSM stratum and all other aircraft is 2,000 ft.

10.4 Continuous Climb/descent Of Non-RVSM Aircraft Through RVSM Airspace. Non-RVSM aircraft may be cleared to climb to and operate above FL410 or descend to and operate below FL290 provided that they:

- a. Do not climb or descend at less than the normal rate for the aircraft.
- b. Do not level off at an intermediate level while passing through the RVSM stratum.

10.5 Special Coordination Procedures For Cruise Operation Of Non-RVSM Aircraft In Oceanic RVSM Airspace.

- a. Only certain categories of Non-RVSM aircraft may flight plan to cruise in RVSM airspace. After special coordination as detailed in c. below, the following Non-RVSM aircraft may flight plan at RVSM flight levels:
 - Department of Defense (DoD) aircraft
 - Flights conducted for aircraft certification and development purposes
 - Air ambulance flights conducted using a Lifeguard call sign
 - Non-U.S. State aircraft operating in the conduct of official government functions. (Non-U.S. State aircraft are aircraft used by other States (countries) in military, custom, and police services).
- b. Non-RVSM State Aircraft. ATC Notification of non-RVSM compliant State aircraft is accomplished through filing of an ICAO flight plan. In Field 18 of the ICAO Flight Plan, include “STS/APVD NONRVSM.”

NOTE: New York Oceanic or San Juan Center, as appropriate, will coordinate Non-RVSM status with any affected adjacent FIR or facility.

- c. Operator Actions. Aircraft operators in the categories described in a. above requesting approval shall:
 1. If departing from, or transiting through the New York portion of WATRS or the San Juan FIR, and initial entry into an RVSM exclusive environment is the New York FIR or the San Juan FIR, obtain approval from New York Center or San Juan Center normally not more than 24 hours and not less than 4 hours prior to intended departure time.

UNITED STATES REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)

NOTE: Aircraft utilizing the call sign "LN" and the radiotelephone "Lifeguard", are exempt from the requirements contained in c.1. above and c.3. below. Filing a flight plan constitutes sufficient notification as required by this paragraph.

2. Include "STS/APVD NON RVSM" in Field 18 of the ICAO Flight Plan.
3. For operations into the New York Oceanic FIR, after departure, the pilot shall notify the ATC facility (on VHF) adjacent to the New York boundary that approval has been obtained from New York Center.
4. In all operations of Non-RVSM aircraft in RVSM airspace, when communicating with air traffic, pilots will follow the direction of 7. above (**PILOT-CONTROLLER PHRASEOLOGY**) and state "Negative RVSM" as directed.

NOTE: Approval means able to operate in the RVSM stratum. Aircraft operating levels will be subject to Air Traffic Control.

- d. Contact details for approval request are as follows:

New York Center

Tel: (631) 468-1495 or (631) 468-5959

San Juan Center

Tel: (787) 253-8664 or (787) 253-8665

10.6 This approval process is intended exclusively for the purposes indicated above and not as a means to circumvent the normal RVSM approval process.

11 PROCEDURES FOR SUSPENSION OF RVSM IN OCEANIC AIRSPACE

11.1 "Suspending" RVSM in this paragraph refers to increasing the vertical separation minimum between all aircraft to 2,000 ft. Air Traffic Service providers will consider suspending RVSM procedures when there are pilot reports of greater than moderate turbulence within affected areas in the New York Oceanic FIR and in oceanic areas in the San Juan FIR. The provision to suspend RVSM will normally only be considered for oceanic areas where direct controller-pilot VHF or UHF voice communication and radar surveillance is not available.

11.2 In the event that RVSM is suspended in an oceanic airspace in WATRS and/or the San Juan FIR, a NOTAM will be issued.

12 HEIGHT DEVIATION REPORTING

12.1 The successful implementation of RVSM in any airspace is dependent on regular monitoring of airspace system safety. An important part of that monitoring program is the reporting of height deviations 300 feet or more from the assigned flight level. Any deviation which is 300 feet or more from the assigned level in RVSM or RVSM Transition airspace, whether intentional or not, should be reported to the appropriate Regional Monitoring Agency.

12.2 Historically, these events have been spawned by several causes:

- a. Misunderstandings between aircrew and ATC facility regarding the assigned flight level.

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

- b. Maneuvering an aircraft away from the assigned flight level.
- c. Responding to contingency events, prior to offsetting laterally from the adjacent track.
- d. Negotiating meteorological effects (turbulence).
- e. Equipment failure.
- f. Responding to TCAS RA and TA.

12.3 The “Altitude Deviation Report Form” for reporting these events is an attachment to the North Atlantic (NAT) MNPS Airspace Operations Manual. This manual is posted in the “MNPSA” section of the NAT Program Coordination Office Website (www.nat-pco.org). The form may be filed at the completion of the flight or it may be filed by the controlling ATC facility, as appropriate. It should be sent to:

Separation Standards Group

FAA William J. Hughes Technical Center

Fax: +01 609 485 5117

North Atlantic Central Monitoring Agency

Fax: +44 1292 692 754

E-Mail: natcma@nats.co.uk;

Caribbean and South American Regions Monitoring Agency

Fax: 55 (12) 39 41 70 55

Internet: www.cgna.gov.br/carsam/Ingles/index.htm

12.4 The data compiled from reports is reviewed regularly and summarized to prepare an estimate of safety for the WATRS airspace. From this information, improved procedures and practices are recommended.

13 IN-FLIGHT CONTINGENCIES IN OCEANIC AIRSPACE— GENERAL PROCEDURES

13.1 The following general procedures apply to both subsonic and supersonic aircraft and are intended for guidance only. Although all possible contingencies cannot be covered, they provide for cases of inability to maintain assigned level due to:

- a. Weather.
- b. Aircraft performance.
- c. Pressurization failure.
- d. Problems associated with high-level supersonic flight.

The procedures are applicable primarily when rapid descent and/or turn-back or diversion to an alternate airport are required. The pilot’s judgment shall determine the sequence of actions taken, taking into account specific circumstances.

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

13.3 If an aircraft is unable to continue flight in accordance with its ATC clearance, a revised clearance shall, whenever possible, be obtained before initiating any action, using a distress or urgency signal as appropriate.

13.4 If prior clearance cannot be obtained, an ATC clearance shall be obtained at the earliest possible time, and, until a revised clearance is received, the pilot shall:

- a. If possible, deviate away from an organized track or route system.
- b. Establish communications with and alert nearby aircraft by broadcasting, at suitable intervals: flight identification, flight level, aircraft position (including the ATS route designator or the track code) and intentions on the frequency in use, as well as on frequency 121.5 (or as a back-up, the inter-pilot air-to-air frequency 123.45).
- c. Watch for conflicting traffic both visually and by reference to ACAS (if equipped).
- d. Turn on all aircraft exterior lights (commensurate with appropriate operating limitations).
- e. Keep the SSR transponder on at all times.

**14 SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES IN
OCEANIC AIRSPACE****14.1 INTRODUCTION**

14.1.1 Although all possible contingencies cannot be covered, the procedures in the following paragraphs provide for the more frequent cases such as:

- a. Inability to comply with assigned clearance due to meteorological conditions;
- b. Enroute diversion across the prevailing traffic flow; and
- c. A loss, or significant reduction, of the required navigation capability when operating in airspace where the navigation performance accuracy is a prerequisite to the safe conduct of flight operations, or in the event of pressurization failure (see below paragraphs).

NOTE: Guidance on procedures to follow when an aircraft experiences a degradation in navigation capabilities can be found in ICAO Doc 4444, Procedures for Air Navigation Services — Air Traffic Management, Chapter 5, section 5.2.2.

14.1.2 The pilot must take action as necessary to ensure the safety of the aircraft. The pilot's judgment shall determine the sequence of actions to be taken with regard to the prevailing circumstances. Air traffic control shall render all possible assistance.

14.2 GENERAL PROCEDURES

NOTE: Figure 14.2.3-1 provides an aid for understanding and applying the contingency procedures contained in the below paragraphs.

14.2.1 If an aircraft is unable to continue the flight in accordance with its ATC clearance, a revised clearance shall be obtained, whenever possible, prior to initiating any action.

14.2.2 If prior clearance cannot be obtained, the following contingency procedures should be employed until a revised clearance is received:

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

- a. Leave the cleared route or track by initially turning at least 30 degrees to the right or to the left in order to intercept a parallel, same direction track or route offset 9.3km (5.0 NM). The direction of the turn should be based on one or more of the following:
 1. Aircraft position relative to any organized track or route system;
 2. The direction of flights and flight levels allocated on adjacent tracks;
 3. The direction to an alternate airport;
 4. Any strategic lateral offset being flown; and
 5. Terrain clearance;
- b. The aircraft should be flown at a flight level and an offset track where other aircraft are less likely to be encountered;
- c. Watch for conflicting traffic both visually and by ACAS (if equipped), leaving ACAS in RA mode at all times unless aircraft operating limits dictate otherwise;
- d. Turn on all aircraft exterior lights (commensurate with appropriate operating limitations);
- e. Keep the SSR transponder on at all times and, when able, squawk 7700, as appropriate;
- f. As soon as practicable, the pilot shall advise air traffic control of any deviation from assigned clearance;
- g. Use whatever means is appropriate (i.e., voice and/or CPDLC) to communicate during a contingency or emergency;
- h. If voice communication is used, the radiotelephony distress signal (MAYDAY) or urgency signal (PAN PAN), preferably spoken three times, shall be used as appropriate;
- i. When emergency situations are communicated via CPDLC, the controller may respond via CPDLC. However, the controller may also attempt to make voice communication contact with the aircraft;
NOTE: Additional guidance on emergency procedures for controllers, radio operators, and flight crew in data link operations can be found in the Global Operational Data Link (GOLD) Manual (Doc 10037).
- j. Establish communications with nearby aircraft by broadcasting at suitable intervals on 121.5 MHz (or as a backup on the inter-pilot air-to-air frequency 123.45 MHz). Also broadcast where appropriate on the frequency in use: aircraft identification, the nature of the distress condition, intention of the person in command, position (including the ATS route designator or the track code, as appropriate), and flight level; and
- k. The controller should attempt to determine the nature of the emergency and ascertain any assistance that may be required. Subsequent ATC action with respect to that aircraft must be based on the intentions of the pilot and overall traffic situation.

UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)

14.2.3 Actions to Be Taken Once Offset from Track

NOTE: The pilot's judgment of the situation and the need to ensure the safety of the aircraft will determine whether the actions outlined below will be taken. Factors for the pilot to consider when diverting from the cleared route or track without an ATC clearance include, but are not limited to: operation within a parallel track system; the potential for User Preferred Routes (UPR) parallel to the aircraft's track or route; the nature of the contingency (for example, aircraft system malfunction); and weather factors (for example, convective weather at lower flight levels).

- a. If possible, maintain the assigned flight level until established on the 9.3km (5.0 NM) parallel, same direction track or route offset. If unable, initially minimize the rate of descent to the extent that is operationally feasible.
- b. Once established on a parallel, same direction track or route offset by 9.3km (5.0 NM), either:
 1. Descend below FL290, establish a 150m (500 ft) vertical offset from those flight levels normally used and proceed as required by the operational situation or, if an ATC clearance has been obtained, proceed in accordance with the clearance; or

NOTE: Descent below FL290 is considered particularly applicable to operations where there is a predominant traffic flow (for example, east-west) or parallel track system where the aircraft's diversion path will likely cross adjacent tracks or routes. A descent below FL290 can decrease the likelihood of conflict with other aircraft, ACAS RA events, and delays in obtaining a revised ATC clearance.

2. Establish a 150m (500 ft) vertical offset (or 300m (1000 ft) vertical offset if above FL410) from those flight levels normally used and proceed as required by the operational situation, or if an ATC clearance has been obtained, proceed in accordance with the clearance.

NOTE: Altimetry system error may lead to less than actual 150m (500 ft) vertical separation when the procedure above is applied. In addition, with the 150m (500 ft) vertical offset applied, ACAS RAs may occur.

UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)

Figure 14.2.3-1 — Visual Aid for Understanding and Applying the Contingency Procedures Guidance

UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**14.3 EXTENDED RANGE OPERATIONS BY AIRCRAFT WITH TWO-TURBINE POWER-UNITS (ETOPS)**

14.3.1 If the contingency procedures are employed by a twin-engine aircraft as a result of an engine shutdown or failure of an ETOPS critical system, the pilot should advise ATC as soon as practicable of the situation, reminding ATC of the type of aircraft involved, and request expeditious handling.

15 WEATHER DEVIATION PROCEDURES**15.1 GENERAL**

NOTE: The following procedures are intended for deviations around adverse meteorological conditions.

15.1.1 When weather deviation is required, the pilot should contact ATC via CPDLC or voice. A rapid response may be obtained by either:

- a. Stating "WEATHER DEVIATION REQUIRED" to indicate that priority is desired on the frequency and for ATC response; or
- b. Requesting a weather deviation using a CPDLC lateral downlink message.

15.1.2 When necessary, the pilot should initiate the communications using the urgency call "PAN PAN" (preferably spoken three times) or by using a CPDLC urgency downlink message.

15.1.3 The pilot shall inform ATC when a weather deviation is no longer required, or when a weather deviation has been completed and the aircraft has returned to its cleared route.

15.2 ACTIONS TO BE TAKEN WHEN CONTROLLER-PILOT COMMUNICATIONS ARE ESTABLISHED

15.2.1 The pilot should notify ATC and request clearance to deviate from track or route, advising when possible the extent of the deviation requested. The flight crew will use whatever means are appropriate (i.e., CPDLC and/or voice) to communicate during a weather deviation.

NOTE: Pilots are advised to contact ATC as soon as possible with requests for clearance in order to provide time for the request to be assessed and acted upon.

15.2.2 ATC should take one of the following actions:

- a. When appropriate separation can be applied, issue clearance to deviate from track; or
- b. If there is conflicting traffic and ATC is unable to establish appropriate separation, ATC should:
 1. Advise the pilot of inability to issue clearance for the requested deviation;
 2. Advise the pilot of conflicting traffic; and
 3. Request the pilot's intentions.

15.2.3 The pilot should take one of the following actions:

- a. Comply with the ATC clearance issued; or

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

- b. Advise ATC of intentions and execute the procedures provided in the below subsection.

15.3 ACTIONS TO BE TAKEN IF A REVISED ATC CLEARANCE CANNOT BE OBTAINED

NOTE: The provisions of this paragraph apply to situations where a pilot needs to exercise the authority of a pilot-in-command under the provisions of ICAO Annex 2, 2.3.1.

15.3.1 If the aircraft is required to deviate from track or route to avoid adverse meteorological conditions, and prior clearance cannot be obtained, an ATC clearance shall be obtained at the earliest possible time. Until an ATC clearance is received, the pilot shall take the following actions:

- a. If possible, deviate away from an organized track or route system;
- b. Establish communications with and alert nearby aircraft by broadcasting at suitable intervals: aircraft identification, flight level, position (including ATS route designator or the track code) and intentions on the frequency in use and on 121.5 MHz (or as a backup on the inter-pilot air-to-air frequency 123.45 MHz);
- c. Watch for conflicting traffic both visually and by reference to ACAS, if equipped;
- d. Turn on all aircraft exterior lights (commensurate with appropriate operating limitations);
- e. For deviations less than 9.3km (5.0 NM) from the originally cleared track or route, remain at a level assigned by ATC;
- f. For deviations greater than or equal to 9.3km (5.0 NM) from the originally cleared track or route, when the aircraft is approximately 9.3km (5.0 NM) from track, initiate a level change in accordance with the below table;
- g. If the pilot receives clearance to deviate from the cleared track or route for a specified distance and subsequently requests but is denied clearance to deviate beyond that distance, the pilot should immediately apply an altitude offset in accordance with the below table;
- h. When returning to track or route, the aircraft should be at the previously assigned flight level prior to a point 9.3km (5.0 NM) from the route centerline.

15.3.2 If contact was not established prior to deviating, continue to attempt to contact ATC to obtain a clearance. If contact was established, continue to keep ATC advised of intentions and obtain essential traffic information.

NOTE: If, as a result of actions taken under the provisions of 15.3.1 above, the pilot determines that there is another aircraft at or near the same flight level with which a conflict may occur, then the pilot is expected to adjust the path of the aircraft as necessary to avoid conflict.

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

Altitude Offset when Denied Clearance to Deviate 9.3km (5.0 NM) or More

Originally Cleared Trace or Route Centerline	Deviations ≥9.3km (5 NM)	Level Change
EAST (000° – 179° magnetic)	LEFT	DESCEND 90m (300 ft)
	RIGHT	CLIMB 90m (300 ft)
WEST (180° – 359° magnetic)	LEFT	CLIMB 90m (300 ft)
	RIGHT	DESCEND 90m (300 ft)

16 STRATEGIC LATERAL OFFSETS IN OCEANIC AIRSPACE TO MITIGATE WAKE TURBULENCE AND TO MITIGATE COLLISION RISK

16.1 Pilots should use the Strategic Lateral Offset Procedure as standard operating practice in the course of normal operations to mitigate collision risk and wake turbulence. The Strategic Lateral Offset Procedure will be in force throughout the New York Oceanic FIR and in oceanic airspace in the San Juan FIR. This procedure is to be used for both wake vortex encounters, and to mitigate the heightened risk of collision when non-normal events such as operational altitude deviation errors and turbulence induced altitude deviations occur due to highly accurate navigational systems.

16.2 Strategic Lateral Offset Procedures will be applied using the following guidelines:

- Strategic lateral offsets and those executed to mitigate the effects of wake turbulence are to be made to the right of a route or track;
- In relation to a route or track, there are three positions that an aircraft may fly: centerline, one or 2 NM right; and,
- Offsets are not to exceed 2 NM right of centerline.

16.3 The intent of this procedure is to reduce risk (increase the safety margin) by distributing aircraft laterally and equally across the three available positions. In this connection, pilots must take account of the following:

- Aircraft without automatic offset programming capability must fly the centerline;
- Aircraft capable of being programmed with automatic offsets may fly the centerline or offset one or 2 NM right of centerline to obtain lateral spacing from nearby aircraft;
- Pilots should use whatever means are available (e.g. TCAS, communications, visual acquisition, GPWS) to determine the best flight path to fly;

**UNITED STATES
REDUCED VERTICAL SEPARATION MINIMUMS (RVSM)**

- d. Any aircraft overtaking another aircraft is to offset within the confines of this procedure, if capable, so as to create the least amount of wake turbulence for the aircraft being overtaken;
- e. For wake turbulence purposes, pilots are also to fly one of the three positions at 16.2b. above and never offset to the left of centerline nor offset more than 2 NM right of centerline;

NOTE: It is recognized that the pilot will use his/her judgment to determine the action most appropriate to any given situation and has the final authority and responsibility for the safe operation of the airplane. The use of air-to-air channel, 123.45, may be used to coordinate the best wake turbulence offset option.

- f. Pilots may apply an offset outbound at the oceanic entry point but must return to centerline at the oceanic exit point. This provision applies to aircraft entering airspace in the San Juan FIR where direct controller-pilot VHF or UHF voice communication is available.
- g. Bermuda. Aircraft transiting radar-controlled airspace in the vicinity of Bermuda may remain on their established offset positions;
- h. There is no ATC clearance required for this procedure and it is not necessary that ATC be advised; and,
- i. Voice position reports are to be based on the current ATC clearance and not the exact coordinates of the offset position.

**UNITED STATES
RULES AND PROCEDURES**

GENERAL

The air traffic rules and procedures applicable to air traffic in U.S. Class A, B, C, D and E airspace conform with Annexes 2 and 11 to the Convention on International Civil Aviation and to those portions applicable to aircraft in the Procedures for Air Navigation Services –Air Traffic Management (Doc 4444 – ATM/501) and to the Regional Supplementary Procedures (DOC 7030) applicable to the NAM, NAT, CAR and PAC Regions, except as noted in the cases below. All differences have been registered with the International Civil Aviation Organization.

United States Federal Aviation Regulations (FARs), ATC procedures and definitions are applicable within the Domestic Airspace, Alaska, Hawaii and Offshore Airspace Areas.

Units of measurement used in the dissemination of aeronautical information.

MEASUREMENT OF	UNIT
Distances used in navigation, position reporting, etc., generally in excess of 2 to 3 NM	Nautical Miles and Tenths
Relatively short distances such as those relating to aerodrome (e.g., runway lengths)	Feet
Altitudes, elevations and heights	Feet
Horizontal speed including wind speed	Knots
Vertical speed	Feet Per Minute
Wind direction for landing and takeoff	Degrees Magnetic
Wind direction except for landing and takeoff	Degrees True
Visibility, including runway visual range	Statute Miles or Feet
Altimeter setting	Inches of Mercury
Temperature	Degrees, Fahrenheit
Weight	Pounds
Time	Hours and Minutes, the day of 24 hours beginning at midnight UTC.

WGS-84 COMPLIANT

FLIGHT PROCEDURES

HOLDING

See Holding Speeds Per U.S. FAA Regulations.

Pilot Action

Start speed reduction when three (3) minutes or less from the holding fix. Cross the holding fix, initially, at or below the maximum holding speed.

UNITED STATES RULES AND PROCEDURES

Compensate for wind effect primarily by drift correction on the inbound and outbound legs. When outbound, triple the inbound drift correction to avoid major turning adjustments; e.g., if correcting left by 8 degrees when inbound, correct right by 24 degrees when outbound.

PROCEDURE LIMITATIONS AND OPTIONS

United States Standard for Terminal Instrument Procedures (TERPS) criteria are provided for the following types of instrument approach procedures:

- a. Precision Approach (PA).
- b. Approach with Vertical Guidance (APV).
- c. Nonprecision Approach (NPA).

Procedure Turns

Where 45 degrees/180 degrees procedure turns are depicted, the point at which the turn may be commenced and the type and rate of turn is left to the discretion of the pilot.

Some procedure turns are specified by procedural track. These turns must be flown exactly as depicted. When a teardrop procedure turn is depicted, and a course reversal is required, this type turn must be executed.

When the approach procedure involves a procedure turn, a maximum speed of not greater than 200 KIAS should be observed, and the procedure turn must be executed within the distance specified in the profile view.

Circling Approach Obstacle Protected Airspace

The circling MDA provides vertical clearance from obstacles when conducting a circle-to-land maneuver within the obstacle protected area. Circling approach obstacle protected areas extend laterally and longitudinally from the centerlines and ends of all runways at an airport by the distances shown in the following tables. The areas are technically defined by the tangential connection of arcs drawn at the radius distance shown from each runway end.

Standard Circling Approach Maneuvering Radius

Circling approach protected areas developed prior to late 2012 used the radius distances shown in the following table, expressed in nautical miles (NM), dependent on aircraft approach category. The approaches using standard circling approach areas can be identified by the absence of the  symbol on the circling line of minima.

Circling MDA in feet MSL	Approach Category and Circling Radius (NM)				
	CAT A	CAT B	CAT C	CAT D	CAT E
All Altitudes	1.3	1.5	1.7	2.3	4.5

Expanded Circling Approach Maneuvering Airspace Radius

Circling approach protected areas developed after late 2012 use the radius distance shown in the following table, expressed in nautical miles (NM), dependent on aircraft approach category, and

**UNITED STATES
RULES AND PROCEDURES**

the altitude of the circling MDA, which accounts for true airspeed increase with altitude. The approaches using expanded circling approach areas can be identified by the presence of the  symbol on the circling line of minima.

Circling MDA in feet MSL	Approach Category and Circling Radius (NM)				
	CAT A	CAT B	CAT C	CAT D	CAT E
1000 or less	1.3	1.7	2.7	3.6	4.5
1001-3000	1.3	1.8	2.8	3.7	4.6
3001-5000	1.3	1.8	2.9	3.8	4.8
5001-7000	1.3	1.9	3.0	4.0	5.0
7001-9000	1.4	2.0	3.2	4.2	5.3
9001 and above	1.4	2.1	3.3	4.4	5.5

Contact Approach

Pilot's operating in accordance with an IFR flight plan may request ATC authorization for a "Contact Approach" provided they are clear of clouds and have at least one (1) mile visibility and can reasonably expect to continue to the destination airport in those conditions.

In the execution of a Contact Approach, the pilot assumes the responsibility for obstruction clearance.

Aircraft Speeds

Unless otherwise authorized by the Administrator, no person may operate an aircraft below 10,000 feet at an indicated airspeed of more than 250 kt (288 mph).

Unless otherwise authorized or required by ATC, no person may operate an aircraft at or below 2500 feet above the surface within 4 nautical miles of the primary airport of a Class C or Class D airspace area at an indicated airspeed of more than 200 knots (230 mph). This paragraph does not apply to any operations within a Class B airspace area. Such operations shall comply with paragraph above.

No person may operate an aircraft in the airspace underlying a Class B airspace area designated for an airport or in a VFR corridor designated through such a Class B airspace area, at an indicated airspeed of more than 200 kt (230 mph).

However, if the minimum safe airspeed for any particular operation is greater than the maximum speed prescribed above, the aircraft may be operated at that minimum speed.

Global Positioning System (GPS)

General Requirements

Authorization to conduct any GPS operation under IFR requires that:

UNITED STATES RULES AND PROCEDURES

- a. GPS navigation equipment used must be approved in accordance with the requirements specified in TSO C-129, or equivalent, and the installation must be done in accordance with Notice 8110.47 or 8110.48, or equivalent.
- b. Aircraft using GPS navigation equipment under IFR must be equipped with an approved and operational alternate means of navigation appropriate to the flight.

GPS IFR Equipment Classes / Categories

Class A — GPS sensor and navigation capability;

Class B — GPS sensor data to an integrated navigation system (i.e., FMS, multisensor navigation system, etc.);

Class C — GPS sensor data to an integrated navigation system (i.e., FMS, multi-sensor navigation system, etc.); which provides enhanced guidance to an autopilot, or flight director, to reduce flight technical errors. Limited to FAR Part 121 or equivalent criteria.

Equipment Classes A1, A2, B1, B2, C1 and C2 require Receiver Autonomous Integrity Monitoring (RAIM). Classes B3, B4, C3 and C4 require an inertial navigation system to provide RAIM equivalent.

Use of GPS for IFR Oceanic, Domestic Enroute, and Terminal Area Operations

GPS IFR operations in oceanic areas can be conducted as soon as all general requirements are met. A GPS installation with TSO C-129 authorization in class A1, A2, B1, B2, C1 or C2 may be used to replace one of the other approved means of long-range navigation, such as dual INS. A single GPS installation with these classes of equipment which provide RAIM for integrity monitoring may also be used on short oceanic routes which have only required one means of long-range navigation.

GPS domestic enroute and terminal IFR operations can be conducted as soon as all the general requirements are met.

The GPS Approach Overlay Program permits pilots to use GPS avionics under IFR for flying designated nonprecision instrument approach procedures, except localizer (LOC), localizer directional aid (LDA) and simplified directional facility (SDF) procedures.

Authorization to fly approaches under IFR using GPS avionics systems requires that:

- a. A pilot use GPS avionics with TSO C-129, or equivalent, authorization in classes A1, B1, B3, C1 or C3; and
- b. All approach procedures to be flown must be retrievable from the current airborne navigation data base supplied by the TSO C-129 equipment manufacturer of the FAA approved source.

GPS Approach Procedures

As the production of stand-alone GPS approaches has progressed, many of the original overlay approaches have been replaced with stand-alone procedures specifically designed for use by GPS systems. The title of the remaining GPS overlay procedures has been revised on the approach chart to "or GPS" (e.g., "VOR or GPS RWY 24," "GPS RWY 24," or "RNAV (GPS) RWY 24"). During these GPS approaches, underlying ground-based NAVAIDs are not required to be

UNITED STATES RULES AND PROCEDURES

operational and associated aircraft avionics need not be installed, operational, turned on or monitored (monitoring of the underlying approach is suggested when equipment is available and functional). Existing overlay approaches may be requested using the GPS title, such as "GPS RWY 24" for the VOR or GPS RWY 24.

NOTE: Any required alternate airport must have an approved instrument approach procedure other than GPS that is anticipated to be operational and available at the estimated time of arrival and which the aircraft is equipped to fly.

AIRPORT OPERATING MINIMUMS

The United States publishes DH/(HAT), MDA/(HAT or HAA) and visibility for landing. Visibility and, for selected runways/locations, ceilings are published for takeoff. Ceiling and visibility are published for alternate at civil airports.

Jeppesen charted minimums are not below State minimums.

IFR Alternate Airport Weather Minimums

The regulations covering the selection and use of alternate airports in respect to ceiling and visibility minimums, require that unless otherwise authorized, no person may include an alternate airport in an IFR flight plan unless current weather forecasts indicate that, at the estimated time of arrival at the alternate airport, the ceiling and visibility will be at or above the alternate minimums prescribed for that airport; or if no minimums are prescribed, the ceiling and visibility at the airport will allow descent from the IFR minimum enroute altitude for approach and landing in basic VFR weather conditions.

PILOT CONTROLLED LIGHTING (PCL)

Radio control of lighting is available at selected airports to provide airborne control of lights by keying the aircraft's microphone. The control system consists of a 3-step control responsive to 7, 5, and/or 3 microphone clicks. The 3-step and 2-step lighting facilities can be altered in intensity. All lighting is illuminated for a period of 15 minutes (except for 1-step and 2-step REILs which may be turned off by keying the mike 5 or 3 times, respectively).

Suggested use is to initially key the mike 7 times; this assures that all controlled lights are turned on to the maximum available intensity. Adjustment can then be made, where the capability is provided, to a lower intensity (or the REIL turned off) by keying the mike 5 and/or 3 times. Radio controlled lighting receivers may be set at a low sensitivity requiring the aircraft to be relatively close to activate the system. Consequently, even when lights are on, always key mike as directed when overflying an airport of intended landing or just prior to entering the final segment of an approach. This will assure the aircraft is close enough to activate the system and a full 15 minutes of lighting duration is available.

Approved lighting systems may be activated by keying the mike as indicated in the following table:

**UNITED STATES
RULES AND PROCEDURES**

KEY MIKE	FUNCTION
7 times within 5 seconds	Highest intensity available
5 times within 5 seconds	Medium or Lower intensity (Lower REIL or RE-IL-off)
3 times within 5 seconds	Lowest intensity available (Lower REIL or RE-IL-off)

SIMULTANEOUS RUNWAY OPERATIONS
Land and Hold Short Operations (LAHSO)

At controlled airports, air traffic may clear a pilot to land and hold short. Pilots may accept such a clearance provided that the pilot-in-command determines that the aircraft can safely land and stop within the Available Landing Distance (ALD). ALD data are published on the Jeppesen Airport charts. Additionally, controllers will provide ALD data upon request.

The pilot-in-command has the final authority to accept or decline any land and hold short clearance. The safety and operation of the aircraft remain the responsibility of the pilot. Pilots are expected to decline a LAHSO clearance if they determine it will compromise safety.

To conduct LAHSO, pilots should become familiar with all available information concerning LAHSO at their destination airport. Pilots should have, *readily available*, the published ALD and runway slope information for all LAHSO runway combinations at each airport of intended landing. Additionally, knowledge about landing performance data permits the pilot to readily determine that the ALD for the assigned runway is sufficient for safe LAHSO.

If the pilot elects to request to land on the full length of the runway, to land on another runway, or to decline LAHSO, a pilot is expected to promptly inform ATC, ideally even before the clearance is issued. A LAHSO clearance, once accepted, must be adhered to, just as any other ATC clearance, unless an amended clearance is obtained or an emergency occurs. A LAHSO clearance does not preclude a rejected landing.

A pilot who accepts a LAHSO clearance should land and exit the runway at the first convenient taxiway before reaching the hold short point. Otherwise, the pilot must stop and hold at the hold short point.

Controllers need a full read back of all LAHSO clearances. Pilots should read back their LAHSO clearance and include the words, "HOLD SHORT OF (runway / taxiway / or point)" in their acknowledgment of all LAHSO clearances.

ILS/MLS Approaches to Parallel Runways

ATC procedures permit ILS instrument approach operations to dual or triple parallel runway configurations. ILS/MLS approaches to parallel runways are grouped into three classes: Parallel (dependent) ILS/MLS Approaches; Simultaneous Parallel (independent) ILS/MLS Approaches; and Simultaneous Close Parallel (independent) ILS Precision Runway Monitor (PRM) Approaches. The classification of a parallel runway approach procedure is dependent on adjacent parallel runway centerline separation, ATC procedures, and airport ATC radar monitoring and

UNITED STATES
RULES AND PROCEDURES

communications capabilities. At some airports one or more parallel localizer courses may be offset up to 3 degrees. Offset localizer configurations result in loss of Category II capabilities and an increase in decision height (50 feet).

Parallel approach operations demand heightened pilot situational awareness. A thorough Approach Procedure Chart review should be conducted with, as a minimum, emphasis on the following approach chart information: name and number of the approach, localizer frequency, inbound localizer/azimuth course, glide slope intercept altitude, decision height, missed approach instructions, special notes/procedures, and the assigned runway location/proximity to adjacent runways. Pilots will be advised that simultaneous ILS/MLS or simultaneous close parallel ILS PRM approaches are in use. This information may be provided through the ATIS.

The close proximity of adjacent aircraft conducting simultaneous parallel ILS/MLS, simultaneous close parallel ILS PRM and Simultaneous Offset Instrument (SOIA) approaches mandates strict pilot compliance with all ATC clearances. ATC assigned airspeeds, altitudes, and headings must be complied with in a timely manner. Autopilot coupled ILS/MLS approaches require pilot knowledge of procedures necessary to comply with ATC instructions. Simultaneous parallel ILS/MLS and simultaneous close parallel ILS PRM approaches necessitate precise localizer tracking to minimize final monitor controller intervention, and unwanted No Transgression Zone (NTZ) penetration. In the unlikely event of a breakout, a vector off the approach course prior to the decision altitude (DA), ATC will not assign altitudes lower than the minimum vectoring altitude. Pilots should notify ATC immediately if there is a degradation of aircraft or navigation systems.

Strict radio discipline is mandatory during parallel ILS/MLS approach operations. This includes an alert listening watch and the avoidance of lengthy, unnecessary radio transmissions. Attention must be given to proper call sign usage to prevent the inadvertent execution of clearances intended for another aircraft. Use of abbreviated call signs must be avoided to preclude confusion of aircraft with similar sounding call signs. Pilots must be alert to unusually long periods of silence or any unusual background sounds in their radio receiver. A stuck microphone may block the issuance of ATC instructions by the final monitor controller during simultaneous parallel ILS/MLS and simultaneous close parallel ILS PRM approaches.

Use of Traffic Alert and Collision Avoidance Systems (TCAS) provides an additional element of safety to parallel approach operations. Pilots should follow recommended TCAS operating procedures presented in approved flight manuals, original equipment manufacturer recommendations, professional newsletters, and FAA publications.

Pilot Training Requirement. Pilots must complete special pilot training, as outlined below, before accepting a clearance for a simultaneous close parallel ILS/PRM or LDA/PRM approach.

- a. For operations under 14 CFR Parts 121, 129, and 135 pilots must comply with FAA approved company training as identified in their Operations Specifications. Training, at a minimum, must require pilots to view the FAA video "ILS PRM AND SOIA APPROACHES: INFORMATION FOR AIR CARRIER PILOTS." Refer to <http://www.faa.gov> for additional information and to view or download the video.
- b. For operations under Part 91:

UNITED STATES RULES AND PROCEDURES

1. Pilots operating transport category aircraft must be familiar with PRM operations. In addition, pilots operating transport category aircraft must view the FAA video "ILS PRM AND SOIA APPROACHES: INFORMATION FOR AIR CARRIER PILOTS." Refer to <http://www.faa.gov> for additional information and to view or download the video.
2. Pilots *not* operating transport category aircraft must be familiar with PRM and SOIA operations. The FAA strongly recommends that pilots not involved in transport category aircraft operations view the FAA video, "ILS PRM AND SOIA APPROACHES: INFORMATION FOR GENERAL AVIATION PILOTS." Refer to <http://www.faa.gov> for additional information and to view or download the video.

Attention All Users Page (AAUP)

ILS/PRM and LDA/PRM approach charts have an AAUP associated with them that must be referred to in preparation for conducting the approach. This page contains instructions that must be followed if the pilot is unable to accept an ILS/PRM or LDA/PRM approach.

ATS AIRSPACE CLASSIFICATION

There are two categories of airspace or airspace areas:

- a. Regulatory (Class A, B, C, D, and E airspace areas, restricted and prohibited areas).
- b. Nonregulatory (military operations areas (MOAs), warning areas, alert areas, and controlled firing areas).

Within these two categories, there are four types:

- a. Controlled.
- b. Uncontrolled.
- c. Special use.
- d. Other airspace.

It is important that pilots be familiar with the operational requirements for each of the various types or classes of airspace.

When overlapping airspace designations apply to the same airspace, the operating rules associated with the more restrictive airspace designation apply.

For the purpose of clarification: Class A airspace is more restrictive than Class B, which is more restrictive than Class C, which is more restrictive than Class D, which is more restrictive than Class E, which is more restrictive than Class G airspace.

UNITED STATES
RULES AND PROCEDURES

Airspace Classes

Mode C Veil —

- The airspace within 30 nautical miles of an airport listed in Appendix D, Section 1 of 14 CFR Part 91 (generally primary airports within Class B airspace areas), from the surface upward to 10,000 feet mean seal level (MSL). Unless otherwise authorized by air traffic control, aircraft operating within this airspace must be equipped with operable radar beacon transponder with automatic altitude reporting capability and operable ADS-B Out equipment.
- However, aircraft that were not originally certificated with an engine-driven electrical system or that have not subsequently been certified with a system installed may conduct operations within a Mode C veil provided the aircraft remains outside Class A, B or C airspace; and below the altitude of the ceiling of a Class B or Class C airspace area designated for an airport or 10,000 feet MSL, whichever is lower.

Federal Airways — Federal airways are Class E airspace areas and, unless otherwise specified, extend upward from 1200 feet to, but not including, 18,000 feet.

Enroute Domestic Areas — Class E airspace areas that extend upward from a specified altitude in those areas where there is a requirement to provide IFR enroute ATC services but the Federal airway system is inadequate.

OFFSHORE AIRSPACE AREAS

There are Class E airspace areas that extend upward from a specified altitude to, but not including, 18,000 feet MSL and are designated as offshore airspace areas. These areas provide controlled airspace beyond 12 nautical miles from the coast of the U.S. in those areas where there is

UNITED STATES RULES AND PROCEDURES

a requirement to provide IFR enroute ATC services and within which the U.S. is applying domestic procedures.

SPECIAL USE AIRSPACE

Special use airspace consists of airspace wherein activities must be confined because of their nature, or wherein limitations are imposed upon aircraft operations that are not a part of those activities.

Prohibited Areas — Airspace within which the flight of aircraft is prohibited due to security or other reasons associated with the national welfare.

Restricted Areas — Airspace within which the flight of aircraft, while not wholly prohibited, is subject to restrictions. Restricted areas denote the existence of unusual, often invisible, hazards such as artillery firing, aerial gunnery, or guided missiles. Penetration of restricted areas without authorization from the using or controlling agency may be extremely hazardous to aircraft and its occupants.

Warning Areas — A warning area is airspace of defined dimensions, extending from three nautical miles outward from the coast of the U.S. that contains activity that may be hazardous to nonparticipating aircraft. The purpose of such warning areas is to warn nonparticipating pilots of the potential danger. A warning area may be located over domestic or international waters or both.

Military Operations Areas (MOA) — Airspace established for the purpose of separating certain military activities from IFR traffic. ATC may clear nonparticipating IFR traffic through an active MOA when separation can be provided. If separation cannot be provided, ATC will reroute or restrict IFR traffic. VFR traffic should exercise extreme caution while flying within a MOA when military activity is being conducted.

Alert Areas — Airspace which may contain a high volume of pilot training or an unusual type of aerial activity. All activity within an Alert Area must be conducted in accordance with Federal Aviation Regulations, without waiver. Pilots of participating aircraft as well as pilots transiting the area must be equally responsible for collision avoidance.

U.S. CLEARANCE DELIVERY PHONE NUMBERS

Pilots departing on an IFR flight plan should consult the Airport Directory for their specific location to determine the telephone number to use to contact clearance delivery.

For locations not listed in the Airport Directory use the table below to determine the correct phone number to be used.

In Alaska the dedicated clearance delivery hotline is available at 1-888-766-8267.

SPECIAL REQUIREMENTS AND REGULATIONS

GENERAL

Unless otherwise authorized by ATC, each person operating a large turbine engine-powered airplane to or from a primary airport within Class B airspace must operate at or above the designated floors while within the lateral limits of the Class B airspace.

A clearance for a visual approach to a primary airport is not authorization for turbine powered airplanes to operate below the designated floors of Class B airspace.

When operating in VFR conditions with an ATC authorization to "MAINTAIN VFR ON TOP/MAINTAIN VFR CONDITIONS", pilots on an IFR flight plan must fly at an appropriate VFR altitude, comply with VFR visibility and distance from cloud criteria, and to be vigilant so as to see and avoid other aircraft.

In Domestic Class A, B, C, D or E airspace, advise ATC anytime the true airspeed at cruising level varies or is expected to vary by +/- 10 kt or Mach 0.02, whichever is less, of the filed true airspeed.

In oceanic Class A and E airspace if ATC has not assigned an airspeed, advise ATC anytime the true airspeed at cruising level varies or is expected to vary by +/- 10 kt or Mach 0.02, whichever is less, of the filed true airspeed.

If ATC has assigned an airspeed, aircraft must adhere to the ATC assigned airspeed and shall request ATC approval before making any change thereto. If it is essential to make an immediate temporary change in the Mach number (e.g., due to turbulence), ATC must be notified as soon as possible. If it is not feasible, due to aircraft performance, to maintain the last assigned Mach number during an enroute climb or descent, advise ATC at the time of the request.

SPECIAL TRAFFIC MANAGEMENT PROGRAMS

Special procedures may be established when a location requires special traffic handling to accommodate above normal traffic demand (e.g., the Indianapolis 500, the Super Bowl) or reduced airport capacity (e.g., airport runway/taxiway closures for airport construction). The spe-

**UNITED STATES
RULES AND PROCEDURES**

cial procedures may remain in effect until the problem has been resolved or until local traffic management procedures can handle the situation and a need for special handling no longer exists.

Slot Controlled Airports

The FAA may adopt rules to require advance operations for unscheduled operations at certain airports. In addition to the information in the rules adopted by the FAA, a listing of the airports and relevant information will be maintained on the FAA Web site listed below.

The FAA has established an Airport Reservation Office (ARO) to receive and process reservations for unscheduled flights at the slot controlled airports. The ARO uses the Enhanced Computer Voice Reservation System (e-CVRS) to allocate reservations. Reservations will be available beginning 72 hours in advance of the operation at the slot controlled airport. Refer to the Web site or touch-tone phone interface for the current listing of slot controlled airports, limitations, and reservation procedures.

NOTE: The web interface/telephone numbers to obtain a reservation for unscheduled operations at a slot controlled airport are:

- a. <http://www.fly.faa.gov/ecvrs>.*
- b. Touch-tone: 1-800-875-9694.*
- c. Trouble number: 540-422-4246.*

QUOTA FLOW CONTROL

Quota Flow Control is designed to balance the ATC system demand with system capacity.

When an Air Route Traffic Control Center (ARTCC) is holding the optimum number of aircraft, the adjacent ARTCCs will be issued quotas concerning aircraft which can be cleared into the impacted ARTCC airspace. When the adjacent center's demand exceeds the quota, aircraft will be held in the adjacent ARTCC's airspace until they can be permitted to proceed.

Flights originating beyond the adjacent ARTCC areas may not have sufficient fuel to absorb the total anticipated delay while airborne. Accordingly, the concerned adjacent ARTCC may permit these flights to land in its area while retaining previously accumulated delay for the purpose of quota priority. When the amount of air traffic backlogging in an adjacent ARTCC area is approaching the saturation point, additional enroute traffic will be subject to prior approval.

Pilots/operators are advised to check for flow control advisories which are transmitted to FSSs, to selected airline dispatch offices and ARTCCs.

GATE HOLDING DUE TO DEPARTURE DELAYS

Pilots should contact ground control/clearance delivery prior to starting engines as gate hold procedures will be in effect whenever departure delays exceed or are anticipated to exceed 15 minutes. The sequence for departure will be maintained in accordance with initial call up unless modified by flow control restrictions. Pilots should monitor the ground control/clearance delivery frequency for engine startup advisories or new proposed start time if the delay changes.

UNITED STATES RULES AND PROCEDURES

LOCAL FLOW TRAFFIC MANAGEMENT PROGRAM

This program is a continuing effort by the FAA to enhance safety, minimize the impact of aircraft noise and to conserve aviation fuel. The enhancement of safety and reduction of noise is achieved in this program by minimizing low altitude maneuvering of arriving turbojet and turboprop aircraft weighing more than 12,500 pounds and, by permitting departure aircraft to climb to high altitudes sooner, as arrivals are operating at higher altitudes at the points where their flight paths cross. The application of these procedures also reduces exposure time between controlled aircraft and uncontrolled aircraft at the lower altitudes in and around the terminal environment. Fuel conservation is accomplished by absorbing any necessary arrival delays for aircraft included in this program operating at the higher and more fuel efficient altitudes.

A fuel efficient descent is basically an uninterrupted descent (except where level flight is required for speed adjustment) from cruising altitude to the point when level flight is necessary for the pilot to stabilize the aircraft on final approach. The procedure for a fuel efficient descent is based on an altitude loss which is most efficient for the majority of aircraft being served. This will generally result in a descent gradient window of 250–350 feet per nautical mile.

When crossing altitudes and speed restrictions are issued verbally or are depicted on a chart, ATC will expect the pilot to descend first to the crossing altitude and then reduce speed. Verbal clearances for descent will normally permit an uninterrupted descent in accordance with the procedure described in the preceding paragraph. Acceptance of a charted fuel efficient descent (Runway Profile Descent) clearance requires the pilot to adhere to the altitudes, speeds, and headings depicted on the charts unless otherwise instructed by ATC. **PILOTS RECEIVING A CLEARANCE FOR A FUEL EFFICIENT DESCENT ARE EXPECTED TO ADVISE ATC IF THEY DO NOT HAVE RUNWAY PROFILE DESCENT CHARTS PUBLISHED FOR THAT AIRPORT OR ARE UNABLE TO COMPLY WITH THE CLEARANCE.**

MISCELLANEOUS INFORMATION

Commercial air transport operators in the United States must adhere to Annex 6 — Operation of Aircraft (not published herein), with the proviso that aircraft which have no operators' local representative available will be required to carry a fixed fuel reserve of not less than 45 minutes at the approved fuel consumption rate plus a variable reserve equivalent to 15% of the fuel required from departure to destination and to an alternate if an alternate is required.

Or, where the reserve calculated in accordance with the above exceeds two hours at the approved fuel consumption rate — two hours reserve fuel.

ALTIMETRY

Within a QNH region (below 18,000 feet) the cruising altitude of an aircraft shall be maintained by reference to an altimeter set to the current reported altimeter setting of a station along the route and within 100 NM of the aircraft, or if there is no station within this area, the current reported altimeter setting of an appropriate available station.

High Barometric Pressure

Cold, dry air masses may produce barometric pressures in excess of 31.00 inches of mercury. Many altimeters do not have an accurate means of being adjusted for settings of these levels and

**UNITED STATES
RULES AND PROCEDURES**

when the altimeter cannot be set to the higher pressure setting the aircraft actual altitude will be higher than the altimeter indicates.

When the barometric pressure exceeds 31.00 inches, air traffic controllers will issue the actual altimeter setting, and:

- a. Enroute/Arrivals. Advise pilots to remain set on 31.00 inches until reaching the final approach segment.
- b. Departures. Advise pilots to set 31.00 inches prior to reaching any mandatory/crossing altitude or 1,500 feet, whichever is lower.

Low Barometric Pressure

When abnormally low barometric pressure conditions occur (below 28.00 inches), flight operations by aircraft unable to set the actual altimeter setting are not recommended.

NOTE: The true altitude of the aircraft is lower than the indicated altitude if the pilot is unable to set the actual altimeter setting.

Temperature

When the air is colder than standard you are lower than indicated. It is the magnitude of this “difference” that determines the magnitude of the error. When operating in extreme cold temperatures, pilots may wish to compensate for the reduction in terrain clearance by adding a cold temperature correction.

SURVEILLANCE SYSTEMS**TRANSPONDER USE BY AIRCRAFT ON AIRPORT MOVEMENT AREAS**

SAFO 15006 advises all operators and pilots of the need to ensure that transponders are in the altitude reporting mode whenever their aircraft is on an airport movement area at all airports.

The Federal Aviation Administration (FAA) uses airport surface surveillance capabilities at some of the busiest airports in the U.S. to determine aircraft and vehicle location when they are operating on an airport movement area. Runway safety systems, such as Airport Surface Detection Equipment-Model X (ASDE-X) and Advanced Surface Movement Guidance and Control System (A-SMGCS), use data from surface movement radar and aircraft transponders to obtain accurate aircraft and vehicle locations, thereby increasing airport surface safety and efficiency.

As the FAA transitions to the Next Generation Air Transportation System, some Airport Surface Detection Equipment-Model 3 systems will be replaced with a multilateration (MLAT)¹/Automatic Dependent Surveillance-Broadcast (ADS-B) system, called Airport Surface Surveillance Capability (ASSC). This capability fuses MLAT sensor data with ADS-B aircraft information on FAA certified airport tower controller displays, tracks surface vehicles and aircraft providing information for Air Traffic Control (ATC) services, and is capable of providing data to other external FAA systems,

² including compliance monitoring capabilities.

**UNITED STATES
RULES AND PROCEDURES**

¹MLAT provides accurate position and identification information by determining an aircraft or vehicle's location based on the time difference between transponder/transmitter signals received at multiple sensors.

²E.g., Surveillance Broadcast Services and Runway Status Lights.

The effectiveness of ASSC and ASDE-X is dependent on operators equipping and operating cooperative surveillance capabilities (i.e., altitude reporting transponders). Nationwide, airports with ASDE-X report an average of twenty non-compliance transponder events per day, even with airport diagram or Automated Terminal Information Service (ATIS), or both, verbiage directing pilots to operate with transponders on. To proactively address these problems, aircraft operating on all airport movement areas at all airports, not just those that are ASDE-X equipped, must have their transponders on in the altitude reporting mode.

Operators should ensure that their procedures and manuals clearly state that flight crews and general aviation (GA) pilots enable transponders to the altitude reporting mode (consult the aircraft's flight manual to determine the specific transponder position to enable altitude reporting) and enable ADS-B Out transmissions (if equipped) any time their aircraft is positioned on any portion of an airport movement area. This includes all defined taxiways and runways on all airports. Flight crews and GA pilots must, per Title 14 of the Code of Federal Regulations (14 CFR) part 91 §91.9, part 121 §121.141 and part 135 §135.21, ensure that they comply with these procedures and manuals as well as pay particular attention to ATIS, Aircraft Communications Addressing and Reporting System (ACARS) messages, airport diagram notations, and General Notes (included on Jeppesen Airway Manual charts) which direct them to comply with directions pertaining to transponder and ADS-B usage.

Generally, these directions state:

- *Departures.* Select the transponder mode which allows altitude reporting and enable ADS-B (if equipped) during pushback. Select TA or TA/RA (if equipped) when taking the active runway.
- *Arrivals.* Maintain or select (if TA or TA/RA equipped) transponder to the altitude reporting position and maintain ADS-B Out transmissions (if equipped) after clearing the active runway. Select STBY or OFF for transponder and ADS-B (if equipped) upon gate arrival.

Operators and GA pilots should ensure their checklists reference transponders in the following places:

- “Before Starting Engines” or “Pushback” checklist
 - TRANSPONDER — Select the altitude reporting mode
 - ADS-B — Enabled (if equipped)
- “Before Takeoff” checklist
 - TA or TA/RA (if equipped) — Enabled
- “After Landing” checklist
 - TRANSPONDER — Select the altitude reporting mode
 - ADS-B — Enabled (if equipped)

UNITED STATES RULES AND PROCEDURES

- TA or TA/RA — Disabled
- “Parking” or “Shutdown” checklist
 - TRANSPONDER — STBY/OFF
 - ADS-B — STBY/OFF (if equipped)

NOTE: Both flightcrews and GA pilots should continue to comply with procedures relating to transponder operation which may be harmful to ground personnel (e.g., deicing of Predictive Wind Shear (PWS) equipped aircraft).

OPERATIONAL POLICY ADS-C DISTANCE-BASED SEPARATION

INTRODUCTION

Distance-based longitudinal separation minima using Automatic Dependent Surveillance-Contract (ADS-C) is implemented in Oakland Oceanic airspace as specified in TBL ENR 7.5-1.

TBL ENR 7.5-1 Minima

Minima				
Standard	RNP	RCP	RSP	Maximum ADS-C Periodic Reporting Interval
50 NM	10	240	180	27 minutes
50 NM	4	240	180	32 minutes
30 NM	4	240	180	14 minutes

Distance-based longitudinal separation minima using ADS-C is implemented in the Anchorage Oceanic and New York Oceanic airspace as specified in TBL ENR 7.5-2.

TBL ENR 7.5-2 Minima

Minima				
Standard	RNP	RCP	RSP	Maximum ADS-C Periodic Reporting Interval
50 NM	10	240	180	27 minutes
50 NM	4	240	180	32 minutes
30 NM	4	240	180	10 minutes

Aircraft Future Air Navigation System (FANS) 1/A communications, navigation and surveillance (CNS) capabilities, interfaced with Advanced Technology and Oceanic Procedures (ATOP), are required for ADS-C distance-based separation to be applied.

NOTE 1: ADS-C distance-based separation standards may not be applied to aircraft utilizing High Frequency Data Link (HFDL).

**UNITED STATES
RULES AND PROCEDURES**

NOTE 2: ADS-C distance-based separation is not currently authorized in the Anchorage Arctic FIR.

APPLICATION

Oakland, New York and Anchorage ARTCCs will apply the following policies to the use of ADS-C distance-based separation:

The separation will be applied to pairs of suitably equipped pairs of aircraft;

Published ATS routes and other tracks (e.g. PACOTS) will continue to be laterally separated by a minimum of 50 NM;

Minimum ADS-C based lateral and longitudinal separation between 30 NM eligible aircraft and 50 NM eligible aircraft is 50 NM; and

Lateral and longitudinal separation standards applied between RNP 10 and non-RNP 10 aircraft remains unchanged.

**AIRCRAFT AND OPERATOR ELIGIBILITY FOR 30 NM DISTANCE-BASED
SEPARATION**

The aircraft and operator must be authorized by the State of the Operator or the State of Registry, as appropriate, for RNP 4, RCP 240, and RSP 180 operations;

The aircraft must be equipped with a minimum of two approved long range navigation systems that will enable the aircraft to maintain RNP 4 for the duration of flight in the applicable airspace;

The aircraft must be equipped with a FANS1/A package (or equivalent) that includes satellite Controller Pilot Data Link Communication (CPDLC) and ADS-C that meet the standards of RTCA Document 258, Interoperability Requirements for ATS Applications Using ARINC 622 Data Communications;

Satellite CPDLC communications and ADS-C surveillance must be conducted in accordance with the ICAO Global Operational Data Link Document (GOLD), as amended, and maintained for the duration of the flight in the applicable Pacific FIRs; and

Pilots and, if applicable, dispatchers must be trained on policies and procedures applicable to ADS-C distance-based separation, including the use of Satellite CPDLC and ADS-C in Pacific oceanic airspace.

Operators should use the ICAO GOLD to develop policy and procedures for CPDLC and ADS-C operations.

Operators must use one of the following documents to develop policy and procedures for RNP 4 operations:

FAA Advisory Circular (AC) 90-105, Approval Guidance for RNP Operations and Barometric Vertical Navigation in the U.S. National Airspace System and in Oceanic and Remote Continental Airspace;

Australian Civil Aviation Safety Authority (CASA) Advisory Circular 91U3(0); or

ICAO Performance-Based Navigation (PBN) Manual (ICAO Document 9613), Volume II, Part C, Chapter 1.

**UNITED STATES
RULES AND PROCEDURES**

ICAO Performance-Based Communication and Surveillance (PBCS) Manual (ICAO Doc 9869).

FLIGHT PLANNING REQUIREMENTS

See ENR 7.1, Paragraph 2, Flight Plan Filing Requirements.

NOTE: Other than the flight plan requirements discussed in ENR 7.1, Paragraph 2, Flight Plan Filing Requirements, application of distance based separation does not affect operator planning processes or procedures for filing flight plans. Operators that have filed and flown User Preferred Routes (UPRs) may continue to do so.

**IN-FLIGHT CONTINGENCY ACTIONS/PROCEDURES AND EMPHASIS ON
SITUATIONAL AWARENESS**

Pilots should be aware that ADS-C distance-based separation can be applied to their aircraft. They should use all available tools to maintain an awareness of other aircraft in their proximity in case an in-flight contingency occurs (e.g., aircraft or ATC system malfunction).

Pilots must advise ATC of a loss of CPDLC and/or ADS-C capability or an inability to continue to meet RNP 4. ATC will transition the aircraft to another form of separation as expeditiously as possible.

If there is a known malfunction of the CPDLC or ADS-C system, ATC will contact aircraft and transition the aircraft to another form of separation as expeditiously as possible.

Leave the cleared route or track by initially turning at least 30 degrees to the right or to the left in order to intercept and maintain a parallel, same direction track or route offset 9.3km (5.0 NM). The direction of the turn should be based on one or more of the following:

- a. Aircraft position relative to any organized track or route system;
- b. The direction of flights and flight levels allocated on adjacent tracks;
- c. The direction to an alternate airport;
- d. Any strategic lateral offset being flown; and
- e. Terrain clearance.

Pilots are required to maneuver (deviate) around convective weather on a regular basis in the course of Pacific operations. The enhanced CNS requirements and capabilities aid pilots and controllers in situations where aircraft are required to maneuver around convective weather. For weather avoidance maneuvers in areas where ADS-C distance-based separation is applied, operators should emphasize the following items in pilot training programs:

Pilots should not assume the ATOP system will automatically quickly detect significant changes to the aircraft flight path. Unlike radar, the ATOP system does not receive aircraft position updates in real time. Aircraft position is updated to the ATOP system at intervals of up to 27 minutes. Controllers may change the update intervals as the situation warrants.

It is imperative that pilots keep ATC advised via CPDLC (or HF voice, if necessary) of their intentions (including significant airspeed changes) during the initial weather avoidance maneuver and any subsequent maneuvers to avoid convective weather.

UNITED STATES RULES AND PROCEDURES

Pilots must be aware that other aircraft could be approximately 30 NM ahead or behind on the same track, and inform ATC expeditiously of changes to flight path or airspeed that could erode longitudinal separation.

Pilots must be familiar with ENR 7.3, Special Procedures for In-Flight Contingencies in Oceanic Airspace.

NOTE: In particular, pilots should be aware of the provision to climb or descend 300 feet (depending on the direction of flight and direction of deviation from track) to mitigate the chance of conflict with other aircraft when forced to deviate without a clearance.

It is recommended that ACAS be operational for aircraft to which 30 NM separation can be applied. ACAS provides a valuable tool to alert the pilot to the presence and proximity of nearby aircraft in weather deviation situations.

In accordance with ICAO Document 4444, pilots are reminded that, regardless of the magnitude of a deviation from assigned route, whenever possible, clearance should be requested in advance from ATC. Prior coordination with ATC will help prevent the aircraft generating unnecessary alerts to ATC for lateral deviation events.

NOTE: This does not apply to SLOP.

Operators should consider adopting guidance for pilots to use heading mode to maneuver around areas of convective weather. Use of heading mode will prevent transmission of unnecessary lateral deviation event alerts that some flight management systems (FMS) automatically transmit to ATC when the FMS automatic lateral offset feature is used for weather avoidance. It should be emphasized that, when using heading mode, pilots should monitor cross track and heading and return to track when weather avoidance maneuvering is complete.

Aircraft navigation errors and system malfunctions will be monitored and documented. Operators should cooperate in follow up investigation of these events.

DIFFERENCES FROM ICAO STANDARDS AND PROCEDURES

ICAO REFERENCE

DEFINITIONS

Advisory Airspace — Advisory Service available in terminal areas and Class C outer area.

Aerodrome control tower — In the U.S., an “aerodrome control facility” is referred to as a “tower” or “airport traffic control tower”; “aerodrome control” is referred to as “airport traffic control service.”

Aerodrome Traffic Zone — There are no more Control Zones (Airport Traffic Zones) or Airport Traffic Areas (ATA). In the 7110.65, PCG, Controlled Airspace covers the defined dimensions of airspace. Class D was formerly the ATA (normally a 5 NM radius around the airport). The old Control Zones were extensions of the ATA to encompass (ILS) Approach Paths.

Airborne Collision Avoidance System (ACAS) — The U.S. uses “traffic alert collision avoidance system (TCAS).” TCAS is an airborne collision avoidance system based on radar beacon signals and operates independent of ground-based equipment. TCAS-I generates traffic advisories only.

UNITED STATES
RULES AND PROCEDURES

TCAS-II generates traffic advisories and resolution (collision avoidance) advisories in the vertical plane.

Air-ground Control Radio Station — FAA Pilot Controller Glossary defines a Flight Service Station (FSS) as an air traffic facility which provides pilot briefings, flight plan processing, enroute flight advisories, search and rescue services, and assistance to lost aircraft and aircraft in emergency situations. FSSs also relay ATC clearances, process Notices to Airmen, and broadcast aviation weather and aeronautical information. In Alaska, FSSs provide Airport Advisory Services.

Air-taxiing — The U.S. uses “hover taxi” for this maneuver above 100 feet above ground level (AGL) and “air taxi” below 100 feet AGL.

Area control service — The U.S. does not use the term “area control service” to indicate controlled flight in controlled areas.

Area control centre — The U.S. equivalent facility for an Area Control Centre (ACC) is an Air Route Traffic Control Center (ARTCC).

ATS route — In U.S. domestic airspace, the term “ATS route” is not used. Routes in the U.S. include VOR airways, jet routes, substitute routes, and off-airway routes. The U.S. also uses instrument departure procedures (DPs) and standard terminal arrivals (STARs).

Controlled airspace — The U.S. terms for controlled airspace have different parameters than for ICAO.

Danger area — The term “danger area” is not used within the U.S. or any of its possessions or territories.

Estimated Off-block Time — The United States uses the term “estimated departure time” for domestic operations.

Flight information centre — The U.S. does not operate flight information centers (FICs). In the U.S., the services provided by FICs are performed by air traffic control (ATC) facilities, flight service stations (FSSs), and rescue coordination centers (RCCs).

Ground Visibility — The U.S. defines Ground Visibility as: Prevailing horizontal visibility near the earth’s surface as reported by the United States National Weather Service or an accredited observer.

Instrument meteorological conditions — The U.S. air traffic service units use the phrase “IFR conditions.”

Level — The U.S. uses “altitude” or “flight level” rather than “level” and “cruising altitude” rather than “cruising level.” The term “level” is not used to mean “height,” “altitude,” or “flight level.”

Movement area — In the U.S., the term “movement area” means “the runways, taxiways, and other areas of an airport/heliport which are utilized for taxiing, hover taxiing, air-taxiing, take-off and landing of aircraft, exclusive of loading ramps and parking areas. At those airport/heliports with a tower, specific approval for entry onto the movement area must be obtained from ATC.”

The U.S. does not use an all-inclusive term to denote the movement area plus loading ramps and parking areas of an airport, nor does the U.S. use the term “maneuvering area” in any related context.

**UNITED STATES
RULES AND PROCEDURES**

Repetitive flight plan (RPL) — The U.S. uses the term “stored flight plan” for domestic operations.

Terminal control area — In the U.S., “terminal control area” has been replaced by “Class B airspace/area.” Standard IFR services are provided to IFR aircraft operating in Class B airspace.

Class B airspace CFR 14 part 71.41, exceeds TCA with more restrictive airman’s qualifications and aircraft certifications.

Total Estimated Elapsed Time — The United States uses the term “estimated time enroute” for domestic operations.

ANNEX 2

3.2.5 Operations on and in the Vicinity of an Aerodrome

Unless otherwise authorized or required by ATC, no person may operate an aircraft within a Class B, C or D surface area except for the purpose of landing at, or taking off, from an airport within that area.

Traffic Avoidance Advice — The U.S. uses the term Traffic Advisory.

Transition altitude — In U.S. domestic airspace, “transition altitude,” “layer” and “level” are not used; however, in the U.S., flight levels begin at FL180 where the reference datum of 29.92 inches of mercury is used as the constant atmospheric pressure. Below FL180, altitudes are based on barometric pressure readings. QNH and QFE altimeter settings are not provided in domestic U.S. airspace.

Visibility — The U.S. defines Visibility as: The ability, as determined by atmospheric conditions and expressed in units of distance, to see and identify prominent unlighted objects by day and prominent lighted objects by night. Visibility is reported as statute miles, hundreds of feet, or meters. The U.S. identifies the following classes of visibility: Flight Visibility, Ground Visibility, Prevailing Visibility, Runway Visibility Value, and Runway Visual Range.

Visual meteorological conditions — The U.S. air traffic service units use the phrase “VFR conditions.”

In addition, in the case of a helicopter approaching to land, avoid the flow of fixed-wing aircraft.

In addition, no person may, within a Class B, C or D surface area operate an aircraft to, from, or on an airport having a control tower operated by the United States unless two-way radio communications are maintained between that aircraft and the control tower.

3.3.1.2.2 The U.S. requires that domestic flight plans be submitted at least thirty minutes before departure. For International flights, the U.S. recommends that they be transmitted so that they are received by ATC authorities in each FIR to be entered, at least 2 hours prior to entry, unless otherwise provided in that State’s requirements.

5.1.2 In the U.S., minimum altitudes for IFR flights are 2,000 feet above the highest obstacle within a horizontal distance of 4 nautical miles from the course to be flown in mountainous terrain and 1,000 feet above the highest obstacle within a horizontal distance of 4 nautical miles from the course to be flown in non-mountainous terrain.

**UNITED STATES
RULES AND PROCEDURES**

Further differences which exist by virtue of the fact that Annex contains no comparable standards for the U.S. national regulations.

- a. The regulations covering the selection and use of alternate airports in respect to ceiling and visibility minima, require that:

Unless otherwise authorized by the FAA Administrator, no person may include an alternate airport in an IFR flight plan unless current weather forecasts indicate that, at the estimated time of arrival at the alternate airport, the ceiling and visibility at that airport will be at or above the alternate airport weather minima.

- b. Operation under IFR in Class A, B, C, D or E airspace malfunction reports:
 1. The pilot-in-command of each aircraft operated in Class A, B, C, D or E airspace under IFR shall report as soon as practical to ATC any malfunctions of navigational, approach, or communication equipment occurring in flight.
 2. In each report the pilot-in-command shall include:
 - (a) aircraft identification.
 - (b) equipment affected.
 - (c) degree to which the capability of the pilot to operate under IFR in the ATC system is impaired; and
 - (d) nature and extent of assistance desired from ATC.

APPENDIX 1 – SIGNALS

4.1.1 The flashing white signal to aircraft in flight, meaning “Land at this aerodrome and proceed to apron” is not used in the United States.

In addition, the alternating red and green signal to aircraft on the ground or in flight means exercise extreme caution.

Air Traffic Control

Air Traffic Control Data - Atlantic

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

NORTH ATLANTIC AND NORTH AMERICA (NAT/NAM)

OPERATIONAL APPROVAL AND AIRCRAFT SYSTEM REQUIREMENTS FOR FLIGHTS IN THE NAT HIGH LEVEL AIRSPACE (HLA)

Flight crews may fly across the North Atlantic within NAT High Level Airspace (HLA) only if they are in possession of the appropriate NAT HLA and RVSM approvals issued by the State of registry of the aircraft or by the State of the operator. The Minimum Equipment List (MEL) for operations must be strictly observed.

For complete information and further guidance to regulatory material relating to North Atlantic aircraft operations refer to the NAT Doc 007 'NORTH ATLANTIC OPERATIONS AND AIRSPACE MANUAL' - (www.icao.int/EURNAT/).

Description and Requirements

Area of Application

NAT HLA is that volume of airspace between FL285 and FL420 within the Oceanic Control Areas of Bodo Oceanic, Gander Oceanic, New York Oceanic East, Reykjavik, Santa Maria and Shanwick, excluding the Shannon and Brest Ocean Transition Areas.

Approval

All flights within NAT HLA airspace must have the approval of either the State of registry of the aircraft, or the State of the operator. Aircraft operating in RVSM airspace are required to be compliant with the altimetry Minimum Aircraft System Performance Specifications (MASPS) and hold an issued approval. Approval for NAT HLA operations will require the checking by the State of registry or State of the operator, of various aspects affecting navigation performance. These aspects include: the navigation equipment used, together with its installation and maintenance procedures; plus the crew navigation procedures employed and the crew training requirements.

NAT Data Link Mandate (DLM)

The NAT DLM requires aircraft to be equipped with, and operating, CPDLC and ADS-C in the NAT region. Currently, the mandate incorporates FL290 to FL410 inclusive.

The NAT DLM is not applicable to aircraft operating in:

- Airspace north of 80° North;
- New York Oceanic East FIR;
- Airspace where an ATS surveillance service is provided by means of radar, multilateration and/or ADS-B, coupled with VHF voice communications, provided the aircraft is suitably equipped (transponder/ADS-B extended squitter transmitter).

Certain categories of flights may be allowed to plan and operate through the mandated airspace with non-equipped aircraft, namely non-equipped flights that file STS/FFR, HOSP, HUM, MEDEVAC SAR, or STATE in Item 18 of the flight plan. (Depending on the tactical situation at the time of flight, however, such flights may not receive an ATC clearance which fully corresponds to the requested flight profile).

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Any aircraft not equipped with FANS 1/A (or equivalent) systems may request to climb or descend through the NAT DLM airspace. Other requests for operation of non-DLM equipped aircraft in the NAT DLM airspace will be considered on a tactical basis.

- a. Altitude reservation (ALTRV) requests and requests for “special operations” (e.g., for scientific research or weather observations) will be considered on a case by case basis, irrespective of the equipage status of the participating aircraft.
- b. If a flight experiences an equipment failure AFTER DEPARTURE which renders the aircraft unable to operate FANS 1/A (or equivalent) CPDLC and/or ADS-C systems, requests to operate in the NAT DLM airspace will be considered on a tactical basis. Such flights must notify ATC of their status PRIOR TO ENTERING the airspace.
- c. If a FANS 1/A data link equipment failure occurs while the flight is OPERATING WITHIN NAT DLM AIRSPACE, ATC must be immediately advised. Such flights may be re-cleared so as to avoid the airspace, but consideration will be given to allowing the flight to remain in the airspace, based on tactical considerations.
- d. If a flight experiences an equipment failure PRIOR to departure which renders the aircraft non-DLM compliant, the flight should re-submit a flight plan so as to remain clear of the NAT regional DLM airspace.

Flights operating on routes T9 and T290 are exempt from NAT Data Link Mandate, however ADS-B use is mandatory to facilitate access to these routes by certain aircraft unable to comply with the NAT DLM.

Airspace excluded from the DLM

- a. Iceland - Greenland Corridor

ADS-B is required west of 30W.

For planning purposes, this area is bounded by the following:

- Northern boundary: 65N/000W - 67N/010W - 69N/020W - 68N/030W - 67N/040W - 69N/050W - 69N/060W - BOPUT.
- Southern boundary: GUNPA (61N/000W) - 61N/007W - 6040N/010W - RATSU (61N/010W) - 61N/020W - 63N/030W - 6330N/040W - 6330N/050W - EMBOK.

- b. Azores Corridor:

Traffic flying to/from Azores Islands is allowed to operate in the NAT HLA, when the oceanic portion of the planned route is contained inside the Santa Maria FIR ATS surveillance airspace and VHF coverage, typically via MANOX, NAVIX or IRKID direct 35N/020W or 36N/020W direct Azores Islands, for aircraft equipped with SSR Mode S/ADS-B transponders.

- c. Bodo Corridor:

Aircraft need to be equipped with transponder/ADS-B extended squitter transmitter.

For flight planning purposes, the following coordinates can be used to define the ATS surveillance airspace within Bodo OCA: 6645N/000E - 7110N/01140E - 75N/00430E - 81N/

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

00130E - 81N/030E - 71N/030E - 7120N/028E - 7120N/025E - 70N/015E - 6545N/007E - 6303N/00403E - 6315N/000E - (6645N/000E).

Horizontal Navigation Requirements for unrestricted NAT HLA Airspace Operations

Lateral Navigation

The navigation system accuracy requirements for NAT HLA operation should only be based on the PBN specifications, RNP10 (PBN application of RNAV10) or RNP4 (see ICAO PBN Manual Doc. 9613). Although when granting consequent approval for operations in NAT HLA, States should take account of the RNP10 time limits for aircraft equipped with dual INS or inertial reference unit (IRU) systems. All approvals issued after 4 February 2016 must be designated as "NAT HLA" approvals. State approval of unrestricted operation in the NAT HLA may presently be granted to an aircraft equipped as follows:

- a. With at least TWO fully serviceable Long Range Navigation Systems (LRNSs). A LRNS may be one of the following:
 1. one Inertial Navigation System (INS);
 2. one Global Navigation Satellite System (GNSS);

NOTE: Currently the only GNSS system fully operational and for which approval material is available, is GPS.

 - 3. one navigation system using the inputs from one or more Inertial Reference System (IRS) or any other sensor system complying with the NAT HLA requirement.
- b. Each LRNS shall be capable of providing to the flight crew a continuous indication of the aircraft position relative to desired track.
- c. It is also highly desirable that the navigation system employed for the provision of steering guidance is capable of being coupled to the auto-pilot.

Longitudinal Navigation

Time-based longitudinal separations between subsequent aircraft following the same track (in-trail) and between aircraft on intersecting tracks in the NAT HLA airspace are assessed in terms of differences in ATAs/ETAs at common points. The time-based longitudinal separation minima currently used in the NAT HLA airspace are thus expressed in clock minutes. The maintenance of in-trail separations is aided by the application of the Mach Number Technique (MNT). However, aircraft clock errors resulting in waypoint ATA errors in position reports can lead to an erosion of actual longitudinal separations between aircraft.

It is thus vitally important that the time-keeping device intended to be used to indicate waypoint passing times is accurate, and is synchronized to an acceptable UTC time signal before commencing flight in NAT HLA airspace. In many modern aircraft, the master clock can only be reset while the aircraft is on the ground.

Thus the **Preflight Procedures** for any NAT HLA operation **must include** a UTC time check and resynchronization of the aircraft master clock (typically the FMS).

The following are examples of acceptable time standards:

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

- a. GPS (corrected to UTC). Available at all times via approved on-board GPS (TSO-C129) equipment;
- b. WWV (NIST - Fort Collins, Colorado) H24 on 2500, 5000, 10000, 15000 and 20000kHz (AM/SSB);
- c. CHU (NRC - Ottawa, Canada) H24 on 3330, 7850 and 14670kHz (SSB);
- d. BBC (UK Greenwich) H24 on 12095kHz; 0200- 2315 UTC on 9410kHz; 0430-0030 UTC on 15070kHz; 0800-1600 UTC on 17705, 17640, 9760 and 9750kHz.

All times given in UTC and every minute within specified periods.

Altimetry Equipment required for Operation in RVSM Airspace

- a. TWO independent operational primary altimetry systems;
- b. one automatic altitude control system; and
- c. one altitude alerting device.

Standard preflight checks of altimeters are required. At least 2 primary altimeters must agree at all times within plus or minus 200ft. At intervals of approximately 1 hour, crosschecks between the primary altimeters should be made.

Partial or Total Loss of Long Range Navigation Capability

Aircraft with triple system installed, with only TWO systems operational, can proceed normally. For aircraft with only TWO operational systems, the following guidance is offered in case of system failure.

North Atlantic

ONE system (of two operational systems) fails BEFORE TAKE-OFF

Delay departure until repair is possible. If the remaining system is fully operative, the pilot may file a new flight plan using the SPECIAL ROUTES as described under 'Special Routes for Use within NAT HLA Airspace with less than acceptable NAT HLA Long Range Navigation Equipment' or obtain a clearance above or below NAT HLA airspace.

ONE system (of two operational systems) fails BEFORE THE OCA BOUNDARY IS REACHED

The flight crew must consider:

- a. landing at a suitable aerodrome before the boundary or returning to the aerodrome of departure;
- b. diverting via one of the SPECIAL ROUTES as described under 'Special Routes for Use within NAT HLA airspace with less than acceptable NAT HLA Long Range Navigation Equipment';
- c. obtaining a re-clearance above or below NAT HLA airspace.

NOTE: A revised Oceanic Clearance will be issued after coordination between all the OACs concerned. Should the organized track system at the time of the incident extend to the northern part of the NAT region, the aircraft concerned may be required to accept a lower than

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

optimum flight level in its revised Oceanic Clearance, especially during peak traffic periods. The above guidance material in no way relieves the pilot from the obligation to take the best possible course of action under the prevailing circumstances.

ONE system (of two operational systems) fails AFTER THE OCA BOUNDARY IS CROSSED

The flight crew should normally continue in accordance with the Oceanic Clearance already received, appreciating that the reliability of the total navigation system has been significantly reduced. However, the flight crew should:

- a. assess the prevailing circumstances (e.g. performance of the remaining system, remaining portion of the flight in NAT HLA airspace, etc.);
- b. prepare a proposal to ATC with respect to prevailing circumstances (e.g. request clearance above or below NAT HLA airspace, turn-back, obtain clearance to fly along one of the SPECIAL ROUTES, etc.);
- c. advise and consult with ATC as to the most suitable action;
- d. obtain appropriate re-clearance prior to any deviation from the last acknowledged Oceanic Clearance. When flight continues in accordance with its original clearance, the pilot should begin a careful monitoring program;
- e. take special care in the operation of the remaining system bearing in mind that routine methods of error checking are no longer available;
- f. check main and stand-by compass systems frequently against the information which is still available;
- g. check performance record of remaining equipment, and if in doubt regarding its performance and/or reliability, the following procedures should be considered:
 1. attempting visual sighting of other aircraft or their contrails which may provide a track indication;
 2. calling the appropriate OAC for information on other aircraft adjacent to the aircraft's estimated position and/or calling on VHF to establish contact with such aircraft (preferably same track/level) to obtain from them useful information (e.g. drift, groundspeed, wind details etc.).

REMAINING system fails AFTER ENTERING NAT HLA AIRSPACE

- a. Immediately notify ATC.
- b. Make best use of procedures specified in para g. 1. and 2. above.
- c. Keep a special look-out for possible conflicting aircraft and make maximum use of external lights.
- d. If no instructions are received from ATC within a reasonable period: consider climbing/descending 500ft/150m, broadcast action on 121.5MHz, and advise ATC as soon as possible.

Complete failure of navigation systems computers

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Should the computer element of the navigation system fail, the basic output of the IRS (LAT/LONG, drift and ground speed) should be available unimpaired. Providing a suitable plotting chart is onboard and the cleared route has been plotted:

- a. Extract mean true tracks between waypoints.
- b. Use the basic IRS/GPS outputs to adjust heading to maintain mean track and calculate ETAs.
- c. At intervals of not more than 15 minutes plot LAT/LONG position on the chart and adjust heading to regain track.

In-flight RVSM Procedures and Contingencies

Prior to entry into NAT HLA airspace, check to ensure the two primary altimeters are reading within 200ft of each other (or lesser value if specified in your aircraft's flight manual). Conduct this check while at level flight. You should also note the stand-by altimeter reading. The readings of the primary and standby altimeters should be recorded to be available for use in any possible contingency situations.

Within NAT HLA airspace, one automatic altitude-control system should be operative and engaged throughout the cruise. This system should only be disengaged when it is necessary to re-trim the aircraft, or when the aircraft encounters turbulence and operating procedures dictate. When passing waypoints, or at intervals not exceeding 60 minutes (whichever occurs earlier), or on reaching a new cleared flight level, a cross-check of primary altimeters should be conducted. If at any time the readings of the two primary altimeters differ by more than 200ft, the aircraft's altimetry system should be considered defective and ATC must be so informed. It is essential in the NAT HLA **that flight crews not using CPDLC/ADS-C always report to ATC immediately on leaving the current cruising level and on reaching any new cruising level.**

The Strategic Lateral Offset Procedure (SLOP) within NAT Airspace

The SLOP is a Standard Operating Procedure throughout the NAT region. This procedure mitigates collision risk and wake turbulence encounters. Pilots conducting oceanic flight within the NAT region with automatic offset programming capability are required to fly offsets right of centerline up to a maximum of 2NM.

Aircraft that do not have a capability to offset in 0.1NM increments should fly the centerline, 1NM, or 2NM right only. Left offsets are prohibited.

It is applicable within the New York Oceanic, Gander Oceanic, Shanwick Oceanic, Santa Maria Oceanic, Nuuk and Reykjavik FIRs, and within the Bodo Oceanic FIR.

SLOP conforms to direction in the ICAO Procedures for Air Navigation Services-Air Traffic Management (PANS-ATM, Doc 4444, 16.5) and is subject to the following guidelines:

- a. Aircraft without automatic offset programming capability **must** fly the route centerline.
- b. Aircraft able to perform offsets in tenths of nautical mile should do so as it contributes to risk reduction.

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

- c. It is recommended that flight crews of aircraft capable of programming automatic offsets should randomly select flying centerline or an offset. In order to obtain lateral spacing from nearby aircraft (i.e. those immediately above and/or below), flight crews should use whatever means are available (e.g. ACAS/TCAS, communications, visual acquisition, GPWS) to determine the best flight path to fly.
- d. An aircraft overtaking another aircraft should offset within the confines of this procedure, if capable, so as to minimize the amount of wake turbulence for the aircraft being overtaken.
- e. For wake turbulence purposes, flight crews should fly one of the offset positions. Flight crews may contact other aircraft on the air-to-air channel, 123.450, as necessary, to coordinate the best wake turbulence mutual offset option.
- f. Pilots may apply an offset outbound after the oceanic entry point and must return to centerline before the oceanic exit point, unless otherwise authorized by the appropriate ATS authority or directed by the appropriate ATC unit.
- g. There is no ATC clearance required for this procedure and it is not necessary that ATC be advised.
- h. Voice Position reports should be based on the waypoints of the current ATC clearance and not the offset positions.
 - i. Aircraft shall not apply SLOP below FL285 in the Reykjavik CTA and Bodo OCA.
 - j. The offset should be applied from the time the aircraft reaches its cruising level until top of descent.
- k. Aircraft shall not apply SLOP for flights operating along T9 and T290 and shall maintain along route centerline.

TCAS Alerts and Warnings

To prevent unwanted TCAS/ACAS warnings or alerts, when first approaching any cleared flight level in NAT RVSM airspace, flight crews should ensure that the vertical closure speed is not excessive. It is considered that, with about 1500ft to go to a cleared flight level, vertical speed should be reduced to a maximum of 1500ft/min and ideally, to between 1000ft/min and 500ft/min. Additionally, it is important to ensure, by manually overriding if necessary, that the aircraft neither undershoots nor overshoots the cleared level by more than 150ft. Turbine-engined aircraft having a maximum certificated take-off mass exceeding 5700kg or authorized to carry more than 19 passengers are required to carry ACAS II in the NAT region. The technical specifications for ACAS II are contained in ICAO Annex 10 Volume IV. Compliance with this requirement can be achieved through the implementation of traffic alert and collision avoidance system (TCAS) Version 7.1 as specified in RTCA/DO-185B or EUROCAE/ED-143.

Special Routes for Use within NAT HLA Airspace with less than acceptable NAT HLA Long Range Navigation Equipment

WARNING: No aircraft should use these routes unless specifically authorized by the State of registry or State of the operator as appropriate.

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Aircraft with SHORT RANGE Navigation Equipment plus ONE operational LONG RANGE Navigation Equipment

ROUTES Europe to/from Canada via Greenland/Iceland

Minimum acceptable operational navigation equipment VOR, DME and ADF plus:

- one Inertial Navigation System (INS);
- one Global Navigation Satellite System (GNSS); or
- one navigation system using the inputs from one or more Inertial Reference System (IRS) or any other sensor system complying with the NAT HLA requirement.

Each LRNS must be capable of providing to the flight crew with a continuous indication of the aircraft position relative to desired track.

It is highly desirable that the navigation system employed for the provision of steering guidance is capable of being coupled to the auto-pilot.

Approved SPECIAL ROUTES:

- ATSIX-61N 1234W-ALDAN-KFV¹;
- RATSU-ALDAN-KFV²;
- GOMUP-60N 15W-61N 1630W-BREKI-KFV¹;
- MOXAL-RATSU²;
- OSKUM-RATSU²;
- KFV-SOPEN-DA-SF-YFB²;
- KFV-EPENI-63N 30W-61N 40W-OZN²;
- OZN-59N 50W-AVUTI (FL290–FL600)-PRAWN-YDP²;
- OZN-59N 50W-CUDDY (FL290–FL600)-PORGY²;
- OZN-58N 50W-HOIST-YYR²;
- SF-DARUB-YXP²;
- RE-6930N 2240W-CP.

¹ HF is required on this route.

² VHF coverage exists and can be used by non-HF equipped aircraft.

ROUTES Northern Europe to/from Spain/Canary Is/Lisbon FIR and Portugal to/from Azores/Madeira

Approved SPECIAL ROUTES with minimum acceptable operational navigation equipment according to 'ROUTES Europe to/from Canada via Greenland/Iceland' above:

- LASNO-T9-BEGAS-STG/AVS;

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

- ADVAT-T290-GELPO;
- routings between the Azores, Funchal, Porto Santo and the Portuguese mainland.

NOTE: For Tango routes T9, T290, T13, T213 and T16 State approval for NAT HLA operations is required.

NOTE: Routes T9 and T290 may be flight planned and flown by approved aircraft equipped with and operating ADS-B (1090MHz ADS-B 'out' capability), VHF and capable of RNP2 (Continental).

Aircraft with ONLY SHORT RANGE Navigation Equipment

ROUTES Europe to/from Iceland

Minimum acceptable operational navigation equipment: VOR/DME and ADF.

Approved SPECIAL ROUTES:

- VALDI-G3-MY-ING-KFV
- PEMOS-G11-MY-G3-ING-KFV

NOTE: The above SPECIAL ROUTES should also be considered when partial loss of long range navigation capacity occurs prior to take-off or prior to entry into NAT HLA airspace. In this latter case a revised flight plan must be filed and ATC clearance obtained.

Special Arrangements for Operation in NAT HLA by NON-NAT HLA Certified Aircraft

Aircraft that do not meet NAT HLA requirements may be allowed to operate in NAT HLA if the following conditions are satisfied:

- a. The aircraft is being provided with ATS surveillance service;
- b. direct controller - pilot VHF voice communication is maintained; and
- c. the aircraft has a certified installation of equipment providing it the ability to navigate along the cleared track.

Special Arrangements for Non-RVSM approved Aircraft

Climb/Descent through RVSM Levels

NAT HLA approved aircraft that are not approved for RVSM operation will be permitted, subject to traffic, to climb/descend through RVSM levels in order to attain cruising levels above or below RVSM airspace. Flights should climb/descend continuously through the RVSM levels without stopping at any intermediate level and should "report leaving" current level and "report reaching" cleared level. Such aircraft are also permitted to flight plan and operate at FL430 either eastbound or westbound above the NAT HLA.

Exceptional Operation at RVSM Levels

ATC may provide special approval for a NAT HLA approved aircraft that is not approved for RVSM operation to fly in the NAT HLA provided that the aircraft:

- is on a delivery flight; or

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

- was RVSM approved but has suffered an equipment failure and is being returned to its base for repair and/or re-approval, or
- is on a mercy or humanitarian flight.

Operators requiring such special approval should request prior approval by contacting the initial Oceanic Area Control Center (OACC), normally not more than 12 hours and not less than 4 hours prior to the intended departure time, giving as much detail as possible regarding acceptable flight levels and routings. Operators should be aware, due to the requirements to provide non-RVSM separation, that requested levels and/or routes may not always be available (especially when infringing active OTS systems). The special approval, if and when received, should be clearly indicated in Item 18 of the ICAO flight plan. Operators must appreciate that the granting of any such approval does not constitute an Oceanic Clearance, which must be obtained from ATC, by the flight crew, in the normal manner.

This service, as explained above, will not be provided to aircraft without approval for NAT HLA operations. It must be noted that the provision of this service is intended exclusively for the purposes listed above and is not the means for an operator or flight crew to circumvent the RVSM approval process. Operators or flight crews are required to provide written justification for the request, upon completion of the flight plan, to the NAT Central Monitoring Agency (CMA). Any suspected misuse of the exceptions rule above, regarding RVSM operation, will be reported and will therefore be subject to follow-up action by the State of registry or State of the operator as applicable.

RTF Phraseology and Flight Planning

Some flight planning systems cannot generate a flight plan through RVSM airspace unless the “W” designator is inserted in Item 10 (equipment). For a flight which has received this special approval, it is of utmost importance that the “W” is removed prior to transmitting the ICAO flight plan to ATC. ATC will use the equipment block information to apply either 1000ft or 2000ft separation. Additionally, flight crews of any such non-RVSM flights operating in RVSM airspace should include the phraseology 'Negative RVSM' in all initial calls on ATC frequencies, requests for flight level changes, read-backs of flight level clearances within RVSM airspace and read-back of climb or descent clearances through RVSM airspace.

NORTH ATLANTIC ORGANIZED TRACK SYSTEM (NAT OTS)

General

As a result of passenger demand, time zone differences and airport noise restrictions, much of the North Atlantic (NAT) air traffic contributes to two major alternating flows: a westbound flow departing Europe in the morning, and an eastbound flow departing North America in the evening. The effect of these flows is to concentrate most of the traffic uni-directionally, with peak westbound traffic crossing the 30W longitude between 1130 UTC and 1900 UTC and peak eastbound traffic crossing the 30W longitude between 0100 UTC and 0800 UTC.

The flight levels normally associated with the OTS are FL340 to FL400 inclusive. These flight levels, and their use have been negotiated and agreed by the NATS ATS providers and are published as the Flight Level Allocation Scheme (FLAS). The FLAS also determines flight levels avail-

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

able for traffic routing partly or wholly outside of the OTS as well as flights operating outside of the valid time periods of the OTS; often referred to as “transition times”. The hours of validity of the two Organized Track Systems (OTS) are as follows:

- (westbound) day-time OTS 1130 UTC to 1900 UTC at 30°W;
- (eastbound) night-time OTS 0100 UTC to 0800 UTC at 30°W.

Use of the OTS tracks is not mandatory. Aircraft may flight plan on random routes which remain clear of the OTS or may fly on any route that joins, leaves, or crosses the OTS. Operators must be aware that while ATC will make every effort to clear random traffic across the OTS at requested levels, reroutes or significant changes in flight level from those planned are likely to be necessary during most of the OTS traffic periods. A comprehensive understanding of the OTS and the FLAS may assist flight planners in determining the feasibility of flight profiles.

Operators proposing to execute NAT crossings during the upcoming OTS period are encouraged to contribute to the OTS planning process. A comprehensive set of Collaborative Decision Making (CDM) procedures for NAT track design is now employed.

To ensure emphasis is placed on operators preferred routes, the CDM process begins with the Preferred Route Message (PRM) system. All NAT operators (both scheduled and non-scheduled) are urged to provide information by AFTN message to the appropriate OACCs regarding optimum routing for any/all of their flights intending to operate during upcoming peak traffic periods. Such information should be provided, in the correct format, as far in advance as possible, but not later than 1900 UTC for the following day-time OTS and 1000 UTC for the following night-time OTS.

Organized tracks are formulated and published as an AFTN track structure message. The day-time structure valid from 1130 UTC until 1900 UTC at 030°W is published by Shanwick, and the nighttime structure, valid from 0100 UTC until 0800 UTC at 030°W by Gander.

Flight Planning on OTS

NAT track structure messages are identified by a 3-digit Track Message Identification number (TMI) appearing at the end of the track message. This number relates to the day of the year (no reference to month). Any subsequent NAT track amendment(s) on a given day will carry a successive alpha number, i.e. TMI033B would reflect the 2nd amendment of the TMI for the 33rd day of the year. **Ensuring that the flight is planned on the correct track of the day is essential.** Crews should also be given copy of the track message(s) at time of briefing.

Operators should use the Flight Level Allocation Scheme (FLAS) for flight planning guidance:

FL430	May be flight planned for both east- and westbound by non-RVSM aircraft.
FL410	Eastbound FL.
FL310, 320, 340, 360, 380, 400	Westbound FL (except within eastbound OTS).
FL330, 350, 370, 390	Eastbound FL (except within westbound OTS).
FL300 and below	Even FLs westbound; odd FLs eastbound.

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

- a. operators are permitted to file flight plans at any flight level for a route which is wholly contained within the routing structure of T13, T16 and T213. Operators are reminded that T13, T16 and T213 are included in the DLM.

Flight planning requirements apply for T9 and T290: Item 10A - GRZ Item 18 - NAV/RNP2

- b. to accommodate significant single direction demand during OTS times, OACCs may exchange flight levels on a tactical basis. This allows additional profiles for main direction flow;
- c. during OTS times, aircraft intending to use the OTS may flight plan levels which are allocated to the published OTS. Additionally, to accommodate demand:
- during the eastbound OTS, eastbound non-OTS aircraft may flight plan at FL340 or FL380;
 - during the westbound OTS, westbound non-OTS aircraft may flight plan at FL330.
- d. unless suitable eastbound tracks exist, during the eastbound OTS times, eastbound traffic originating in New York OACC, planned to enter Shanwick OACC, is recommended to flight plan as follows:
- FL310 or FL340 and restrict routing to landfall BEDRA or south;
 - FL310, FL340 or FL380 and restrict routing to landfall either: BEDRA or south, or to remain south of the OTS, whichever is further south.
- e. during the westbound OTS, track and random westbound aircraft, flight planned to enter Shanwick and Gander airspace which landfalls BOKTO-AVPUT inclusive should not flight plan at FL340. FL340 is reserved for flights between Reykjavik OACC and Gander OACC.

Random Flight Planning (Predominantly East - West Direction)

For flights operating **at or south of 70N**, the planned tracks shall normally be defined by significant points formed by the intersection of half or whole degrees of latitude with meridians spaced at intervals of 10 degrees from the Greenwich meridian to longitude 70W.

For flights operating **north of 70N and at or south of 80N**, the planned tracks shall normally be defined by significant points formed by the intersection of parallels of latitude expressed in degrees and minutes with meridians normally spaced at intervals of 20 degrees from the Greenwich meridian to longitude 60W, using the longitudes 000W, 020W, 040W and 060W.

For flights operating **at or south of 80N**, the distance between significant points shall, as far as possible, not exceed one hour's flight time. When the flight time between successive significant points is less than 30 minutes, one of these points may be omitted. Additional significant points should be established when deemed necessary due to aircraft speed or the angle at which the meridians are crossed, e.g.:

- a. at intervals of 10 degrees of longitude (between 5W and 65W) for flights operating **at or south of 70N**; and
- b. at intervals of 20 degrees of longitude (between 10W and 50W) for flights operating **north of 70N and at or south of 80N**.

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

For flights operating **north of 80N**, the planned tracks shall normally be defined by significant points formed by the intersection of parallels of latitude expressed in degrees and minutes with meridians expressed in whole degrees. The distance between significant points shall normally equate to not less than 30 and not more than 60 minutes of flying time.

Random Flight Planning (Predominantly North - South Direction)

For flights whose flight paths **at or south of 80N** are predominantly oriented in a north-south direction, the planned tracks shall normally be defined by significant points formed by the intersection of whole degrees of longitude with specified parallels of latitude which are spaced at intervals of 5 degrees.

For flights operating **north of 80N**, the planned tracks shall be defined by points of intersection of parallels of latitude expressed in degrees and minutes with meridians expressed in whole degrees. The distance between significant points shall normally equate to not less than 30 and not more than 60 minutes of flying time.

Mach Number Technique

Mach Number Technique (MNT) is a technique whereby aircraft operating successively along suitable routes are cleared by ATC to maintain a Mach number for a portion of the enroute phase of flight.

MNT is used by ATC to control the longitudinal spacing between pairs of aircraft that are close to minimum longitudinal separation. When two or more aircraft are operating along the same route at the same flight level and maintaining the same Mach number, the time interval between them is more likely to remain constant than by using any other method.

Oceanic Clearances include assigned Mach numbers (when required) which are to be maintained until ATC issues the clearance RESUME NORMAL SPEED. Aircraft capable of maintaining an assigned Mach must flight plan their requested Mach number. ATC uses assigned Mach number or other speed information, along with position information to calculate estimated times along the cleared route. These times are used as the basis for longitudinal separation and for coordination with adjacent units.

ATC will try to accommodate flight crew/dispatcher requested or flight planned Mach numbers when issuing Oceanic Clearances. It is rare that ATC will assign a Mach number more than 0.01 faster or 0.02 slower than that requested and will issue the clearance RESUME NORMAL SPEED when traffic permits. The monitoring and maintenance of longitudinal separation is dependent upon the provision of accurate times in position reports.

An assigned Mach number must be maintained. If an immediate temporary change in an assigned Mach number is essential (due to turbulence for example), ATC must be so informed.

If a Mach number has been assigned, flight crews should maintain their last assigned Mach number during climbs in oceanic airspace. If due to aircraft performance this is not feasible ATC should be advised at the time of the request for the climb. After leaving oceanic airspace flight crews maintain their assigned Mach number in domestic controlled airspace unless and until the appropriate ATC unit authorizes a change.

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Adherence to ATC approved Routes

If an aircraft has inadvertently deviated from the route specified in the ATC clearance it shall forthwith take action to regain such route within 100NM from the position at which the deviation was observed.

NORTH ATLANTIC VOICE COMMUNICATION PROCEDURES

Operations in the NAT outside VHF coverage require the carriage of two long range communication systems, one of which must be HF. SATVOICE and/or CPDLC (appropriate to route of flight) may satisfy the requirement of the second-long range communication system.

Due to coverage limitations, an Inmarsat CPDLC or SATVOICE system does not qualify as a long range communication system when operating north of 80N. Aircraft that are equipped with both Inmarsat (J5) and Iridium (J7) data link capability should use Iridium when north of 80N.

Many NAT air/ground communications are still conducted on single side-band HF frequencies. For operations in the NAT region fully functioning HF communications equipment is required when operating outside VHF coverage.

When using HF, SATVOICE, or CPDLC, flight crews shall maintain a continuous air-ground communication watch on the assigned frequency, unless SELCAL equipped, in which case they should ensure the following sequence of actions:

- a. provide the SELCAL code in the flight plan; (any subsequent change of aircraft for a flight will require refiling of the flight plan or submitting a modification message (CHG) which includes the new registration and SELCAL);
- b. check the operation of the SELCAL equipment, at or prior to entry into oceanic airspace, with the appropriate radio station. (This SELCAL check shall be completed prior to commencing SELCAL watch); and
- c. maintain thereafter a SELCAL watch.

It is important to note that it is equally essential to comply with the foregoing SELCAL provisions even if SATVOICE or CPDLC are being used for routine air/ground ATS communications. This will ensure that ATC has a timely means of contacting the aircraft.

Radio operators usually maintain a continuous air-ground communication watch on more than one single frequency, therefore it is useful for flight crews to state the frequency used when placing the initial call to the radio station.

In the event of HF communication failure, when so equipped, an aircraft should use satellite voice communications to contact the responsible aeradio station via special telephone numbers/short codes (shown on chart proper). If not equipped with SATCOM then the flight crew should attempt to use VHF and request relay of position reports via another aircraft. For this purpose the air to air VHF frequency 123.45MHz may be used. If necessary the initial contact with the other aircraft may be made on 121.5MHz.

The Aeronautical Mobile Satellite (Route) Service (AMS(R)S), more commonly referred to as SATVOICE, can be used as a supplement to HF & CPDLC communications throughout the NAT region for any routine, nonroutine or emergency ATS air/ground communications.

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Radio stations are also responsible for the operation of General Purpose VHF (GP/VHF) outlets. North Atlantic flights may use these facilities for all regular and emergency communications with relevant OACCs.

It is important for the flight crew to appreciate that when using GP/VHF, as with HF and SAT-VOICE, these communications are with a radio station and the flight crew is not in direct contact with ATC. However, contact between the flight crew and ATC can be arranged, if necessary, via patch-through on HF or GP/VHF frequencies by Iceland Radio and Shanwick Radio.

NORTH ATLANTIC DATA LINK COMMUNICATION PROCEDURES

- a. Operational procedures to be used are specified in the ICAO Doc 10037, Global Operational Data Link Document (GOLD).
- b. When operating CPDLC the aircraft data link system provides indication to flight crews of any degraded performance which results from a failure or loss of connectivity. The flight crew should then notify the ATS unit of the failure as soon as practicable. Timely notification is essential to ensure that the ATS unit has time to assess the situation and apply a revised separation standard, if necessary.
- c. Similar to SATVOICE usage, pilots electing to use data link communications for regular ATS communications in the ICAO NAT region remain responsible for operating SELCAL (including completion of a SELCAL check), or maintaining a continuous air-ground communication watch on the assigned HF frequency outside VHF coverage.
- d. Flights equipped with CPDLC and/or ADS-C should ensure that the data link system is logged on to the appropriate OACC. This applies even when the aircraft is provided with ATS surveillance services. With the introduction of PBCS separation, establishing and maintaining a data link connection becomes even more important since an active data link connection is one of the requirements for the application of the separation.
- e. ADS-B based ATS surveillance service is provided in Reykjavik, Nuuk, Bodo, Gander Oceanic, New York Oceanic East and Santa Maria Oceanic FIR.

COMMON PROCEDURES FOR RADIO COMMUNICATION FAILURE

The following procedures are intended to provide general guidance for aircraft which experience a communications failure while operating in, or proposing to operate in, the NAT region. These procedures are intended to complement and not supersede State procedures/regulations. It is not possible to provide guidance for all situations associated with a communications failure.

General

- a. The flight crew of an aircraft experiencing a two-way ATS communications failure should operate the SSR transponder on identity Mode A code 7600 and Mode C.
- b. When so equipped, an aircraft should use SATVOICE communications to contact the responsible radio station via special telephone numbers/short codes (shown on chart proper).

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

- c. If the aircraft is not equipped with SATVOICE then the flight crew should attempt to use VHF to contact any (other) ATC facility or another aircraft, inform them of the difficulty and request that they relay information to the ATC facility with which communications are intended.
- d. The inter-pilot air-to-air VHF frequency, 123.450MHz, may be used to relay position reports via another aircraft.
- e. In view of the traffic density in the NAT region, flight crew of aircraft experiencing a two-way ATS communications failure should broadcast regular position reports on the inter-pilot frequency 123.450MHz until such time as communications are re-established.
- f. Due to the potential length of time in oceanic airspace, it is strongly recommended that a flight crew experiencing communications failure whilst still in European domestic airspace does not enter the Shanwick OCA.

Communications Failure prior to entering NAT Oceanic Airspace

If operating **with** a received and acknowledged Oceanic Clearance, the flight crew shall enter oceanic airspace at the cleared oceanic entry point, level and speed and proceed in accordance with the received and acknowledged Oceanic Clearance. Any level or speed changes required to comply with the Oceanic Clearance shall be completed in domestic airspace within the vicinity of the oceanic entry point.

If operating **without** a received and acknowledged Oceanic Clearance, the flight crew shall enter oceanic airspace at the first oceanic entry point, level and speed, as contained in the filed flight plan and proceed via the filed flight plan route to landfall. That first oceanic level and speed shall be maintained to landfall.

Communications Failure prior to exiting NAT Oceanic Airspace

Cleared on filed Flight Plan Route

The flight crew shall proceed in accordance with the last received and acknowledged Oceanic Clearance to the last specified oceanic route point, normally landfall, then continue on the filed flight plan route. Maintain the last assigned oceanic level and speed to landfall. After passing the last specified oceanic route point, conform with the relevant State procedures/regulations.

Cleared on other than Flight Plan Route

The flight crew shall proceed in accordance with the last received and acknowledged Oceanic Clearance to the last specified oceanic route point, normally landfall. After passing this point, rejoin the filed flight plan route by proceeding directly to the next significant point ahead of the track of the aircraft as contained in the filed flight plan. Where possible use published ATS route structures, then continue on the flight plan route. Maintain the last assigned oceanic level and speed to the last specified oceanic route point. After passing this point conform with the relevant State procedures/regulations.

Summary of Operational Procedures Required following Loss of Air/Ground ATS Communications in the NAT Region

- Equipment failure before receiving an Oceanic Clearance:

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Divert or fly the flight plan route, speed and initial planned oceanic level to landfall.

- Blackout encountered (in an HF comms domestic ATC environment) before receiving an Oceanic Clearance:

Continue at domestic cleared level and follow flight planned route and speed to landfall.

- Equipment failure or blackout after receiving an Oceanic Clearance:

Fly that clearance to landfall.

NORTH ATLANTIC CROSSING CLEARANCE PROCEDURES AND FREQUENCIES

General

Various methods of obtaining Oceanic Clearances include:

- use of published VHF clearance delivery frequencies;
- by HF communications to the OACC through the appropriate radio station (in accordance with specified timeframes);
- a request via domestic or other ATC agencies;
- by data link, when arrangements have been made with designated airlines to request and receive clearances using on-board equipment (ACARS).

Oceanic Clearances are required for all flights within NAT controlled airspace (at or above FL60). Flight crews should request Oceanic Clearances from the ATC responsible for the first OCA within which they wish to operate, following the procedures and the time-frame laid down in appropriate AIPs and NAT OPS Bulletins. Such clearances are applicable only from that entry point.

To assist in optimum airspace utilization, when requesting an Oceanic Clearance the flight crew should:

- advise of any required changes to oceanic flight planned level, track, or speed;
- advise the maximum acceptable flight level at the oceanic boundary;
- advise of preferred alternative NAT track if applicable.

When flight crews are requesting Oceanic Clearance, they are required to maintain contact on the control frequency, unless having received permission to leave the frequency.

If an aircraft encounters an in-flight equipment failure relevant to the airspace, enroute to the NAT oceanic airspace, then the flight crew must advise ATC when requesting an Oceanic Clearance.

The flight crew should monitor the forward estimate for oceanic entry, and if this changes **in excess of 2 minutes**, unless providing position reports via ADS-C, pass a revised estimate to ATC. As planned longitudinal spacing by these OACCs is based on the estimated times over the oceanic entry fix or boundary, failure to adhere to this ETA amendment procedure may jeopardize planned separation between aircraft, thus resulting in a subsequent re-clearance to a less economical track/flight level for the complete crossing. Any such failure may also penalize following aircraft.

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

If any of the route, flight level or speed in the clearance differs from that flight planned, requested or previously cleared, attention may be drawn to such changes when the clearance is delivered (whether by voice or by data link). Flight crews should pay particular attention when the issued clearance differs from the flight plan.

If the entry point of the Oceanic Clearance differs from that originally requested and/or the oceanic flight level differs from the current flight level, the flight crew is responsible for requesting and obtaining the necessary domestic re-clearance to ensure that the flight is in compliance with its Oceanic Clearance when entering oceanic airspace. If flight crews have not received their Oceanic Clearance prior to reaching the OCA boundary, they must follow the guidance provided in the appropriate State AIP.

Unless otherwise stated the Oceanic Clearance issued to each aircraft is at a specified flight level and cruise Mach Number. Subsequent enroute changes to flight level or Mach Number should not be made without prior ATC clearance, except in an urgency situation (e.g. encountering unanticipated severe turbulence).

Abbreviated Clearances

An abbreviated clearance is issued by Air Traffic Services when clearing an aircraft to fly along the whole length of an organized track. The flight crew should confirm the current NAT track message by using the TMI number (including any appropriate alpha suffix) in the readback. There is no requirement for the flight crew to read back the NAT track coordinates. If any doubt exists as to the TMI or the NAT track coordinates, the flight crew should request the complete track coordinates. Similarly, if the flight crew cannot correctly state the TMI, confirmation will include NAT track coordinates in full and a full read back of those coordinates will be required. If the term, "via flight plan route" is used when issuing an Oceanic Clearance, the flight crew is required to read-back the full coordinates of the flight plan route, from the oceanic entry point to the exit point.

OCEANIC AREA CONTROL CENTERS SPECIFIC PROCEDURES

Shanwick OCA

Oceanic Clearance (Westbound)

Aircraft operating within the UK FIR/UIR and the northern part of the France UIR should request Oceanic Clearance from "Shanwick Oceanic" on VHF (VHF coverage depicted on chart). UK departures are to request clearance as soon as possible after departure. Aircraft overflying the UK FIR/UIR and the northern part of the France UIR are to request clearance when they consider that they are within the specified VHF coverage. Aircraft other than Jet should request clearance at least 40 minutes before the ETA for the OCA entry point.

*NOTE: Flights routing via RATSU (61N 010W) do not require OCA clearance from Shanwick OCA. Therefore, aircraft intending to route via RATSU (61N 010W) must **not** contact Shanwick Clearance Delivery.*

Aircraft unable to contact "Shanwick Oceanic" on VHF, should request clearance on NAT HF frequencies at least 40 minutes before the ETA for the oceanic boundary and thereafter maintain a SELCAL watch for receipt of the Oceanic Clearance.

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Aircraft Communication Addressing and Reporting System (ACARS) equipped aircraft may request and receive their westbound Oceanic Clearance via data link, utilizing the Oceanic Clearance Link (OCL), for entry points on the Shanwick eastern boundary (from LUSEN to PASAS) without the requirement to contact Shanwick on RTF. Approval for the use of this system will be given by the Team Leader Asset Engineering Ops. Support at Shanwick Oceanic. This system should not be used by aircraft within 30 minutes of the Shanwick boundary; VHF or HF RTF should be used.

Requests for Oceanic Clearance shall include:

- a. call sign;
- b. OCA entry point and ETA;
- c. requested MACH number and Flight Level;
- d. any change to Flight Plan affecting OCA;
- e. the highest acceptable Flight Level which can be maintained at the OCA entry point.

Maintain a listening watch for receipt of the Oceanic Clearance. If successful SELCAL check has been completed with the appropriate aeradio station, a SELCAL watch should be maintained. Unless advised otherwise, use the following primary frequencies:

VHF:

- **123.95MHz** for aircraft registered in States west of 030°W;
- **127.65MHz** for aircraft registered in States east of 030°W.

HF:

- family A for aircraft flying routes with reporting coordinates between 43N and 47N;
- family B and C for aircraft flying routes with reporting coordinates between 47N and 64N. Primary assignment for aircraft flying central routes;
- family D for aircraft flying routes with reporting coordinates north of 62N;
- family F assigned on a tactical basis and coordinated between Shanwick Radio and Gander Radio;
- family H, I and J assigned on a tactical basis and coordinated between Shanwick Radio, adjoining NARTEL Radio Stations and Domestic Air Traffic Control agencies.

While in communication with Shanwick for Oceanic Clearance, aircraft must also maintain communication with the ATC authority for the airspace within which they are operating. Aircraft unable to contact Shanwick on VHF or on NARTEL HF should request the ATC authority for the airspace in which they are operating to relay their request for Oceanic Clearance to Shanwick.

Due to the short flying times between Scottish and Irish aerodromes and the Shanwick OCA boundary, pilots may be required to request and receive an Oceanic Clearance prior to departure.

Departures from Dublin (Intl) and Weston airport request Oceanic Clearance for all Oceanic entry points when airborne.

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Cork departures, if flight planned to enter Shanwick airspace via OMOKO, TAMEL or LASNO require Oceanic Clearance prior to departure. All other Oceanic entry, if the elapsed time to Shanwick Entry Point is 40 minutes or less, Oceanic Clearance required prior to departure.

Departures from Belfast (Aldergrove), Belfast (Belfast City), Londonderry (Eglinton), Glasgow and Prestwick if flight planned to enter Shanwick at GOMUP or ETILO, Oceanic Clearance required prior to departure. If flight planned to enter Shanwick at all other entry points, request when airborne. Non-jet Departures request Oceanic Clearance when airborne.

NOTE: Aircraft departing Belfast (Aldergrove) which have received Oceanic Clearance via AFTN prior to departure are required to call Oceanic Clearance Delivery once airborne to give a full readback of their Oceanic Clearance.

Departures from all other aerodromes, if the elapsed time to the Shanwick entry point is 40 minutes, or less, Oceanic Clearance required prior to departure.

Oceanic Clearances should be requested from Shanwick Oceanic via OCL. Shannon ACC will, on request, obtain Oceanic Clearance from Shanwick Oceanic and pass the clearance to the flight prior to departure.

Shannon departures should contact Shannon ACC on Phone or on 121.7MHz 40 minutes before ETD to request Oceanic Clearance. Pilots should contact Shannon ACC on 121.7MHz at least 15 minutes before start up, to obtain Oceanic Clearance.

Aircraft departing Dublin (Intl) and Weston airport planned to enter NAT airspace should request Oceanic Clearance when airborne using OCL or Shanwick Radio 127.9MHz or HF.

At other airports contact local ATS unit 40 minutes before ETD for Oceanic Clearance.

If Oceanic Clearance is not required prior to departure, pilots are reminded that they should request clearance between 90 and 30 minutes prior to the Shanwick boundary. At civil aerodromes where ATC is provided, request clearance directly by telephone to Shanwick or ask local ATC to relay the request. At MIL aerodromes and civil aerodromes where ATC is **NOT** provided, request clearance by using OCL or HF RTF prior to departure, or OCL, HF or VHF after departure. Pilots departing from Prestwick should contact Shanwick directly using the appropriate VHF frequency.

An Oceanic clearance issued by Shanwick is effective from the Shanwick OCA boundary. It is the pilots responsibility to ensure that the flight complies with this clearance, in particular, that the flight crosses the Shanwick OCA boundary at the flight level contained in the clearance issued by Shanwick. For flights entering Shanwick OCA from domestic airspace, it is the responsibility of the pilot to obtain from the appropriate domestic ATC authority any necessary clearance or re-clearance to enable the flight to comply with the Oceanic Clearance. It is the pilots responsibility, when necessary, to remain clear of Oceanic Airspace whilst awaiting the issuance of an Oceanic Clearance.

Flights entering Shanwick directly from the Madrid FIR/UIR should request the Oceanic Clearance on HF at least 40 minutes before the ETA for 45N. If unable on HF, request the Oceanic Clearance through the Madrid domestic ATC frequency.

REMARKS:

1. TMI IS 099 AND OPERATORS ARE REMINDED TO INCLUDE THE TMI NUMBER AS PART OF THE OCEANIC CLEARANCE READ BACK.
2. SEND RCL 90-30 MINUTES PRIOR TO OCEANIC ENTRY POINT.
3. PBCS OTS LEVELS 350-390. PBCS TRACKS AS FOLLOWS.

Shannon Oceanic Transition Area (SOTA), Northern Oceanic Transition Area (NOTA)

Parts of the Shanwick OCA are designated as the Shannon Oceanic Transition Area (SOTA) and the Northern Oceanic Transition Area (NOTA). NOTA airspace is included in the NAT HLA and hence NAT HLA airspace requirements are still applicable from FL285 to FL420 in NOTA. However, SOTA is not included in the NAT HLA. Therefore flights within SOTA routing such that they are subject to an Oceanic Clearance, are required to be NAT HLA MNPS approved. ATC service is provided by Shannon ACC via VHF. If unable to contact on VHF use HF. In the westbound NAT OTS signal Shanwick OAC promulgates the track structure(s) applicable together with such other information as may be considered useful for operators to identify the route to be flown.

The domestic landfall points OSBOX, KESIX, BEGID, SOVED, MOGLO, NETKI, KOKIB, BEXET, OLGON, GISTI, RILED, XETBO, LEKVA, ELBOX, EPUNA, ATSUR, BIMGO, NASBA, GUNSO, EVBAK and JABEX, which are associated with the OCA Exit points, are promulgated in the eastbound OTS message. If an eastbound NAT flight is rerouted via an oceanic landfall different to that filed in the flight plan, the flight may route DCT from the new landfall to the original filed exit point from Irish airspace.

Westbound NAT random flights and NAT OTS flights operating in the SOTA or NOTA, designated as MET reporting flights are to treat 8W for SOTA and 10W for NOTA as a midpoint and 15W as a designated reporting point. The 8W respectively 10W and 15W MET reports are to be given with the 15W position report to Shanwick on HF. Eastbound flights are not required to make MET reports when flying in the SOTA/NOTA.

Flight plans required for the SOTA/NOTA should be addressed to the IFPS addresses EUCHZMFP and EUCBZMFP.

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Flights requesting a change to their Oceanic Clearance must:

- a) if east of 10°W make their request to Shanwick on VHF/HF or CPDLC otherwise;
- b) if west of 10°W make their request to Shannon ACC on VHF.

Brest Oceanic Transition Area (BOTA)

Part of the Shanwick OCA is designated as the Brest Oceanic Transition Area (BOTA). BOTA is not included in the NAT HLA. Hence only flights routing such that they are subject to an Oceanic Clearance, are required to be NAT HLA MNPS approved. ATC service in BOTA is provided by Brest ATC. Eastbound flights may be given more direct routes by Brest UAC after passing 0845W meridian. The request for the Oceanic Clearance may be relayed by Brest ATC when unable to contact Shanwick on VHF or HF.

Reykjavik OCA

Aircraft entering the Reykjavik Control Area shall request an Oceanic Clearance prior to entering the Reykjavik OCA as follows:

- a. on data link in accordance with the document "ACARS Data Link Oceanic Clearance" published in Jeppesen ATC-Chapter, ATC-Data - Atlantic.
- b. from Iceland Radio on HF;
- c. aircrews approaching Reykjavik airspace from the Scottish and Stavanger areas can contact Iceland Radio on VHF primary 127.85, secondary 129.625 to obtain their Oceanic Clearance.

Reykjavik cannot issue Oceanic Clearances until coordination data has been received from the adjacent air traffic control center and the flight data has been activated within the Reykjavik Flight Data Processing System (FDPS). This occurs a certain time before the aircraft is estimated to enter the Reykjavik CTA and the time interval varies depending on the control area from which the aircraft enters the Reykjavik CTA.

Aircraft that are not data link equipped and are unable to contact Iceland Radio on HF/VHF should request the ATC authority for the airspace in which they are operating to relay their request for Oceanic Clearance to Reykjavik Center. Pilots should always endeavor to obtain Oceanic Clearance prior to entering Reykjavik OCA, however if any difficulty is encountered the pilot should not hold while awaiting clearance unless so directed by ATC. In such circumstances, pending receipt of the Oceanic Clearance, the aircraft should continue to maintain the flight level cleared by the current control authority.

Aircraft obtaining an Oceanic Clearance from Iceland Radio on HF/VHF should also maintain communication with the ATC authority for the airspace in which they are operating.

When operating in BIRD and BGGL FIRs, aircrew unable to make position reports via VHF or CPDLC, ADS-C or FMC are expected to use HF or SATCOM telephone if so equipped. SATCOM voice communications should be made to Iceland radio, short code is 425105. The numbers 425101 and 425103, are connected at Reykjavik ATC center and are valid for aircrew encountering emergencies.

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

Bodo OCA

Flights entering the NAT Region through Bodo OCA shall request their Oceanic Clearance from Polaris ACC (Bodo) on 127.725MHz, through Bodo Radio on appropriate HF frequencies, or through the appropriate data link service. Oceanic Clearance via data link should be requested at least 30 minutes prior to Oceanic entry. For VHF/HF, at least 20 minutes prior to entry. Departures from aerodromes situated close to the NAT Region boundary shall request Oceanic Clearance as soon as possible after departure.

Pilots should always endeavor to obtain an Oceanic Clearance prior to entering Bodo Oceanic Control Area, however, if any difficulty is encountered, the pilot should not hold while awaiting clearance unless directed to do so by ATC. All aircraft within Bodo OFIR are required to maintain listening watch, SELCAL or aural, with Bodo Radio on HF family D. While in communication with Bodo Oceanic Control or Bodo Radio for Oceanic Clearance, aircraft must also maintain communication with the ATC authority for the airspace within which they are operating.

Santa Maria OCA

Oceanic Clearances may be requested via the Santa Maria Oceanic Clearance Delivery (OCD) data link service or via the available voice services on VHF, HF or SATVOICE. All operators shall request their Oceanic Clearance at least 40 minutes before the ETO for the Santa Maria OCA boundary.

Flights departing from aerodromes located in Lisbon FIR, which are close to Santa Maria OCA boundary, shall request Oceanic Clearance as soon as possible after departure. Flights departing from Madeira Islands entering Santa Maria OCA via IRKID or ABALO are exempted of being leveled at oceanic entry point as long as prior authorization is obtained from Lisbon ATC or Santa Maria ATC.

Flights departing from Azores Islands will receive the Oceanic Clearance in a three step process. The appropriate Tower must be informed of the intended flight level for oceanic crossing and will issue an initial flight level clearance. After departure, Santa Maria Radar will assure the climb to the approved final level. The pilot will only receive the oceanic route and speed clearance later on, usually through Santa Maria Radio on HF.

Pilots should always endeavor to obtain Oceanic Clearance prior to entering Santa Maria Oceanic Control Area; however if any difficulty is encountered the pilot should not hold while waiting for the clearance, unless so instructed by ATC.

Gander OCA

Unless otherwise advised by ATC the following Oceanic Clearance Delivery (OCD) procedures are in effect daily between 2330 and 0730 UTC (DST 2230 and 0630 UTC) for all eastbound oceanic flights that transit the Gander domestic FIR/CTA. Clearance Delivery frequencies are published daily in the Remarks section on the eastbound NAT Track Message. During published clearance delivery hours, pilots are to contact "Gander Clearance Delivery" on the frequency designated for their oceanic entry point. Pilots should contact Clearance Delivery when they are within 200NM of the specified clearance delivery frequency location. In the event that contact

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

cannot be established, pilots are to advise ATC on the assigned control frequency. The following frequencies and frequency locations will normally be used:

135.45	NATASHQUAN (CYNA) (N50 11 W061 47) YNA VOR
128.45	ALLAN'S ISLAND (N46 50 W055 47)
119.42	SYDNEY (N46 09 W060 03) YQY VOR
132.025	BREVOORT (N63 20 W064 08)
134.20	KUUJJUAQ (CYVP) (N58 05 W068 25) YVP VOR

Operators who do not receive the NAT track message are to contact "Gander Clearance Delivery" when within 200NM of the frequency location. In the event that contact cannot be established, pilots are to advise ATC on the assigned control frequency.

Pilots are to maintain a continuous listening watch on the assigned control frequency while obtaining the oceanic clearance.

Flights that are equipped to request and receive solicited electronic oceanic clearances are not required to contact Clearance Delivery if an electronic clearance is received and confirmed successfully. Confirmation is the receipt of the following message: CLA RECEIVED CLEARANCE CONFIRMED END OF MESSAGE. If the above message is not received, data link oceanic clearances must be verified, either with Gander Clearance Delivery, during published hours, or on the control frequency, outside of published hours.

For detailed Gander data link Oceanic Clearance Delivery (OCD) Crew Procedures refer to the NAT OPS Bulletins (<http://www.icao.int/>).

1. TMI IS 099 OPERATORS ARE REMINDED TO INCLUDE THE TMI NUMBER AS PART OF THE OCEANIC CLEARANCE READ BACK.
2. SEND RCL 90-60 MINUTES PRIOR TO OCEANIC ENTRY POINT.

Communications

All aircraft operating in the Gander OCA must be capable of conducting two-way radio communication with ATC. The radio communication equipment shall consist of at least one HF and one other long-range communication system (HF, CPDLC, or SATVOICE). Carrying HF radio and the additional long-range communication system is mandatory, except for operations on routes covered by VHF facilities.

All flights operating in the Gander OCA should check in on international air-ground frequencies.

Gander Oceanic Transition Area (GOTA)

Electronic RCL Messages Through GOTA

Pilots submitting an RCL (request for clearance) must use oceanic entry and exit points located within GOTA and not a boundary fix along the Montreal CTA boundary. Oceanic entry and exit points and details are available in the Gander Data Link Oceanic Clearance Delivery Crew Procedures document. Flight crews submitting an RCL based on Montreal CTA boundary (e.g. IKMAN, MIBNO) will cause system errors and may affect the ocean profile.

New York OCA East

For flights planning to enter the NAT directly from the New York Oceanic East FIR, the IFR clearance to destination received at the departure aerodrome constitutes the route portion of the Oceanic Clearance. Once airborne, and prior to entry into the NAT, aircraft will be assigned an altitude and a speed (if required) by New York Center. The receipt of all 3 elements of an Oceanic Clearance: route, flight level, and speed constitutes the complete Oceanic Clearance. A subsequent change to any element(s) of the Oceanic Clearance does not alter the others. Flights entering Canadian domestic airspace from the New York Oceanic East FIR and then subsequently entering the NAT require a complete Oceanic Clearance. Flights entering the southern portion of New York East FIR from Piarco CTA will be issued all 3 components of the Oceanic Clearances prior to entering New York OCA.

Currently 50NM lateral separation standard is implemented in the New York Oceanic East FIR between aircraft meeting RNP10 or RNP4 specifications.

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

New York ARTCC

For details refer to Jeppesen ATC-Chapter "NORTH ATLANTIC (NAT) OCEANIC CLEARANCE PROCEDURES".

PERFORMANCE BASED SEPARATION MINIMA IN NAT AIRSPACE

Overview

Performance based separation minima as small as 35.2km (19NM) lateral and 25.9km (14NM) longitudinal predicated on PBCS and PBN, in accordance with ICAO Doc 4444 Procedures for Air Navigation Services - Air Traffic Management (PANS-ATM) has been implemented in the ICAO NAT Region.

Application

- The 55.5km (30NM) and 93km (50NM) longitudinal separation minima are between eligible aircraft pairs within the New York East and Santa Maria OCAs;
- the 5 minute longitudinal separation minimum is applied between eligible aircraft pairs within the Gander, Reykjavik, Santa Maria and Shanwick OCAs;
- the 42.6km (23NM) lateral separation minimum is applied between eligible aircraft pairs within the Gander, Reykjavik, Santa Maria, New York East (30NM lateral applied) and Shanwick OCAs.

NOTE: NAT Doc008 'Application of Separation Minima' Appendix A contains details of the separation minima applied in the North Atlantic Region.

Operator/Aircraft Eligibility

Operators are eligible to flight plan to operate on published PBCS tracks provided the flights are:

- authorized for Required Navigation Performance 4 (RNP4);
- fitted with and operating FANS 1/A CPDLC and ADS-C; and
- authorized for RCP240 and RSP180.

Operators/aircraft not eligible for performance based separation may be permitted to;

- infringe PBCS tracks at FL350 - FL390 (inclusive) at only one point (including Oceanic Entry/Exit Point) i.e. cross but not join an OTS PBCS track, and;
- climb or descend through levels FL350 - FL390 on a PBCS track provided the climb or descent is continuous.

For details of separation minima in NAT Airspace refer to Jeppesen ATC-Chapter "PERFORMANCE BASED SEPARATION MINIMA IN NAT AIRSPACE".

POSITION REPORTING PROCEDURES

- Unless otherwise requested by ATC, position reports for flights on routes not defined by designated reporting points shall be made at the significant points listed in the flight plan.

**ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)**

- b. ATC may require any flight operating in a north/south direction to report its position at any intermediate parallel of latitude when deemed necessary.
- c. In requiring aircraft to report their position at intermediate points, ATC is guided by the requirement to have positional information at approximately hourly intervals and also by the need to accommodate varying types of aircraft and varying traffic and MET conditions.
- d. Unless providing position reports via ADS-C, if the estimated time for the “next position”, as last reported to ATC has changed **in excess of 2 minutes**, a revised estimate must be transmitted to the ATS unit concerned as soon as possible.
- e. Flight crews must always report to ATC as soon as possible on reaching any new cruising level.
- f. For flights outside domestic ATS route networks, positions should be expressed in terms of latitude and longitude except when flying over named reporting points. For flights whose tracks are predominantly east or west, latitude should be expressed in degrees and minutes, longitude in degrees only. For flights whose tracks are predominantly north or south, latitude should be expressed in degrees only, longitude in degrees and minutes. However, it should be noted that when such minutes are zero then the position report may refer solely to degrees.

STANDARD AIR-GROUND MESSAGE TYPES AND FORMATS

Aircraft entering, operating within, or leaving the Oceanic Control Areas of Gander, New York, Bodo, Reykjavik, Santa Maria and Shanwick will transmit the elements of information in position reports to the appropriate Oceanic Control.

For content and data sequence refer to ATLANTIC CHART/1 panel 4 or CHART/2 panel 6.

*NOTE 1: “When Able Higher” (WAH) report must be provided by all flights entering the NAT HLA airspace portion of the New York OCA and Santa Maria OCA. WAH reports on entering other NAT OCAs is optional but useful and may be requested by any OAC. The WAH report includes the time or location the flight will be **able** to accept the next higher flight level. More than one level may be quoted if that information is available.*

*It should be noted that ATC acknowledgement of a WAH report (and any included request) is **NOT** a clearance to change altitude.*

*NOTE 2: **Report immediately on reaching any new cruising level following a re-clearance or completing a step climb, etc.***

WEATHER REPORTING

In accordance with ICAO Annex 3, aircraft are no longer required to provide voice reports of MET observations of wind speed and direction nor outside air temperature.

When an ATS unit establishes an ADS-C contract, it may also request the MET group, which contains wind and temperature data to satisfy the MET authorities’ requirements for the provision of MET data. However, it must be appreciated that any such automated MET reports do not include information on any observations of special or non-routine significant meteorological phenomena,

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

such as moderate/severe turbulence or icing, volcanic ash, thunderstorms, etc. Therefore any flight crew providing position reports via data link, who encounters any such significant meteorological phenomena should report this information via voice or, if appropriate, via a CPDLC free text downlink message. The format to be used for the reporting of such observations should, where appropriate, be by reference to geographical coordinates.

WEATHER DEVIATION PROCEDURES FOR OCEANIC - CONTROLLED AIRSPACE

For Weather Deviation Procedures refer to Jeppesen ATC-Chapter "Special Procedures for In-Flight Contingencies in Oceanic Airspace".

TRANSPONDER OPERATION

All aircraft operating as IFR flights in the NAT region shall be equipped with a pressure-altitude reporting SSR transponder. Unless otherwise directed by ATC, pilots flying in the NAT airspace shall operate transponders continuously in Mode A/C Code 2000, except that the last assigned code shall be retained for a period of 30 minutes after entry into NAT airspace or after leaving a surveillance service area. Pilots should note that it is important to change from the last assigned domestic code to Code 2000 since the original domestic code may not be recognized by the subsequent Domestic Radar Service on exit from the oceanic airspace.

The following exceptions apply:

- a. Reykjavik ACC provides a radar control service in the southeastern part of its area and consequently transponder codes issued by Reykjavik ACC must be retained throughout the Reykjavik OCA until advised by ATC.
- b. All eastbound flights routing Reykjavik - Shanwick - Scottish shall squawk Mode A Code 2000 10 minutes after entering Shanwick airspace.
- c. T9: The change to Code 2000 should be made 10 minutes after passing BEGAS northbound and 10 minutes after passing LASNO southbound.
- d. T290: The change to Code 2000 should be made 10 minutes after passing ADVAT northbound and 10 minutes after passing GELPO southbound.

It should be noted that this procedure does not affect the use of the special purpose codes (7500, 7600 and 7700) in cases of unlawful interference, radio failure or emergency. However, given the current heightened security environment flight crews must exercise **caution** when selecting codes not to inadvertently cycle through any of these special purpose codes and thereby possibly initiate the launching of an interception.

New York Oceanic FIR

All aircraft transitioning into the West Atlantic Route System (WATRS) via fixed ATS routes must remain on the last ATC-assigned beacon code.

ADS-B OPERATION

ADS-B equipage is not mandated in NAT HLA airspace except on route Tango 9 and Tango 290.

ATLANTIC NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

CONTINGENCY SITUATIONS AFFECTING ATM PROVISION IN THE NAT REGION

In the anticipation of situations arising which might result in the partial or total disruption of Air Traffic Services within the NAT region, NAT ATS providers have developed arrangements which would, in such events, be put in place to ensure, as far as possible, the continued safety of air navigation. Such arrangements include required actions by pilots and operators of affected flights. These arrangements are detailed in the “Air Traffic Management Operational Contingency Plan - North Atlantic Region” (NAT Doc 006) www.icao.int/EURNAT/.....

Operators and pilots planning and conducting operations in North Atlantic region should ensure their familiarity with these arrangements and in particular with the actions expected of pilots in such contingency situations.

SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES IN OCEANIC AIRSPACE

For Special Procedures for In-flight Contingencies refer to Jeppesen ATC-Chapter “Special Procedures for In-Flight Contingencies in Oceanic Airspace”.

STANDARD AIR GROUND MESSAGE TYPES AND FORMAT

Position Report

For routine position reports. The phraseology used to indicate the next position on the assigned route is “ESTIMATING”, for the following subsequent position “NEXT”, “ABLE” or “REQUEST”, as applicable for the acceptable or requested next higher FL position or time. Content and data sequence:

- “**Position**”;
- flight identification (additionally state frequency when using HF);
- present position;
- time over present position (hours and minutes);
- present flight level;
- next position on assigned route or OCA entry point;
- estimated time for next position or OCA entry point;
- next subsequent position;
- next higher FL acceptable or requested at position or time;
- any further information e.g. MET data or company message.

Request Clearance

In conjunction with a routine position report, to request a change of Mach number, flight level, or route and to request westbound Oceanic Clearance prior to entering Reykjavik, Santa Maria and Shanwick OCA's. Content and data sequence:

- “**Request Clearance**”;

ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)

- flight identification (additionally state frequency when using HF);
- present or last reported position;
- time over present or last reported position (hours and minutes);
- present flight level;
- next position on assigned route or OCA entry point;
- estimated time for next position or OCA entry point;
- next subsequent position;
- requested Mach number, flight level, or route;
- further information or clarifying remarks.

To request a change in Mach number, or route when a position report message is not appropriate. Content and data sequence:

- **“Request Clearance”**;
- flight identification (additionally state frequency when using HF);
- requested Mach number, or route;
- further information or clarifying remarks.

Revised Estimate

To update time estimate for next position. Content and data sequence:

- **“Revised Estimate”**;
- flight identification (additionally state frequency when using HF);
- next position on route;
- revised estimate for next position (hours and minutes);
- further information.

When able Higher

To pass information on position or time a climb to the next higher FL is acceptable or a clearance for higher FLs is requested when inclusion in a position report message is not appropriate. Content and data sequence:

- flight identification (additionally state frequency when using HF);
- requested or acceptable FLs;
- at position or time.

**ATLANTIC
NORTH ATLANTIC (NAT) HIGH LEVEL AIRSPACE (HLA)****Miscellaneous Message**

To pass information or make a request in plain language that does not conform with the content of other message format. No message designator is required as this will be inserted by the ground station.

Content and data sequence:

- flight identification (additionally state frequency when using HF);
- general information or request in plain language and format free.

**ATLANTIC
ACARS DATA LINK OCEANIC CLEARANCE**

ACARS DATA LINK OCEANIC CLEARANCE FLIGHT CREW PROCEDURES

INTRODUCTION

The ACARS Data link oceanic clearance service is provided by means of VHF and satellite to ACARS equipped aircraft via communications service providers ARINC and SITA. It should not be confused with FANS 1/A CPDLC. Operators intending to participate in the ACARS data link process are required to contact their communications service provider and indicate that they would like to receive the service.

Procedures for flights intending to receive an unsolicited clearance or that are not capable of sending a Request for Clearance (RCL) downlink message via ACARS data link entering Gander oceanic are included in Attachment A.

CONNECTING TO SYSTEM

Populate ACARS logon with the appropriate flight number and Oceanic Control Area (OCA) facility.

REQUESTING A CLEARANCE

Enough time should be allowed to request, receive, and understand the oceanic clearance (or amended clearance) well before reaching the Oceanic Entry Point (OEP).

NOTE: (Shanwick) Flights must not enter without an oceanic clearance.

Flight crews should send an RCL via ACARS. ATC cannot reply to an RCL with any message other than a Oceanic Clearance uplink message (CLX).

The call sign in the RCL must match the aircraft identification as contained in the ICAO flight plan or the RCL will be rejected

The RCL must contain all the following information:

- OEP;
- ETA for the OEP;
- Requested Mach Number;
- Requested Flight Level;
- The highest acceptable Flight Level which can be attained at the OEP (via free text);
- If higher than requested is acceptable; provide the highest acceptable altitude as MAX;

EXAMPLE: Requesting FL360 - enter free text MAX F380;

- If requested is the highest acceptable; provide the requested altitude as MAX;

EXAMPLE: Requesting FL360 - enter free text MAX F360.

The RCL should be sent in accordance with the following table:

**ATLANTIC
ACARS DATA LINK OCEANIC CLEARANCE**

OCA		Prior to OEP
Gander		90-60 minutes
Shanwick and Bodo		90-30 minutes
Santa Maria		At least 40 minutes
Reykjavik (entering from)	Stavanger and Scottish	25 minutes
	Murmansk	30 minutes ¹
	Edmonton	45 minutes ¹
Rule of thumb for Reykjavik 20-25 minutes		
<i>NOTE 1: (Gander) Flight crews in receipt of an ACARS data link oceanic clearance from Gander OCA while in the New York OCA but subsequently routing through Gander Domestic airspace before re-entering the NAT HLA, should not modify the FMC prior to exiting the New York OCA. Modifications in accordance with the oceanic clearance should be executed while within Gander Domestic airspace.</i> <i>NOTE 2: (Reykjavik) If the flight planned route does not contain a waypoint on the Reykjavik OCA boundary then the Entry Point should be the next flight plan waypoint before the Reykjavik OCA boundary. In such cases the entry point in the Oceanic Clearance (CLX) message will be a system calculated boundary crossing point and this change will be highlighted with the text "ENTRY POINT CHANGE <position>" in the ATC/line. Exception to this are waypoints EPMAN, DARUB, JULET and LT.</i>		

¹ Due to coverage limitations, aircraft equipped with Inmarsat data link won't be able to obtain an oceanic clearance via ACARS data link when north of 82°N. Aircraft equipped with Iridium and/or HF ACARS data link should be able to obtain an oceanic clearance via ACARS data link regardless of location.

A significant delay or complete failure to send the RCL may result in the flight not receiving an ACARS data link oceanic clearance. The oceanic clearance will then have to be requested via voice.

NOTE 1: Note: (Gander) Flights departing from airports less than 45 minutes flying time from the OEP should request clearance 10 minutes prior to start up.

NOTE 2: (Gander) Under some circumstances, an ACARS data link oceanic clearance may be received prior to the RCL being sent.

NOTE 3: (Reykjavik) The ACARS data link oceanic clearance is not available for flights departing from airports in Iceland, Greenland and the Faroe Islands. The oceanic clearance to those flights is delivered by the appropriate Control Tower or AFIS before departure.

NOTE 4: (Shanwick) Due to the short flying times between Scottish and Irish aerodromes and the Shanwick OCA boundary, pilots may be required to request and receive an Oceanic Clearance prior to departure.

**ATLANTIC
ACARS DATA LINK OCEANIC CLEARANCE**

NOTE 5: (Santa Maria) A RCL is not required for flights departing from airports in the Azores either via data-link or voice. The oceanic clearance to those flights will be provided by ATC via Santa Maria Radio, VHF or CPDLC route confirmation before leaving surveillance coverage.

The following message indicates that the RCL has been received:

OCA	RCL RECEIVED
Gander	IF NO CLEARANCE RECEIVED WITHIN 30 MINUTES OF OCEANIC ENTRY POINT REVERT TO VOICE PROCEDURES END OF MESSAGE.
Reykjavik, Bodo, Santa Maria	IF NO CLEARANCE WITHIN 15 MINUTES REVERT TO VOICE PROCEDURES
Shanwick	IF NO CLEARANCE WITHIN 15 MINUTES CONTACT SHANWICK BY VOICE

If the appropriate message listed above is not received within 5 minutes of sending the RCL, the flight crew should request the clearance via voice. Clearance readback must include the Track Message Identifier (TMI) if on the OTS.

NOTE: (Shanwick) A second attempt to send an RCL can be made. If an RCL is invalid or incomplete, ATC will send an advisory message with instruction.

If the call sign in the ACARS data link oceanic clearance is not correct, the clearance is not valid. The flight crew must request the oceanic clearance via voice and include the TMI in the clearance readback if on the OTS.

If the ACARS data link oceanic clearance is not received within the times listed above, the flight crew must request the oceanic clearance via voice.

CLEARANCE DELIVERY

ACARS data link clearances contain full route coordinates. Clearances on an OTS Track also include the Track Identifier e.g. ALPHA, BRAVO etc.

Flight crews must check that the route coordinates received match the full Lat/Long coordinates loaded in the FMC. If on the OTS, also check that they agree with the current NAT track message. Query any discrepancies using voice procedures.

NOTE: (Gander) If an ACARS data link clearance must be confirmed by voice, contact Gander Clearance Delivery between the hours of 2330z-0730z (DST 2230z-0630z), when within 200NM of a Gander clearance delivery frequency as published in the OTS Track Message. Outside of these hours or when the flight will not pass within 200NM of a published frequency, contact the current controller.

The flight level contained in the ACARS data link oceanic clearance is the "cleared oceanic flight level" for the purposes of complying with the lost communication procedures detailed in State AIPs, ICAO Doc 7030 (North Atlantic Regional Supplementary Procedures) and NAT Doc 007.

ATLANTIC ACARS DATA LINK OCEANIC CLEARANCE

ATC is responsible for providing a clearance to enable the flight to reach this flight level before reaching the OEP. If there is a concern, flight crews should contact ATC.

CAUTION: The flight level contained in the ACARS data link oceanic clearance IS NOT a clearance to climb. Flight crews must request ALL level changes with ATC and not change flight level upon the receipt of the oceanic clearance.

The ACARS data link oceanic clearance may include a reroute to an OEP which is different from the current cleared route and/or may specify an OEP which is different from the flight plan. In all cases, flights should continue to operate in accordance with the current cleared route until a verbal reclearance is received from ATC.

CAUTION: Upon receipt of a revised oceanic clearance (i.e., one not conforming to the flight planned route), both pilots must independently verify the full latitude and longitude coordinates of "un-named" (Lat/Long) waypoints defining the route contained in the revised oceanic clearance.

If the clearance does not contain the line END OF MESSAGE (which could be on a subsequent page), it is possible that the clearance was not complete. Flight crews must verify the clearance via voice and include the TMI if on the OTS.

NOTE: (Shanwick) ACARS data link will not be used to issue clearances when aircraft is estimated to be within 15 minutes from the OCA boundary.

CLEARANCE NEGOTIATION

Upon receipt of the RCL, the controller may issue an ACARS message instructing the flight crew to contact ATC by voice to negotiate the clearance requirements with the crew.

Amendments to the ACARS data link oceanic clearance should be requested via voice. Flights equipped to send an RCL should send one before requesting the amendment via voice.

NOTE: (Gander) Amendments to the ACARS data link oceanic clearance should be requested by contacting Gander Clearance Delivery.

CLEARANCE ACKNOWLEDGEMENT

When the ACARS data link oceanic clearance is received, flights equipped to send a Clearance Acknowledgement (CLA) should do so. Flights not equipped to send a CLA must acknowledge the ACARS data link oceanic clearance via voice.

NOTE: (Shanwick) If no CLA is received within 10 minutes of sending the CLX, ATC will advise the crew CLEARANCE CANCELLED REVERT TO VOICE PROCEDURES.

The following message indicates that the ACARS data link oceanic clearance process is complete and that no further action is required by the flight crew to acknowledge or verify the oceanic clearance: *CLA RECEIVED CLEARANCE CONFIRMED END OF MESSAGE.*

If this message is not received within 5 minutes of sending the CLA, then the ACARS data link oceanic clearance must be verified via voice and include the TMI if on the OTS.

If unable to send a CLA or a CLA error message is received, the ACARS data link oceanic clearance must be verified via voice and include the TMI if on the OTS.

**ATLANTIC
ACARS DATA LINK OCEANIC CLEARANCE**

When verifying an ACARS data link oceanic clearance via voice the following information must be provided:

- ETA for the OEP;
- Cleared oceanic route: Track identifier (e.g. Track C) if on the OTS, or full route coordinates if on a Random;
- Cleared oceanic flight level;
- Cleared Mach number; and
- NAT TMI (e.g. TMI 157 if on the OTS).

ATC/REMARKS

The ATC/line will list which item (or items) of the clearance was changed from the previously issued clearance (or if the item is different from that requested). The terms used in the ATC/line are explained below:

Level Change	Clearance is at a level different from that requested or previously cleared.
Mach Change	Clearance is at a speed different from that requested or previously cleared.
Entry Point Change	Clearance is via an Entry Point different from that requested, or previously cleared.
Route Change	The route contained is a change from the filed flight plan or the route in the reclearance is different from the previously issued clearance. <i>NOTE: If the previously issued clearance was on a NAT TRACK, the route description may change to RANDOM ROUTE, or vice versa depending on depending on the reclearance.</i>
Route Amendment	The route in the clearance is different from the route in the flight plan.
Route Change at {Position}	Clearance is via a single route point different from that requested or previously cleared.
Route Change at Multiple Route Points	Clearance is via a route that has two or more points different from that requested or previously cleared.
Request Level Change at {Position}	Pilot should request a level change at point specified.
Unable to Approve Request	Shanwick unable to approve request for change to clearance. This Reclearance should be a copy of the previous clearance. Flight crews should check for any discrepancy or ATC/field information.
Clearance Limit	The clearance limit in the clearance is different from the destination in the flight plan.

**ATLANTIC
ACARS DATA LINK OCEANIC CLEARANCE****RECLEARANCES**

When an ACARS data link oceanic clearance is amended, it will include the ATC/line and the RECLEARANCE line.

The RECLEARANCE line will contain a number from 1 to 9, to identify the first and subsequent reclearances. Reclearances may not be numbered consecutively, but the latest reclearance will always have a higher number.

All reclearances must be acknowledged. The CLA should be sent for the clearance with the highest RECLEARANCE number.

If the reclearance does not contain the line END OF MESSAGE, it is possible that the clearance was incomplete. Flight crews must verify the clearance via voice and include the TMI if on the OTS.

Revert to voice if there is any doubt as to the oceanic clearance.

RCL/CLA ERRORS

Message	Flight Crew Action
RCL REJECTED RCL SENT TOO EARLY	Check the ETA, and re-request at the correct time
RCL REJECTED RCL RECEIVED TOO LATE RE- VERT TO VOICE PROCEDURES	Clearance request received less than 30 minutes prior to the boundary. Check ETA. If less than 30 minutes from the boundary, OCL cannot be used. Contact OCA by voice immediately. If more than 30 minutes from the boundary, amend ETA and resubmit RCL.
RCL REJECTED REQUEST BEING PROCESSED AWAIT TRANSACTION COMPLE- TION	Await clearance issued on the basis of the original RCL, then input new RCL if required.
RCL REJECTED FLIGHT PLAN NOT HELD	Check that the correct callsign was used. Amend and re-request or contact via voice.
RCL REJECTED REGISTRATION DOES NOT MATCH FLIGHT PLAN REVERT TO VOICE PROCEDURES	Revert to voice
RCL REJECTED MULTIPLE FLIGHT PLAN HELD RE- VERT TO VOICE PROCEDURES	Revert to voice

**ATLANTIC
ACARS DATA LINK OCEANIC CLEARANCE**

Message	Flight Crew Action
RCL REJECTED INVALID <Callsign, Mach No, Level, OEP> RESUBMIT YOUR REQUEST	Check the identified error, amend and re-submit the RCL.
(CLA or) RCL REJECTED ERROR IN MESSAGE	An error has been detected and further data link communication should not take place. Revert to voice.
RCL REJECTED INVALID REGISTRATION REVERT TO VOICE PROCEDURES	Revert to voice
RCL REJECTED CALLSIGN ALREADY IN USE	Revert to voice
RCL REJECTED NETWORK CONGESTION REVERT TO VOICE PROCEDURES or RCL REJECTED OCL SERVICE NOT CURRENTLY AVAILABLE REVERT TO VOICE PROCEDURES or RCL (or CLA) REJECTED GROUND SYSTEM ERROR REVERT TO VOICE PROCEDURES	A network or ground system error has been detected. Revert to voice
RCL RECEIVED (OCA) CLEARANCE NOT ACKNOWLEDGED SEND DATALINK ACKNOWLEDGEMENT NOW	Clearance Acknowledgement has not been received. Acknowledge clearance by data link now. Failure to do so will result in transaction termination.
RCL REJECTED TRANSACTION TIME OUT REVERT TO VOICE PROCEDURES	Acknowledgement has not been received. Clearance is not valid.

**ATLANTIC
ACARS DATA LINK OCEANIC CLEARANCE**

Message	Flight Crew Action
RCL/CLA RECEIVED NEGOTIATION REQUIRED CONTACT SHANWICK BY VOICE	Negotiation is required, or communications problems encountered. Contact Shanwick by voice immediately. Anticipate that clearance will be issued via data link.
RCL/CLA REJECTED CLEARANCE CANCELLED REVERT TO VOICE PROCEDURES	Invalid CLA received at OCL. Transaction failed. Contact Shanwick by voice immediately. or A Reclearance message has not been delivered. The current clearance may not be valid. Contact Shanwick by voice immediately.

FLIGHT CREW CHECKLIST

1	Complete ACARS logon
2	Send the RCL
3	Ensure confirmation message is received
4	If error message received, revert to voice
5	Receive ACARS data link oceanic clearance
6	Confirm call sign in clearance matches the call sign in the flight plan
7	Confirm that route coordinates match the full Lat/Long coordinates in the FMS and on the NAT Track Message (if on the OTS)
8	Send CLA
9	Ensure confirmation message is received
10	If error message received, revert to voice

**ATTACHMENT A - GANDER ONLY - UNSOLICITED OCEANIC CLEARANCES - NO
RCL**

Gander provides a service specific to aircraft not equipped to send an RCL. This service needs to be set up in advance with your communication service provider and NavCanada. Aircraft registration occurs twice per month on the 1st and 15th day.

1.1 — Procedures for flights intending to receive an unsolicited clearance or that are not capable of sending a Request for Clearance (RCL) downlink message via ACARS data link should include 'AGCS' in item 18 of the ICAO flight plan.

1.2 — Flights not equipped to send an RCL must complete the ACARS logon and expect a clearance automatically in Gander's airspace.

**ATLANTIC
ACARS DATA LINK OCEANIC CLEARANCE**

1.3 — Flights not equipped to send an RCL, but equipped to receive an ACARS data link oceanic clearance should:

- Include ‘AGCS’ in item 18 of the ICAO flight plan; and
- Expect to receive their ACARS data link oceanic clearances automatically. If the ACARS data link oceanic clearance is not received within the time limits listed above, the oceanic clearance must be requested via voice

1.4 — Departures from Gander (CYQX), Goose Bay (CYYR), and St. John’s (CYYT); oceanic clearance will be sent at the same time or with a departure clearance.

ATLANTIC

ADVANCED SURVEILLANCE ENHANCED PROCEDURAL SEPARATIONS (ASEPS) USING ADS-B IN
IN NAT AIRSPACE**TRIAL IMPLEMENTATION OF ASEPS USING ADS-B****INTRODUCTION**

The expansion of automatic dependent surveillance - broadcast (ADS-B) service, as facilitated by receivers hosted on satellites, into oceanic and remote areas previously limited by ground-based ATS surveillance systems is making it possible to maintain a safe, orderly and expeditious flow of air traffic using smaller air traffic control separation standards than are required today. Used together with the existing ground based ATS surveillance infrastructure, space-based (SB) ADS-B is permitting uninterrupted ATS surveillance for equipped aircraft before, during and after entry into the North Atlantic (NAT) Region.

With the anticipated expansion of ADS-B availability into oceanic and remote areas, the ICAO Separation and Airspace Safety Panel (SASP) were tasked to develop proposals for ADS-B separation minima for implementation in oceanic and remote en-route airspace. The proposed minima (described below) can be used between aircraft meeting the specifications for RNP4 and RCP240 where ADS-B service is provided and Controller Pilot Data Link Communications (CPDLC) is available.

On the 28 March 2019, Shanwick, Gander and Santa Maria Oceanic Control Areas commenced a trial implementation of the following longitudinal separations. Application of the ATS surveillance based procedural longitudinal separation was as per the PANS ATM, Doc 4444 proposal for amendment from the ICAO SASP, as paraphrased below:

- a. 17NM longitudinal separation of aircraft operating on same track or intersecting tracks provided that the relative angle between the tracks is less than 90 degrees;
- b. 14NM provided the relative angle between the tracks is less than 45 degrees;
- c. Opposite-direction aircraft on reciprocal tracks may be cleared to climb or descend to or through the levels occupied by another aircraft provided that the aircraft have reported by ADS-B having passed each other by 5NM.

On or soon after the 10 October 2019, Shanwick, Gander and Santa Maria Oceanic Control Areas will commence a trial implementation of 19NM lateral spacing between parallel or non-intersecting tracks. Operators will be advised via Aeronautical Information Circular (AIC) of the commencement of lateral ASEPS implementation trial.

GENERAL

There is no change to non VHF direct controller-pilot communications infrastructure or procedures using CPDLC, as contained in the Global Operational Data Link (GOLD) Manual (Doc 10037), and Satellite Voice Operations Manual (Doc 10038).

Flight crews are expected to comply with the normal non-surveillance procedures, which include position reports via voice or ADS-C, and all other operator specific procedures currently used.

Application of the ATS surveillance based separations where direct controller-pilot VHF voice communications is not available requires aircraft meeting the specifications for RNP4, RCP240 and RSP180 as annotated by the appropriate designator in the ICAO flight plan.

ATLANTIC**ADVANCED SURVEILLANCE ENHANCED PROCEDURAL SEPARATIONS (ASEPS) USING ADS-B IN IN NAT AIRSPACE**

The existing FANS1/A infrastructure, including ADS-C waypoint change event contracts, vertical and lateral event contracts and CPDLC confirm assigned route [UM137/DM40], will continue to be utilized to extract intent data (NEXT and NEXT+1) from the flight's FMS as part of conformance monitoring.

QUALIFICATIONS TO PARTICIPATE IN THE TRIAL

Eligible flights are those that meeting the following requirements:

- a. RVSM/HLA approval;
- b. ADS-B, with dedicated 1090MHz out capability;
- c. aircraft meeting the specifications for RNP4;
- d. aircraft meeting the specifications of RCP240 and RSP180.

ATS systems use Item 10 (Equipment) of the standard ICAO flight plan to identify an aircraft's data link and navigation capabilities. The operator should insert the following items into the ICAO flight plan for FANS 1/A or equivalent aircraft:

- a. Item 10a (Radio communication, navigation and approach aid equipment and capabilities):
 1. insert 'J5' to indicate CPDLC FANS1/A SATCOM (Inmarsat) or 'J7' to indicate CPDLC FANS1/A SATCOM (Iridium) data link equipment;
 2. insert 'P2' to indicate RCP240 approval.
- b. Item 10b (Surveillance equipment and capabilities):
 1. insert 'D1' to indicate ADS with FANS1/A capabilities; and
 2. B1 or B2 to indicate ADS-B.
- c. Item 18 (Other Information): insert the characters 'PBN/' followed by 'L1' for RNP4 and SUR/RSP180.

Operators do not have to apply to be part of the trial. As long as they meet the qualifications above, they will be participants in the trial.

If the ACAS II system is not operational but the flight is authorized based on State MEL relief provisions, the operator may request a clearance that does not result in the application of ASEPS lateral separation. This would be done by the pilot advising Gander, Santa Maria or Shanwick ATC:

– Prior to entry from adjacent ACC:

During Oceanic Clearance Request with Gander, Santa Maria or Shanwick ATC, by stating in voice request or including 'RMK/NO ACAS' via OCL request or;

– Prior to entry from New York or Iceland OACs:

Via HF or SATCOM Voice 30 minutes before the Gander, Santa Maria or Shanwick OCA boundaries or;

– After entry:

ATLANTIC**ADVANCED SURVEILLANCE ENHANCED PROCEDURAL SEPARATIONS (ASEPS) USING ADS-B IN
IN NAT AIRSPACE**

Via HF or SATCOM Voice as soon as possible after failure of ACAS II system is detected.

STRATEGIC LATERAL OFFSET PROCEDURE (SLOP)

The Strategic Lateral Offset Procedures (SLOP), implemented as a standard operating procedure in the NAT Region, remains applicable.

CONTINGENCY PROCEDURES

For In-flight Contingencies and Weather Deviation Procedures refer to Jeppesen ATC-Chapter “Special Procedures for In-Flight Contingencies in NAT Oceanic Airspace”.

ATLANTIC
SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES

SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES

INTRODUCTION

Although all possible contingencies cannot be covered, the procedures provide for the more frequent cases such as:

- a. Inability to comply with assigned clearance due to meteorological conditions;
- b. Enroute diversion across the prevailing traffic flow (for example, due to medical emergencies); and
- c. Loss of, or significant reduction in, the required navigation capability when operating in an airspace where the navigation performance accuracy is a prerequisite to the safe conduct of flight operations, or pressurization failure.

The pilot shall take action as necessary to ensure the safety of the aircraft and the pilot's judgement shall determine the sequence of actions to be taken, having regard to the prevailing circumstances. Air traffic control shall render all possible assistance.

GENERAL PROCEDURES

If an aircraft is unable to continue the flight in accordance with its ATC clearance, a revised clearance shall be obtained, whenever possible, prior to initiating any action. If prior clearance cannot be obtained, the following contingency procedures should be employed until a revised clearance is received:

- a. Leave the cleared route or track by initially turning at least 30 degrees to the right or to the left, in order to intercept and maintain a parallel, direction track or route offset 9.3km (5NM). The direction of the turn should be based on one or more of the following:
 1. aircraft position relative to any organized track or route system;
 2. the direction of flights and flight levels allocated on adjacent tracks;
 3. the direction to an alternate airport;
 4. any strategic lateral offset being flown; and
 5. terrain clearance.
- b. the aircraft should be flown at a flight level and an offset track where other aircraft are less likely to be encountered;
- c. maintain a watch for conflicting traffic both visually and by reference to ACAS (if equipped) leaving ACAS in RA mode at all times, unless aircraft operating limitations dictate otherwise;
- d. turn on all aircraft exterior lights (commensurate with appropriate operating limitations);
- e. keep the SSR transponder on at all times and, when able, squawk 7700, as appropriate;
- f. as soon as practicable, the pilot shall advise air traffic control of any deviation from assigned clearance;

ATLANTIC SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES

- g. use whatever means is appropriate (i.e. voice and/or CPDLC) to communicate during a contingency or emergency;
- h. if voice communication is used, the radiotelephony distress signal (MAYDAY) or urgency signal (PAN PAN) preferably spoken three times, shall be used, as appropriate;
- i. when emergency situations are communicated via CPDLC, the controller may respond via CPDLC. However, the controller may also attempt to make voice communication contact with the aircraft;
- j. establish communications with and alert nearby aircraft by broadcasting, at suitable intervals on 121.5MHz (or, as a backup, on the inter-pilot air-to-air frequency 123.45MHz) and where appropriate on the frequency in use: aircraft identification, the nature of the distress condition, intention of the person in command, position (including the ATS route designator or the track code, as appropriate) and flight level; and
- k. the controller should attempt to determine the nature of the emergency and ascertain any assistance that may be required. Subsequent ATC action with respect to that aircraft shall be based on the intentions of the pilot and overall traffic situation.

ACTIONS TO BE TAKEN ONCE OFFSET FROM TRACK

NOTE: The pilot's judgement of the situation and the need to ensure the safety of the aircraft will determine whether the actions below in a. or b., will be taken. Factors for the pilot to consider when diverting from the cleared route or track without an ATC clearance include, but are not limited to:

- operation within a parallel track system,
- the potential for User Preferred Routes (UPRs) parallel to the aircraft's track or route,
- the nature of the contingency (e.g. aircraft system malfunction); and
- weather factors (e.g. convective weather at lower flight levels).

If possible maintain the assigned flight level until established on the 9.3km (5NM) parallel, same direction track or route offset. If unable, initially minimize the rate of descent to the extent that is operationally feasible.

Once established on a parallel, same direction track or route offset by 9.3km (5NM), either:

- a. descend below FL290, and establish a 150m (500ft) vertical offset from those flight levels normally used, and proceed as required by the operational situation or if an ATC clearance has been obtained, proceed in accordance with the clearance; or

NOTE: Descent below FL290 is considered particularly applicable to operations where there is a predominant traffic flow (e.g. east-west) or parallel track system where the aircraft's diversion path will likely cross adjacent tracks or routes. A descent below FL290 can decrease the likelihood of: conflict with other aircraft, ACAS RA events and delays in obtaining a revised ATC clearance.

ATLANTIC
SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES

- b. establish a 150m (500ft) vertical offset (or 300m (1000ft) vertical offset if above FL410) from those flight levels normally used, and proceed as required by the operational situation, or if an ATC clearance has been obtained, proceed in accordance with the clearance.

NOTE: Altimetry System Error may lead to less than actual 500ft vertical separation when the above procedure is applied. In addition, with the 500ft vertical offset applied, ACAS RAs may occur.

ATLANTIC
SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES

SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES
IN OCEANIC AIRSPACE (non-weather)

ATLANTIC
SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES

WEATHER DEVIATION PROCEDURES

General

The following procedures are intended for deviations around adverse meteorological conditions. When weather deviation is required, the pilot should contact ATC via CPDLC or voice. A rapid response may be obtained by requesting a weather deviation using a CPDLC downlink message (Doc 4444, Appendix 5, Lateral Downlinks (LATD) refers) or stating "WEATHER DEVIATION REQUIRED" to indicate that priority is desired on the frequency and for ATC response. When necessary, the pilot should initiate the communications using CPDLC downlink message (Doc 4444, Appendix 5, Emergency/urgency downlink (EMGD) refers) or by using the urgency call "PAN PAN" (preferably spoken three times).

The pilot shall inform ATC when weather deviation is no longer required, or when a weather deviation has been completed and the aircraft has returned to its cleared route.

Actions to be taken when Controller-Pilot communications are established

The pilot should contact ATC and request clearance to deviate from track or route, advising the extent of the deviation requested. The flight crew will use whatever means is appropriate (i.e., CPDLC and/or voice) to communicate during a weather deviation.

NOTE: Pilots are advised to contact ATC as soon as possible with requests for clearance in order to provide time for the request to be assessed and acted upon.

ATC should take one of the following actions:

- a. when appropriate separation can be applied, issue clearance to deviate from track; or
- b. if there is conflicting traffic and ATC is unable to establish appropriate separation, ATC shall:
 1. advise the pilot of inability to issue clearance for the requested deviation;
 2. advise the pilot of conflicting traffic; and
 3. request the pilot's intentions.

The pilot should take the following actions:

- a. comply with the ATC clearance issued; or
- b. advise ATC of intentions and execute the procedures detailed below.

Actions to be taken if a revised ATC clearance cannot be obtained

NOTE: The provisions of this section apply to situations where a pilot needs to exercise the authority of a pilot-in-command under the provisions of Annex 2, 2.3.1.

If the aircraft is required to deviate from track or route to avoid adverse meteorological conditions and prior clearance cannot be obtained, an ATC clearance shall be obtained at the earliest possible time. Until an ATC clearance is received, the pilot shall take the following actions:

- a. if possible, deviate away from an organized track or route system;

ATLANTIC
SPECIAL PROCEDURES FOR IN-FLIGHT CONTINGENCIES

- b. establish communications with and alert nearby aircraft by broadcasting, at suitable intervals: aircraft identification, flight level, position (including ATS route designator or the track code) and intentions, on the frequency in use and on 121.5MHz (or, as a backup, on the inter-pilot air-to-air frequency 123.45MHz);
- c. watch for conflicting traffic both visually and by reference to ACAS (if equipped);
- d. turn on all aircraft exterior lights (commensurate with appropriate operating limitations);
- e. for deviations of less than 9.3km (5NM) from the originally cleared track or route remain at a level assigned by ATC;
- f. for deviations greater than or equal to 9.3km (5NM) from the originally cleared track or route, when the aircraft is approximately 9.3km (5NM) from track, initiate a level change in accordance with table below;
- g. if the pilot receives clearance to deviate from cleared track or route for a specified distance and, subsequently, requests, but cannot obtain a clearance to deviate beyond that distance, the pilot should apply an altitude offset in accordance with table below before deviating beyond the cleared distance;
- h. when returning to track or route, be at its assigned flight level when the aircraft is within approximately 9.3km (5NM) of the centre line; and
- i. if contact was not established prior to deviating, continue to attempt to contact ATC to obtain a clearance. If contact was established, continue to keep ATC advised of intentions and obtain essential traffic information.

NOTE: If, as a result of actions taken under the provisions of b. and c. above, the pilot determines that there is another aircraft at or near the same flight level with which a conflict may occur, then the pilot is expected to adjust the path of the aircraft, as necessary, to avoid conflict.

Originally cleared track or route center line	Deviations $\geq$ 9.3km (5NM)	Level Change
East 000°-179° magnetic	LEFT	DESCEND 300ft (90m)
	RIGHT	CLIMB 300ft (90m)
West 180°-359° magnetic	LEFT	CLIMB 300ft (90m)
	RIGHT	DESCEND 300ft (90m)

ATLANTIC CPDLC UPLINK MESSAGE LATENCY MONITOR FUNCTION

CPDLC UPLINK MESSAGE LATENCY MONITOR FUNCTION

INTRODUCTION

In NAT airspace reduced lateral and longitudinal separation minima predicated on Performance Based Communication and Surveillance (PBCS) specifications RCP 240 and RSP 180 was implemented. One of the safety requirements in RCP 240 that are allocated to the aircraft system is Safety Requirement #15 (SR-15):

When the aircraft system receives a message whose timestamp exceeds ET_{RCMP} , the aircraft system shall provide appropriate indication.

To support SR-15, ATC can uplink the CPDLC free text message SYSU-6 (UM169) SET MAX UPLINK DELAY VALUE TO 300 SEC to prompt the pilot to enter the specified latency value into the aircraft avionics (refer to the Global Operational Data Link Manual (GOLD) ICAO Doc 10037 Appendix A table A.4.13).

Information below provides guidance to Aircraft Operators and pilots on how to react when receiving the message SET MAX UPLINK DELAY VALUE TO 300 SEC from Air Traffic Control (ATC).

BACKGROUND

The intention of the message latency monitor function is to prevent pilots from acting on a CPDLC uplink message that has been delayed in the network. The most serious of such cases would be the pilot executing a clearance that was no longer valid.

There are variations between aircraft types in implementation of the message latency monitor function:

- The Airbus implementation and some General Aviation aircraft implementations function in such a way that the aircraft automatically rejects a delayed uplink message by sending an error message to ATC and does not show the message to the pilot. The message sent to ATC is normally this: ERROR INVALID DATA. UPLINK DELAYED IN NETWORK AND REJECTED RESEND OR CONTACT BY VOICE.
- The Boeing implementation and some General Aviation aircraft implementations function in such a way that the delayed message is displayed to the pilot with an indication that the message has been delayed. It is then up to the pilot to act as appropriate, refer to Pilot Procedures below.
- Some aircraft have a deficient implementation that has not been designed in accordance to industry standards.
- Some CPDLC equipped aircraft do not have the message latency monitor function implemented at all.

Because aircraft implementations are varied, it is impossible for ATC to tailor the uplink of the message SET MAX UPLINK DELAY VALUE TO 300 SEC to different aircraft types. It has therefore been decided among the NAT Air Navigation Service Providers (ANSPs) to uplink this message to all CPDLC connected aircraft immediately after they enter each control area. An aircraft may therefore receive this message multiple times during a flight.

ATLANTIC CPDLC UPLINK MESSAGE LATENCY MONITOR FUNCTION

Within the NAT Oceanic Control Areas the CPDLC message THIS IS AN AUTOMATED MESSAGE TO CONFIRM CPDLC CONTACT WITH XXX CENTER upon entry into the respective Control Area will be discontinued and replaced with the message SET MAX UPLINK DELAY VALUE TO 300 SEC. This new message will serve two purposes:

- a. To prompt the pilot to set the specified uplink delay value in the aircraft avionics; and
- b. to establish the Current Data Authority (CDA) for ATC.

PILOT PROCEDURES

Pilots shall be familiar with aircraft functionality that concerns the CPDLC uplink message latency monitor.

When the pilot receives the uplink CPDLC message SET MAX UPLINK DELAY VALUE TO 300 SEC he/she shall:

- a. Send a positive response to ATC as prompted by the avionics (ACCEPT [ROGER]) regardless of whether the aircraft supports the latency monitor.

NOTE 1: It is important that pilots respond to the SET MAX UPLINK DELAY VALUE TO 300 SEC uplink message to avoid having open unanswered CPDLC messages in the system. This also applies to aircraft that have deficient message latency monitor functionality or no such functionality at all.

NOTE 2: The Global Operational Data Link Manual specifies that the pilot should append the response downlink with the free text message TIMER NOT AVAILABLE when the message latency monitor function is not available in the aircraft.

- b. If the aircraft is equipped with a correctly functioning message latency monitor, enter the specified uplink delay into the avionics in accordance with the aircraft procedures. Some avionics will automatically set the delay value in accordance with the uplink message and do not allow for a manual input.

NOTE: If an aircraft is instructed to log off and then log on again mid-flight, ATC may send the message SET MAX UPLINK DELAY VALUE TO 300 SEC again once the logon is completed.

When a pilot receives a CPDLC uplink message with an indication that the message has been delayed the pilot shall:

- a. Revert to voice communications to notify the ATS unit of the delayed message received and to request clarification of the intent of the CPDLC message; and
- b. respond appropriately to close the message as per the instructions of the controller.
- c. The pilot must not act on the delayed uplink message until clarification has been received from the controller.
- d. If a pilot receives a random clearance, for example a change in FL, without the pilots requesting a FL change, it is good practice to check the time-stamp in the message to ensure it is logically relevant.

ATLANTIC NORTH ATLANTIC (NAT) OCEANIC CLEARANCE PROCEDURES

INTRODUCTION

New York ARTCC issues Oceanic Clearances to eastbound aircraft entering North Atlantic High Level Airspace (NAT HLA).

Due to continuing safety concerns associated with the non-adherence to, or incorrect execution of, Oceanic Clearances and tactical reroutes, the FAA evaluated its current method of issuing an Oceanic Clearance by New York ARTCC. This analysis identified several procedural changes that could be made to the method by which an Oceanic Clearance is issued in order to improve safety.

These procedural changes will not eliminate the issuance of any portion of the Oceanic Clearance and will satisfy the requirements contained in NAT Doc 007, Chapter 5, "Oceanic ATC Clearances." It is not the intent to remove any altitude or speed confirmation; only the re-issuing of the cleared route will be eliminated.

PROCEDURES

There are three components to an Oceanic Clearance: (1) route; (2) altitude; and (3) speed. New York ARTCC will use multiple methods to comply with the NAT requirement to issue the three elements of an Oceanic Clearance.

Aircraft entering the New York ARTCC Oceanic CTA from a FAA facility:

The airport clearance which an aircraft receives on the ground at its departure aerodrome is considered to be the route portion of the Oceanic Clearance. Altitude and speed assignment will occur prior to entry into the New York ARTCC Oceanic CTA.

As is the current operating procedure, unsolicited en-route route, altitude or speed amendments may occur due to changing traffic situations. At all times, the last assigned route, altitude and speed are to be maintained and should be considered the new oceanic profile.

Having received all three components, the requirement to receive an oceanic clearance will have been met.

NOTE: For example – An aircraft has filed an FPL from MDSD to EDDF. This would take the flight from the Santo Domingo FIR, through the Miami FIR and then the New York FIR before entering Santa Maria. The airport clearance provided on the ground at MDSD would fulfill the route requirement of the Oceanic Clearance. Once airborne and in the Miami FIR, final speed and altitude assignment will be given after the flight is coordinated between Miami and New York.

North American (NAM) region departures:

Aircraft departing airports close to an oceanic boundary will receive the route portion of their Oceanic Clearance from Clearance Delivery. At most major airports in North America, the route portion is up-linked to the flight deck using the Pre-departure Clearance (PDC) method. This is an automated means to transmit the flight plan on file with air traffic control directly to the flight crew. At airports without the use of PDC, clearances are relayed via voice.

Once airborne and within United States offshore RADAR airspace, aircraft will be assigned an oceanic altitude and Mach number. The oceanic altitude may or may not be the aircraft current cleared altitude.

Caribbean/South American (CAR/SAM) region departures:

**ATLANTIC
NORTH ATLANTIC (NAT) OCEANIC CLEARANCE PROCEDURES**

For aircraft originating from airports within the CAR/SAM region, New York ARTCC will utilize the procedures outlined in 5.6 of NAT Doc 007 to fulfill the requirements of the route portion of an oceanic clearance. Once airborne and within United States offshore RADAR airspace, the aircraft will be assigned its oceanic altitude and Mach number.

Piarco FIR traffic:

Aircraft originating from airports within the CAR/SAM region and not entering a United States offshore RADAR sector will not be included in these changes at this time.

Piarco will continue to use existing procedures for these aircraft.

Canadian FIR traffic:

Aircraft originating from airports within the NAM region and not entering a United States offshore RADAR sector will not be included in these changes at this time.

Moncton ACC and Gander ACC will continue to use existing procedures for these aircraft.

If a route, speed or altitude change en-route is desired, then aircraft should make a request from the ATC unit in which they are operating. At all times, the last assigned route, altitude and speed are to be maintained.

In conjunction with this procedure, operators are encouraged to file in Item 15 of the FPL the coordinates of a track in lieu of the track identification letter (e.g. NATU).

Operators are reminded of the requirement to file an FPL and any subsequent changes with New York Oceanic at KZWYZOZX, along with any other ATC facilities that may require such filing.

**ATLANTIC
OPERATIONS WITHOUT AN ASSIGNED FIXED SPEED (OWAFS)**

OPERATIONS WITHOUT AN ASSIGNED FIXED SPEED

INTRODUCTION

The requirement to issue an assigned fixed Mach to all flights has been removed from NAT SUPPs (ICAO Doc 7030), however, due to the technical design of the ACARS Clearance (CLX) message and NAT Air Navigation Service Providers (ANSP) application of longitudinal separation using the Mach number technique, nearly all oceanic clearances issued to turbojet aircraft in the NAT Region include an assigned Mach. If any variation to the assigned Mach is desired, flight crews must request such changes from ATC.

Aircraft manufacturers, however, recommend a variable cruise Mach operation for maximum efficiency. Thus, the assumption that most flights would prefer to operate in the NAT region without a fixed Mach speed.

It should be noted that implementation of those new procedures may not occur simultaneously within all NAT oceanic control areas. Aircraft operators are advised to consult AICs and NOTAMS for relevant NAT control areas.

OPERATIONS WITHOUT AN ASSIGNED FIXED SPEED OVERVIEW

All aircraft, regardless of FANS equipage, will be eligible for the application of OWAFS in both ATS surveillance and non-surveillance airspace.

Current ACARS/Voice oceanic clearance procedures will be retained.

Oceanic clearance procedures will remain unchanged. A fixed Mach will continue to be part of the oceanic clearance.

There will be two modes of operation regarding speed:

- a. Clearance with an assigned speed
- b. No speed assignment - provisions of ICAO Annex 2 (paragraph 3.6.2.2 apply)

ATC will apply "speed control" as needed in accordance with guidance in ICAO Doc 4444.

The terms Cost Index or ECON should not normally be used in communications between ATC and aircraft with respect to the authorization for or use of OWAFS.

Implementation of OWAFS will, where possible, make use of existing CPDLC message sets and/or standard voice phraseology.

The following common phraseology, between ATC and flight crew, will be implemented across the NAT:

- a. To clear aircraft on a fixed speed:
 1. Voice: MAINTAIN MACH (number)
 2. CPDLC: SPDU-4/UM106: MAINTAIN (speed)
 3. ACARS data link oceanic clearance: Assigned Mach speed is required in oceanic CLX messages
- b. To remove the speed restriction:

**ATLANTIC
OPERATIONS WITHOUT AN ASSIGNED FIXED SPEED (OWAFS)**

1. Voice: RESUME NORMAL SPEED
2. CPDLC: SPDU-13/UM116: RESUME NORMAL SPEED
- c. Response to a pilot inquiry:
 1. Voice: NO [ATC] SPEED RESTRICTIONS
 2. CPDLC SPDU-14/UM169 (free text): NO SPEED RESTRICTION

If aircraft has been cleared on a fixed Mach speed:

- a. Flight crews will not need to request OWAFS, ATC will offer a variable Mach when possible.
- b. Flight crew abides by ICAO Annex 2 (paragraph 3.6.2.2 b) Deviation from ATC assigned Mach number/indicated airspeed: the appropriate air traffic services unit shall be informed immediately.

If the aircraft then receives RESUME NORMAL SPEED (via CPDLC or Voice), the flight crew no longer needs to comply with a previously issued Mach. However, the flight crew shall advise ATC if, as the result of the RESUME NORMAL SPEED message, they intend to adjust their speed by plus or minus Mach 0.02 or more from their last assigned speed.

OWAFS will be offered to aircraft whenever the opportunity exists.

OWAFS will be managed by each NAT ANSP in a manner dictated by required separation standards and safety of operations.

OWAFS OPERATIONAL SCENARIO

Pre-Oceanic Entry:

- a. Airline operator files a flight plan for flight number AB 123 with a NAT crossing speed of M.81.
- b. Between 90 and 60 minutes prior to the oceanic entry point (OEP), AB 123 requests an oceanic clearance with a speed of M.81.
- c. ATC issues oceanic clearance for AB 123 that includes an assigned speed of M.81.

Established in Oceanic Airspace:

- a. ATC controlling AB 123 assesses the traffic situation with other aircraft.
- b. If the required minimum is sufficiently ensured:
 1. For CPLDC equipped aircraft an uplink message SPDU-13/UM116 RESUME NORMAL SPEED will be sent.
 2. For aircraft without CPDLC capability, a voice message RESUME NORMAL SPEED will be sent.
- c. The flight crew no longer needs to comply with a previously issued Mach. However, the flight crew shall advise ATC if, as the result of the RESUME NORMAL SPEED message, they intend to adjust their speed by plus or minus Mach 0.02 or more from their last assigned

ATLANTIC OPERATIONS WITHOUT AN ASSIGNED FIXED SPEED (OWAFS)

speed. In this case, with a previously assigned speed of .81, they must inform ATC if the flight either slows to M.79 or less or speeds up to M.83 or more.

- d. ATC monitors AB 123's progress, and its separation from other aircraft, in accordance with normal operating procedures.
- e. ATC coordinates with the receiving ANSP in accordance with inter-unit agreements.
- f. Upon arrival at the new OCA boundary, AB 123 continues to operate without assigned speed.
- g. As a result of a change in the tactical situation, and OWAFS can no longer be offered, AB123 receives a CPDLC uplink SPDU-4 (UM106) MAINTAIN (speed - in this case M.81), or the equivalent clearance by voice, signifying a cessation of OWAFS due to conflicts.
- h. Following resolution of conflicts, ATC again applies the procedures described before, allowing the flight crew to resume normal speed.

FLIGHT CREW TRAINING

Appropriate flight crew education will be required to ensure a thorough understanding of OWAFS procedures especially regarding responses to standard voice or CPDLC messages relating to speed assignments.

CONTINGENCY PROCEDURES

Advise ATC immediately of any data link issues that might affect FANS (CPDLC/ADS-C) data link operations or any situation, like weather conditions, that require a more significant speed change.

SPECIAL EMPHASIS ITEMS

Operator attention is directed to the list below which provides a "quick reference" for OWAFS.

Flight Crew

- Should ensure a FANS (CPDLC/ADS-C) connection with the appropriate oceanic control area;
- Can request RESUME NORMAL SPEED via CPDLC (if not offered);
- Should insert the appropriate current flight plan "cost index" (ECON) into the FMS. This should typically be within +/- .01 Mach of the assigned Mach;
- Must inform ATC if as a result of the RESUME NORMAL SPEED uplink and subsequent insertion of cost index (ECON) the speed varies plus or minus Mach 0.02 or more from the assigned Mach via CPDLC or voice; and
- ATC will assign a fixed Mach if variable Mach can no longer be supported.

**ATLANTIC
OPERATIONS WITHOUT AN ASSIGNED FIXED SPEED (OWAFS)**

CPDLC Uplink Messages in support of OWAFS

CPDLC UPLINK OR VOICE	MESSAGE MEANING	REASON ATC WOULD UPLINK	CREW ACTION
RESUME NORMAL SPEED	Instruction to resume a normal speed. The aircraft no longer needs to comply with a previously issued speed restriction	Allows for the use of cost index to produce a variable Mach. Fixed Mach is no longer required	Insert the appropriate cost index into the FMC that should typically produce a Mach within +/- .01 Mach of the assigned Mach
MAINTAIN [speed]	Instruction to maintain the specified speed	An assigned speed is required for traffic separation	Insert the assigned Mach into the FMC and comply with the instruction

**ATLANTIC
PERFORMANCE BASED COMMUNICATION AND SURVEILLANCE**

PERFORMANCE BASED COMMUNICATION AND SURVEILLANCE (PBCS)

GENERAL

The Air Traffic Management (ATM) application of reduced separation minima is predicated on specific communication and surveillance capabilities, namely Required Communication Performance (RCP) and Required Surveillance Performance (RSP). The RCP and RSP specifications are a set of requirements for air traffic service provision and associated ground equipment, aircraft capability and operations needed to support PBCS. These include performance requirements that are allocated to system components in terms of the communication and surveillance to be provided and associated data, delivery time, continuity, availability, integrity, safety and functionality needed for the proposed operation in the context of a particular airspace design. For further information, please refer to Jeppesen ATC-Chapter "Performance based Communication and Surveillance (PBCS) - Doc 9869".

PERFORMANCE BASED OPERATIONS IN NAT HLA

Performance-based operations and monitoring have been implemented in the NAT HLA to ensure the ongoing safety and efficiency of ATM operations. The performance of FANS 1/A (and equivalent), Controller-Pilot Data Link communications (CPDLC) and Automatic Dependent Surveillance-Contract (ADS-C) are monitored in the NAT HLA against the RCP 240 and RSP 180 specifications. From 29 March 2018 flights will be required to indicate compliance with these specifications in order to qualify for operations in airspace where reduced lateral and/or longitudinal separation minima are applied. Initially this will apply to the OTS between FL350 and FL390 inclusive but will be extended to the whole of the NAT HLA in due course.

Required Communication Performance (RCP) 240 and Required Surveillance Performance (RSP) 180

The provision of PBCS in the NAT HLA applies RCP 240 and RSP 180 specifications to the application of 30NM, 50NM and 5 minute longitudinal separation minima and application of a 23NM lateral separation minimum.

An RCP specification includes communication performance requirements that are allocated to system components in terms of the communication to be provided and the associated transaction time, continuity, availability, integrity and safety and functionality needed for the proposed operation in the context of a particular airspace concept. The following table shows the RCP 240 specification:

RCP Specification	RCP Transaction Time (seconds)	RCP Continuity (probability)	RCP Availability (probability)	RCP integrity (acceptable rate / Flight Hours)
RCP 240	240	0.999	0.999	10 ⁻⁵

**ATLANTIC
PERFORMANCE BASED COMMUNICATION AND SURVEILLANCE**

An RSP specification includes surveillance performance requirements that are allocated to system components in terms of the surveillance to be provided and the associated data delivery time, continuity, availability, integrity, accuracy of the surveillance data and safety and functionality needed for the pro-posed operation in the context of a particular airspace concept. The following table shows the RSP 180 specification:

RSP Specification	RSP Delivery Time (seconds)	RSP Continuity (probability)	RSP Availability (probability)	RSP integrity (acceptable rate / Flight Hours)
RSP 180	180	0.999	0.999	FOM=Navigation Specification Time at Position Accuracy +/-1 Sec Data integrity (malfunction) = 10^{-5}

The Air Traffic Services (ATS) system, Communications Service/Satellite Service Provider (CSP/SSP) system, aircraft operator and the aircraft system must all comply with an RCP/RSP specification. The PBCS requirements for the design of the aircraft system concern its functionality, interoperability and performance in accordance with national airworthiness standards. There are no additional PBCS requirements concerning the production and airworthiness certificates other than those required by national regulations.

Operator Eligibility

Only those operators that satisfy the requirements of RCP 240 and RSP 180 will be eligible for the reduced separation minima afforded by these specifications in the NAT HLA. Minimum Navigation Performance Specification (MNPS) approval (issued prior to 1 January 2015) or NAT HLA MNPS approval remains a requirement. Operators will be eligible to indicate compliance with RCP 240 and RSP 180 provided that the aircraft are:

- a. Required Navigation Performance (RNP) 4 compliant;
- b. Automatic Dependent Surveillance – Contract (ADS-C) equipped; and
- c. Controller Pilot Data Link Communications (CPDLC) equipped.

The above mentioned equipment must have been manufactured in accordance with the required technical specifications and the installation approved from an airworthiness perspective (normally stated in the Aeroplane Flight Manual) in accordance with the requirements for integrity, availability and continuity set out in the Performance Based Communication and Surveillance Manual (ICAO Doc 9869). The system must also provide flight crew with alerts associated with the RCP 240 and RSP 180 specifications and specific items related to PBCS capability must be included in the minimum equipment list (MEL). Any operational procedures are to be included in the operator's manuals (both flight and ground operations) using the Global Operational Data Link (GOLD)

ATLANTIC PERFORMANCE BASED COMMUNICATION AND SURVEILLANCE

Manual (ICAO Doc 10037) and the PBCS Manual as Acceptable Means of Compliance. These procedures must include contingency/failure procedures and a process to report problems encountered by flight crews, dispatchers and maintenance personnel.

In addition to the above initial PBCS approvals will be granted according to the following criteria:

- a. Those aircraft that have a PBCS Statement of Compliance (SOC) in the AFM;
- b. Those aircraft that, although there is no SOC in the AFM, have CPDLC and ADSC equipment installed that:
 1. Is approved in accordance with RTCA DO 306/EUROCAE ED 122;
 2. Is installed in an approved manner.
- c. Those aircraft that do not satisfy the requirements of (a) and (b) above but whose PBCS compliance has been proved by the use of established performance monitoring and reporting procedures; and
- d. Satisfactory PBCS service provision is assured. This includes service provision principles being established between the aircraft operators and the Communication Service Providers (CSPs)/Satellite Service Providers (SSPs) in accordance with the PBCS Manual or the proposed PBCS Charter.

The required Communications/Navigation/Surveillance (CNS) systems must be operational and flight crews must report any failure or malfunction of GNSS, ADS-C or CPDLC equipment to Air Traffic Control (ATC) as soon as it becomes apparent.

The aircraft operator shall ensure that arrangements with the CSPs/SSPs stipulate the RCP/RSP allocations, including any monitoring or recording requirements. The aircraft operator shall also ensure that these arrangements include a provision for the CSP/SSP to notify the ATS units appropriate for the route system of the aircraft operator of failure conditions impacting PBCS operations.

The operator shall participate in ANSP and regional PBCS monitoring programmes which are applicable to its route system and shall provide the following information to regional PBCS monitoring entities specified in the Aeronautical Information Publication (AIP):

- a. operator name;
- b. operator contact details; and
- c. other coordination information.

Any changes to the information listed above are to be notified to the appropriate PBCS monitoring entities.

The operator shall establish procedures to report problems encountered by flight crew or other personnel to the regional PBCS monitoring entities associated with the route of flight on which the problem occurred. The operator is also to establish procedures to disclose operational data, including that from its CSPs/SSPs, in a timely manner to the appropriate PBCS monitoring entity, when requested, for the purposes of investigating a reported problem.

ATLANTIC
PERFORMANCE BASED COMMUNICATION AND SURVEILLANCE

Flight Planning

The operator shall ensure that the appropriate information to denote PBCS capabilities is included in the ICAO flight plan as follows:

- a. All FANS 1/A CPDLC equipped aircraft planning to operate in the NAT HLA shall insert the appropriate designator (J2, J3, J4, J5 and/or J7) in Item 10a of the flight plan;
- b. All FANS 1/A CPDLC RCP 240 compliant aircraft intending to operate in the NAT HLA shall insert the designator P2 in Item 10a of the flight plan;
- c. All FANS 1/A ADS-C compliant aircraft planning to operate in the NAT HLA shall insert the designator D1 in Item 10b of the flight plan;
- d. All FANS 1/A ADS-C RSP 180 compliant aircraft planning to operate in the NAT HLA shall insert SUR/RSP180 in Item 18 of the flight plan; and
- e. All RNP 4 compliant aircraft planning to operate in the NAT HLA shall insert PBN/L1 in Item 18 of the flight plan.

From 29 March 2018 NAT ANSPs will apply the RCP 240 flight plan designator to determine aircraft eligibility for relevant separation minima.

ATLANTIC
PERFORMANCE BASED SEPARATION MINIMA IN NAT AIRSPACE

PERFORMANCE BASED SEPARATION MINIMA

Overview

Performance based separation minima as small as 35.2km (19NM) lateral and 25.9km (14NM) longitudinal predicated on PBCS and PBN, in accordance with ICAO Doc 4444 Procedures for Air Navigation Services - Air Traffic Management (PANS -ATM) has been implemented in the ICAO NAT Region.

Application

- a. The 55.5km (30NM) and 93km (50NM) longitudinal separation minima are between eligible aircraft pairs within the New York East and Santa Maria OCAs;
- b. The 5 minute longitudinal separation minimum is applied between eligible aircraft pairs within the Gander, Reykjavik, Santa Maria and Shanwick OCAs;
- c. The 42.6km (23NM) lateral separation minimum is applied between eligible aircraft pairs within the Gander, Reykjavik, Santa Maria, New York East (30NM lateral applied) and Shanwick OCAs.

NOTE: NAT Doc 008 'Application of Separation Minima' Appendix A contains details of the separation minima applied in the North Atlantic Region.

Organized Track System (OTS)

- a. The 42.6km (23NM) lateral separation minimum is implemented by applying 42.6km (23NM) lateral spacing through whole and half degrees of latitude between NAT Organized Track System (OTS) tracks between flight level (FL) 350-390 (inclusive), except when the OTS occurs in the New York East OCA;
- b. OTS tracks spaced using 42.6km (23NM) lateral separation minima at any point will be designated as PBCS tracks and will be uniquely identified in Remark 3 of the Track Message;
- c. A PBCS track will either be:
 - A whole degree PBCS track or
 - A half degree PBCS track (e.g. 54 degrees - 30 minutes NORTH latitude 20 degrees WEST longitude).

NOTE: There will be no combination of whole and half degrees of latitude within any single OTS track.

- d. Publication of PBCS tracks may expand beyond three tracks.

Operator/Aircraft Eligibility

Operators should consult with the State authority responsible for their operation to obtain appropriate PBCS and PBN authorizations in order to be eligible for the performance based separation minima.

Eligibility for the provision of performance based minima is based on the following:

**ATLANTIC
PERFORMANCE BASED SEPARATION MINIMA IN NAT AIRSPACE**

	Required Navigation Performance (RNP)		FANS 1/A CPDLC ADS-C	RCP240	RSP180
	10/4	4			
93km (50NM) longitudinal separation	X		X	X	X
55.5km (30NM) longitudinal separation		X	X	X	X
5 minute longitudinal separation	X		X	X	X
42.6km (23NM) lateral separation		X	X	X	X

- Operators are eligible to flight plan to operate on published *PBCS tracks* provided the flights are:
 - a. Authorized for Required Navigation Performance 4 (RNP4);
 - b. Fitted with and operating FANS 1/A CPDLC and ADS-C ; and
 - c. Authorized for RCP240 and RSP180.
- Operators/aircraft not eligible for performance based separation may be permitted to;
 - Infringe PBCS tracks at FL350 - FL390 (inclusive) at only one point (including Oceanic Entry/ Exit Point) i.e. cross but not join an OTS PBCS track, and;
 - Climb or descend through levels FL350 – FL390 on a PBCS track provided the climb or descent is continuous.

NOTE: Such clearances will only be permitted on a tactical basis.

ATLANTIC PERFORMANCE BASED SEPARATION MINIMA IN NAT AIRSPACE

- In accordance with ICAO Annex 6, for operations where communication equipment is required to meet an RCP and RSP specification for PBCS, an aeroplane shall:
 - a. be provided with communication equipment which will enable it to operate in accordance with the prescribed RCP and RSP specification(s);
 - b. have information relevant to the aeroplane RCP and RSP specification capabilities listed in the flight manual or other aeroplane documentation approved by the State of Registry; and
 - c. have information relevant to the aeroplane RCP and RSP specification capabilities included in the Minimum Equipment List (MEL).
- The State of the Operator shall, for operations where an RCP and RSP specification for PBCS has been prescribed, ensure that the operator has established and documented:
 - a. normal and abnormal procedures, including contingency procedures;
 - b. flight crew qualification and proficiency requirements, in accordance with appropriate RCP/RSP specifications;
 - c. a training programme for relevant personnel consistent with the intended operations; and
 - d. appropriate maintenance procedures to ensure continued airworthiness, in accordance with appropriate RCP and RSP specifications.

ATLANTIC PERFORMANCE BASED SEPARATION MINIMA IN NAT AIRSPACE

- The State of the Operator shall also ensure that, in respect of the foregoing operations, adequate provisions exist for:
 - a. receiving the reports of observed communication performance issued by monitoring programmes established in accordance with Annex 11, Chapter 3, 3.3.5.2; and
 - b. taking immediate corrective action for individual aircraft, aircraft types or operators, identified in such reports as not complying with the RCP and RSP specification(s).

Flight Planning Provisions

- Operators must file the correct ICAO Flight Plan annotations in Items 10 and 18 to indicate that required equipment and authorizations are available for the flight.
 - a. Item 10a (Radio communication, navigation and approach aid equipment and capabilities)
 - Insert “J5” to indicate FANS 1/A Inmarsat CPDLC SATCOM and/or “J7” to indicate FANS 1/A CPDLC Iridium SATCOM data link equipage and operation;
 - Insert “P2” to indicate RCP 240 authorisation;
 - Insert “R” to indicate that aircraft navigation system equipage and operation meet Performance Based Navigation (PBN) levels specified in Item 18. See 4.1 c) below on the related Item 18 entry for RNP4.
 - b. Item 10b (Surveillance equipment and capabilities)
 - Insert “D1” to indicate FANS 1/A ADS-C equipage and operation.
 - c. Item 18 (Other information)
 - Insert the characters “PBN/” followed by “L1” to indicate RNP 4 authorization;
 - Insert the characters “SUR/” followed by “RSP180” with no spaces to indicate RSP180 authorization.
- Only those operators/aircraft eligible for 42.6km (23NM) operations are allowed to operate on PBCS tracks between FL350-390 (inclusive). All PBCS tracks and flight levels are uniquely identified in “Remark c.” of the OTS Track Message as shown below:

ATLANTIC
SPECIAL EMPHASIS ITEMS FOR NAT AIRSPACE

SPECIAL EMPHASIS FOR OPERATORS – WAYPOINT INSERTION

The Special Emphasis Items (SEI) listed below should be incorporated into operator training programs and operations manuals with the intent of raising pilot and dispatcher awareness of the importance of following procedures in an environment where ½ degree waypoints are applied. Each SEI is followed by an explanation of the factors leading it to be identified as an SEI.

Pilot Training on Map and FMC Displays of ½ Degree and Whole Degree Waypoints

To mitigate misinterpretation of waypoint coordinates, operator initial and re-current training programs and operations manuals must incorporate training and guidance to enable pilots to understand map and FMC displays of ½ degree and whole degree waypoints regardless of the waypoint format being used for waypoint FMC input.

Explanation

Map displays and certain FMC pages generally do not display full waypoint degrees **and** minutes, e.g. when the full 13 latitude/longitude characters are used to insert ½ degree waypoints.

Example FMC and MAP Displays

The figures emphasize that for a large number of aircraft, the input of waypoints containing whole degrees of latitude and waypoints containing half-degrees of latitude will result in identical 7-character FMC and waypoint map displays.

ATLANTIC
SPECIAL EMPHASIS ITEMS FOR NAT AIRSPACE

Figure 1. Example FMC Display: Full Waypoint Latitude and Longitude (13-characters) inserted into FMC

- a. 52 degrees-30 minutes North latitude, 20 degrees West longitude inserted into the FMC using full latitude and longitude degrees, minutes and seconds (i.e., 13 characters).
- b. The waypoint IDENT is truncated to 7 characters with **no display of minutes of latitude**.

ATLANTIC
SPECIAL EMPHASIS ITEMS FOR NAT AIRSPACE

Figure 2. Example Map Display: 13-characters inserted into FMC (Full Waypoint Latitude and Longitude)

- 50 degrees-30 minutes North, 20 degrees West is displayed in 7 characters (N50W020).
- Minutes of latitude are not displayed.**
- The Map display would be the same for 50 degrees-00 minutes North, 20 degrees West.

ATLANTIC SPECIAL EMPHASIS ITEMS FOR NAT AIRSPACE

Aircraft Navigation Database (NDB) Waypoint Identifiers

NAT operators should use a full latitude/longitude (e.g., 13-character) input for waypoints containing both half-degree and whole degrees of latitude and whole degrees of longitude.

NAT operators **with an operational need to populate the aircraft NDB** with a 5-character waypoint identifier should ensure that the aircraft NDB vendors and flight planning services use an alternate half-degree of latitude 5-character format such as Hxxyy, where xx = degrees and 30 minutes of NORTH latitude and yy = degrees of WEST longitude (e.g., H5250 = 52° 30' NORTH 050° 00' WEST). (It is recognized that, for whole degree waypoint inputs, such operators will likely continue using the ARINC 424, 7.2.5 "N-suffix" format (e.g., 5250N = 52° 00' NORTH 050° 00' WEST)).

It is recommended that insertion of waypoints into the FMC be accomplished by established automated data link systems (e.g. AOC and CPDLC) wherever possible.

Regardless of FMC waypoint format and entry method, flight crew procedures should require each pilot to independently display and verify the DEGREES and MINUTES loaded into the FMC for the latitude/longitude waypoints defining the route contained in the NAT oceanic clearance to mitigate potential display ambiguity.

ATC CPDLC route clearance uplinks will be in a full Lat/Long format and will require those operators using ARINC 424 and the "H" format to ensure their flight crews are trained to display and verify the full Lat/Longs of any uplink.

Explanation

Half-degree waypoint identifiers in the ARINC 424, paragraph 7.2.5 "N-prefix" format have led to a number of Gross Navigation Errors (GNEs) and Lateral Deviations. The guidance for waypoint insertion in paragraph 5.3 above is intended to remove the potential for such errors. They occur when a pilot intending to input a waypoint defined by a half-degree of latitude inadvertently loads a waypoint containing a whole-degree of latitude, or vice versa, because the "N" is not loaded in the correct pre-fix or suffix position.

Oceanic Clearances containing a re-route issued by voice/OCL may include half-degree waypoints. Operators should ensure that their flight crew procedures and associated training are sufficiently robust to mitigate against navigational error due to waypoint insertion errors.

NOTE: Flight Crews are reminded they have the option to respond "UNABLE" to an oceanic re-route and negotiate with ATC accordingly.

Pilot Procedures for Verifying Waypoint Degrees and Minutes Inserted into Aircraft Navigation Systems

Procedures must be used to display and verify the DEGREES and MINUTES loaded into the Flight Management Computer (FMC) for the "un-named" (Lat/Long) waypoints defining the route contained in the oceanic clearance.

Regardless of FMC waypoint format and entry method, crew procedures should be designed to promote strong crew resource management techniques, to prevent opportunities for error occurring as a result of confirmation bias and to generally maintain an attitude of healthy suspicion. Accordingly, the waypoint verification procedures should be conducted as detailed below.

ATLANTIC SPECIAL EMPHASIS ITEMS FOR NAT AIRSPACE

- During pre-flight LRNS programming, both pilots independently verify the full latitude and longitude coordinates of “un-named” (Lat/Long) waypoints defining the expected route of flight within oceanic airspace as entered in the FMC.
- Upon receipt of a revised oceanic clearance (i.e., one not conforming to the flight planned route), both pilots independently verify the full latitude and longitude coordinates of “un-named” (Lat/Long) waypoints defining the route contained in the revised oceanic clearance.
- Approaching an oceanic waypoint, one pilot should verify the full latitude and longitude coordinates of that waypoint in the FMC, the NEXT and NEXT +1 waypoints, while the other pilot crosschecks the latitude and longitude coordinates against the master flight plan/oceanic clearance.

Explanation

Due to the factors in the map and FMC display of ½ degree and whole degree waypoints, it is imperative that pilots follow the procedure above to avoid lateral errors caused by incorrect insertion of waypoints. Verification of the full DEGREES and MINUTES of oceanic waypoints loaded into the FMC is a critical step in ensuring a proper navigational load.

Pilot Track and Distance Check

It is strongly recommended that pilot pre-flight and in-flight procedures call for the pilot to compare the track and distance between waypoints shown on the Computer Flight Plan (CFP) to those displayed by the FMC.

Pilots should be aware that waypoint insertion errors of ½ degree of latitude may in some cases result in only small differences in track and distance, however, the track and distance check can help prevent waypoint insertion errors of one degree or more that have been observed in oceanic operations.

NOTE: The currency of magnetic variation tables loaded into aircraft navigation databases and the point at which the track is measured affect the track displayed on the FMC by as much as ±3 degrees.

Explanation

This check remains valuable because waypoint insertion errors are **not** limited to ½ degree errors and waypoint insertion errors of one degree or more have been observed in oceanic operations. Waypoint insertion errors of ½ degree produce a small difference in leg segment track and distance, however, as noted above, waypoint insertion errors are not limited to ½ degree.

Pilot Action When Notified By ATC of Possible Deviation from Cleared Track

Flight crews are advised that, should they be notified that ATC systems indicate the aircraft is not flying the cleared route, they should immediately display the full degrees and minutes loaded into the FMC for the NEXT and NEXT + 1 waypoints, and verify against the cleared route before responding.

Voice message example:

ATLANTIC
SPECIAL EMPHASIS ITEMS FOR NAT AIRSPACE

“SHANWICK CONFIRMS YOUR POSITION REPORT INDICATES INCORRECT ROUTING. CHECK FULL DEGREES AND MINUTES LOADED INTO FMC. YOUR CLEARED ROUTE IS [route]”

CPDLC message example:

YOUR POSITION REPORT INDICATES INCORRECT ROUTING. CHECK FULL DEGREES AND MINUTES LOADED INTO FMC. YOUR CLEARED ROUTE IS [route]

When ATC notifies the pilot that the aircraft has indicated it has already deviated from the cleared track (UM169f: *ADS-C INDICATES OFF ROUTE. ADVISE INTENTIONS*), the pilot shall **immediately** display the full DEGREES and MINUTES loaded into the FMC for the NEXT waypoint, and verify against the cleared route.

ATLANTIC VOLCANIC ASH OPERATION PROCEDURE

GENERAL

This procedure is based on EASA Safety Information Bulletin 2010-17R7 published on 24 JUN 15 and further European developments with respect to the operation of aircraft in areas where concentrations of volcanic ash may be present.

It is emphasized that a volcanic ash encounter is potentially hazardous and areas of known contamination above a certain concentration must generally be avoided. Volcanic ash may extend for several hundreds of miles and the contaminated zone may not be visible. The decision to operate should be taken carefully.

Areas affected by volcanic ash above a certain concentration will be notified by SIGMET. If applicable, associated operational information shall be published by NOTAM.

Additional Information on the subject can be found on the following websites:

www.icao.int

www.easa.europa.eu/easa-and-you

AREAS OF CONTAMINATION

Area of Low Contamination

The Area of Low Contamination is an airspace of defined dimensions where volcanic ash may be encountered at concentrations greater than $0.2 \times 10^{-3} \text{g/m}^3$, but less or equal than $2 \times 10^{-3} \text{g/m}^3$.

Area of Medium Contamination

The Area of Medium Contamination is an airspace of defined dimensions where volcanic ash may be encountered at concentrations greater than $2 \times 10^{-3} \text{g/m}^3$, but less than $4 \times 10^{-3} \text{g/m}^3$.

Area of High Contamination

The Area of High Contamination is an airspace of defined dimensions where volcanic ash may be encountered at concentrations equal to or greater than $4 \times 10^{-3} \text{g/m}^3$.

RECOMMENDATIONS

EASA makes the following recommendations:

- a. Avoid operation in visible volcanic ash or, where visibility of the ash is impaired (IMC, night), avoid operation in discernible volcanic ash.
- b. When ash is forecast to be present within European airspace, it is recommended that an operator conduct flight operations in accordance with its established Volcanic Ash Safety Risk Assessment.
 1. For European operators, a Volcanic Ash Safety Risk Assessment should be developed, and accepted by the respective competent authority, in accordance with the guidance provided in GM2 ORO.GEN.200(a)(3) for aircraft operators.
 2. Non-European operators should establish their Volcanic Ash Safety Risk Assessment in accordance with ICAO Document 9974: 'Risk management of flight Operations with

ATLANTIC VOLCANIC ASH OPERATION PROCEDURE

known or forecast volcanic ash contamination'. The development of a separate Safety Risk Assessment is not required.

- c. Instructions for continued airworthiness developed by aircraft and engine Type Certificate holders for operation in airspace contaminated by volcanic ash should be followed.

In case no such instructions are available, information as listed under **GENERAL ADVICE FOR AIRCRAFT MAINTENANCE INSPECTIONS WHEN OPERATING IN AIRSPACE WITH A LOW CONTAMINATION OF VOLCANIC ASH** provides recommended maintenance inspections when operating in airspace with a low contamination of volcanic ash.

- d. In case of encounter with volcanic ash in flight, flight crew should immediately report it to the ATS unit providing service in that airspace. This real-time information will facilitate providing operational feedback to the Volcanic Ash Advisory Center and to Eurocontrol/NM.

In addition to the established reporting lines, notably to the engine and aircraft Type Certificate holders, the State of Registry of the aircraft and to the NAA of the State(s) through which the flight was conducted, operators should report to EASA (report@easa.europa.eu) any encounter with volcanic ash or any other relevant maintenance and airworthiness related findings.

GENERAL ADVICE FOR AIRCRAFT MAINTENANCE INSPECTIONS WHEN OPERATING IN AIRSPACE WITH A LOW CONTAMINATION OF VOLCANIC ASH

The following is provided as advice to operators if their aircraft and/or engine Type Certificate holders have not developed instructions for continued airworthiness for operation in airspace with a low contamination of volcanic ash.

Accomplish daily inspections when operating in an area of low volcanic ash contamination, to detect any erosion, accumulation of volcanic ash, or aircraft- and/or engine damage or system degradation. Turbine engines as well as piston engines operation can be adversely affected by volcanic ash on the ground or in the air.

The inspections should include the following:

- wing leading edges;
- navigation and landing lights, radomes;
- landing gear;
- horizontal stabilizer;
- all extruding structure;
- pitot tubes and static ports;
- windows and windshields;
- engine inlets and nacelles (turbine), induction air filter (piston);
- engine compressors and turbines;
- engine oil systems;

**ATLANTIC
VOLCANIC ASH OPERATION PROCEDURE**

- rotor blades;
- ventilation and pressurization systems (e.g., the air cycle machines, ozone converter, recirculation fans, HEPA filter etc.);
- smoke detectors (e.g., detectors located in the cargo compartment, lavatory, electrical equipment bay, remote crew rest areas, etc.).

Based on the results of the above inspections, more detailed inspections may be necessary.

Unless specific instructions have already been provided by aircraft and/or engine Type Certificate holders to be applied after encountering a volcanic ash, the above inspections should also be performed after each flight, whenever the following phenomena are observed or detected or experienced during flight.

- acrid odors similar to electrical smoke;
- rapid onset of engine problems;
- St. Elmo's fire;
- bright white/orange glow appearing at the engine inlets;
- dust in the cockpit or cabin;
- sudden (unexpected) outside darkness;
- airspeed fluctuations;
- landings lights casting sharp, distinctly visible beam.

Protect and cover aircraft that are parked in areas that may be contaminated by the fall-out or settling of volcanic ash in accordance with the aircraft and/or engine TC holder's advice where possible. Any volcanic ash residues must be removed prior to operations and following the TC holder's recommendations when available.

Air Traffic Control

State Rules and Procedures - Atlantic

**GREENLAND
RULES AND PROCEDURES****GENERAL**

In general, the air traffic rules and procedures in force and the organization of the air traffic services are in conformity with ICAO Standards, Recommended Practices and Procedures.

Units of measurement used in all air and ground operations are as listed in the following table.

Measurement of	Unit
Distance used in navigation, position reporting, etc., generally in excess of 2 nautical miles	Nautical Miles and Tenths
Relatively short distances such as those relating to aerodromes (e.g., runway lengths)	Meters
Altitude, elevations and heights	Feet
Horizontal speed including wind speed	Knots
Vertical speed	Feet per Minute
Wind direction for landing and taking off	Degrees Magnetic
Wind direction except for landing and taking off	Degrees True
Visibility including runway visual range	Kilometers or Meters ¹
Altimeter setting	Hectopascals ²
Temperature	Degrees Celsius
Weight	Metric Tons or Kilograms
Time	Hours and Minutes, the day of 24hrs beginning at midnight UTC

¹ Thule APP/TWR: Statute Miles

² Thule APP/TWR: Inches

WGS-84 IMPLEMENTATION STATUS

WGS-84 partially compliant.

FLIGHT PROCEDURES**HOLDING**

Holding procedures comply with Jeppesen ATC-Chapter "Flight Procedures (DOC 8168) - Holding Procedures", Table IV-1-1, Holding Speeds.

PROCEDURE LIMITATIONS AND OPTIONS

Instrument approach procedures are based on PANS-OPS Document 8168.

GREENLAND RULES AND PROCEDURES

AIRPORT OPERATING MINIMUMS

Greenland publishes OCA(H)s and partly ceiling and visibilities for landing. In some cases ceiling and visibilities are published for take-off. For Upernavik additionally DA/MDA are published.

Jeppesen charted minimums are not below State minimums.

ATS AIRSPACE CLASSIFICATION

Greenland has adopted the ICAO ATS airspace classification as listed in Jeppesen ATC-Chapter "ICAO ATS Airspace Classification - Annex 11".

Airspace classes "A", "D", "E" and "G" are used within Nuuk FIR.

Continuous two-way communication is required in certain parts of class "G" airspace, designated TIZ or TIA.

In airspace class "G" at or below 900m (3000ft) MSL or 300m (1000ft) above terrain, whichever is the higher, aircraft may operate in flight visibility not less than 3km, clear of cloud and insight of the surface, if the speed is 140kt IAS or less. Lower flight visibilities of 1.5km for aircraft in the aerodrome traffic pattern are permitted, if clear of cloud and in sight of the aerodrome.

SPECIAL REQUIREMENTS AND REGULATIONS

WAKE TURBULENCE

B-757 must be considered as:

- HEAVY when being followed by another aircraft;
- MEDIUM when following another aircraft.

TRAFFIC INFORMATION ZONE (TIZ)

Except as may otherwise be arranged with the AFIS unit, a pilot:

- who intends to land on or take off from the aerodrome shall prior to entering TIZ or prior to taxiing for take-off establish two-way radio communication with the AFIS unit;
- who intends to fly through TIZ shall prior to entering TIZ establish two-way radio communication with the AFIS unit.

FLIGHT PLANNING

All flights entering or passing through Nuuk FIR shall forward a FPL including information about registration and operator/owner.

Flight Plan Message Addressing

ATS messages for Nuuk FIR shall be addressed as follows:

**GREENLAND
RULES AND PROCEDURES**

Route	AFTN addressing
Entering Nuuk FIR/Reykjavik CTA (FL195+)	BIRDZPZX BGGLYIYR
Entering Nuuk FIR/Gander CTA (FL195+)	CZQXZQZX BGGLYIYR
Landing or entering Nuuk FIR below FL195	BGGLZQZX
Departure from Nuuk FIR	ZPZX preceded by the location indicator of the departure aerodrome, or BGGLZQZX if the departure aerodrome does not have a location indicator.

Flight plans and ATS messages concerning foreign States military aircraft intending to operate within Nuuk FIR shall be addressed also to BGGLZQZX, regardless of flight level used or CTA affected.

ICAO flight plans for aircraft holding diplomatic clearance for overflying or landing in Greenland shall be addressed to BGGHYXYX, and in Item 18 of the flight plan shall be filled in: RMK/COPY PROGRESS TO SPECIFIED ADDRESS BGGHYXYX.

Flight Planning for Narsarsuaq

Flights planning for Narsarsuaq as destination, alternate, enroute alternate or for extended range operation with two-engine airplanes outside operating hours, contact:

Narsarsuaq Airport

Tel: +299 382855

E-Mail: bgbw@mit.gl

and submit flight plan via:

AFTN: BGBWZTZX

REDUCED RUNWAY SEPARATION

At controlled aerodromes separation minimums may be applied which are lower than the minimums stated in ICAO DOC 4444.

REQUIRED NAVIGATION PERFORMANCE

RNAV routes UW22, UW23, UW24, UW25, UW28, UW30, UW31, UW51 are designated RNP2 all other RNAV routes are designated RNP2 or GNSS.

SEPARATION BELOW FL285 IN THE REYKJAVIK CTA

Lateral Separation

Lateral separation used at FL285 and below, in all cases the aircraft must be equipped with GNSS.

GREENLAND RULES AND PROCEDURES

- a. Communicating directly with ATC on VHF:
 1. 15NM between aircraft in level flight;
 2. 7NM lateral separation between aircraft that are climbing/descending through the level of the other aircraft.
- b. Any types of communication:

Lateral separation of 20NM while one aircraft climbs/descends through the level of another aircraft operating on intersecting and non-intersecting tracks.

Longitudinal Separation

Longitudinal separation used at FL285 and below, in all cases the aircraft must be equipped with GNSS and communicating directly with ATC on VHF:

- a. 10 minutes;
- b. 20NM between aircraft operating on tracks that intersect at 0-90 degree angle;
- c. 10NM between aircraft operating on tracks that intersect at 0-90 degree angle provided that the leading aircraft maintains a true airspeed of 20kt or more faster than the succeeding aircraft;
- d. 10NM between aircraft operating on tracks that intersect at 0-90 degree angle while one aircraft climbs/descends provided that the other aircraft maintains a level while vertical separation does not exist.

Strategic Lateral Offset Procedures (SLOP)

Aircraft shall not apply SLOP below FL285 in the Reykjavik CTA.

IMPLEMENTATION OF LATERAL SEPARATION BASED ON GNSS WITHIN NUUK CTA/TMA

Lateral Separation Standards

- 15NM lateral separation between aircraft in level flight provided the aircraft are equipped with GNSS and are communicating directly with ATC on VHF;
- 7NM lateral separation between aircraft on non-intersecting tracks that are climbing/descending through the level of the other aircraft provided the aircraft are equipped with GNSS and are communicating directly with ATC on VHF;

Equipment Eligibility

The new separation standards may be applied between aircraft that have an IFR certified GNSS installation as indicated with the letter 'G' in Item 10 of the ICAO flight plan. Such systems are:

- a. A GNSS receiver that is approved in accordance with the requirements specified in TSO C-129a or higher or with equivalent European Aviation Safety Programme (EASA) documentation ETSO-C129a; or
- b. an integrated navigation system incorporating GNSS input.

GREENLAND RULES AND PROCEDURES

Operators and pilots are reminded that the inclusion of the letter 'G' in Item 10 of the flight plan signifies the following:

- a. the presence of relevant serviceable GNSS equipment on board the aircraft; and
- b. GNSS equipment and capabilities are commensurate with flight crew qualifications; and
- c. where applicable, authorization from the appropriate authority has been obtained.

Required Navigation Accuracy

For Basic-GNSS navigation systems a Course Deviation Indicator (CDI) is assumed to be set to show +/-5NM either side of the nominal track in enroute mode. A pilot (or autopilot) is expected to fly within half of the full-scale deflection 95% of the flying time.

For aircraft equipped with an RNP capable navigation system the pilot shall select an RNP value of RNP2 or better in enroute mode or ensure that the CDI scaling is 5NM or less.

Strategic Lateral Offset Procedures (SLOP)

Aircraft shall not apply SLOP within Nuuk CTA/TMA.

SPECIAL PROCEDURES NUUK FIR

Reporting Procedures

- a. Flights conducted along an ATS route shall give position reports when passing the compulsory reporting points established on the route.
- b. Flights not conducted along an ATS route and with an EET of more than 40 minutes shall report position at HH+00 and HH+30.
- c. Upon landing on terrain or at places where ATS are not provided the pilot-in-command shall, when closing the flight plan give an ETD. If the time of departure varies by more than 30 minutes from the ETD the pilot shall give a revised ETD.
- d. Aircraft performing a series of flights with many short stops where it will be impracticable to give position reports and departure and arrival messages may in the flight plan state an area limited by a circle with a radius of MAX 20NM. The pilot-in-command can then report that he will operate in this area until a given time. If deviating by more than 30 minutes from this time the pilot shall inform the appropriate ATS unit of a revised time for the termination of the flight.

During operation in such an area the aircraft must give position reports to the ATS unit concerned at intervals not exceeding 3 hours.

- e. Upon departure from terrain or places specified in Item c) or from an area of operation specified in Item d), the pilot-in command shall report point of departure and time, destination, ETA, endurance and number of persons on board to the ATS unit concerned.

Reporting of Oilspill or Fueldumping at Sea

The pilot-in-command, the owner or the user of an aircraft can report the following incidents:

GREENLAND RULES AND PROCEDURES

- observation of oilspill at sea;
- fueldumping performed at sea.

The report shall be submitted via nearest ATS unit or after landing to:

Arktisk Kommando/Joint Arctic Command

Tel: +299 36 40 00

E-Mail: ako@mil.dk
ako-commcen@mil.dk

Alerting Service

Alerting service is carried out in accordance with ICAO provisions with the exception of the following:

- a. When operating as described under REPORTING PROCEDURES, Item c), the aircraft will be declared to be in an uncertainty phase (INCERFA) if the actual departure message has not been received within 30 minutes after ETD.
- b. When operating as described under REPORTING PROCEDURES, Item d), the aircraft will be declared to be in an uncertainty phase (INCERFA) if no report has been received 30 minutes after the flight in the area should have been terminated.

If during the planning of a flight or series of flights for which the said procedures apply but cannot be adhered to due to the special nature of the flight(s), a dispensation is required from the Danish Transport, Construction and Housing Authority.

ACAS/TCAS II REQUIREMENTS

All civil fixed-wing turbine-engined aircraft having a maximum take-off mass exceeding 5700kg, or a maximum approved passenger seating configuration of more than 19 are required to be equipped with ACAS/TCAS II version 7.1.

DIFFERENCES FROM ICAO STANDARDS AND PROCEDURES

ICAO REFERENCE

Annex 2

3.1.1 In addition the pilot-in-command shall take care that other air traffic is not unnecessarily impeded or disturbed. The pilot-in-command shall take care that the flight interferes with the surroundings as little as possible. This applies in particular when flying over built-up areas, recreational areas and areas with sensitive fauna.

3.2.5 (c) At AFIS aerodromes it is possible to make a right turn (also without being instructed by ATC) if this is indicated.

3.2.5 (d) In addition the runway in use determined by the appropriate ATS unit shall be used unless safety determines that another runway be preferred.

3.3.1.2 In addition to ICAO specifications a flight plan shall be submitted prior to operating:

GREENLAND RULES AND PROCEDURES

- any IFR flight; and
- any flight across the Danish border or the Danish territorial waters, unless the Danish Transport Authority has permitted exceptions.

3.3.4 Unless otherwise prescribed by the Danish Civil Aviation Administration a departure report shall be made at the earliest possible moment after departure to the appropriate ATS unit by any flight for which a flight plan has been submitted. Such report is not required after departure from an aerodrome where ATS are provided on condition that radio communication or visual signals indicate that the departure has been observed.

3.6.2.1.2 The mentioned provision also applies to aircraft operating along an ATS route segment defined by reference to non-directional beacons (NDB).

4.6 Additional flying between the pylons of bridges and under bridges, under overhead lines or similar installations is prohibited unless specially authorized by the Danish Transport Authority.

4.6 (b) In addition to ICAO provisions: VFR flights shall not be flown at a height less than 150m (500ft) above the highest obstacle within a radius of 150m (500ft) from the aircraft.

Annex 10

5.2.1.4.1 Transmission of numbers

All numbers used in the transmission of aircraft call sign, heading, runway, wind direction and speed shall be transmitted by pronouncing each digit separately.

- Flight levels shall be transmitted by pronouncing each digit separately except for the case of flight levels in whole hundreds.
- The altimeter setting shall be transmitted by pronouncing each digit separately except for the case of a setting of 1000 hPa which shall be transmitted as “ONE THOUSAND”.
- All numbers used in the transmission of transponder codes shall be transmitted by pronouncing each digit separately except that, when the transponder codes contain whole thousands only, the information shall be transmitted by pronouncing the digit in the number of thousands followed by the word “THOUSAND”.

PANS-ATM (DOC 4444)

Amendments 7 and 8 to PANS-ATM are planned for implementation in Denmark (NAT-Region), during 2022.

7.11 Air Traffic Control will exercise discretion in the application of reduced runway separation minimums. However, the pilot of the following aircraft will be responsible for judging that adequate separation exists in relation to the preceding aircraft. The provisions for application of reduced runway separation minimums are as follows:

Departing Aircraft

During daylight hours an aircraft may be permitted to take-off even though the preceding aircraft has not crossed the up-wind end of the runway or has started a turn, provided that:

- all preceding landing aircraft are clear of the runway;

**GREENLAND
RULES AND PROCEDURES**

- the preceding departing aircraft is airborne;
- the departing aircraft has been informed of the preceding departing aircraft;
- weather conditions permit the following aircraft to see the preceding departing aircraft continuously until standard separation is provided.

Landing Aircraft***Landing after a preceding Aircraft***

During daylight hours an aircraft may be allowed to land on a runway before the preceding aircraft has cleared it, provided that:

- the runway is long enough;
- the landing aircraft has been warned of the preceding landing aircraft by the use of the phraseology “LANDING AFTER PRECEDING LANDING (aircraft type)”, instead of the usual “CLEARED TO LAND”;
- weather conditions permit the following aircraft to see the preceding landing aircraft continuously, until it has turned off the runway.

Landing after a preceding departing Aircraft

During daylight hours an aircraft may be allowed to land on a runway before the preceding departing aircraft is clear of it, provided that:

- the preceding departing aircraft is airborne;
- the landing aircraft has been warned of the preceding departing aircraft by the use of the phraseology “LAND AFTER DEPARTING (aircraft type)”, instead of the usual “CLEARED TO LAND”;
- weather conditions permit the landing aircraft to see the departing aircraft continuously, until the landing is completed.

**ICELAND
RULES AND PROCEDURES**

GENERAL

In general, the air traffic rules and procedures in force and the organization of the air traffic services are in conformity with ICAO Standards, Recommended Practices and Procedures.

Units of measurement used in all air and ground operations are as listed in the following table.

Measurement of	Unit
Distances used in navigation, position reporting, etc., generally in excess of 2 nautical miles	Nautical Miles and Tenths
Relatively short distances such as those relating to aerodromes (e.g., runway lengths)	Meters
Altitude, elevations and heights	Feet
Horizontal speed including wind speed	Knots
Vertical speed	Feet per Minute
Wind direction for landing and taking off	Degrees Magnetic
Wind direction except for landing and taking off	Degrees True
Visibility including runway visual range	Kilometers or Meters
Altimeter setting	Hectopascals (Inches O/R)
Temperature	Degrees Celsius
Weight	Metric Tons or Kilograms
Time	Hours and Minutes, the day of 24hrs beginning at midnight UTC

WGS-84 IMPLEMENTATION STATUS

WGS-84 compliant.

FLIGHT PROCEDURES

HOLDING

Holding procedures comply with Jeppesen ATC-Chapter "Flight Procedures (DOC 8168) - Holding Procedures", Table IV-1-1, Holding Speeds.

PROCEDURE LIMITATIONS AND OPTIONS

Instrument approach procedures are based on the PANS-OPS, Document 8168.

Keflavik (BIKF) VORTAC procedures are based on Military Instrument Procedure Standardization (MIPS).

ICELAND RULES AND PROCEDURES

Procedures for aircraft to descend below cloud (cloud break procedure/cloud penetration) and to complete their flight in accordance with VFR have been designed for following airports: Djupivogur, Isafjordur, Nordfjordur, Bildudalur and Vestmannaeyjar.

Cloud break procedures are in accordance with PANS-OPS. The obstacle clearance *altitude* is never lower than 500ft and the obstacle clearance *height* is never lower than 300ft, whichever is higher. These procedures are identified by the navigational aid type used for the final approach lateral guidance, followed by the single letter suffix C or D (e.g.: RNAV C, NDB D).

Due to the limited space available, it is important that the approaches to the patterns and the holding procedures be carried out as precisely as possible. Pilots are strongly requested to inform ATC if for any reason the approach and/or holding cannot be performed as required.

AIRPORT OPERATING MINIMUMS

Iceland publishes OCA(H) and in some cases OCA(H) and DA(H).

Jeppesen published minimums are not below State minimums.

For cloud break/cloud penetration procedures the VFR visibility minimums according to AIP are charted.

ATS AIRSPACE CLASSIFICATION

Iceland has adopted the ICAO ATS airspace classification as listed in Jeppesen ATC-Chapter "ICAO ATS Airspace Classifications - Annex 11".

Airspace classes "A", "C", "D", "E" and "G" are used within Reykjavik FIR/CTA.

For IFR flights in class "C" speed limitation 250kt IAS below FL100 is applied.

In airspace class "G": CAT A and B aircraft may fly, during hours of daylight, when flight visibility is reduced to 3km, at speeds of 140kt IAS or less.

For completion of cloud break/cloud penetration procedures the following VFR minimums apply at and below 3000ft:

Airspace	Flight visibility	Distance from cloud
A, B, C, D, E	5km	1500m horizontally 1000ft vertically
F, G	5km*	Clear of cloud and with the surface in sight

* CAT A & B aircraft during hours of daylight, when flight visibility is reduced to 3km, at speeds of 140kt or less.

**ICELAND
RULES AND PROCEDURES****SPECIAL REQUIREMENTS AND REGULATIONS****COMMUNICATION**

All aircraft operating within the Reykjavik CTA shall maintain continuous watch on the appropriate frequency of Iceland Radio unless engaged in direct controller pilot communications with Reykjavik Control.

When operating outside of VHF coverage the carriage of fully functioning HF is mandatory. Aircraft with only functioning VHF communications equipment should ensure that they remain within VHF coverage of appropriate ground stations throughout the flight.

Operations outside VHF coverage require the carriage of two long range communication systems, one of which must be HF. SATVOICE and CPDLC may satisfy the requirement of the second-long range communication system. Due to coverage limitations, an Inmarsat CPDLC or SATVOICE system does not qualify as a long range communication system when operating north of 80N. Aircraft that are equipped with both Inmarsat (J5) and Iridium (J7) data link capability should use Iridium when north of 80N.

Surveillance Service in the NAT Region

When crossing from one oceanic control center to the next, towards NAT, the phraseology "Radar service is terminated" or "Surveillance service is terminated" might no longer be used by ATC, due to improved SSR equipment and ADS-B coverage.

FLIGHT PLANNING**Time of Submission**

Flight plans shall not be submitted more than 120 hours before the estimated off-block time of a flight.

Fight plans shall be submitted with the minimum prior notice:

- a. 30 minutes for domestic flights;
- b. 60 minutes for international flights; except
- c. 180 minutes for flights to Europe (NMOC).

IFPS/NMOC Operations

The Integrated Initial Flight Plan Processing System element of the EUROCONTROL Network Management Operations Center (NMOC) is the sole source for the distribution of the IFR General Air Traffic (GAT) FPL and associated messages to ATS units within the IFPS. The only required addresses are those of the two IFPS Units (IFPU) at Haren (Brussels) and Bretigny (Paris).

Flight Plan Message Addressing

Flight movement messages for IFR flights relating to traffic shall be addressed as follows:

– departures from Iceland entering the EUR region:

SITA: BRUEP7X, PAREP7X

ICELAND RULES AND PROCEDURES

AFTN: EUCHZMFP, EUCBZMFP

– for other flights:

Category of Flight	Route into, via or departing from	Message Address Phone number E-mail
IFR GAT/OAT	Reykjavik CTA/CTR, Faxi TMA, Akureyri TMA, Keflavik CTR	BIRDZPZZ ¹ +354 424 4240 fjarrit@isavia.is
VFR GAT/OAT Mixed IFR/VFR GAT/OAT	Reykjavik CTA, Faxi TMA	BIRDZPZX +354 424 4240 fjarrit@isavia.is
	Akureyri TMA	BIRDZPZX +354 424 4030 fjarrit@isavia.is
	Keflavik CTR	BIRDZPZX +354 424 4050 fjarrit@isavia.is
	Reykjavik CTR	BIRDZPZX +354 424 4040 fjarrit@isavia.is

¹ Add BGGLYIYR for flights via or departing from Reykjavik CTA entering Nuuk FIR

Flight plans for flights within Faxi TMA only

Exception to standard flight planning procedures apply for flights to and from Keflavik or Reykjavik not flying outside the boundary of Faxi TMA.

With the condition that the pilot leave a full ICAO FPL in a secure place such as at a flight school.

Pilots and student-pilots can submit flight plans to Keflavik or Reykjavik TWR via phone:

– for Reykjavik:

Tel: +354 424 4040

– for Keflavik:

Tel: +354 425 4050

Information shall be submitted in the following order:

ICELAND RULES AND PROCEDURES

- a. call sign;
- b. route of flights;
- c. estimated enroute time;
- d. endurance;
- e. name of pilot and number of passengers;
- f. pilots GSM number.

For information or feedback contact:

E-mail: procedures@isavia.is

Repetitive Flight Plan (RPL)

Reykjavik FIR Repetitive Flight Plan (RPL) system is not used.

Repetitive Flight Plan (RPL) system is no longer used within the IFPS.

Requirements for Flight Plans on Random Route Segments at or South of 70 Degrees North

For flights operating at or south of 70N, the planned tracks shall normally be defined by significant points formed by the intersection of half or whole degrees of latitude with meridians spaced at intervals of 10° from the Greenwich meridian to longitude 70W.

The distance between significant points shall, as far as possible, not exceed one hour's flight time. Additional significant points should be established when deemed necessary due to aircraft speed or the angle at which the meridians are crossed, e.g. at intervals of 10° of longitude (between 5W and 65W).

- a. Aircraft operating across the boundary between Reykjavik FIR and Scottish FIR shall file through one of the named points BARKU, DEVBI, BESGA, NALAN, OSBON, PEMOS, RIXUN or SOSAR as appropriate.
- b. Flights routing between RATSU and GUNPA in either direction shall operate direct (DCT) between those points.
- c. Eastbound flights routing across the boundary between Reykjavik FIR and Stavanger (Sola) shall file their route via one of the following waypoints: GUNPA, VALDI, ERSER, IPTON, BARUD or ISVIG.
- d. Flight Plans entering the Reykjavik CTA from the Edmonton CTA:
 - 1. At or north of 82N, a boundary position at 060W;
 - 2. south of 82N, one of the following waypoints: APSIN, BUDUM, DEXUN, ELNUS, PAMLA, SINVU, DOGGY, MODET, GELBO, DAPAK, MEDPA, INGUM, NADMA, ADSAM, BOPUT, CANEL, DARUB, IKNOG, EPMAN.
- e. Flights entering Gander Oceanic and then proceeding either through Montreal airspace and Edmonton airspace, or directly into Edmonton before entering Reykjavik Oceanic shall file as follows:

**ICELAND
RULES AND PROCEDURES**

1. Aircraft routing over 65N, at or east of 060W, shall file a waypoint at 65N;
2. aircraft routing over 65N, west of 060W, shall file via named waypoint by the boundary between Edmonton and Reykjavik.

Requirements for Flight Plans departing/arriving at Keflavik or Reykjavik

- a. Flights with Keflavik or Reykjavik as departure point or destination are not required to file their route via waypoints at 010W, if routing north of RATSU (61N010W).
- b. Flights departing Keflavik and Reykjavik shall not file their route via G3 unless short range equipped only.
- c. Flights departing Keflavik shall not file their route between 63N and 64N at 10W.

The following tables show the routing for departing flights from Keflavik and Reykjavik:

BIKF Departures to the East

Departure Point	Waypoint 60NM from BIKF	Waypoint 120NM from BIKF	Waypoint at 6130N	Waypoint at 010W	Next Way-point	Next Way-point
BIKF	If FPL is north of LUTER then according to FPL via 10° west or DCT 00L or every 5° north.					
	LUTER	N/A		Between 64N010W and 66N010W; Flights departing Keflavik shall not file their route between 63N and 64N at 10W	At or north of 64N000W	Waypoint at ENOB/ ENOR or ULLL domestic boundary

Requirements for Flight Plans on Random Route Segments North of 70 and at or South of 80 Degrees North

The planned tracks shall normally be defined by significant points formed by the intersection of parallels of latitude expressed in degrees and minutes with meridians normally spaced at intervals of 20° from the Greenwich meridian to longitude 060W, using the longitudes 000W, 020W, 040W and 060W. The distance between significant points shall, as far as possible, not exceed 1 hour flight time. Additional significant points should be established when deemed necessary due to aircraft speed or the angle at which the meridians are crossed, e.g. at intervals of 20° of longitude (between 010W and 050W). However, when the flight time between successive significant points is less than 30 minutes, one of these points may be omitted. For flights whose flight paths at or south of 80N are predominantly oriented in a north-south direction, the planned tracks shall normally be defined by significant points formed by the intersection of whole degree of longitude with specified parallels of latitude which are spaced at 5°.

Requirements for Flight Plans on Random Route Segments North of 80 Degrees North

The planned tracks shall be defined by points of intersection of parallels of latitude expressed in degrees and minutes with meridians expressed in whole degrees. The distance between significant points shall, normally equate to not less than 30 and not more than 60 minutes of flying time.

POSITION REPORTING PROCEDURES

Controlled flights providing position information to Reykjavik OACC via ADS-C shall only provide voice position reports when requested.

OCEANIC CLEARANCE

Aircraft entering the Reykjavik Control Area shall request an oceanic clearance prior to entering the Reykjavik OCA as follows:

- a. On data link in accordance with the document "ACARS Data Link Oceanic Clearance" published in Jeppesen ATC-Chapter, ATC-Data - Atlantic.
- b. From Iceland Radio on HF.

ICELAND RULES AND PROCEDURES

- c. Aircrews approaching Reykjavik airspace from the Scottish and Stavanger areas can contact Iceland Radio on VHF primary 127.85MHz, secondary 129.625MHz to obtain their oceanic clearance.

Reykjavik cannot issue oceanic clearances until coordination data has been received from the adjacent air traffic control center and the flight data has been activated within the Reykjavik Flight Data Processing System (FDPS). This occurs a certain time before the aircraft is estimated to enter the Reykjavik CTA and the time interval varies depending on the control area from which the aircraft enters the Reykjavik CTA. The following can be used as guidelines for the crew to determine when the RCL message can be accepted by the Reykjavik FDPS.

Aircraft that are not data link equipped and are unable to contact Iceland Radio on HF/VHF should request the ATC authority for the airspace in which they are operating to relay their request for oceanic clearance to Reykjavik center. Pilots should always endeavour to obtain oceanic clearance prior to entering Reykjavik OCA; however if any difficulty is encountered the pilot should not hold while awaiting clearance unless so directed by ATC. In such circumstances, pending receipt of the oceanic clearance, the aircraft should continue to maintain the flight level cleared by the current control authority.

Aircraft obtaining an oceanic clearance from Iceland Radio on HF/VHF should also maintain communication with the ATC authority for the airspace in which they are operating.

When operating in Reykjavik and Nuuk FIRs, aircrew unable to make position reports via VHF or CPDLC, ADS-C or FMC are expected to use HF or SATCOM telephone if so equipped. SATCOM voice communications should be made to Iceland radio, short code is 425105. The numbers 425101 and 425103, are connected at Reykjavik ATC center and are valid for aircrew encountering emergencies.

REQUIRED NAVIGATION PERFORMANCE

RNAV routes Y148 and Y149 are designated RNAV5 at or above FL150 and RNP2 below FL150 all other RNAV routes are designated RNP2 or GNSS.

SEPARATION IN REYKJAVIK CTA

Lateral Separation

Minimum Lateral Separation

- a. 23NM between aircraft which are:
 1. RNP4 approved;
 2. Automated Dependent Surveillance-Contract (ADS-C) equipped;
 3. Controller Pilot Data Link Communications (CPDLC) equipped;
 4. RCP 240 approved; and
 5. RSP 180 approved.
- b. 50NM between aircraft which are NAT HLA approved provided that a portion of the route of the aircraft is within, above, or below HLA;

ICELAND RULES AND PROCEDURES

- c. 90NM between aircraft operating outside the NAT HLA and at least one aircraft is not NAT HLA approved between Iceland and points in Scandinavia and in the United Kingdom;
- d. 120NM between other aircraft.

Use of Latitude

In the practical application of the minima mentioned above, tracks may be spaced with reference to their difference in latitude, using 1.5 degrees instead of 90NM; and 2 degrees instead of 120NM, provided that in any interval of 10 degrees longitude the change in latitude of at least one of the tracks does not exceed:

- a. 3 degrees at or south of 58N;
- b. 2 degrees north of 58N and south of 70N; and
- c. 1 degree at or north of 70N and south of 80N.

At or north of 80N, or where the above rates of change of latitude are exceeded, the required lateral separation must be ensured by reference to the track spacing expressed in nautical miles.

Enroute Climbs and Descents

The application of lateral separation between aircraft carrying out climbs/descents enroute and other aircraft shall be based on condition that the required separation between the climbing/descending aircraft and other enroute affected aircraft exists at the time a climb/descent clearance is issued and will continue to exist during climb/descent at the recleared flight level(s), unless longitudinal separation is provided.

Separation at FL285 and below

Lateral separation used at FL285 and below, in all cases the aircraft must be equipped with GNSS.

- a. Communicating directly with ATC on VHF:
 - 1. 15NM between aircraft in level flight;
 - 2. 7NM lateral separation between aircraft that are climbing/descending through the level of the other aircraft.
- b. Any types of communication:

Lateral separation of 20NM while one aircraft climbs/descends through the level of another aircraft operating on intersecting and non-intersecting tracks.

Longitudinal Separation

Subsonic Transport Operations

- a. Minimum longitudinal separation between turbojet aircraft shall be:
 - 1. 15 minutes; or

**ICELAND
RULES AND PROCEDURES**

2. 10 minutes, provided the Mach number technique is applied whether in level, climbing or descending flight, and the aircraft concerned have reported over a common point to follow continuously diverging tracks until some other form of separation is provided, and
 - (a) at least 10 minutes longitudinal separation exists at the point where the tracks diverge; and
 - (b) at least 5 minutes longitudinal separation will exist where lateral separation is achieved; and
 - (c) lateral separation will be achieved at or before the next significant point (normally 10 degrees of longitude along track(s)) or, if not, within 90 minutes of the time the second aircraft passes the common point or within 600NM of the common point, whichever is estimated to occur first.
3. Between 9 and 5 minutes inclusive provided the Mach number technique is applied; and
 - (a) the aircraft concerned have reported over a common point and follow the same identical track or continuously diverging tracks until some other form of separation is provided; and
 - (b) the preceding aircraft is maintaining a true Mach number greater than the following aircraft in accordance with the following:
 - 9 minutes if the preceding aircraft is Mach 0.02 faster than the following aircraft.
 - 8 minutes if the preceding aircraft is Mach 0.03 faster than the following aircraft.
 - 7 minutes if the preceding aircraft is Mach 0.04 faster than the following aircraft.
 - 6 minutes if the preceding aircraft is Mach 0.05 faster than the following aircraft.
 - 5 minutes if the preceding aircraft is Mach 0.06 faster than the following aircraft.
 - (c) if the aircraft have not reported over a common point, it is possible to ensure, by an ATS surveillance system, that the appropriate time interval will exist at the common point from which they either follow the same track or continuously diverging tracks.
- b. 5 minutes between aircraft which are:
 1. RNP4 approved;
 2. Automated Dependent Surveillance-Contract (ADS-C) equipped;
 3. Controller-pilot data link communications (CPDLC) equipped;
 4. RCP 240 approved; and
 5. RSP 180 approved.
- c. Minimum longitudinal separation between non-turbo-jet aircraft shall be:
 1. 30 minutes; and
 2. 15 minutes if the aircraft are equipped with GNSS and are communicating via VHF.

ICELAND RULES AND PROCEDURES

Enroute Climbs and Descents

The application of longitudinal separation between aircraft carrying out climbs/descents enroute and other aircraft operating in the same direction shall be based on condition that the required separation between the climbing/descending aircraft and other enroute affected aircraft exists at the time a climb/descent clearance is issued and will continue to exist during climb/descent at the re-cleared flight level(s), unless lateral separation is provided.

NOTE: Application of longitudinal separation between climbing/descending aircraft when Mach number technique is used is based on the assumption that the last assigned Mach number will be maintained during enroute climbs and descents. In the event that it is not feasible to do so, pilots concerned must inform ATC at the time of the climb/decent request or clearance.

5 minutes longitudinal separation between GNSS equipped aircraft climbing or descending aircraft while vertical separation does not exist provided:

- a. The level change is commenced within 10 minutes of the time the second aircraft has reported over a common point; and
- b. the vertical separation at the time of commencement of change is 4000ft or less; and
- c. when issuing the clearance through third party communication or CPDLC, a restriction must be added to the clearance to ensure that the 10 minute conditions satisfied. This shall be achieved by including a restriction to reach a vertically separated flight level within 10 minutes from the time the second aircraft has reported over the common point.

Longitudinal Separation at FL285 and below

Longitudinal separation used at FL285 and below, in all cases the aircraft must be equipped with GNSS and communicating directly with ATC on VHF:

- a. 10 minutes;
- b. 20NM between aircraft operating on tracks that intersect at 0-90 degree angle;
- c. 10NM between aircraft operating on tracks that intersect at 0-90 degree angle provided that the leading aircraft maintains a true airspeed of 20kt or more faster than the succeeding aircraft;
- d. 10NM between aircraft operating on tracks that intersect at 0-90 degree angle while one aircraft climbs/descends provided that the other aircraft maintains a level while vertical separation does not exist.

Strategic Lateral Offset Procedures (SLOP)

Aircraft shall not apply SLOP below FL285 in the Reykjavik CTA.

SUPERSONIC FLIGHTS

Supersonic flight is prohibited within Reykjavik FIR as follows:

- a. over land and within 12NM from the base line of the Icelandic territorial waters, below FL300;
- b. over sea outside 12NM, below FL150.

**ICELAND
RULES AND PROCEDURES****DATA LINK SERVICES****Area of applicability**

FANS 1/A ADS-C and CPDLC service is provided in the Reykjavik CTA, excluding Faxi TMA as follows:

- a. in the whole airspace for aircraft that file Iridium (J7) and/or HF (J2) data link capability in Item 10a of the ICAO FPL;
- b. south of 82°N for aircraft that file Inmarsat (J5) data link capability in Item 10a of the ICAO FPL.

Generally, when a CPDLC aircraft is operating in an airspace beyond the range of VHF voice communications, and CPDLC is available, then:

- a. CPDLC will be the primary means of communication, and
- b. voice will be used as the alternative means of communication (for example, third party HF or SATVOICE);
- c. aircraft that are equipped with both Inmarsat (J5) and Iridium (J7) data link capability shall use Iridium when north of 80N.

Within the VHF coverage, an ATSU may provide CPDLC service as the primary means of communication to alleviate frequency congestion or to enable the use of automation associated with the use of CPDLC. In such airspace, VHF voice communication is the alternative means of communication for CPDLC aircraft.

Logon

The FANS data link logon address for Reykjavik CTA is BIRD.

For correct functioning of FANS data link the aircraft identification entered into the avionics must be precisely the same as that contained in the filed flight plan. This should be confirmed by the flight crew prior to logon.

Reykjavik oceanic area control center can only accept FANS logon once coordination data has been received from the adjacent area and the flight plan has been activated in the Reykjavik Flight Data Processing System. The following list indicates how many minutes before reaching the Reykjavik CTA boundary a successful logon with BIRD may be expected:

Entering Reykjavik CTA from:

- Bodo: 20 minutes (the connection is normally transferred automatically from Bodo to Reykjavik);
- Edmonton: 30 minutes (the connection is normally transferred automatically from Edmonton to Reykjavik);
- Gander: 20 minutes (the connection is normally transferred automatically from Gander to Reykjavik);

ICELAND RULES AND PROCEDURES

- St Petersburg: 20 minutes, if the aircraft is equipped with Iridium and/or HF data link. If the aircraft is only equipped with Inmarsat data link then logon to BIRD after passing 82°N south-bound;
- Scottish Domestic: 15 minutes (the connection is normally transferred automatically from Scottish to Reykjavik);
- Shanwick Oceanic: 30 minutes (the connection is normally transferred automatically from Shanwick to Reykjavik);
- Stavanger: 15 minutes.

Departing from airports within the lateral limits of Reykjavik CTA:

- aircraft shall logon after departure.

Clearance for descend via STAR

Clearance for descend via STAR into BIKF is now available through CPDLC. The phraseology DESCEND VIA STAR TO FL100 is used. There is however not a corresponding clearance for CPDLC. Therefore the CPDLC clearance with the same meaning is: DESCEND VIA STAR. DESCEND TO AND MAINTAIN FL100.

REDUCED RUNWAY SEPARATION

Reduced Runway Separation applies for Akureyri, Keflavik and Reykjavik airports according to ICAO Doc 4444 para 7.11.

AUTOMATIC DEPENDENT SURVEILLANCE BROADCAST (ADS-B)

The Area Control Service derives information from ADS-B stations in Iceland, the Faroe Islands and in Greenland with range varying from 200NM to 250NM at FL300 and above. The Area Control Service also uses space-based ADS-B with coverage south of 70N above FL255 and north of 70N above FL180 within BGGL FIR and above MSL within BIRD FIR.

An aircraft carrying 1090MHz extended squitter (1090ES) ADS-B equipment shall disable ADS-B transmission unless:

- a. the aircraft emits position information of an accuracy and integrity consistent with the transmitted values of the position quality indicator; or
- b. the aircraft always transmits a value of zero for one or more of the position quality indicators (NUCp, NIC, NAC or SIL), when the requirements of para a. above cannot be met; or
- c. the operator has received an exemption granted by the appropriate ATS authority.

Aircraft operators wishing to receive an exemption from the procedures specified above for an individual flight shall apply for an exemption to Isavia ANS at least 5 days in advance of the flight. Any approvals for such exemptions may be contingent on specific conditions such as routing, flight level and time of day.

Applications for exemptions shall be sent to:

Isavia ANS

**ICELAND
RULES AND PROCEDURES**

E-Mail: acc@isavia.is

SECONDARY SURVEILLANCE RADAR (SSR)

All aircraft operating as IFR flights in the Reykjavik FIR shall be equipped with a pressure-altitude reporting SSR transponder. All flights operating within Faxi TMA, shall be equipped with SSR.

ACAS/TCAS II REQUIREMENTS

All civil fixed-wing turbine-engined aircraft having a maximum take-off mass exceeding 5700kg, or a maximum approved passenger seating configuration of more than 19 and all other aircraft which are equipped with ACAS II on a voluntary basis are required to be equipped with and operate ACAS/TCAS II version 7.1.

Flying with an inoperative ACAS/TCAS II is permitted, including within RVSM airspace, provided it is done in accordance with the applicable Minimum Equipment List (MEL). The MEL for ACAS/TCAS II throughout Europe is Class A - 10 days (excluding the day of discovery).

DIFFERENCES FROM ICAO STANDARDS AND PROCEDURES**ICAO REFERENCE****Annex 2**

3.3.1.2 All flights that want to be provided with alerting service shall file a flight plan with the ANSP.

3.3.5.4 When communication facilities at the arrival aerodrome are known to be inadequate and alternate arrangements for the handling of arrival reports on the ground are not available, the following action shall be taken. Immediately prior to landing the aircraft shall transmit to the appropriate air traffic services unit, a message comparable to an arrival report. This transmission shall be made to the aeronautical station serving the air traffic services unit in charge of the flight information region in which the aircraft is operated.

3.6.2.2 Deviations from the current flight plan. In the event that a controlled flight deviates from its current flight plan, the following action shall be taken:

c) Deviation from true airspeed: if the sustained true airspeed at cruising level varies or is expected to vary by 5 per cent or more from the current flight plan, the appropriate air traffic services unit shall be so informed.

d) Change in time estimate: if the time estimate for the next applicable reporting point, flight information region boundary or destination aerodrome, whichever comes first, changes in excess of 2 minutes from that previously notified to air traffic services, or such other period of time as is prescribed by the appropriate ATS authority or on the basis of regional air navigation agreements, the flight crew shall notify the appropriate air traffic services unit as soon as possible.

3.6.2.3 The Icelandic regulation does not include provisions concerning the change of Mach number/true airspeed.

Entry Requirements

Entry Requirements

Entry Requirements Data - Canada

CA 1

ENTRY REQUIREMENTS DATA

1 DESIGNATED AUTHORITIES

1.1 The designated authorities responsible for facilitating international air navigation and their addresses are provided in the following subsections.

1.1.1 Civil Aviation

Transport Canada is the responsible aeronautical authority in Canada.

Transport Canada, Safety and Security

Assistant Deputy Minister

Address: 330 Sparks Street
Ottawa
ON
K1A 0N8

The Transport Canada, Aerodromes and Air Navigation Branch is responsible for the establishment and administration of the Regulations and Standards for the provision of AIS in Canada.

Enquiries relating to regulations and standards for Aeronautical Information Services (AIS) should be addressed to:

Transport Canada Civil Aviation

Flight Standards (AARTA)

Address: 330 Sparks Street
Ottawa
ON
K1A 0N8

Tel: 1-800-305-2059

Fax: 613-957-4208

E-Mail: TC.Flights.Standards-Normesdevol.TC@tc.gc.ca

a. Customs:

Canada Border Services Agency

Address: 191 Laurier Avenue West
Ottawa
ON
Canada
K1A 0L8

Tel: 1-800-461-9999 (EN) (Canada)
1-800-959-2036 (FR) (Canada)
+1 204-983-3500 or
+1 506-636-5064 (outside Canada)

Fax: +1 613-941-5691

CA 1
ENTRY REQUIREMENTS DATA

E-Mail: CBSA-ASFC@canada.gc.ca

b. Immigration:

Citizenship and Immigration Canada

Address: 365 Laurier Avenue West

Ottawa

ON

K1A 1L1

Tel: 1-888-242-2100 (Canada)

If anywhere outside of Canada, contact the Canadian embassy, high commission or consulate responsible for your region. For contact information, refer to the Visa Offices section of Citizenship and Immigration Canada's Web site:

<www.cic.gc.ca/english/information/offices/missions.asp>

c. Health:

Health Canada

Address: Tunney's Pasture, 1918-A-1

Ottawa

ON

Canada

K1A 0K9

Tel: +1 613-957-2991

Fax: +1 613-941-5366

E-Mail: info@hc-sc.gc.ca

d. Agriculture Quarantine:

Canadian Food Inspection Agency

Address: 59 Camelot Dr.

Ottawa

ON

Canada

K1A 0Y9

Tel: +1 613-225-2342

1-800-442-2342

Fax: +1 613-228-6601

Air transport services (overflights and technical stops):

Transport Canada

ENTRY REQUIREMENTS DATA

Figure 1.1 — Transport Canada Regions

CA 2

ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

SECTION 2**2.1 GENERAL**

- a. All flights into, over or from the territory of Canada, as well as all flights landing in the territory of Canada, are to be carried out in accordance with Canada's civil aviation regulations.
- b. Aircraft landing in or departing from the territory of Canada are required to first land at an airport at which customs control facilities have been provided.

2.2 COMMERCIAL FLIGHTS

Aircraft flying on international commercial operations (other than Canada and U.S. operations) can use the airports listed on Jeppesen INTERNATIONAL AND MILITARY AIRPORTS, International Commercial Flight Airports.

General aviation operators are not limited to the airports available for commercial flights on Jeppesen INTERNATIONAL AND MILITARY AIRPORTS, International Commercial Flight Airports. They must consult the Jeppesen Airport Directory, the *Canada Flight Supplement* or the *Water Aerodrome Supplement*, Section B, "Aerodrome/Facility Directory," for information on all registered civil and military airports in Canada

2.2.1 Public Health Measures Applied to Aircraft

Document requirements are the same for commercial and private flights.

Garbage must be removed from aircraft at the first point of entry unless prior permission is received from the Canadian Food Inspection Agency.

A permit must be obtained from the Canadian Food Inspection Agency for all animals being transited through Canada.

Vaccinations are not required.

(See DESIGNATED AUTHORITIES for address.)

2.2.2 Requirements for Passports

An air operator is required to present each passenger seeking entry to Canada to the Canadian Inspection Services (CIS) at a place designated for that purpose. Failure to do so is an offense and the company is liable to a fine, the amount of which the CIS will determine for each passenger not presented.

All visitors to Canada require valid passports, including visiting crew members. Exceptions include the following individuals:

- a. a citizen of the U.S.;
- b. a resident of Greenland entering Canada from Greenland;
- c. a visitor seeking entry from the United States or St-Pierre et Miquelon who has been lawfully admitted to the United States for permanent residence;
- d. a French citizen who resides permanently in St-Pierre et Miquelon and seeks entry from Stepper et Miquelon;

CA 2

ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

- e. a member of the armed forces of any designated state entering Canada pursuant to the Visiting Forces Act; and
- f. a visitor who is seeking entry as, or in order to become, a member of the crew of a vehicle and who is in possession of a seaman's identity document issued to him/her pursuant to International Labour Organization conventions or is in possession of an airline flight crew license or crew member certificate issued to him/her in accordance with International Civil Aviation Organization specifications. The flight crew license holder must be a member of the operating crew.

Certain identity or travel documents may be accepted by immigration authorities. A list of acceptable documents may be obtained from Citizenship and Immigration Canada (see DESIGNATED AUTHORITIES for address).

ALL IMMIGRANTS to Canada require valid passports, except refugees under the Convention Relating to the Status of Refugees who are in possession of a valid and subsisting immigrant visa. Any immigrant not in possession of a passport or one of the specified alternatives may be refused entry to Canada and removed at the air operator's expense.

2.2.3 Visas

Without exception, every immigrant seeking to land in Canada must be in possession of a valid and subsisting immigrant visa.

Successful permanent resident applicants are issued a Confirmation of Permanent Residence (IMM 5292B) from a Canadian consulate or post outside of Canada. This document, combined with a facilitation counterfoil placed in the holder's passport or travel document, replaces the immigrant visa (IMM 1000) issued under the *Immigration Act* (1976). The Confirmation of Permanent Residence contains a photograph of the holder, as well as a box for the holder's signature, which must be completed upon entry to Canada. The document must be presented to an officer at an AOE.

The Confirmation of Permanent Residence by itself is not sufficient in all cases to board an airplane flying to Canada. Persons who are from countries not included in the visa exempt countries listed in Section 190 of the *Immigration and Refugee Protection Regulations* (2002) and who are holding passports or travel documents will be issued a visa counterfoil bearing the coding "IM," meaning "applicant for permanent resident status," to facilitate boarding. Section 190 of the *Immigration and Refugee Protection Regulations* can be found on the Department of Justice Canada website: <laws-lois.justice.gc.ca/eng/regulations/SOR-2002-227/page-62.html#h-88>

Visitors to Canada are required to obtain a visitor visa prior to their arrival, unless they fall under one of the exempt categories in Section 190 of the *Immigration and Refugee Protection Regulations*. A visitor to Canada who is required to obtain a visa before appearing at an AOE and who is not in possession of a valid visa may be refused admission to Canada and removed at the air operator's expense. Any air operator who carries to Canada a person who is required to obtain a visa before appearing at an AOE and who is not in possession of a valid visa is guilty of an offense and is liable to a fine, the amount of which the CIS will determine. Contact Canadian immigration authorities for details. See DESIGNATED AUTHORITIES for contact information.

CA 2

ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

Persons requiring visas to enter Canada must also be in possession of a visa to transit through Canada. Persons who are in transit through Canada on a flight that stops in Canada solely for the purpose of refuelling are exempt from the visitor visa requirement if they are on a flight bound for the U.S. and have a valid U.S. visa or they were lawfully admitted to the U.S. and are on a flight originating in the U.S.

Departure formalities are not required for embarking passengers.

2.3 PRIVATE FLIGHTS

2.3.1 General

Private aircraft flying over or landing in Canada for non-commercial purposes need not obtain prior permission; however, a flight plan must be filed.

For customs purposes, private aircraft are any civil aircraft flying to or from Canada for personal or business reasons, and not carrying passengers or cargo for compensation or hire. Customs officers determine whether an aircraft pilot or crew or both is operating in a private or commercial capacity. The ownership, aircraft type or predominant usage of the aircraft has little bearing on this determination. Many corporate and business aircraft operate as “private aircraft,” while individually owned aircraft may operate for compensation.

The term “passengers and/or cargo carried for compensation or hire” means passengers or cargo or both transported in exchange for payment or other consideration, including monetary payment or services rendered, when the passengers or cargo or both are not connected with the operation of the aircraft, ownership or business.

2.3.2 Transborder Flights

A transborder flight is a flight between Canada and the United States. According to CARs, section 602.73, “Requirement to File a Flight Plan or a Flight Itinerary,” a flight plan must be filed for all flights between Canada and a foreign state.

a. *Flights from Canada to the United States*

United States Customs and Border Protection (CBP) requires private aircraft pilots or their designees arriving in the U.S. from a foreign location, or departing the U.S. for a foreign location, to transmit electronically to CBP passenger manifest information for each individual travelling onboard the aircraft. The CBP requires private aircraft pilots or their designees to provide additional data elements when submitting a notice of arrival and also requires them to submit a notice of departure. Private aircraft pilots or their designees will be required to submit the notice of arrival and notice of departure information to CBP in the same transmission as the corresponding arrival or departure passenger manifest information via the Electronic Advance Passenger Information System (eAPIS) or an approved alternate system. Data must be received by CBP no later than 60 minutes before an arriving private aircraft departs from a foreign location destined for the U.S. and no later than 60 minutes before a private aircraft departs a U.S. airport or location for a foreign place. Advise customs (ADCUS) and CANPASS notifications are no longer accepted on flight plans for transborder flights departing from Canada to the U.S.

CA 2

ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

Private pilots or their designees are required to set up an eAPIS account at least five days prior to their first transborder flight. For additional information, consult the CBP web site at <www.cbp.gov>.

The publication *U.S. Customs and Border Protection Guide for Private Flyers* outlines special arrangements and restrictions applicable to U.S. airports. This publication is available online at the following address <https://www.eapisfile.com/Docs/eAPIS/private_flyers_guide.pdf>.

b. *Flights from the United States to Canada*

All aircraft arriving in Canada from a foreign point of origin must land at an airport designated for Canada Border Services Agency (CBSA) clearance unless otherwise authorized by the CBSA. Pilots who arrive in Canada by private, company owned or charter aircraft carrying 15 people or fewer have the option of reporting to the CBSA by telephone through the telephone reporting centre (TRC) at 1-888-226-7277 or in person directly at a staffed airport of entry (AOE). Flights with more than 15 passengers on board must clear directly at a staffed AOE. Pilots who choose to report to the CBSA via telephone through the TRC are required to provide advance notification of arrival and information about travellers and goods to the TRC a minimum of two (2) hours but no more than 48 hours before arrival by calling 1-888-226-7277. The pilot must advise the TRC of any updates to the original estimated time of arrival (ETA), destination, or changes to traveller information before arriving in Canada. Immediately upon landing in Canada, the pilot must make a second phone call to the TRC at 1-888-226-7277 to report the arrival of the aircraft and receive further instructions. The pilot and all travellers aboard must not leave the aircraft until advised to do so. If, due to weather conditions or other emergency circumstances, the aircraft has to land at a place not designated for CBSA reporting, the pilot must call the TRC at 1-888-226-7277, the nearest CBSA office or a Royal Canadian Mounted Police (RCMP) office immediately upon landing in Canada.

Medical evacuation (MEDEVAC) non-emergency flights are subject to standard general aviation requirements. Non-emergency MEDEVAC flights include transport of a patient from a foreign hospital back to Canada after medical treatment has been received and transport of a patient to a Canadian hospital for non-emergency procedure/treatment. These specific non-emergency MEDEVAC flights should enter Canada via a staffed AOE or AOE/15 within its hours of operation. Like general aviation, all arrangements for CBSA clearance should be done through the CBSA TRC (1-888-226-7277) at least 2 hours prior to landing.

Emergency MEDEVAC flights include transport of a patient where the patient's life is in imminent danger and medical intervention is urgently required. In such cases, the two (2) hours minimum advance notification and the requirement to land at a designated AOE are waived. To ensure that urgent medical care is provided to the patient, the aircraft may land at a site as close to the hospital as required, i.e., the hospital helicopter pad. For MEDEVAC emergency flights the pilot will note the following:

- Contact the TRC as soon as flight particulars are available to provide minimal information such as: destination, airplane registration number, number of passenger and names of passengers, if available;

CA 2

ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

- Call the TRC at the first opportunity after the aircraft has landed to provide the CBSA with the remaining information and follow any instructions given by the officer.

Aerodromes that are designated as AOE's with customs services available are indicated in the Aerodrome/Facility Directory of the *Canada Flight Supplement* (CFS) or the *Canada Water Aerodrome Supplement* (CWAS). (See also – Jeppesen CANADA ENTRY REQUIREMENTS — Customs Procedures and Airports of Entry.)

Additional information on telephone reporting for aircraft is available in Memorandum D2-5-12, *Telephone Reporting for General Aviation and Marine Pleasure Craft* on the Canada Border Services Agency website: <http://cbcs-asfc.gc.ca/publications/dm-md/d2/d2-5-12-eng.html>.

2.3.3 Documentary Requirements for Customs Clearance of Aircraft

Entry

Private, business, tourist or military aircraft requiring customs clearance when entering Canada are not required to submit a general declaration. However, they are required to report verbally to customs. Furthermore, the aircraft may be recorded on a specified form supplied by the Canada Border Services Agency to ensure adequate control of the aircraft while it is in Canada.

The general declaration is required for aircraft in the Northwest Territories (north of N60°), where, instead of customs officers, RCMP officers or employees of a Canadian government agency enforce customs procedures.

CANPASS

Private or Corporate aircraft that meet the requirements of the CANPASS – Private Aircraft or CANPASS – Corporate Aircraft program can land at any airport of entry any time the site is open, regardless of the hours of operation of the local Canada Border Services Agency (CBSA) office. The aircraft can also land at a designated CANPASS-only airport. The pilot is in charge of the aircraft and he or she must report all passengers and their goods on behalf of the aircraft. Pilots are responsible for reporting themselves, their crew and passengers to a telephone reporting centre (TRC) by calling 1-888-CANPASS (1-888-226-7277) at least 2 hours before but no more than 48 hours prior to the aircraft's estimated time of arrival in Canada.

To have CANPASS – Private Aircraft privileges, the aircraft may not carry more than 15 people (including the crew). The pilot also cannot charge passengers a fee for passage when using CANPASS privileges. All persons aboard the aircraft must be CANPASS members. If there is a traveller aboard who is not a member, the pilot has to follow the procedures for private or corporate aircraft. A person's CANPASS membership does not extend to members of his or her immediate family or to friends travelling with him or her. Each person on the aircraft has to be enrolled in the CANPASS – Private or CANPASS – Corporate Aircraft program.

Exit

Same requirements as for COMMERCIAL FLIGHTS.

CA 2

ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

2.4 REGULATIONS CONCERNING THE IMPORTATION OF PLANTS AND ANIMALS**2.4.1 Endangered Species**

Regulations now prohibit the import or export of over 1000 endangered species, as well as their recognizable parts and products, without proper permits. The following species and any articles made from them are only some of those which require permits: elephants (ivory), monkeys, all cats except domestic, alligators, crocodiles, orchids, American cacti, falcons, the larger sea turtles. For more information, contact the Administrator, Convention on International Trade in Endangered Species, Canadian Wildlife Service.

2.4.2 Animals, Birds, Food and Plants

To guard against the introduction of foreign diseases or parasites into Canada, The Canadian Food Inspection Agency controls the admission of animals, birds, plants and products derived from them, such as meats. The regulations may change quickly as a result of epidemics in other parts of the world. For import regulations contact:

a. for animals, contact:

The Canadian Food Inspection Agency

Address: Animal Health Division
59 Camelot Dr.
Nepean
ON
K1A 0Y9

Tel: (613) 225-2342, ext. 4629

Fax: (613) 228-6630

b. for plants, seeds, etc., contact:

The Canadian Food Inspection Agency

Address: Plant Health Division
59 Camelot Dr.
Nepean
ON
K1A 0Y9

Tel: (613) 225-2342, ext. 4334

Fax: (613) 228-6605

The Canadian Food Inspection Agency has published rules about agricultural items whose entry into Canada are controlled. Information is available at the following website: <www.cfia-acia.agr.ca>

CA 3

INTERNATIONAL AND MILITARY AERODROMES

SECTION 3

3.1 INTERNATIONAL AIRPORTS

Some airports are designated "International Airport" by Transport Canada to support international commercial air transport and are listed as such in the **ICAO Air Navigation Plan - North Atlantic, North American, and Pacific Regions* (ICAO Doc 8755/13).

3.1.1 ICAO Definitions

International Scheduled Air Transport, Regular Use (RS) — An airport which may be listed in the flight plan as an airport of intended landing.

International Scheduled Air Transport, Alternate Use (AS) — An airport specified in the flight plan to which a flight may proceed when it becomes inadvisable to land at the airport of intended landing.

International General Aviation, Regular Use (RG) — All aircraft other than those operated on an international air service.

NOTE: Any of the listed regular airports may be used as a regular or alternate airport.

3.1.2 Airport Use

Based on these definitions, the following airports can be used by aircraft flying on international operations (other than Canada and U.S. operations).

International Commercial Flight Airports

Regular Use Airports	
Calgary Intl (CYYC)	Ottawa/MacDonald-Cartier Intl (CYOW)
CFB Goose Bay (CYYR) ^{1,2}	Quebec/Lesage Intl (CYQB)
Edmonton Intl (CYEG)	St. John's Intl (CYYT)
Gander Intl (CYQX)	Stephenville (CYJT)
Halifax/Stanfield Intl (CYHZ)	Toronto/Pearson Intl (CYYZ)
Hamilton (CYHM)	Vancouver Intl (CYVR)
Montréal Intl (Mirabel) (CYMX) ⁶	Victoria Intl (CYYJ) ⁵
Montréal/-Trudeau Intl (CYUL)	Winnipeg/Richardson Intl (CYWG)
Alternate Use — Refuelling Only Airports	
CFB Goose Bay (CYYR) ²	Stephenville (CYJT)
Iqaluit (CYFB)	Prince George (CYXS)
Alternate Use Airports	
Abbotsford (CYXX)	Montréal Intl (Mirabel) (CYMX) ⁶

CA 3 INTERNATIONAL AND MILITARY AERODROMES

International Commercial Flight Airports (continued)

CFB Comox (CYQQ) ³	Windsor (CYQG)
CFB Goose Bay (CYJR) ^{1,2}	
<i>NOTE 1: CFB Goose Bay may be used by all international and domestic general and commercial aircraft. Civilian aircraft do not require prior permission to use the airport.</i> <i>NOTE 2: Supplies and services for passengers at CFB Goose Bay are limited. Use of CFB Goose Bay as an alternate or refuelling stop should be planned accordingly.</i> <i>NOTE 3: While a runway at CFB Comox airport is suitable for large aircraft engaged in international operations, the facilities for refuelling and handling large civil aircraft and for providing immigration, health and passenger amenity services are extremely limited. Operators using CFB Comox airport as an international alternate and requiring these facilities and services can anticipate extensive delays and passenger discomfort.</i> <i>NOTE 4: For regular, general aviation use.</i> <i>NOTE 5: For use by international non-scheduled air transport.</i> <i>NOTE 6: Mirabel is intended for scheduled cargo, only. No aircraft handling and ground services are available.</i>	

3.2 INTERNATIONAL COMMERCIAL FLIGHTS OPERATING INTO AND OUT OF CANADA OR TRANSITING CANADIAN AIRSPACE

All foreign commercial air operators are required to conduct commercial air transport service aircraft flights into or out of Canada or over Canadian airspace in accordance with the appropriate procedures for scheduled and non-scheduled air transport services.

3.2.1 Commercial Air Transport Services into and out of Canada

For scheduled commercial air transport service aircraft flights into and out of Canada, the foreign air operator must:

- hold a Canadian Foreign Air Operator Certificate (FAOC) issued by the Minister of Transport in accordance with *Canadian Aviation Regulations* (CARs), section 701.01, “Application”;
- be designated an air operator in accordance with a bilateral air services agreement between Canada and the State of certification of the foreign air operator, or according to any other arrangement between the two States; and
- possess a scheduled international service licence issued by the Canadian Transportation Agency.

For non-scheduled air transport service aircraft flights into and out of Canada, the foreign air operator must:

- hold a Canadian FAOC issued by the Minister of Transport in accordance with CARs, section 701.01, “Application”;

CA 3

INTERNATIONAL AND MILITARY AERODROMES

- obtain prior permission from the Canadian Transportation Agency unless the commercial air transport service is otherwise provided for in a bilateral air services agreement between Canada and the State of certification of the foreign air operator; and
- possess a non-scheduled international service licence issued by the Canadian Transportation Agency.

3.2.2 Commercial Air Transport Service Flights Registered in an ICAO Member State

If an aircraft is registered in an ICAO member State, a foreign commercial air operator can transit Canadian airspace or conduct technical stops at Canadian airports for scheduled and non-scheduled commercial flights without further authorization from Transport Canada provided the air operator **holds** a current Canadian FAOC valid for the type of aircraft being operated.

If the foreign air operator does **not hold** a Canadian FAOC valid for the type of aircraft being operated, the air operator must request flight authorization ten working days prior to the flight. The request for authorization must include the following information:

- The name of the foreign air operator and the call sign of the flight or flights;
- The type of aircraft to be flown, the aircraft registration and the seating capacity;
- A list of the dangerous goods being carried or, if no dangerous goods are being carried, a statement that reads “No dangerous goods are being carried”;
- A statement that reads “The aircraft is airworthy and is being operated under the authority of a normal certificate of airworthiness that has been issued pursuant to Article 31 of the Convention on International Civil Aviation”; and
- The proposed flight routing, including the last point of departure outside of Canada; the first point of entry into Canada; the date and time of arrival at and departure from any Canadian airport or airports; and the place or places abroad where passengers and freight will be embarking and disembarking.

Forward the request to the Foreign Inspection Division Overflight Desk by aeronautical fixed telecommunications network (AFTN), fax or e-mail:

AFTN: CYHQYAYB
Fax: +1 613-949-4227
E-mail: overflights-survol@tc.gc.ca

3.2.3 Commercial Air Transport Service Flights Registered in a Non-ICAO Member State

If an aircraft is registered in a State that is not an ICAO member, a foreign commercial air operator must obtain permission through diplomatic channels prior to operating a commercial air transport service flight to or from a Canadian airport or through Canadian airspace.

CA 3

INTERNATIONAL AND MILITARY AERODROMES

The State of the air operator must provide complete information about the flight in a diplomatic note to the Department of Foreign Affairs, Trade and Development, and include the following details:

- The name of the foreign air operator and the call sign of the flight or flights;
- The type of aircraft to be flown, the aircraft registration and the seating capacity;
- A list of the dangerous goods being carried or, if no dangerous goods are being carried, a statement that reads “No dangerous goods are being carried”;
- A statement that reads “The aircraft is airworthy and is being operated under a flight authority that is equivalent to the certificates of airworthiness that are issued pursuant to Article 31 of the Convention on International Civil Aviation”; and
- The proposed flight routing, including the last point of departure outside Canada; the first point of entry into Canada; the date and time of arrival at and the departure from any Canadian airport or airports; and the place or places abroad where passengers and freight will be embarking and disembarking.

3.2.4 State Aircraft Flights to and from a Canadian Airport or Transiting Canadian Airspace

A foreign commercial air operator of a State aircraft must obtain permission through diplomatic channels prior to operating a flight to or from a Canadian airport or transiting Canadian airspace.

The State of the air operator must provide complete information about the flight in a diplomatic note to the Department of Foreign Affairs, Trade and Development, and include the following details:

- The name of the foreign air operator and the call sign of the flight or flights;
- The type of aircraft to be flown and the aircraft registration or identification; and
- The proposed flight routing, including the last point of departure outside Canada; the first point of entry into Canada; the date and time of arrival at and departure from any Canadian airport or airports; and the place or places abroad where passengers and freight will be embarking and disembarking.

3.2.5 Aircraft Flights Operated Pursuant to a Flight Authority other than a Normal Certificate of Airworthiness

When a foreign air operator of a foreign-registered aircraft that is to be operated under the authority of a special flight permit or special flight authority, and the aircraft does not conform to Article 31 of the Convention on International Civil Aviation and Annex 8, “Airworthiness of Aircraft,” to the Convention on International Civil Aviation, the operator of the aircraft is required to get the Foreign Inspection Division, Transport Canada, to validate the aircraft’s special flight permit or authority prior to operation to or from a Canadian airport or through Canadian airspace.

NOTE 1: To initiate the process of obtaining a Canadian FAOC, contact the Foreign Inspection Division, Transport Canada, at the following address:

Transport Canada

Tel: 613-990-1100

Fax: 613-949-4227

Foreign Operations Applications and Inquiries

E-Mail: foa-aoe@tc.gc.ca

NOTE 2: To be designated in accordance with a bilateral agreement, consult the foreign commercial air operator's regulatory authority.

NOTE 3: To apply for a licence, contact the Canadian Transportation Agency at the following address:

Secretary

Canadian Transportation Agency

*Address: Ottawa
ON
Canada
K1A 0N9*

Tel: 1-800-222-2592

Fax: 819-953-5253

Telex: 1-800-669-5575

E-Mail: FAX-LATA-ALCD@otc-cta.gc.ca

NOTE 4: Off-loading persons, personal belongings, baggage, goods or cargo during a technical landing at a Canadian airport will be permitted where circumstances require it to ensure the safety of persons or property. Permission to transfer the persons, personal belongings, baggage, goods, cargo and/or crew to another aircraft must be obtained from Transport Canada and the following Canadian inspection services:

- Canada Border Services Agency*
- Citizenship and Immigration Canada*
- Health Canada*
- Canadian Food Inspection Agency*

NOTE 5: If the aircraft is carrying dangerous goods, the following information is required:

CA 3
INTERNATIONAL AND MILITARY AERODROMES

- *The class, quantity (weight in each class), and shipping name of the dangerous good or goods and the United Nations number, as well as a statement indicating that the dangerous goods are packaged in accordance with the International Air Transport Association Regulations/ICAO Requirements, and if applicable, the Nuclear Safety and Control Act.*
- *Confirmation that the civil aviation authority of the State from which the flight originates and the civil aviation authority of the air operator have authorized the flight.*

NOTE 6: *To apply for a flight authority validation contact the Foreign Inspection Division, Transport Canada at the following address:*

Transport Canada

National Operations Branch

Foreign Operations Division (AAROF)

*Address: Place de Ville, Tower C, 7th floor
 330 Sparks Street
 Ottawa
 ON
 Canada
 K1A 0N5*

Tel: 613-990-1100 (general inquiries)

Fax: 613-949-4227

Foreign Operations Division Overflights Desk

E-Mail: overflights@tc.gc.ca

When applying for the flight authority validation, submit the following documents along with the specified fee:

- *a copy of the certificate of registration for the aircraft;*
- *name and address of the person who has legal custody and control of aircraft;*
- *a copy of the special flight permit or special flight authority, including all conditions required to be complied with when the aircraft is being operated;*
- *whether persons/cargo will be carried on board;*
- *purpose of the flight;*
- *the flight routing, including airport of departure, technical stops and airport of arrival; and*
- *a fee of \$100 in Canadian funds payable by cheque or credit card. The cheque should be made out to the Receiver General of Canada. The credit card can be either Master Card or Visa. Identify the type of credit card and include the name of the cardholder, the card number and the expiry date. Transport Canada will debit the amount owed.*

NOTE 7: *Unless operational requirements dictate otherwise, technical stops for foreign commercial air operators will be restricted to the following international airports:*

CA 3
INTERNATIONAL AND MILITARY AERODROMES

Calgary (CYYC)	Hamilton (CYHM)	Stephenville (CYJT)
Edmonton (CYEG)	Montréal/-Trudeau (CYUL)	Toronto (CYYZ)
Gander (CYQX)	Ottawa (CYOW)	Vancouver (CYVR)
Goose Bay (CYYR; military)	Québec (CYQB)	Victoria (CYYJ)
Halifax (CYHZ)	St. John's (CYYT)	Winnipeg (CYWG)

The following information is important to note when making a technical stop:

- At civilian airports, the air operator is responsible for notifying the airport manager and Canada Border Services Agency before the flight.
- Prior permission required (PPR) is normally necessary at Department of National Defence military airports.
- Flight crews should consult the Jeppesen Airport Directory for current civil or military airport information.

Use of Department of National Defence and Civil High Arctic Airports

Commercial air operators wanting to use Department of National Defence and civil high arctic airports, as well as the airport in Alert, Nunavut, are required to apply to Transport Canada at the following address:

Transport Canada

Attn: Director General, Civil Aviation

Address: 330 Sparks Street, 5th floor
 Ottawa
 ON
 Canada
 K1A 0N5

Details concerning the type of aircraft, servicing requirements and scheduling should accompany the request. Private operators may apply directly to the appropriate Department of National Defence Base Commander, or they may contact Wing Operations at the telephone number listed in the Jeppesen Airport Directory.

Private operators wanting to use the airport in Alert, Nunavut, are required to apply to Department of National Defence headquarters at the following address:

National Defence Headquarters

CA 4

CUSTOMS PROCEDURES AND AIRPORTS OF ENTRY

SECTION 4

4.1 CUSTOMS PROCEDURES

- a. Pilots must land at a Canada Border Services Agency (CBSA) authorized Airport of Entry (AOE) and a flight plan must be filed for all transborder flights.
- b. Airports which are designated as an AOE with CBSA services available are indicated on the following pages. "ADCUS" (advise customs) notifications on flight plans will no longer be accepted, and pilots must make their own arrangements for CBSA clearance by calling 888-226-7277 at least 2 hours but not more than 48 hours before flying into Canada. *Pilots are also cautioned that for flight arrivals outside of the established hours, CBSA service may not always be available and, if service is made available, call-out charges may be levied.*
- c. **Telephone Reporting Centre program:** Travellers on a Canadian or U.S. registered private, company-owned, or small charter aircraft carrying no more than 15 passengers, arriving directly from the United States, must use a telephone reporting system to receive permission from a customs or immigration officer to enter Canada. The pilot must provide advance notification of arrival and information on all passengers and goods onboard to the CBSA at least 2 hours but not more than 48 hours before flying into Canada by calling the Telephone Reporting Centre at 1-888-226-7277.

Pilots are reminded that providing advance notification of arrival in Canada to the CBSA Telephone Reporting Centre does not fulfill their flight planning requirements and that a flight plan must be filed for all transborder flights.

- d. For those flights commencing outside the geographical areas covered under the 1-888-226-7277 number (North America), the following number is available:

Hamilton, ON

Tel: 905-679-2073

Fax: 905-308-8740

- e. Where, due to weather conditions or other emergency, the aircraft lands at a place which is not designated as a place for customs report, the pilot shall call 1-888-226-7277 or the nearest office of the Royal Canadian Mounted Police as soon as possible.
- f. Medical evacuation flights (MEDEVAC) should enter Canada via a staffed AOE or AOE/15 within the hours of operations. All arrangements for custom clearance should be done through the CBSA Telephone Reporting Centre (1-888-226-7277) at least 2 hours prior to landing, or in cases of medical emergency flights, as soon as the information becomes available.
- g. **U.S. Customs:** U.S. Customs and Border Protection (CBP) requires private aircraft pilots or their designees arriving in the United States from a foreign port or location destined for a U.S. port or location, or departing the United States to a foreign port or location, to transmit electronically to CBP passenger manifest information for each individual traveling onboard the aircraft. The CBP requires private aircraft pilots or their designees to provide additional data elements when submitting a notice of arrival and requires private aircraft pilots or their

CA 4

CUSTOMS PROCEDURES AND AIRPORTS OF ENTRY

designees to submit a notice of departure. Private aircraft pilots or their designees will be required to submit the notice of arrival and notice of departure information to CBP in the same transmission as the corresponding arrival or departure passenger manifest information via the Electronic Advance Passenger Information System (eAPIS) or an approved alternate system. Data must be received by CBP no later than 60 minutes before an arriving private aircraft departs from a foreign location destined for the United States and no later than 60 minutes before a private aircraft departs a U.S. airport or location for a foreign port or place. ADCUS and CANPASS notification on flight plans departing the U.S. or Canada will no longer be accepted.

Private pilots or their designees are required to set up an eAPIS account at least five days prior to their first transborder flight. For additional information consult the CBP web site at www.cbp.gov/

The publication "U.S. Customs and Border Protection Guide for private flyers" outlines special arrangements and restrictions applicable to American airports. This publication is available online at the following address www.cbp.gov/xp/cgov/travel/pleasure_boats/private_flyers/

4.2 AIRPORTS OF ENTRY — CANADA

5.5 AIRCRAFT ENTRY REQUIREMENTS

Private and non-scheduled commercial aircraft overflying or landing for non-commercial purposes need not obtain prior permission.

Nonscheduled commercial aircraft landing for commercial purposes with 20 (or more) passengers must obtain prior permission from the:

Service de l'Aviation Civile

Fax: +508 412379

at least 2 days prior to departure (at least 7 days if more than 1 flight).

All requests must include:

- a. Name, address and, phone/fax number of aircraft owner and operator.
- b. Nonscheduled international license number (with copy of the license for first flight in the year).
- c. Type and capacity of aircraft and registration marks.
- d. Date, departure, and destination airport; landing and take-off times (UTC).
- e. Number of passengers.
- f. Purpose of flight.

CA 5

- g. For contributory group charters and air travel clubs, the name and address of charterer, cost per passenger, and attestation that all passengers are members of the club, or association.
- h. If the charterer is a travel agency, joint travel agency approval number.
- i. For all flights, include lodging arrangements, if possible, while in French territory.

All requests must include the name, address and signature of the person initiating the request.

Information regarding the aerodrome and facilities may be addressed to:

3 APPLICABLE ICAO DOCUMENTS

3.1 National regulations and practices concerning facilitation of international air transport are being carried out at all international airports, as far as possible, in accordance with the provisions set forth in the Standards and Recommended Practices of Annex 9 to the Convention on International Civil Aviation. Differences from certain Annex 9 provisions exist only in those cases where it has not yet been possible to amend national legislation accordingly. Continuous efforts are being made to eliminate these differences.

**UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT**

1 GENERAL

1.1 All flights into or over the territories of the U.S. and landing in such territories shall be carried out in accordance with the regulations of the United States regarding civil aviation.

1.2 Aircraft landing in or departing from the territories of the U.S. must first land at, or finally depart from, an international airport except as may be otherwise noted in this section.

1.3 All aircraft entering the United States must land at a designated international airport of entry unless prior approval to land at a landing rights or other airport has been obtained from U.S. Customs. The term "international airport of entry" refers to any airport designated by the Secretary of the Treasury or the Commissioner of Customs as a port of entry for civil aircraft arriving in the United States from any place outside thereof and for cargo carried on such aircraft. (Note: Frequently the word "international" is included in the name of an airport for other than Customs purposes, in which case it has no special Customs meaning.) The term "landing rights airport" refers to an airport of entry at which permission to land must be granted by the appropriate Customs officer with acknowledgment of the Immigration and Naturalization Service, the Public Health Service, and the Animal and Plant Health Inspection Service of the Department of Agriculture. Such landing rights are required before an aircraft may land at an airport which has not been designated for Customs purposes as an international airport of entry. In the case of scheduled aircraft, such permission shall be obtained from the Service / Area Director of Customs of the Port where the first landing will occur. In all other cases, including private aircraft, landing permission may be obtained from the District Director of Customs or the customs officer in charge of the port of entry or customs station nearest the intended place of landing. All persons entering the United States must be inspected for U.S. Customs, Immigration and Public Health purposes.

1.4 Subject to the observance of the applicable rules, conditions, and limitations of the Federal Aviation Regulations (FAR) and the Department of Transportation (DOT)/Office of the Secretary of Transportation (OST), Office of International Aviation, as described below, foreign civil aircraft registered and manufactured in any foreign country which is a member of the International Civil Aviation Organization (ICAO) may be navigated in the United States. Foreign civil aircraft manufactured in a country which at the time of manufacture was not a member of ICAO may be navigated in the U.S. if the country has notified ICAO that the aircraft meets the standards described in the Chicago Convention or if a notice has been filed with the DOT/OST, Office of International Aviation through diplomatic channels, that the aircraft meets the standards described in the Chicago Convention.

1.5 Aircraft registered under the laws of foreign countries, not members of ICAO, may be navigated in United States territory only when authorized by the DOT/OST, Office of International Aviation.

1.6 All foreign civil aircraft operated to, from, or within the United States must carry on board effective certificates of registration and airworthiness issued by the country of registry. Also, each member of the flight crew must carry a valid airman certificate or license authorizing that member to perform their assigned functions in the aircraft.

1.7 Transportation of firearms by aircraft passengers. Regulations of the Alcohol, Tobacco and Firearms Division of the Internal Revenue Service make it unlawful for any person knowingly to deliver or cause to be delivered to any common or contract carrier for transportation or shipment

UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

in interstate or foreign commerce, to persons other than licensed importers, licensed manufacturers, licensed dealers, or licensed collectors, any package or other container in which there is any firearm or ammunition without written notice to the carrier that such firearm or ammunition is being transported or shipped; except that any passenger who owns or legally possesses a firearm or ammunition being transported aboard any common or contract carrier for movement with the passenger in interstate or foreign commerce may deliver said firearm or ammunition into the custody of the pilot, captain, conductor or operator of such common or contract carrier for the duration of the trip.

1.8 MISCELLANEOUS INFORMATION

1.8.1 Commercial air transport operators in the U.S. must adhere to Annex 6 – Operation of Aircraft with the proviso that aircraft which have no operators local representative available to them will be required to carry a fixed fuel reserve of not less than 45 minutes at the approved fuel consumption rate plus a variable reserve equivalent to 15% of the fuel required from departure to destination and to an alternate if an alternate is required or where the reserve calculated in accordance with the above exceeds two hours at the approved fuel consumption rate – two hours reserve fuel.

2 SCHEDULED COMMON CARRIAGE FLIGHTS

2.1 GENERAL

2.1.1 Generally, when an operator of an aircraft advertises its transportation services to the general public or particular classes or segments of the public for compensation or hire, it is a common carrier. In turn, the transportation service the operator performs is considered to be in common carriage. The scheduled flights into, from and landing in the territory of the U.S. for purposes of loading or unloading passengers, cargo and mail (revenue flights), must first obtain from the U.S. DOT/OST, Office of International Aviation (X-40) a foreign air carrier permit. Applications for common carrier authority must be filed with X-40. If X-40, with the President's approval, determines that the carrier is fit, willing, and able to perform the service it proposes and that the service is in the public interest, X-40 shall issue the carrier a foreign air carrier permit, subject to the disapproval of the President of the United States.

2.1.2 The scheduled flights in transit across the territory of the U.S. or landing for reasons other than for the purpose of loading and unloading of passengers, cargo or mail (non-revenue flights), which are registered in a State which is a party to the International Air Services Transit Agreement, shall submit a notice of transit to X-40. The notice of transit must be submitted at least 15 days prior to the flight and must include:

2.1.2.1 Name, country of organization and nationality (including the nationality of all ownership interests) of the operator;

2.1.2.2 Name of the country in which the aircraft to be used in the service is registered.

2.1.2.3 A full description of the proposed operations including the type of operations (passenger, property, mail, or combination), date of commencement, duration and frequency of flights, and routing (including each terminal and intermediate point that will be served); and

UNITED STATES

ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

2.1.2.4 Copies of advertising of the flights, if advertised in the United States.

2.1.3 If the Notice is timely filed, the flights may be operated in the absence of a contrary notification from X-40.

2.1.4 Scheduled flights in transit across the territory of the U.S. or landing for reasons other than for the purpose of loading and unloading of passengers, cargo or mail (non-revenue flights), which are registered in a State which is not a party to the International Air Services Transit Agreement, must obtain prior permission from X-40 at least 15 days prior to the flight. All permission requests must include the same information as requested in para 2.1.2. (See also para 1.5.) The carrier may not transit U.S. territory unless and until it receives a foreign aircraft permit to do so from X-40.

2.1.5 The permission to transit United States territory as described above also includes the right to make stops in the United States for technical purposes (for example, refueling and servicing of the aircraft) as long as the stopover does not exceed 24 hours. Stopovers which do exceed 24 hours are permitted only in those cases where a transfer of passengers, property or mail to another aircraft is necessary for the safety of the aircraft, passengers, property, or crew. Stopovers for the pleasure or convenience of passengers are not included in the transit authority.

2.2 DOCUMENTARY REQUIREMENTS FOR CLEARANCE OF AIRCRAFT

2.2.1 The undermentioned documents must be submitted to U.S. authorities for clearance on entry and departure of aircraft. All documents listed below must follow the ICAO standard format as set forth in the relevant appendixes to Annex 9, and are acceptable only when furnished in English.

2.2.2 Aircraft Documents Required (Arrival and Departure)

Required by:	General Declarations:	*Passenger Manifest:	Cargo Manifest:
Customs Agriculture	1	0	1
Plant and Quarantine	1	0	1
Immigrations	1	0	1
Public Health	1	0	0
Total	4	0	3

*Flight crew members must be in possession of a valid passport and visa regardless of length of stay unless the crew members are exempted through previous agreement.

2.3 PUBLIC HEALTH MEASURES APPLIED TO AIRCRAFT

2.3.1 At airports without Public Health Service Quarantine staff, the Customs, Immigration or Agriculture Officer present will represent the Public Health Service.

2.3.2 No public health measures are required to be carried out with respect to aircraft entering U.S. territory except that disinfection of an aircraft may be required if it has left a foreign area that

UNITED STATES ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

is infected with insect-borne communicable disease and the aircraft is suspected of harboring insects of public health importance. Disinfection is defined as: "The operation in which measures are taken to kill the insect vectors of human disease present in carriers and containers."

2.3.3 Disinfection shall be the responsibility of the air carrier and shall be subject to monitoring by the Director of the Public Health Service.

2.3.4 Disinfection of the aircraft shall be accomplished immediately after landing and blocking. The cargo compartment shall be disinfected before the mail, baggage, and other cargo are discharged and the rest of the aircraft shall be disinfected after passengers and crew deplane.

2.3.5 Disinfection shall be performed with an approved insecticide in accordance with the manufacturer's instructions. The current list of approved insecticides and sources may be obtained from the Division of Quarantine, Center for Prevention Services, Centers for Disease Control, Atlanta, GA 30333.

2.3.6 All food and potable water taken on board an aircraft at any airport and intended for human consumption thereon shall be obtained from sources approved in accordance with Title 21, Code of Federal Regulations, Parts 1240 and 1250.

2.3.7 Aircraft inbound or outbound on an international flight shall not discharge over the U.S. any excrement or waste water or other polluting materials. Arriving aircraft shall discharge such matter only at servicing areas approved under regulations cited in 2.3.6 above.

2.3.8 Aircraft on an international voyage, which are in traffic between U.S. airports, shall be subject to inspection when there occurs on board, among passengers or crew, any death, or any ill person, or when illness is suspected to be caused by insanitary conditions.

3 NON-SCHEDULED, NON-COMMON CARRIAGE FLIGHTS

3.1 GENERAL

3.1.1 Non-scheduled, non-common carriage flights are transportation services for remuneration or hire that are not offered to the general public.

3.1.2 Non-scheduled flights in transit across the territory of the U.S. or landing for reasons other than the purposes of loading and unloading passengers, cargo or mail (non-revenue flights) which are registered in a State which is a member of the International Civil Aviation Organization (ICAO) may do so without the necessity of obtaining prior permission, provided passengers are not permitted to leave the airport during stopover or provided that each stopover does not exceed 24 hours. Stopovers which do exceed 24 hours are permitted only in those cases where a transfer of passengers, property or mail to another aircraft is necessary for the safety of the aircraft, passengers, property, or crew. Stopovers for the pleasure or convenience of passengers are not included in the transit authority.

3.1.3 Non-scheduled flights landing in the territory of the U.S. for reasons of loading or unloading passengers, cargo or mail (revenue flights), must obtain prior permission from the DOT/OST, Office of International Aviation (X-40) at least 15 days prior to the flight. All permission requests must include:

3.1.3.1 Name and address of applicant.

**UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT**

- 3.1.3.2** Aircraft make, model, and registration or identification marks.
- 3.1.3.3** Country in which the aircraft is registered.
- 3.1.3.4** Name and address of registered owner of aircraft.
- 3.1.3.5** Type of flight(s) (passenger, cargo, or agricultural or industrial operation).
- 3.1.3.6** Purpose of flight(s).
- 3.1.3.7** Date of flight(s).
- 3.1.3.8** Routing of the flight(s).
- 3.1.3.9** Number of flight(s).
- 3.1.3.10** Name of charterer.
- 3.1.3.11** Charter price.

3.1.4 Applications should be made on DOT/OST, Office of International Aviation Form 4509; however, if time does not permit, applications by telegram will be accepted as long as they include the information described above. Telegraphic applications must include a prepaid voucher sufficient to allow a sixty word reply. The permit issued by the DOT/OST, Office of International Aviation must be carried aboard the aircraft during flight over U.S. territory.

3.2 THE FOLLOWING COMMERCIAL AIR OPERATIONS REQUIRE PRE-FLIGHT AUTHORIZATION FROM X-40

3.2.1 Agricultural and industrial operations which include, but are not limited to, such services as crop dusting, pest control, pipeline patrols, mapping, surveying, banner towing or skywriting.

3.2.2 Occasional and infrequent planeload charter flights carrying persons or property to and/ or from the U.S.. The number of these flights that may be performed is limited to six in any calendar year. Foreign civil aircraft are not permitted to transport persons or property or mail for compensation or hire between points wholly within the U.S..

3.2.3 Continuing cargo operations for one or more contractors. Applicants may be authorized to serve up to 10 different contractors in a 12-month period; however, authorization may be granted only if it is clear that the service is not in common carriage and the carrier and contractor enter into a contract which provides for (a) continuing cargo operations for a period of at least 6 months; (b) an absolute or minimum number of flights or volume of cargo to be transported; and (c) a guarantee by the contractor to the carrier to pay for the minimum number of flights to be performed or volume of cargo to be transported whether or not he uses the capacity. Continuing cargo operations wholly within the U.S. cannot be authorized.

3.2.4 Persons wishing to operate foreign civil aircraft from, to, or within the U.S. other than as described in this section may request permission to perform those services by filing an application with X-40. The application should include the information described above in this section. Permission to perform these services may be granted if X-40 finds that the service is consistent with applicable law and is in the interest of the public of the U.S..

3.2.5 Non-scheduled flights in transit across the territory of the U.S. or landing with or without purposes of loading and unloading passengers, cargo or mail (revenue or non-revenue flights)

**UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT**

which are registered in a State which is not a member of the International Civil Aviation Organization (ICAO) must obtain prior permission from X-40 at least 15 days prior to the flight. All permission requests must include the same information as requested in para 3.1.3 (See also para 1.5).

3.3 DOCUMENTARY REQUIREMENTS FOR CLEARANCE OF AIRCRAFT

3.3.1 Same requirements as for scheduled flights; in addition, Customs Form 178 must be filled out for all private aircraft arrivals.

4 PRIVATE FLIGHTS

4.1 PROCEDURES

4.1.1 Private aircraft that operate to, from, within, or transit territorial airspace of the United States must meet special security requirements in effect through Special Notices pursuant to 14 CFR Section 99.7, Special Security Instructions.

REFERENCE-

FAA Notices to Airmen (NOTAMS), Special Notices, at (http://www.faa.gov/pilots/flt_plan/notams/). International Flight Information Manual for U.S. Prohibitions, Restrictions, and Notices, at (http://www.faa.gov/airports_airtraffic/air_traffic/publications/ifim/).

4.1.2 If an operator intends to carry out a private flight in transit across the territory of the U.S. with intermediate landing, the operator must provide advance notice of arrival to U.S. Customs officials at or nearest the first intended landing. Customs officials, upon notification, will notify the necessary Immigration, Public Health and Agriculture officials. Advance notice must be received in sufficient time to enable the officials designated to inspect the aircraft to reach the place of landing before the arrival of the aircraft. At least one hour advance notice is required for this purpose during regular business hours. More advance notice may be required during other times.

4.1.3 Notification of arrival must include:

4.1.3.1 Type of aircraft and registration number.

4.1.3.2 Name of aircraft commander.

4.1.3.3 Number of alien passengers.

4.1.3.4 Number of U.S. citizen passengers.

4.1.3.5 Place of last foreign departure.

4.1.3.6 Estimated time and location of crossing U.S. border/coastline.

4.1.3.7 Name of intended U.S. airport of first landing (designated airport).

4.1.3.8 Estimated time of arrival.

4.1.4 Private aircraft arriving from Canada or Mexico may request that advance notice of arrival to Customs officers be included in the flight plan to be transmitted to a Federal Aviation Administration (FAA) facility which is filed in those countries if destined to an airport in the U.S. where flight notification advise Customs (ADCUS) service is available. An ADCUS message in the remarks section of the flight plan consists of the word ADCUS followed by the pilot's name and the number of persons on board (POB) with a notation of the number of non-U.S. citizens (i.e.,

UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

ADCUS John Doe 5 POB 2 NON). This notification may be provided through FAA; however, this entails the relaying of information and is not as timely or reliable as direct communication. It is recommended that if possible, pilots attempt to communicate directly with Customs by telephone or other means to insure that an officer will be available at the time requested. It is the ultimate responsibility of the pilot to insure Customs is properly notified, and the failure to do so may subject the pilot to penalty action. At those airports where ADCUS service is available, the FAA will forward the ADCUS information to the customs official on duty. At a landing rights airport such notices will then be treated as an application for permission to land. A flight plan notice must be filed sufficiently before the estimated time of arrival of the flight to permit Customs to make a determination as to whether or not to grant the requested landing rights.

4.1.5 Aircraft may use the following method of notifying Customs when departing from a country or remote area where a pre-departure flight plan cannot be filed or an advise Customs (ADCUS) message cannot be included in a pre-departure flight plan: Call the nearest enroute domestic or international FAA flight service station as soon as it is estimated that radio communications can be established and file a VFR or DVFR flight plan and include as the last item the ADCUS information. The station with which such a flight plan is filed will forward it to the appropriate FAA station who will notify the Customs office responsible for the destination airport.

4.1.6 If the pilot fails to include "advise Customs" in the radioed flight plan, it will be assumed that the pilot has made other arrangements and FAA will not advise Customs.

4.1.7 FAA assumes no responsibility for any delays in advising Customs if the flight plan is given to FAA too late for delivery to Customs before arrival of the aircraft. *It is still the pilot's responsibility to give timely notice even though a flight plan is given to the FAA.* FAA cannot relay an "advise Customs" flight plan if the pilot indicates a destination airport where flight service notice to Customs is NOT available. When dependable facilities for giving timely notice of arrival are not available, a landing shall be made at a place where the necessary facilities do exist before coming into any area from any place outside the U.S..

4.1.8 All private aircraft arriving in the U.S. via (a) the U.S./Mexican border or Pacific Coast from a foreign place in the Western Hemisphere south of 33 degrees north latitude or (b) the Gulf of Mexico and Atlantic Coasts from a foreign place in the Western Hemisphere south of 30 degrees north latitude, from any place in Mexico, or from the U.S. Virgin Islands, shall furnish a notice of intended arrival to the Customs service at the *nearest* designated airport, listed in paragraph 6., to the point of first border or coastline crossing. They must land at this airport for inspection, unless they have an overflight exemption, see paragraph 4.5. Landing rights must be obtained from Customs to land at designated airports that are *not* also approved as International Airports. The requirement to furnish an advance notice of intended arrival shall not apply to private aircraft departing from Puerto Rico and conducting their flights under Instrument Flight Rules (IFR) until crossing the U.S. coastline or proceeding north of 30 degrees north latitude prior to crossing the coastline. The notice must be furnished at least one hour before crossing the U.S. coastline or border. The notice may be furnished directly to Customs by telephone, radio, or other means, or may be furnished by means of an ADCUS message in the flight plan through the FAA to Customs. The FAA will accept these notices up to 23 hours in advance.

UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT

4.1.9 A one hour advance notice of coastline or border penetration (but not landing) is required of private aircraft arriving in the continental U.S. from Puerto Rico that are *not* conducting their flight on an IFR flight plan and those private aircraft that have flown beyond the inner boundary of the Air Defense Identification Zone (ADIZ) south of 30 degrees north latitude on the Atlantic Coast, beyond the inner boundary of the Gulf Coast ADIZ, south of the U.S./Mexican border, or beyond the inner boundary of the Pacific Coast ADIZ south of 33 degrees north latitude which *have not landed in a foreign place*. This notice requirement may be satisfied by either filing a flight plan with the FAA and placing ADCUS in the remarks section of the flight plan or by contacting Customs directly at least one hour prior to the inbound crossing of the U.S. border or coastline.

4.2 NOTICE TO CUSTOMS

4.2.1 The notice to Customs required by paragraph 4.1.9 of this section shall include the following:

4.2.1.1 Aircraft registration number.

4.2.1.2 Name of aircraft commander.

4.2.1.3 Number of U.S. citizen passengers.

4.2.1.4 Number of alien passengers.

4.2.1.5 Place of last departure.

4.2.1.6 Estimated time and location of crossing U.S. border/coastline.

4.2.1.7 Name of U.S. airport of first landing (one of the designated airports listed in paragraph 6 of this section, unless an exemption has been granted in accordance with paragraph 4.5 of this section).

4.2.1.8 Estimated time of arrival.

4.3 LANDING REQUIREMENT

4.3.1 Private aircraft that are coming from a foreign place are required to furnish a notice of intended arrival in compliance with paragraphs 4.1.9 and 4.2 of this section and must land for Customs processing at the nearest designated airport to the border or coastline crossing point as listed in paragraph 6 of this section, unless exempted from this requirement in accordance with paragraph 4.5 of this section. In addition to the requirements of this paragraph, private aircraft commanders must comply with all other landing and notice of arrival requirements. This landing requirement shall not apply to private aircraft that have not landed in a foreign place or are arriving directly from Puerto Rico.

4.4 PRIVATE AIRCRAFT DEFINED

4.4.1 For the purpose of this section, "private aircraft" means any civil aircraft not being used to transport persons or property for compensation or hire. The term "person transported for compensation or hire" means a person who would not be transported unless there was some payment or other consideration, including monetary or services rendered, by or for the person and who is not connected with the operation of the aircraft or its navigation, ownership, or business. An aircraft will be presumed to not be carrying persons or merchandise for hire, and thus will be private air-

**UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT**

craft for Customs purposes, when the aircraft is transporting only the aircraft owner's employees, invited guests, or the aircraft owner's own property. This presumption may be overcome by evidence that the employees, "guests," or property are being transported for compensation or other consideration. If an aircraft is used by a group of individuals, one of whom is the pilot making the flight for his own convenience, and all persons aboard the aircraft including the pilot contribute equally toward payment of the expense of operating the aircraft owned or rented by them, the aircraft would be considered private.

4.5 EXEMPTION FROM THE LANDING REQUIREMENT

4.5.1 The owner or aircraft commander of a private aircraft required to furnish a notice of intended arrival in compliance with paragraph 4.1.9 of this section may request an exemption from the landing requirement specified in paragraph 4.3 of this section. If approved, the applicant is bound to comply with all other requirements, including operating at or above 12,500 feet mean sea level, providing advance notice of penetration to U.S. Customs at least one hour in advance of crossing the border or coastline, furnishing advance notice of arrival at the first intended airport of landing, etc. The request should be addressed to the Port Director of U.S. Customs having jurisdiction over the airport to be utilized most frequently when arriving from points south of the U.S. Requests for exemptions can be for either a single specific flight or term (one year) approval. Applications for a single overflight exemption must be received at least 15 days in advance of the intended date of arrival; for term exemption, at least 30 days in advance.

4.5.2 Air charters or taxi service cannot be granted an unqualified term exemption since they cannot reasonably comply with the requirements of a term application, namely, comprehensive details of the passengers they will transport in the course of one year. By submitting all other details, air charters/ taxis will accrue the benefit of "conditional" approval. This approval is called conditional because the operator must receive the concurrence of the District Director prior to each trip. Concurrence will be based upon factors such as the foreign point of departure to the U.S. and the passengers being transported. The benefit realized by the charter/taxi operator is that the time constraints listed above for timely submission of single overflight exemptions can be drastically reduced. Local Customs ports will establish minimum time frames in accordance with their own requirements.

4.5.3 Required elements of any overflight exemption include the following:

4.5.3.1 Aircraft registration number and serial number.

4.5.3.2 Identification information for the aircraft (make, model, color scheme, and type, such as turboprop, etc.).

4.5.3.3 A statement that the aircraft is equipped with a functioning mode C (altitude reporting) transponder which will be in use during the overflight.

4.5.3.4 A statement that the aircraft is capable of flying above 12,500 feet and that it will be operated at such an altitude when utilizing the overflight exemption unless ordered to fly at a lower altitude by FAA air traffic controllers.

4.5.3.5 Names, home addresses, social security numbers (optional), and dates of birth of owners of the aircraft. (If the aircraft is being operated under a lease, the name and address of the lessee, in addition to that of the owner).

**UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT**

4.5.3.6 Names, home addresses, social security numbers (optional), dates of birth, and any FAA certificate numbers of all crew members that the applicant wishes to have approved. Individual applications from each crew member must also be attached and should take the form of a signed letter from the crew member in question. The applicant must verify the accuracy of the information provided by the crew member to the best of the applicants ability. The application must contain a statement to this effect.

4.5.3.7 Names, home addresses, social security numbers (optional), and dates of birth of usual and potential passengers to the greatest extent possible. An approved passenger must be on board to utilize the overflight exemption.

4.5.3.8 Description of usual or anticipated cargo or baggage.

4.5.3.9 Description of the company's usual business activity, if the aircraft is company owned.

4.5.3.10 Name of intended airport(s) of first landing in the U.S. (The overflight exemption will only be valid to fly to airports preapproved by Customs).

4.5.3.11 Foreign place(s) from which the flight(s) will originate.

4.5.3.12 Reason for the request of overflight exemption.

4.5.4 Information should be as complete and accurate as possible and should be specific rather than general. The following points will assist in preparing an acceptable application:

4.5.4.1 Include all potential crew members who might be present on the aircraft during the term of the desired exemption. In order for overflight exemptions to remain valid, all crew members on a flight must have been listed on your application.

4.5.4.2 Provide as many identifiers as possible for all crew and passengers. Social security numbers, passport numbers, aircraft pilot license numbers, etc., will contribute greatly to expediting background investigations.

4.5.4.3 Describe the type of business the corporation is engaged in. If the corporation that owns the aircraft is merely an air transportation service for the benefit of an affiliated company, please provide details.

4.5.4.4 List the foreign cities and countries the aircraft will visit. It is to your advantage to describe the nature of your business in each location, or to indicate that certain destinations are vacation/ entertainment locations.

4.5.4.5 The reason for overflight exemption requests should be as tangible and concretely stated as possible. Estimate the costs incurred by making an extra landing at a "designated airport" (fuel, wear on aircraft components, landing fees, additional time/distance).

4.5.4.6 Provide an estimate of the number of nautical flying miles which will be saved on an annual basis if the exemption is granted.

4.5.4.7 Companies involved in air ambulance-type operations may be granted a single overflight exemption when emergency situations arise, as well as in the case of nonemergency transport for individuals seeking medical treatment. Both U.S. and foreign registered aircraft will be eligible for the special exemption. The applicant must provide all the necessary information normally required for an overflight exemption. Customs should be notified at least 24 hours prior to departure. If this

**UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF AIRCRAFT**

cannot be accomplished, Customs will allow receipt of the overflight exemption application up to departure time, as well as in flight through a flight service station.

4.5.5 Applicants should be aware that the processing of term applications requires time for all background reports to be prepared for the deciding official. Incomplete applications will not be processed, and the applicant will be notified of the specific additional information that must be supplied. Should an application for overflight be denied at the district level, an appeal process is available. Letters of denial will include the name and address of the Service / Area Director of Customs responsible for the district office that denied your application. You may petition the Service / Area Director for reconsideration of your request.

5 PUBLIC HEALTH MEASURES APPLIED TO AIRCRAFT

5.1 Same requirements as for scheduled flights.

6 AIRPORTS DESIGNATED AS ENTRY POINTS

Airports Designated as Entry Points for Aircraft Arriving from Mexico and Other Foreign Countries in the Western Hemisphere South of 30 Degrees North Latitude.

Location	Airport Name
ARIZONA	
Douglas	Bisbee-Douglas International
Douglas	Douglas Municipal
Nogales	Nogales International
Tucson	Tucson International
Yuma	Yuma International

Laredo	Laredo International
McAllen	Miller International
Presidio	Presidio-Lely International

7 ENTRY AND CLEARANCE CUBA

7.1 Aircraft arriving from or departing for Cuba must land at or depart from Miami International Airport. Upon arrival, the pilot will present a manifest of all passengers on board to an officer of the U.S. Immigration and Naturalization Service or to a Customs officer acting as an Immigration officer. No passenger arriving from Cuba by aircraft will be released by Customs, nor will the aircraft be cleared or permitted to depart before the passenger is released by an Immigration officer or a Customs officer acting on behalf of that agency.

7.2 Aircraft proceeding to Cuba are required to have a validated license issued by the Department of Commerce or a license issued by the Department of State.

7.3 These special requirements do not apply to aircraft arriving from or departing to the U.S. Naval Base at Guantanamo Bay. Aircraft from this base must meet the same requirements as aircraft arriving from other Caribbean nations.

UNITED STATES
ENTRY, TRANSIT, AND DEPARTURE OF PASSENGERS AND CREW

1 CUSTOMS REQUIREMENTS

1.1 Incoming passengers are required to complete a Customs declaration. All baggage or articles belonging to the disembarking passengers are subject to Customs inspection. Permission of the Customs Officer is required prior to discharging any merchandise or baggage not previously cleared by Customs or prior to permitting passengers or persons employed on the aircraft not cleared by Customs to depart unless such removal or departure is necessary for the purpose of safety or the preservation of life or property. In case of an emergency or forced landing, Customs, Immigration, Public Health and Agriculture officials must be notified immediately.

1.2 No departure formalities are required upon departure for embarking passengers.

1.3 Any aircraft departing from the U.S. on a business or pleasure flight to unauthorized destinations (Cuba, Iran, Iraq, Libya, North Korea, Sudan, Syria) or aircraft carrying passengers or merchandise for hire, or which will take on board or discharge passengers anywhere outside the U.S., is required to obtain clearance at the Customs port of entry at or nearest the last place of takeoff from the U.S.

1.4 A private aircraft departing from the U.S. on a business or pleasure flight to an authorized destination, are not required to present a departure manifest or have a U.S. Customs clearance of any type, although modified, military type, privately owned aircraft are subject to certain restrictions (see Entry, Transit, and Departure of Cargo) under the regulations of the Office of Munitions Control of the Department of State.

2 IMMIGRATION REQUIREMENTS

2.1 Aircraft operators are required to present all persons for U.S. immigration inspection. Aliens must comply with all provisions of current immigration laws and regulations. Aliens who are lawfully domiciled residents of the U.S., must, with certain exceptions, not generally applicable here, present their valid alien registration cards (Form I-151) issued by the Immigration Office. U.S. citizens must be able to satisfy inspectors of their citizenship and should, therefore, carry with them sufficient identification.

2.2 Valid passports and visas are required for all alien passengers arriving and departing on the same or through flights or transferring to another flight at the same or a nearby airport. The visa requirement may be exempted for passengers in direct transit with a layover period of up to eight hours who are passengers on scheduled air carriers which are signatory to a previously approved transit agreement with the Immigration and Naturalization Service.

2.3 An alien passenger entering the U.S. for the purpose of immigration must hold a valid passport and an immigration visa, the latter being issued at U.S. Consulates abroad. Temporary visitors must be in possession of a valid passport and visa.

2.4 Flight crew members must be in possession of a valid passport and visa regardless of length of stay unless the crew members are exempted through previous agreement (see para 2.2).

2.5 ARRIVAL AND DEPARTURE MANIFESTS

2.5.1 Neither arrival nor departure manifests containing information on all passengers are required in the U.S. However, the U.S. Immigration and Naturalization Service does require the

UNITED STATES
ENTRY, TRANSIT, AND DEPARTURE OF PASSENGERS AND CREW

completion and submission to immigration officials, of an arrival/departure card for each non-resident alien entering the U.S., regardless of length of stay.

2.6 ARRIVING FLIGHTS

2.6.1 The captain or agent of every aircraft arriving in the U.S. from a foreign place or from an outlying possession of the U.S. is responsible for and must insure that an arrival/departure card (Form I-94) is prepared by each nonresident alien passenger and is presented to the immigration officer at the port of arrival. The I-94 card, however, is not required for the citizens of Canada and the French Islands of St. Pierre and Miquelon, near Newfoundland. In addition, an arrival/departure card is not required for an arriving, direct transit passenger at a U.S. port from which he will depart directly to a foreign place or an outlying possession of the U.S. on the same flight, provided that a listing which includes the number of such direct transit passengers is provided or that the number of such passengers are noted on the U.S. Customs Service Form 7507 or on the International Civil Aviation Organization's General Declaration and such passengers remain, during ground time, in a separate area under the direction and control of the Customs Service.

2.6.2 Captains of private aircraft not engaged in the carriage of persons or cargo for hire (non-revenue flights) are not required to present arrival/departure cards (Form I-94). This, however, does not relieve a non-resident alien passenger from the responsibility of completing and submitting a Form I-94 to immigration officials when required. Most alien passengers must execute and present Form I-94 (revised March 1, 1986). Prior editions may not be used. Form I-94 must be completed by all persons except U.S. citizens, returning resident aliens, aliens with immigrant visas, and Canadians visiting or in transit. Mexican nationals in possession of Immigration Form I-86 or Form I-586 are exempt from Form I-94 reporting requirements when their itinerary is limited to California, Arizona, New Mexico, or Texas and will not exceed 72 hours in duration. This exemption does not apply when travel will exceed 25 miles from the international border between Mexico and the U.S. Travel to Nevada by Mexican nationals is exempted for periods of less than 30 days. Mexican nationals proceeding to destinations more than 25 miles from the border in these states will have to obtain a visitor's permit I-444 when arriving in the U.S. Mexican nationals presenting official or diplomatic passports and destined to the U.S. for purposes other than permanent assignment are exempted from Form I-94 reporting requirements.

2.6.3 Completion of the arrival/departure cards (Form I-94) must be as follows:

- a. Alien passengers on temporary visit in the U.S. must complete all items of Form I-94 in duplicate, one copy of which is attached to the passport for surrender to immigration officials upon departure.
- b. Alien passengers in direct transit, when required to complete Form I-94, are to insert the symbol TRWOV on the line headed "Passenger Boarded At" and need not complete items 3, 8 and 9. Form I-94 is to be completed in single copy only.
- c. When the Form I-94 is required by individuals entering the U.S. by private aircraft it should indicate PRIVATE in block #7 Airline and Flight Number. They do not need to complete block #9-City Where You Boarded. All other items on the form are self-explanatory and should be completed prior to actual arrival in the U.S.

UNITED STATES
ENTRY, TRANSIT, AND DEPARTURE OF PASSENGERS AND CREW

2.6.4 When inspection of an arriving passenger is deferred at the request of the air carrier to another port of debarkation, the required forms relating to any such passenger shall be returned, together with a Form I-92, when the Form I-94 procedure is used, for presentation by the captain, master, or agent at the port where inspection is to be conducted.

2.7 DEPARTING FLIGHTS

2.7.1 The captain or agent of every aircraft (other than private) departing from the U.S. for a foreign place or an outlying possession of the U.S. is responsible for and must insure that all alien passengers on board, (except for citizens of Canada and the French islands of St. Pierre and Miquelon, near Newfoundland), surrender to the immigration officer at the port of departure, prior to departure, the passport copy of the arrival/departure card (Form I-94) which was completed upon arrival in the U.S. Aircraft departing on regularly scheduled flights from the U.S., however, may collect the cards and defer their presentation, along with either the Bureau of Customs Form 7507 or the ICAO General Declaration, containing the listing of alien direct transit passengers for whom the arrival/departure card was not prepared upon arrival.

2.7.2 Private aircraft owners are responsible for the proper completion and submission of Form I-94 for all crew and passengers affected by the reporting requirement. Departure documents should be annotated on the reverse of the document to indicate Port of Departure and Date of Departure. Following Carrier, print the word PRIVATE. In the space provided for Flight Number/Ship Name, print the aircraft's tail number. Departure documents should be submitted to a U.S. Immigration or U.S. Customs inspector at the time of departure from the U.S. or mailed to the Appalachian Computer Service address in London, KY. Aircraft owners are responsible for the submission of all I-94 Departure Records upon departure to a foreign destination.

2.7.3 Resident aliens of the U.S. who will be traveling abroad under a foreign passport must insure that their Alien Registration Card, Form 151, is available for presentation to gain re-entry into the U.S. upon completion of trip.

2.8 CURRENCY REPORTING REQUIREMENTS

2.8.1 There is no limitation in terms of the total amount of monetary instruments which may be brought into or taken out of the U.S., nor is illegal to do so. However, if you transport or cause to be transported (including by mail or other means), more than \$10,000 in monetary instruments on any occasion into or out of the U.S., or if you receive more than that amount, you must file a report (Customs Form 4790) with U.S. Customs (Currency and Foreign Transactions Reporting Act, 31 U.S.C. 1101, et seq.). Monetary instruments include U.S. or foreign coin in current circulation, currency, traveler's checks, money orders, and negotiable instruments or investment securities in bearer form. Failure to comply can result in civil and criminal penalties.

3 PUBLIC HEALTH REQUIREMENTS

3.1 Disembarking passengers are not required to present a vaccination certificate except when coming directly from an area infected with cholera, yellow fever or smallpox. Smallpox vaccination is necessary only if, within the 14 days before arrival, the traveler has been in a country reporting smallpox.

UNITED STATES
ENTRY, TRANSIT, AND DEPARTURE OF PASSENGERS AND CREW

3.2 The pilot in command of an aircraft destined for a U.S. airport must report immediately to the Quarantine Station at or nearest the airport at which the aircraft will arrive, the occurrence, on board of any death or any ill person among passengers or crew. Ill person is defined as:

- a. Temperature of 100 degrees Fahrenheit (38 degrees Celsius) or greater accompanied by rash, glandular swelling, or jaundice, or which has persisted for more than 48 hours; or
- b. Diarrhea, defined as the occurrence in a 24-hour period of three or more loose stools or of a greater than normal (for the person) amount of loose stools.

3.3 The pilot in command is responsible for detaining the aircraft and persons and things arriving thereon and keeping them free from unauthorized contact pending release when required by Sections 71.31, 71.46, 71.62, 71.63, and 71.102 of the Foreign Quarantine Regulations of the Public Health Service (Part 71, Title 42, Code of Federal Regulations).

**UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF CARGO**

1 REQUIREMENTS CONCERNING CARGO AND OTHER ARTICLES

1.1 Customs entry and clearance of cargo and unaccompanied baggage destined for points within U.S. territory must be completed at the first international airport of entry.

1.2 Transshipment of cargo and other articles must be dealt with at the first international airport of entry according to related regulations. All aircraft entering the U.S. or arriving any place in the U.S. from any other place in the U.S. carrying residue foreign cargo shall not depart from the place of landing without receiving permission from the Customs Officer.

2 AGRICULTURAL QUARANTINE REQUIREMENTS

2.1 The U.S. Department of Agriculture, Plant Protection and Quarantine Division (PPQ), has strict requirements regarding the entry, handling and disposition of garbage and galley refuse on all flights arriving from any foreign country, except Canada (7 CFR Parts 94 and 330). A list of sanitary international airports approved by PPQ can be secured from any PPQ office at major airports.

2.2 Meat, meat products, milk, live birds, poultry or other domestic farm animals can only enter the U.S. under certain conditions from certain countries under the regulations of the PPQ.

2.3 No insects or other plant pests shall knowingly be transported into the U.S. If the pilot of any aircraft has reason to believe any flying or crawling insects are aboard his/her aircraft, such information should be relayed to the nearest PPQ office or inspector when landing.

2.4 Permits are required to bring most fruits, vegetables, plants, seeds, etc., into the U.S. from foreign countries. A guide to restricted or prohibited products can be secured from any PPQ office.

2.5 Dogs, cats, monkeys, psittacine birds (parrot family), turtles, shipments of disease organisms and vectors, and dead bodies are subject to entry restrictions prescribed in the Foreign Quarantine Regulations of the Public Health Service (42 CFR Part 71, Subject J).

3 EXPORTATION OF AIRCRAFT, CARGO AND OTHER ARTICLES

3.1 All U.S. and foreign registered aircraft departing the U.S. for a foreign destination on a temporary sojourn must have export authorization. The two types of export authorization are a license exception (AVS) and a license. Detailed information on both the license exception and the license can be obtained from:

The U.S. Department of Commerce

Address: Bureau of Export Administration
Exporter Counseling Division
Washington, DC
20230

Tel: (202) 482-4811

Fax: (202) 482-3617

UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF CARGO

3.2 A license exception (AVS) is an authorization to export the aircraft if certain criteria are satisfied. This exception does not require an application nor will there be an issuance of a license document prior to the flight.

REFERENCE

15 CFR Section 740.15

3.3 License exception AVS authorizes an operating civil aircraft of foreign registry that has been in the U.S. on a temporary sojourn to depart from the U.S. under its own power for any destination, provided that:

3.3.1 No sale or transfer of operational control of the aircraft to nationals of Cuba, Iran, Iraq, Libya, North Korea, Sudan, or Syria has occurred while in the U.S.

3.3.2 The aircraft is not departing for the purpose of sale or transfer of operational control to nationals of Cuba, Iran, Iraq, Libya, North Korea, Sudan, or Syria; and

3.3.3 It does not carry from the U.S. any item for which an export license is required and has not been granted by the U.S. Government.

3.4 License exception AVS authorizes a civil aircraft of U.S. registry operating under an Air Carrier Operating Certificate, Commercial Operating Certificate or Air Taxi Operating Certificate issued by the Federal Aviation Administration, or conducting flights under operating specifications approved by the FAA pursuant to FAR 129, may depart from the U.S. under its own power for any destination provided that:

3.4.1 The aircraft does not depart for the purpose of sale, lease or other disposition of operational control of the aircraft or its equipment, parts, accessories or components to a foreign country or any national thereof.

3.4.2 The aircraft's U.S. registration will not be changed while abroad;

3.4.3 The aircraft is not to be used in any foreign military activity while abroad; and

3.4.4 The aircraft does not carry from the U.S. any item for which a license is required and has not been granted by the U.S. government.

3.5 License exception AVS authorizes any other operating civil aircraft of U.S. registry to depart from the U.S. under its own power for any destination, except to Cuba, Iran, Iraq, Sudan, Syria, Libya, and North Korea (flights to these destinations require a license), provided that:

3.5.1 The aircraft does not depart for the purpose of sale, lease, or other disposition of operational control of the aircraft or its equipment, parts, accessories or components to a foreign country or national thereof.

3.5.2 The aircraft's U.S. registration will not be changed while abroad.

3.5.3 The aircraft is not to be used in any foreign military activity while abroad.

3.5.4 The aircraft does not carry from the U.S. any item for which an export license is required and has not been granted by the U.S. government; and

UNITED STATES ENTRY, TRANSIT AND DEPARTURE OF CARGO

3.5.5 The aircraft will be operated while abroad by a U.S. licensed pilot, except that during domestic flights within a foreign country, the aircraft may be operated by a pilot currently licensed by that foreign country.

3.6 A license authorizes the departure of the aircraft within the special limitations set forth in the license document. It is issued only on the basis of a formal application requesting the issuance of a license prior to the flight.

3.7 Once it has been determined that an export license is required, an application for the license should be submitted to the Bureau of Export Administration, U.S. Department of Commerce. An application consists of Form BXA-748P (multipurpose application). This form and information on the application process can be obtained free of charge from either the U.S. Department of Commerce in Washington, or any of its District Offices (see para 4).

3.8 Applications for validated licenses by non-U.S. citizens require that the applicant appoint an agent subject to U.S. jurisdiction to act on his/her behalf. If an emergency situation necessitates the expedition of the application process, contact the Counseling Division Staff of the Bureau of Export Administration (telephone 202-482-4811) or any Department of Commerce District Office for assistance.

4 DEPARTMENT OF COMMERCE DISTRICT OFFICES

4.1 Birmingham, AL; Anchorage, AK; Phoenix, AZ; Los Angeles, CA; San Francisco, CA; Denver, CO; Hartford, CT; Miami, FL; Atlanta, GA; Savannah, GA; Honolulu, HI; Chicago, IL; Indianapolis, IN; Des Moines, IA; New Orleans, LA; Baltimore, MD; Boston, MA; Detroit, MI; Minneapolis, MN; St. Louis, MO; Omaha, NE; Reno, NV; Newark, NJ; Albuquerque, NM; Buffalo, NY; New York, NY; Greensboro, NC; Cincinnati, OH; Cleveland, OH; Portland, OR; Philadelphia, PA; Pittsburgh, PA; San Juan, PR; Columbia, SC; Memphis, TN; Dallas, TX; Houston, TX; Salt Lake City, UT; Seattle, WA; Charleston, WV; Milwaukee, WI; Cheyenne, WY.

5 REGULATIONS CONCERNING CIVIL MOVEMENT OF ARMS, AMMUNITION AND MILITARY TYPE AIRCRAFT

5.1 Importation of military type aircraft and the carriage or importation of firearms or ammunition are regulated by the U.S. Department of the Treasury, Division of Alcohol, Tobacco and Firearms.

5.2 A permit must be obtained from the Alcohol, Tobacco and Firearms Division for the importation of certain military type aircraft regardless of demilitarization. Aircraft that are exempt from permits are specifically listed in the regulations on Importation of Arms, Ammunition and Implements of War (26 CFR Part 180).

5.3 A permit must be obtained from the Alcohol, Tobacco and Firearms Division for the importation of firearms and ammunition for commercial transactions.

5.4 Transportation or shipment of firearms or ammunition in interstate or foreign commerce to persons other than licensed importers, licensed manufacturers, licensed dealers or licensed collectors, without written notice to the carrier that such firearms or ammunition is being transported or shipped is unlawful.

**UNITED STATES
ENTRY, TRANSIT AND DEPARTURE OF CARGO**

5.5 Any passenger who owns or legally possesses a firearm or ammunition being transported aboard any common or contract carrier for movement with the passenger must deliver said firearm or ammunition into the custody of the pilot, captain, conductor or operator of such common or contract carrier for the duration of the trip.

5.6 Applications for permits should be made on Form 6 (Firearms), preferably 30 days in advance of importation. Form IRS-4522, International Import Certificate, may also be required by the exporting country and should accompany applications on Form 6 (Firearms) when necessary.

5.7 Exportation of military type aircraft are regulated by the U.S. Department of State, Office of Munitions Control.

5.8 A license must be obtained from the Office of Munitions Control, Department of State, for the exportation from the U.S. of certain military type aircraft regardless of demilitarization. Aircraft that are exempt from licenses are specifically listed in the regulations on International Traffic in Arms (22 CFR Part 121). Applications for licenses are made as follows:

- a. For permanent export, on Form DSP-5. Apply at least 30, preferably 60, days in advance. A Form DSP-63a may also be required from the importing country.
- b. For temporary export, on Form DSP-73. Apply at least 10 days in advance.

**UNITED STATES
FEES AND CHARGES****1 GENERAL**

1.1 Charges for services and facilities vary from aerodrome to aerodrome, and information concerning such charges may be obtained at the aerodromes. Unless alternative arrangements have been made, all charges for the use of the aerodrome, such as landing fees, passenger service charges, cargo charges, storage charges, and the like, are payable on demand or before the aircraft departs the aerodrome. All such charges are established by and payable to the various administrative authorities of the various aerodromes.

1.2 A private aircraft will be charged a processing fee of \$25 once every calendar year. This will be charged the first time the aircraft arrives from a foreign place in the calendar year or may be paid in advance. This fee is charged to the aircraft, not the pilot, and the receipt should be kept with the aircraft.

1.3 Commercial aircraft operators will be charged a processing fee of \$5 per paying passenger for each arrival from foreign to the U.S. This fee will not be charged for passengers arriving from Canada, Mexico, and certain nearby Caribbean countries.

2 CHARGES FOR INSPECTION SERVICES

2.1 Generally speaking, free service is provided at airports during regular business hours (usually 8 a.m. to 5 p.m.), Monday through Saturday, and from 8 a.m. to 5 p.m. on Sundays and national holidays. However, tours of duty at airports are based on the need for services and are altered at some ports to coincide with scheduled changes and peak workloads.

2.2 Overtime charges may be imposed, in certain cases, for Immigration and Naturalization Services and Public Health Service quarantine inspection of aircraft whose operations are not covered by published schedules. Information concerning such charges may be obtained from the Immigration and Naturalization Office and the Public Health Service Medical Officer in Charge at, or nearest, the intended place of landing.

3 PENALTIES FOR VIOLATIONS

3.1 Since the law provides for substantial penalties for violations of the Customs regulations, aircraft operators and pilots should make every effort to comply with them.

3.2 A \$5,000 penalty will be assessed for common violations such as:

3.2.1 Failure to report arrival.

3.2.2 Failure to obtain landing rights.

3.2.3 Failure to provide advance notice of arrival.

3.2.4 Failure to provide penetration report on southern border.

3.2.5 Departing without permission or discharging passengers or cargo without permission.

REFERENCE

19 CFR 122.161

**UNITED STATES
FEES AND CHARGES**

NOTE 1: Importation of contraband, including agricultural materials, or undeclared merchandise can result in penalty action and seizure of aircraft, which varies according to the nature of the violation and pertinent provision of law.

NOTE 2: The above penalties are double to \$10,000 for a second offense. Seizure of aircraft may occur at any time depending upon the circumstances behind the violation.

NOTE 3: If a penalty is incurred, application may be made to the Customs officer in charge for a reduction in amount or cancellation, giving the grounds upon which relief is believed to be justified. If the operator or pilot desires to further petition for relief of the penalty, he/she may appeal to the appropriate District Director of Customs. If still further review of the penalty is desired, written appeal may be made to the proper Regional Commissioner of Customs, and in some cases, to Customs Headquarters.

3.3 Any person violating any provision of the Public Health Service regulations shall be subject to a fine of not more than \$1,000 or to imprisonment for not more than 1 year, or both, as provided in section 368 of the Public Health Service Act (42 U.S.C. 271).

4 AIR NAVIGATION FACILITY CHARGES

4.1 The Federal Aviation Administration does not charge for the use of federal air navigation facilities or telecommunications services.

ALASKA
NATIONAL REGULATIONS AND REQUIREMENTS

See US Entry Requirements.

ENTRY REQUIREMENTS (CIVIL)

Air Commerce Regulations of the United States place certain responsibilities upon owners and operators of aircraft engaging in flights to and from foreign countries.

Customs, and other agencies concerned, desire to facilitate air travel to the fullest extent possible while carrying out their responsibilities. Plane operators can assist greatly by familiarizing themselves with the regulations and by complying with them under all circumstances. Failure to do so may incur substantial penalties.

The following sets forth the principal requirements of concern to private plane operators engaging in international flights. In general, a private aircraft is considered to be an aircraft owned, leased or rented by the operator or his employer and not carrying passengers or cargo for hire nor proceeding to, or returning from, a place from which or to which passengers or cargo have been or will be carried for hire. Such an aircraft may carry the owner's or operator's guests or employees. Private aircraft will not be required to file entry or departure documents.

FLIGHTS ACROSS U.S. BORDERS. — All pilots contemplating flights across U.S. borders should refer to complete regulations in latest INTERNATIONAL FLIGHT INFORMATION MANUAL. Pilots must report for inspection at the time of each entry to avoid inconveniences, additional expenses and penalties.

OVERTIME CHARGES, OTHER EXPENSES. — The operator of private aircraft will be required to pay overtime charges for inspections performed by Customs and Immigration Officers during hours other than regular office hours and on Sundays and Holidays. The operator will be required to pay transportation and all expenses, up to \$25.00, incurred in connection with the inspection of aircraft at airports not manned by customs officers. The U.S. Customs Service suggests that pilots contact the customs officer direct prior to departure to obtain latest information on customs hours and estimated overtime charges, if any, since such costs sometimes are substantial.

INTERNATIONAL AIRPORTS OF ENTRY

If the operator of a private aircraft returning to, or visiting, the United States wishes to land at an International Airport of Entry, two hours advance notice is required, but more is desired. If arrival will be after normal business hours, notice during business hours is advisable. If this is not practical, please give as much more than the required two hours as is possible. You may expedite your customs inspection by providing timely notice. The following are International Airports of Entry in Alaska.

Juneau (Intl) 907-586-7211

Wrangell (Apt) 907-874-3415

OTHER AIRPORTS

If the operator intends to land at a place not designated as International Airport of Entry, he must obtain permission to make such landing and give advance notice of arrival to the customs office nearest the intended place of first landing. Advance notice of arrival may be included in the Flight

ALASKA
NATIONAL REGULATIONS AND REQUIREMENTS

Plan filed in Canada if destined to an airport where flight notification service is available and this notice will be treated as an application for permission to land.

The following airports in Alaska are manned by customs officers and permission to land at these airports may be obtained from the customs officers at the airport. Requests for permission should be submitted during regular office hours. If such requests are not submitted during office hours, additional advance notice (two hours or more) should be given to help prevent delay in locating an officer.

Anchorage (Intl) ³	907-271-6313
Fairbanks (Intl) ³	907-474-0307
Ft Yukon (Apt) ¹	907-474-0307
Ketchikan (Intl) ²	907-225-2254
Northway (Apt) ²	907-778-2223
Sitka (Apt) ²	907-747-3374
Skagway (Apt) ^{1, 2}	907-983-2325
Valdez (Apt) ²	907-835-2355

¹ Indicates Flight Service notification to U.S. Customs is not available. Flight notification service is available to airports not so marked.

² Indicates Landing Rights may be granted provided the aircraft is not subject to quarantine inspection by the U.S. Public Health Service. (Sec 71.46, P.H.S. Foreign Quarantine Regulations).

³ These are called international Airports but they are not so designated by Federal Agencies and permission to land is required.

Regular business hours of U.S. Customs Offices are 0800-1700 Local time daily.

UNITED STATES
INTERNATIONAL AIRPORTS (AIRPORTS OF ENTRY)

GENERAL

Private aircraft pilots must adhere to the requirements of the Advance Information on Private Aircraft Arriving and Departing the United States Final Rule. Current information, including the Guide for Private Flyers, is maintained at the following address:

http://www.cbp.gov/xp/cgov/travel/pleasure_boats/private_flyers/

INTERNATIONAL AIRPORTS

Aircraft arriving at international airports don't need to request permission to land, known as landing rights, from Customs and Border Protection (CBP). However, an advance notice of the estimated time of arrival, in local time, must be transmitted to CBP for each flight. In general, a one-hour advance notice of arrival is sufficient, although please note that a longer time is required at certain airports. Aircraft operators must bear in mind that this advance notice is based upon the time that the CBP officer will receive the notification, not the time the flight plan or message is filed.

If an ADvise CUSoms (ADCUS) message is not included in the flight plan, FAA will not advise CBP of intended arrival. The pilot is ultimately responsible for ensuring that CBP is properly notified. At airports that do not provide this service (flight plan notification), notices of arrival must be made directly to CBP.

LANDING RIGHTS AIRPORTS

In addition to providing advance notice of arrival, as just described (international Airports), pilots must also obtain specific permission to land at a Landing Rights airport before intended use. Except for short flights, advance notice of arrival may be transmitted to CBP in the ADCUS section of flight plans at airports where flight notification service is available. These notices will be treated as an application for permission to land, although the pilot is still ultimately responsible for ensuring that CBP is properly notified. Landing rights may be denied if inspection service cannot be provided. If flight notification service is not available at a particular airport, pilots must submit applications for landing rights and must provide arrival notices directly to CBP.

CBP officers may, at their discretion, grant blanket landing rights for certain airports for a specified period of time; in these cases, pilots will only be required to provide advance notice of arrival.

“USER-FEE” AIRPORTS

Congress created the “User-Fee” Airport Program a part of the Tariff and Trade Act of 1984. Under this program, certain airports that do not meet the criteria for becoming a CBP port of entry can petition to become a designated “user-fee” airport instead.

“User-fee” airports are so named because the costs associated with them are reimbursable: Private aircraft operators using designated “user-fee” airports are frequently required to reimburse the airport operator for the costs associated with processing their arrivals. These costs may well run from \$100 to \$300 or more per arrival.

UNITED STATES
INTERNATIONAL AIRPORTS (AIRPORTS OF ENTRY)

DESIGNATED AIRPORTS

Private aircraft coming from a foreign location are required to furnish a notice of intended arrival in compliance with special reporting requirements, which apply to private flights originating in areas south of United States borders. These flights must land for CBP processing at a designated airport nearest the border or coastline crossing point unless the aircraft has been exempted from this requirement. In addition to the requirements of this paragraph, private aircraft commanders must comply with all other landing and notice-of-arrival requirements. This landing requirement does not apply to private aircraft that have not landed in a foreign place or that are arriving directly from Puerto Rico and conducted their flights under instrument flight rules (IFR) until they crossed the United States coastline or proceeded north of 30 degrees north latitude prior to crossing the coastline.

MORE INFORMATION

CBP phone numbers and service hours at Port of Entry airports are frequently revised. Due to the volatile nature of this information refer to the following CBP web site:

NATIONAL REGULATIONS AND REQUIREMENTS**

PASSPORT

Required, except of following persons:

- a. nationals of Finland, Iceland, Norway and Sweden arriving from or departing to these countries;
- b. a group of aliens traveling on a valid collective passport;
- c. holders of a valid refugee identity document;
- d. holders of a valid "Stateless Person" identity document;
- e. holders of an alien resident permit, re-entry permit or laissez-passer issued by a competent authority;
- f. citizens holding a national identity card of one of the following countries: Austria, Belgium, France, Germany, Greece, Italy, Liechtenstein, Luxembourg, Netherlands, Portugal, Switzerland, United Kingdom;
- g. holders of a seaman's book presented in connection with documentation for signing on or paying off a ship at a Greenland or foreign port;
- h. air crew member licences and certificates issued by a Contracting State of ICAO;
 - i. military NATO personnel holding a military identity card and NATO Travel Orders for a stay not exceeding 3 months;
 - j. holders of identity documents issued by the Vatican authorities;
- k. holders of laissez-passer document issued by the UN or the European Union (EU);
 - l. American, British or Canadian citizens serving in the NATO forces in Western Europe holding a military identity card and a travel permit for a stay not exceeding 3 months;
- m. holders of a certificate "For Stateless Alien" issued by the American military authorities in Germany to dependents of American military personnel for a stay not exceeding 3 months;
- n. pupils participating in school journeys within the European Union (EU) providing they have a lawful residence in an EU State.

VISA

Required, with the following exceptions:

- a. citizens of Andorra, Argentina, Australia, Austria, Belgium, Bermuda (only BDTC passports), Brazil, Brunei, Canada, Chile, Costa Rica, Croatia, Cyprus, Czech Republic, Ecuador, El Salvador, Estonia, Finland, France, Germany, Greece, Guatemala, Honduras, Hungary, Iceland, India (only diplomatic and service passports), Ireland, Israel, Italy, Jamaica, Japan, Rep. of Korea, Liechtenstein, Lithuania, Luxembourg, Malaysia, Malta, Mexico, Monaco, Netherlands, New Zealand, Nicaragua, Norway, Pakistan (only diplomatic and service passports), Panama, Paraguay, Philippines (only diplomatic and service passports), Poland, San Marino, Singapore, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey (only diplomatic and service passports), USA, Uruguay, the Vatican State and Venezuela;

**GREENLAND
NATIONAL REGULATIONS AND REQUIREMENTS**

- b. holders of a valid British “Common Format Passport”, defining the passport holder as “British Citizen”;
- c. holders of “look alike” British passports who have not stayed outside the United Kingdom for a period of 2 years and who also have one of the following passport endorsements:
 - “holder has the right of re-admission”;
 - “holder is entitled to re-admission to the United Kingdom”;
 - “holder has the right of abode in the United Kingdom”;
- d. holders of valid British passports from the Channel Islands and Isle of Man defining the holder as “British Citizen”;
- e. holders of valid “British Dependent Territories Citizens” (BDTC) passport, issued to persons with the right to reside in Gibraltar, who also have page 5 of the passport endorsed “Holder is defined as a United Kingdom national for Community purposes”;
- f. holders of a valid refugee identity document issued by Belgium, Cyprus, Denmark, Finland, Germany, Iceland, Ireland, Italy, Liechtenstein, Luxembourg, Malta, Netherlands, Norway, Portugal, Spain, Switzerland, Sweden or the United Kingdom provided the holder is lawfully residing in the State that issued the document;
- g. holders of valid Danish, Finnish, Icelandic, Latvian, Norwegian or Swedish alien resident permits being valid for re-admission to the country having issued the document;
- h. holders of travel documents listed under PASSPORT items h) to n);
- i. holders of a valid residence permit in Greenland.

Airport transit visas are required for citizens of the following countries who are transiting a Greenland airport, with or without change of aircraft: Afghanistan, Bangladesh, Democratic Republic of Congo, Eritrea, Ethiopia, Ghana, Iran, Iraq, Nigeria, Pakistan, Somalia and Sri Lanka.

NOTE: Additional requirements may exist. Please contact the appropriate authority to confirm information.

AIRCRAFT ENTRY REQUIREMENTS

GENERAL

No prior permission is required for overflights and non-commercial landings of aircraft registered in States which are signatories to the Chicago Convention. Applications for permission of such flights of aircraft registered in States which are not signatories to the Chicago Convention and with which Greenland has not concluded a special agreement, shall be submitted to the:

Danish Transport, Construction and Housing Authority (TBST)

Address: Carsten Niebuhrs Gade 43
Copenhagen V
Denmark
DK-1577

**GREENLAND
NATIONAL REGULATIONS AND REQUIREMENTS**

Tel: +45 72 21 8800
Fax: +45 72 62 6790
E-Mail: info@tbst.dk

Application shall reach the Danish Transport, Construction and Housing Authority (TBST) not later than 5 days in advance, not including Saturdays, Sundays and Danish legal holidays and shall include the following information:

- a. operator's name, address, telephone/telefax numbers;
- b. aircraft type, nationality and registration marks;
- c. intended route and destination of flight and time and place of passage of the Nuuk FIR boundaries;
- d. date and estimated time of arrival at or departure from the aerodromes concerned (in case of landing).

SCHEDULED FLIGHTS

Application from non-Community air carriers for permission to initiate regular flights shall be submitted to the Danish Transport, Construction and Housing Authority (TBST) or, when prescribed in an agreement, to the Danish Ministry of Foreign Affairs.

Ministry of Foreign Affairs

Address: Asiatic Plads 2
Copenhagen K
Denmark
1402

Tel: +45 33 92 0000
Fax: +45 31 54 0533
E-Mail: um@um.dk

Application for the approval of time-tables shall be submitted to the Danish Transport, Construction and Housing Authority (TBST) (see GENERAL) not later than 30 days before the effective date of the time-table. The application shall contain information on number of weekly frequencies, destinations, times of operation, aircraft type and aircraft capacity, flight numbers and operator.

Furthermore the application shall contain the following information:

- a. operator's name, address, telephone/telefax numbers;
- b. aircraft type and registration marks;
- c. insurance;
- d. nature of the flight;
- e. date and time table number;
- f. name(s), of the charterer/charterers;

**GREENLAND
NATIONAL REGULATIONS AND REQUIREMENTS**

- g. wet-lease;
- h. code-share.

EU carriers shall submit notification of their time-tables not later than 15 days before the effective date of the time-table and shall contain same information as shown for application above.

NON-SCHEDULED FLIGHTS

Non-scheduled commercial air traffic (charter flights) is subject to prior permission unless exempted by European Union (EU) regulations.

Operators not exempt shall submit applications to the Danish Transport, Construction and Housing Authority (TBST) (see GENERAL) according to the following lead times (Saturdays, Sundays and Danish holidays not included):

- up to 4 flights within 2 months: 48 hours in advance;
- more than 4 flights within 2 months: 30 days in advance.

Applications shall include the following items in the order shown:

- a. operator's name, address, telephone/telefax numbers;
- b. aircraft type and registration marks;
- c. insurance;
- d. name(s), address(s) and telephone/telefax number(s) of charterer(s);
- e. date and flight plan number;
- f. charter category;
- g. wet-lease.

Operators exempt from permission shall submit only a notification to the Danish Transport, Construction and Housing Authority (TBST) according to the above provisions except that items d) and f) may be omitted from the notification.

PRIVATE FLIGHTS

Private flight of aircraft registered in States which are signatories to the Chicago Convention are allowed without prior permission. Private flights of aircraft registered in States that are not parties to the Chicago Convention or non-Danish registered aircraft operated by a Greenland resident are subject to prior permission. Applications shall be submitted through diplomatic channels so as to reach the Danish Transport, Construction and Housing Authority (TBST) not later than 5 days in advance, not including Saturdays, Sundays and Danish legal holidays. The application shall include the following information:

- a. type, nationality and registration marks of aircraft;
- b. name, nationality and address of the owner and the pilot-in-command;
- c. intended route and destination of the flight as well as date, time and place of passage of the Nuuk FIR boundaries;

**GREENLAND
NATIONAL REGULATIONS AND REQUIREMENTS**

- d. number of persons on board.

STATE OR MILITARY AIRCRAFT FLIGHTS

If exemption has not been granted by special agreement, application has to be submitted through diplomatic channels to the

Tactical Air Command Denmark

Address: Karup Airport
Airport Office
N.O. Hansensvej 4
Karup J.
Denmark
7470

Tel: +45 97 10 0610

Fax: +45 97 10 0665

and the Danish Transport, Construction and Housing Authority (TBST) (see GENERAL), respectively. The application shall have been received not later than 5 days before the estimated time for passage of the FIR boundaries. Saturdays, Sundays and Danish legal holidays shall not be included in this time-limit. For application details see chapter PRIVATE FLIGHTS above.

AIRPORT(S) OF ENTRY

Aircraft flying to or departing from Greenland shall make their first landing at, or final departure from an international airport.

Aasiaat, Ilulissat, Kangerlussuaq, Kulusuk, Maniitsoq, Narsarsuaq, Nerlerit Inaat, Nuuk, Paamiut, Qaanaaq, Sisimiut, Upernavik, Uummannaq (Qaarsut). Additionally, all other public airports and heliports are approved for traffic to/from Schengen States only.

SPECIAL EQUIPMENT TO BE CARRIED

TYPES OF FLIGHT

- a. Transiting Flights:
- flights transiting Nuuk FIR, whereby Greenlandic territory is overflown;
 - flights to and from Greenland, whereby a maximum of 2 landings are made.
- b. Internal Flights:
- flights conducted within Greenlandic area, except such flights to and from Greenland, whereby a maximum of 2 landings are made.

**GREENLAND
NATIONAL REGULATIONS AND REQUIREMENTS**

EQUIPMENT TO BE CARRIED ON ALL INTERNAL AND CERTAIN TRANSITING FLIGHTS

On all internal flights and on transiting flights with single-engined and those multi-engined aircraft not capable to maintain the prescribed minimum safe altitude in the event of engine failure the following emergency equipment shall be carried:

a. Signaling Equipment:

1. an emergency locator transmitter;
2. two signal flares of the day and night type;
3. eight red signal cartridges and a means of firing them;
4. a signal sheet (minimum 1x1m) in a reflecting colour;
5. a signal mirror;
6. an electric hand torch.

b. Survival Equipment:

1. a compass;
2. a knife;
3. a sleeping bag with waterproof inner lining or a rescue blanket (Astron) per person;
4. four boxes of matches in waterproof containers;
5. a ball of string;
6. a cooking stove with fuel and accompanying mess tins.

During winter conditions and when flying over the icecap the following shall additionally be carried:

1. a snow saw or snow shovel;
2. candles with a burning time about 2 hours per person. The minimum shall be not less than candles giving a burning time of 40 hours;
3. tent(s) for all on board. If dinghies are carried, the tent(s) need not to be carried.

c. Emergency Provisions:

Emergency rations equivalent to 2000 calories per person. The rations can consist of e.g.: Vacuum dried soup, coffee powder, sugar, chocolate, dried fruit, pemmican, or the like.

It is recommended that life vests be carried for everyone on board and that roofed dinghies sufficient to accommodate everyone on board be carried.

EMERGENCY LOCATOR TRANSMITTER (ELT)

One emergency locator transmitter (ELT) able to function on its own power continuously outside the aircraft at least 48 hours and to transmit simultaneously on the frequencies 121.5MHz and 406.0MHz shall be carried.

ICELAND
NATIONAL REGULATIONS AND REQUIREMENTS

PASSPORT

Required, except when arriving directly from countries within the Schengen area.

VISA

Required, except:

- the holder of a residence permit of the Schengen States.
- citizens of Denmark, Finland, Iceland, Sweden and Norway and other States as determined by the Minister of the Interior.

NOTE: Additional requirements may exist. Please contact the appropriate authority to confirm information.

Address: Armula 2
 Reykjavik
 Iceland
 108

Tel: +354 480 6000

Fax: +354 480 6003

E-Mail: fly@icetra.is

Internet: <http://www.icetra.is>

SCHEDULED FLIGHTS

Air Carrier from non-EU Member State and Air Carrier from EU Member State without a valid Operating Licence according to Regulation (EC) No. 1008/2008

Scheduled operations require permission (concession) by the Icelandic Transport Authority or that the operation of scheduled services is permitted by agreement between Iceland and the appropriate foreign State. However, air carrier has to obtain the prior authorizations and permissions and comply with the conditions pursuant to the applicable concession or agreement. Furthermore, the air carrier has to comply with the appropriate regulations and decisions issued by the Minister of the Interior and the Icelandic Transport Authority and give such information as is deemed necessary for traffic purposes.

NON-SCHEDULED FLIGHTS

Civil aircraft, registered in a State signatory to the Chicago Convention outside the European Economic Area, intending to make traffic stops in Iceland for commercial purposes requires special permission. Application for permission shall be addressed 10 working days before the flight, and in case of a single flight 3 working days to the Icelandic Transport Authority.

ICELAND NATIONAL REGULATIONS AND REQUIREMENTS

Where exemption from this requirement is provided for in a bilateral or multilateral agreement, notification of the flight should be sent to Icelandic Transport Authority at least 3 working days before the flight in case of a single flight, but 10 working days before departure of first flight if more than one flight is scheduled.

Civil aircraft, registered in a State not party to the Chicago Convention, may not without special permission fly into Icelandic territorial airspace and make traffic stops for commercial purposes.

Application for such permission shall be made to Icelandic Transport Authority no less than 48 hours before estimated time of entering Icelandic territorial airspace in case of a single flight, but 15 working days before the flight if more than one flight scheduled (Saturdays, Sundays and Icelandic holidays are not included in this time limit). The application shall contain the following information:

- a. name and address of the operator;
- b. nationality, registration marks and type of aircraft;
- c. routing and destination with indication of the position and time of passing border into Icelandic territorial airspace;
- d. date and estimated time of arrival at and departure from Icelandic airports;
- e. radio equipment and frequencies;
- f. the purpose of the flight, number of passengers and nature, and volume of cargo;
- g. declaration of insurance for third party liability. In case of aircraft with limited and restricted certificate of airworthiness a declaration of insurance for search and rescue should be submitted.

In order to protect essential air transport interests Iceland may restrict the possibility to perform flights which otherwise meet the conditions.

DOMESTIC AIR TRANSPORT

The carrying out of domestic air transport by non Icelandic air carrier (cabotage) is prohibited unless prior permission has been granted by Icelandic Transport Authority or is permitted either by Council Regulation No. 1008/2008 or by agreement between Iceland and the appropriate foreign state.

FLIGHTS INTO, OR IN TRANSIT NON-STOP ACROSS ICELANDIC TERRITORY AND/OR STOPS FOR NON-TRAFFIC PURPOSES

The right to fly into or in transit non-stop across Icelandic territory and/or make stops for non-traffic purposes without the need to obtain prior permission is granted:

- a. for non-scheduled flights by aircraft registered in a foreign State which is party to the Chicago Convention;
- b. for scheduled air services if these rights are granted according to multilateral or bilateral agreements.

ICELAND
NATIONAL REGULATIONS AND REQUIREMENTS

Notification of the flight shall be made to the Icelandic Transport Authority at least 48 hours before estimated time of entering Icelandic territorial airspace.

Applications, from operators in States not signatory to the Chicago Convention, for permission to operate scheduled flights for commercial purposes in Icelandic territory should be submitted to the Icelandic Transport Authority not less than 30 days prior to the first flight and contain the same information as for NON-SCHEDULED flights.

PRIVATE FLIGHTS

No prior permission is required for private flights operated into, in transit over from Icelandic territory with aircraft registered in States which are parties to the Chicago Convention.

The information contained in the flight plan is accepted as adequate advance notification of the arrival of incoming aircraft and must be transmitted so that it will be received by the public authorities concerned at least 2 hours in advance of arrival, the landing must be carried out at a previously designated international aerodrome.

Prior permission is required for private flights operated in Icelandic territorial airspace with aircraft registered in States not party of the Chicago Convention. Applications should be submitted to the Icelandic Transport Authority not later than 48 hours prior to the estimated time of departure (Saturdays, Sundays and Icelandic holidays shall not be included in this time limit) and contain the same information as for NON-SCHEDULED flights.

SCHEDULE AND AIRPORT COORDINATION**AKUREYRI**

Akureyri is designated as a scheduled facilitated airport (Level 2). A slot request must be sent in standard SSIM format to:

Airport Coordination Denmark

Address: Vilhelm Lauritzens Alle 1
Kastrup
Denmark
2770

Tel: +45 53 787 757
+45 53 787 747

Emergency

Emergency

Emergency Procedures - Canada

CA 1
RESPONSIBLE AUTHORITY

SECTION 1

1.1 GENERAL

SAR service in Canada was established in accordance with the provisions of ICAO Annex 12. The Canadian Forces are responsible for conducting SAR operations for aeronautical incidents in Canada.

Aeronautical SAR service is provided through three joint rescue coordination centers (JRCC), located at Victoria, B.C., Trenton, Ont., and Halifax, N.S. The JRCCs control all rescue units in their region through an extensive civil/military communications network. The addresses of the JRCCs are:

VICTORIA

(serving British Columbia and the Yukon)

Joint Rescue Coordination Centre Victoria

Address: P.O. Box 17000 Station Forces
Victoria BC V9A 7N2

Tel: 1-800-567-5111 (toll-free within region)
250-413-8933
#SAR or #727 (toll-free cellular)

TRENTON

(serving Alberta, Manitoba, Northwest Territories, western Nunavut, Ontario, western Quebec, Saskatchewan)

Joint Rescue Coordination Centre Trenton

Address: P.O. Box 1000 Station Forces
Astra ON K0K 3W1

Tel: 1-800-267-7270 (within Canada)
613-965-3870

HALIFAX

(serving New Brunswick, Newfoundland and Labrador, Nova Scotia, eastern Nunavut, Prince Edward Island, eastern Quebec)

Joint Rescue Coordination Centre Halifax

Address: P.O. Box 99000 Station Forces
Halifax NS B3K 5X5

Tel: 1-800-565-1582 (within region)
(902) 427-8200

NOTE: All JRCCs will accept collect telephone calls dealing with missing or overdue air or marine craft.

CA 1 RESPONSIBLE AUTHORITY

1.2 TYPES OF SERVICE AVAILABLE

Aeronautical SAR service is available continuously throughout Canada and the Canadian territorial coastal water areas of the Atlantic, Pacific and Arctic oceans. Canadian Forces SAR units are equipped with helicopters and fixed-wing aircraft to conduct searches and provide rescue services, including rescue specialists (search and rescue technicians) who are capable of parachuting into remote locations. These rescue personnel can render initial medical aid and provide emergency supplies and survival support. The Civil Air Search and Rescue Association (CASARA), a nationwide volunteer organization, assists the Canadian Forces with aeronautical SAR cases.

Workload permitting, JRCC personnel are prepared to present briefings on SAR services and techniques to the public and aviation groups on request. Visits to JRCCs are encouraged, as long as prior notice is provided.

Other major SAR providers in Canada include:

- a. The Canadian Coast Guard, which has primary responsibility for marine incidents along Canada's ocean coasts, in all waterways in the Arctic, and in the waters of the Great Lakes St. Lawrence Seaway System;
- b. Provincial and territorial governments, which, through their police service, respond to SAR incidents involving persons on land, or on inland waterways;
- c. Parks Canada's warden service, which is responsible for ground or inland water SAR within National Parks;
- d. Trained volunteers across Canada who also play a key role in providing SAR services to the public.

As mutual aid is one of the strengths of Canada's SAR system, the JRCCs may call upon any of these other providers, as well as the private sector, to assist with an aeronautical SAR case.

1.3 SAR AGREEMENTS

Two bilateral agreements relating to aeronautical SAR exist between Canada and the United States. The first permits public aircraft of either country that are engaged in aeronautical SAR operations to enter or leave the other country without being subject to normal immigration or customs formalities. The second agreement permits vessels and wrecking appliances of either country to render aid and assistance on specified border waters and on the shores and in the waters of the other country along the Atlantic and Pacific Coasts within a distance of 30 NM from the international boundary on those coasts.

In situations not covered by the agreements above, requests from the United States for aircraft of their own registry to participate in a SAR operation within Canada may be addressed to the nearest JRCC. The JRCC would reply and issue appropriate instructions.

CA 1
RESPONSIBLE AUTHORITY

Figure 1.1 — Search and Rescue Regions (SRR)

CA 2
FLIGHT PLANNING

SECTION 2

2.1 GENERAL

In addition to signals from ELTs, the flight plan and flight itinerary are the primary sources of information for SAR operations. Therefore, proper flight planning procedures must be followed and the filed routes adhered to in order to ensure early detection and rescue.

In Canada, the area covered in a visual search will typically extend to a maximum of 15 NM on either side of the flight-planned route, starting from the aircraft's last known position and extending to its destination. In mountainous regions, search areas will be defined to best suit the terrain and the planned route of flight. It is therefore critical to the safety of pilots that they maintain their route as planned, and advise ATS of any en route change or deviation as soon as practicable.

Refer to ATC Section 3 for details relating to filing and closing various plans, notifications or itineraries.

2.2 REQUEST FOR SEARCH AND RESCUE ASSISTANCE

As soon as information is received that an aircraft is overdue, operators or owners should immediately alert the nearest JRCC or any ATS unit, giving all known details. The alerting call should not be delayed until after a small scale private search. Such a delay could deprive those in need of urgent assistance at a time when it is most needed.

2.3 MISSING AIRCRAFT NOTICE (MANOT)

When an aircraft is reported missing, the appropriate JRCC will issue a MANOT to the ATS units that are providing services in or near the search area. MANOTs will be communicated to pilots planning to overfly the search area by notices posted on flight information boards, orally during the filing of flight plans, or by radio communication.

Pilots receiving MANOTs are requested to maintain a thorough visual lookout and, insofar as it is practicable, a radio watch on 121.5 MHz when operating in the vicinity of the track the missing aircraft had planned to follow.

Once a MANOT has been issued, a major search effort will be initiated. Such an operation will be published in a NOTAM, and will involve a large number of military and civilian aircraft flying in a relatively confined area. Aircraft that are not participating in the search will be requested to keep a sharp lookout for other traffic, report any probable crash sightings to the closest FIC or JRCC and remain clear of active search areas if possible.

INITIAL MANOT MESSAGE			
Required Information		Example	
A.	MANOT number – SAR Operation Type of MANOT – JRCC Responsible	A.	MANOT six SAR-FSOX Initial-JRCC Victoria
B.	Type of Aircraft – Registration – Color	B.	Cessna 180 C-FSOX Red with white wings and black lettering

**CA 2
FLIGHT PLANNING**

INITIAL MANOT MESSAGE			
Required Information		Example	
C.	Number of Crew and/or Passengers	C.	Pilot, plus 3
D.	Route	D.	Fort St. John to Abbotsford
E.	Departure Date/Time (local)	E.	1 May - 1000 PST
F.	LKP (last known position) Date/Time (local)	F.	Prince George 1 May - 1131 PST
G.	Fuel Exhaust Time	G.	Fuel exhaust time 1 May - 1500 PST
H.	Frequency of ELT	H.	121.5 MHz and 243.0 MHz

On termination of the search, another MANOT will be issued and designated as final.

2.4 AIDING PERSONS IN DISTRESS

When a pilot observes an aircraft, ship or vessel in distress, he shall, if possible:

- a. keep the craft in sight until presence is no longer necessary;
- b. report the following information to the JRCC or ATS unit:
 - time of observation,
 - position of craft,
 - general description of scene, and
 - apparent physical condition of survivor(s).

NOTE: See para. 4.9 “Canada Shipping Act Extract” concerning the obligations of an aircraft to render assistance to ships or vessels in distress.

Pilots should be familiar with the distress signal that may be used by small boats. It consists of a rectangular, fluorescent orange-red cloth panel on which a black square and disc are displayed.

CA 2
FLIGHT PLANNING

PROCEDURES FOR SIGNALING VESSELS

PROCEDURES PERFORMED IN SEQUENCE BY AN AIRCRAFT

SIGNIFICANCE

 1. CIRCLE the vessel at least once.	 2. CROSS the vessel's projected course close AHEAD at low altitude while ROCKING the wings. (See Note)	 3. HEAD in the direction in which the vessel is to be directed.	The aircraft is directing a vessel towards an aircraft or vessel in distress. (Repetition of such signals shall have the same meaning.)
4. CROSS the vessel's wake close ASTERN at low altitude while ROCKING the wings. (See Note)			The assistance of the vessel in no longer required. (Repetition of such signals shall have the same meaning.)

NOTE: Opening and closing the throttle or changing the propeller pitch may also be practiced as an alternative means of attracting attention to that of rocking the wings. However, this form of sound signal may be less effective than the visual signal of rocking the wings owing to high noise level on board the vessel.

CA 3 EMERGENCY LOCATOR TRANSMITTER (ELT)

SECTION 3

3.1 GENERAL

ELTs are required for most general aviation aircraft (see CAR 605.38). They operate on a primary frequency of 121.5 MHz, 243 MHz, or 406 MHz, and help search crews locate downed aircraft and rescue survivors.

Pilots are strongly encouraged to switch from old analog 121.5 MHz ELTs to the newer 406 MHz digital ELTs since position information from a 406 MHz ELT is calculated and relayed to the appropriate JRCC for action. The 406 MHz beacon is associated with a unique user; therefore, identification is rapid and resolution of a false alarm may only require a few phone calls. In addition, activation of a 406 MHz ELT is detected by satellites, whereas, a 121.5 MHz signal relies on the aircraft being within the range of an ATS facility or on another aircraft passing by at high altitude. SAR response could be delayed for several hours when a 121.5 MHz ELT is activated. Survivability decreases with time and, on numerous occasions, lives have been saved as a result of the early detection possible with a 406 MHz beacon. The 121.5 MHz signal common to all ELTs also produces a distinctive siren-like tone that can be heard on a radio receiver tuned to this frequency. This signal helps incoming SAR responders pinpoint an aircraft's position. During routine operations, hearing a 121.5 MHz signal also alerts pilots to the inadvertent activation of their ELT. Therefore, pilots should briefly monitor the frequency after each flight to ensure their ELT is not emitting a signal.

Properly maintained ELTs with serviceable batteries should provide continuous operation for a minimum of 24 hr at a wide range of temperatures. Batteries that remain in service beyond their recommended life may not provide sufficient power to produce a usable signal. ELTs that contain outdated batteries are not considered to be serviceable.

All ELTs currently operating on 406 MHz can be detected by COSPAS-SARSAT satellites. It is vital to note that as of February 1, 2009, COSPAS-SARSAT satellites will only detect 406 MHz ELT signals. A 406 MHz ELT is now required to ensure that the COSPAS-SARSAT system is automatically notified in the event of an aircraft crash. However, 121.5 MHz signals are still used for short-range location during SAR operations.

3.2 TYPES OF ELT

There are five types of ELT:

TYPE A or AD — *Automatic Ejectable or Automatic Deployable* — This type automatically ejects from the aircraft and is set in operation by inertia sensors when the aircraft is subjected to a crash deceleration force acting through the aircraft's flight axis. This type is expensive and is seldom used in general aviation.

TYPE F or AF — *Fixed (not ejectable) or Automatic Fixed* — This type is automatically set in operation by an inertia switch when the aircraft is subjected to crash deceleration forces acting in the aircraft's flight axis. The transmitter can be manually activated or deactivated and in some cases may be remotely controlled from the cockpit. Provision may also be made for recharging the batteries from the aircraft's electrical supply. An additional antenna may be provided for portable use of the ELT. Most general aviation aircraft use this ELT type, which must

CA 3

EMERGENCY LOCATOR TRANSMITTER (ELT)

have the function switch placed to the “ARM” position for the unit to function automatically in a crash.

TYPE AP — *Automatic Portable* — This type is similar to type F or AF except that the antenna is integral to the unit for portable operation.

TYPE P — *Personnel* — This type has no fixed mounting and does not transmit automatically. A manual switch is used to start or stop the transmitter.

TYPE W or S — *Water-activated or Survival* — This type transmits automatically when immersed in water. It is waterproof, floats and operates on the surface of the water. It has no fixed mounting. It should be tethered to survivors or life rafts.

3.3 INSTALLATION AND MAINTENANCE REQUIREMENTS

Installation of an ELT, as required by CAR 605.38, must comply with Chapter 551 of the *Airworthiness Manual*.

For maintenance, inspection, and test procedures, refer to CAR 605 and CAR 571.

3.4 ELT OPERATING INSTRUCTIONS (NORMAL USE)

Preflight

(Where practicable):

- inspect the ELT to ensure that it is secure, free of external corrosion, and that antenna connections are secure;
- ensure that the ELT function switch is in the “ARM” position;
- ensure that ELT batteries have not reached their expiry date; and
- listen on 121.5 MHz to ensure the ELT is not transmitting.

Inflight

Monitor 121.5 MHz when practicable. If an ELT signal is heard, notify the nearest ATS unit of:

- position, altitude and time when signal was first heard;
- ELT signal strength;
- position, altitude and time when contact was lost; and
- whether ELT signal ceased suddenly or faded.

Pilots should not attempt a SAR operation. If unable to contact anyone, pilots should continue attempts to gain radio contact with an ATS unit, or land at the nearest suitable aerodrome where a telephone is located.

NOTE: If signal remains constant, it may be your ELT.

Postflight

Listen to 121.5 MHz. If an ELT is detected, and your ELT has not been switched to “OFF”, deactivate it. For those ELT models that do not have an “OFF” switch, disconnect and re-set the unit as

CA 3 EMERGENCY LOCATOR TRANSMITTER (ELT)

per the manufacturer's instructions. Notify the nearest ATS unit or JRCC of the time the signal was first heard, the actions you have taken and whether the signal has ceased or is on-going. If you still hear an ELT on 121.5 MHz after you have deactivated your ELT, it may not be yours. Notify the nearest ATS unit or JRCC.

3.5 ELT OPERATING INSTRUCTIONS (EMERGENCY USE)

The ELTs in general aviation aircraft contain a crash activation sensor, or G-switch, which is designed to detect the deceleration characteristics of a crash and automatically activate the transmitter. However, it is always safest to place the ELT function switch to "ON" as soon as possible after the crash, if practicable.

Geostationary satellites will detect an unobstructed 406 MHz ELT within minutes of activation; there are no satellite-based means of detecting a 121.5 MHz signal. In addition to geostationary satellites, polar orbiting low altitude satellites continually overfly Canada and will also detect a 406 MHz beacon within 90 min of activation, producing a position report.

Some military and commercial aircraft also monitor 121.5 MHz or 243 MHz and will notify ATS or SAR agencies of any ELT transmissions they hear.

In case of emergency, do not delay ELT activation until flight-planned times expire, as such delays will only delay rescue. Do not cycle the ELT through "OFF" and "ON" positions to preserve battery life, as irregular operation reduces localization accuracy and will hamper homing efforts. Once your ELT has been switched to "ON", *do not switch it "OFF"* until you have been positively located and directed to turn it off by the SAR forces.

If you have landed to wait out bad weather, or for some other non-emergency reason, and no emergency exists, do not activate your ELT. However, your aircraft will be reported overdue, and a search will begin if the delay will extend beyond:

- a. 1 hr past the ETA filed on a flight plan; or
- b. the SAR time specified, 24 hr after the duration of the flight, or the ETA specified on a flight itinerary.

To avoid an unnecessary search, notify the nearest ATS unit of your changed flight plan or itinerary. If you cannot contact an ATS unit, attempt to contact another aircraft on one of the following frequencies in order to have that aircraft relay the information to ATS:

- a. 126.7 MHz;
- b. local VFR common frequency;
- c. local ACC IFR frequency listed on Enroute charts;
- d. 121.5 MHz; or
- e. HF 5680 kHz, if so equipped.

If you cannot contact anyone, a search will begin at the times mentioned above. At the appropriate time, switch your ELT to "ON", and leave it on until search crews locate you. Once located, use your aircraft radio on 121.5 MHz (turn the ELT off if there is interference) to advise the SAR crew of your condition and intentions.

CA 3 EMERGENCY LOCATOR TRANSMITTER (ELT)

ELTs and COSPAS-SARSAT work together to speed rescue. The ELT “calls for help”; COSPAS-SARSAT hears that call, and promptly notifies SAR authorities, who then dispatch help.

NOTE: Delays in activating your ELT will delay your rescue.

3.6 MAXIMIZING THE SIGNAL

If the ELT is a portable model with its own auxiliary antenna, and can be safely removed from the aircraft, it should be placed as high as possible on a level surface to reduce obstructions between it and the horizon. Raising an ELT from ground level to 2.44 m (8 ft) may increase the range by 20 to 40 percent. The antenna should be vertical to ensure optimum radiation of the signal. Placing the transmitter on a piece of metal, or even the wing of the aircraft, if it is level, will provide the reflectivity to extend transmission range. Holding the transmitter close to the body in cold weather will not significantly increase battery power output. As the body will absorb most of the signal energy, such action could reduce the effective range of the transmission.

If the ELT is permanently mounted in the aircraft, ensure that it has not been damaged and is still connected to the antenna. If it is safe to do so (i.e. no spilled fuel or fuel vapors), confirm the ELT's operation by selecting 121.5 MHz on the aircraft radio and listening for the audible siren-like tone.

Reminder: The search will be conducted to locate the aircraft. If the aircraft lands in an uninhabited area, stay with the aircraft and the ELT. The aircraft is easier to see than people are. If possible, have smoke, flares or signal fires ready to attract the attention of search crews who are homing to the ELT. Smoke, flares and signal fires should be sited with due regard for any spilled fuel resulting from the crash.

3.7 ACCIDENTAL ELT TRANSMISSIONS

To forestall unnecessary SAR (UNSAR) missions, all accidental ELT activations should be reported to the nearest ATS unit, or the nearest JRCC, giving the location of the transmitter, and the time and duration of the accidental transmission. ELT alarms trigger considerable activity within ATS and SAR units. Although some accidental ELT transmissions can be resolved without launching SAR or Civil Air Search and Rescue Association (CASARA) aircraft, such as a properly-registered 406 MHz beacon, the JRCCs will adopt the safe course. Promptly notifying ATS or a JRCC of an accidental ELT transmission may prevent the unnecessary launch of a search aircraft.

If they are promptly reported, there is no charge or penalty associated with the accidental triggering of an ELT.

3.8 TESTING PROCEDURES

When originally installed in an aircraft, and when parts of the ELT system are moved or changed, an ELT will be tested in accordance with the CAR 571. Every few months, or as recommended by the manufacturer, pilots should test their ELT. Testing procedures for ELTs will vary depending upon the type.

406 MHz ELTs

CA 3 EMERGENCY LOCATOR TRANSMITTER (ELT)

Since the digital signals from 406 MHz ELTs are detected almost immediately by COSPAS-SARSAT satellites, the transmitters should never be activated in their operational mode except in an emergency.

406 MHz ELTs should only be tested in accordance with the manufacturer's instructions. Most 406 MHz ELTs are equipped with an integral self-test function. The manufacturer's instructions describe how to carry out this self-test and interpret its results. The instructions should be followed closely to avoid false alerts. Activation of the self-test will transmit a 406-MHz, digitally-altered test signal to the Canadian Beacon Registry. If the ELT is appropriately registered, the test signal will cause an e-mail to be sent to the address on file. This will confirm both a successful self-test as well as the status of the registration. The self-test function may also transmit a 121.5 MHz test signal. In this case, ensure that the test is conducted at the top of the hour (UTC) within the first five minutes.

121.5/243 MHz ELTs

Any testing of an ELT that operates only on 121.5 MHz or 243 MHz must only be conducted during the first 5 min of any UTC hour, and restricted in duration to not more than 5 s.

Such tests can be done between two stations separated by at least half a kilometer, or by a single aircraft, using its own radio receiver.

a. Two-station 121.5/243 MHz ELT test:

1. position the aircraft about one-half kilometer from the tower, FSS or other aircraft that will monitor 121.5 MHz. Ensure the listening station is clearly visible from the aircraft, as ELT transmissions are line-of-sight. Intervening obstacles, such as hills, buildings, or other aircraft, may prevent the listening station from detecting the ELT transmission.
2. using the aircraft radio or other pre-arranged signals, establish contact with the listening station. When the listening station confirms that it is ready, switch the 121.5/243 MHz ELT function to "ON". After no more than 5 s, turn the ELT function switch to "OFF". The listening station should confirm that the ELT was heard.
3. reset the ELT function switch to "ARM".
4. tune the aircraft radios to 121.5 MHz to confirm that the ELT stopped transmitting.
5. if the listening station did not hear the ELT, investigate further before flying the aircraft.

When conducting the two-station test at a busy airport, take due regard of tower or FSS workload. Keep the voice radio transmissions to a minimum. If the "listening" station does not hear the ELT transmission, it may be necessary to move the aircraft to another location on the airfield to conduct the test.

It will often be impractical to coordinate a 121.5/243 MHz ELT test with a tower, FSS, or other aircraft. In such circumstances, pilots can use the following procedures to test their ELTs. Such tests are to be conducted in the first 5 min of any UTC hour, and test transmissions must be limited to 5 s or less.

b. Single-station ELT test:

1. tune the aircraft radio receiver to 121.5 MHz.

CA 3 EMERGENCY LOCATOR TRANSMITTER (ELT)

2. switch on the ELT just long enough to hear the tone, and immediately return the function switch to “ARM”.

NOTE:

1. *It is best to have another person in the cockpit to ensure the minimum “on-air” test period.*
2. *Do not exceed the 5 s “on-air” time.*

3. recheck 121.5 MHz on the aircraft receiver to ensure that the ELT stopped transmitting.

When conducting a single aircraft test, it is possible that the aircraft radios will hear the ELT output, even though the ELT power transistor is defective, and will not be detected by a receiver half a kilometer away. However, this test will uncover a totally unserviceable ELT, and is better than no test.

NOTE: While all 406 MHz ELTs also transmit a 121.5 MHz homing signal, testing of 406 MHz ELTs must follow the manufacturer’s instructions provided with the unit.

3.9 SCHEDULE OF REQUIREMENTS

The following schedule outlines the requirement to carry an ELT. Gliders, balloons, airships, ultra-light airplanes and gyroplanes are exempt, as are aircraft operated by the holder of a flight training unit (FTU) operating certificate that are engaged in flight training and operated within 25 NM of the departure airport. Additional exemptions are contained in CAR 605.38.

Column I	Column II	Column III
Aircraft	Area of Operation	Minimum Equipment
1. All Aircraft except those exempted.	Over land	One ELT of type AD, AF, AP, A, or F.
2. Large multi-engine turbojet airplanes engaged in an air transport service carrying passengers.	Over water at a distance from land that requires the carriage of life raft pursuant to CAR 602.63.	Two ELTs of type W or S, or one of each.
3. All aircraft that require an ELT other than those set out in item 2.	Over water at a distance from land that requires the carriage of life raft pursuant to CAR 602.63.	One ELT of type W or S.

If an ELT becomes unserviceable, the aircraft may be operated according to the operator’s approved Minimum Equipment List (MEL). Where no MEL has been approved, the aircraft may be operated for up to 30 days, provided:

- a. the ELT is removed at the first airport at which repairs or removal can be accomplished;
- b. the ELT is promptly sent to a maintenance facility;

CA 3

EMERGENCY LOCATOR TRANSMITTER (ELT)

- c. and a placard is displayed in the cockpit stating that the ELT has been removed, and the date of removal (see CAR 605.39).

Despite these exemptions, all pilots are reminded of the rugged, inhospitable terrain that covers much of Canada.

CAUTION: Although some flights without ELTs may be legal, they are not advisable.

ELTs are designed to speed rescue to survivable crashes, and they should function automatically. However, if you are aware of their capabilities and limitations, you can improve the performance of your ELT, and thus assist SAR.

CA 4
AIRCRAFT EMERGENCY ASSISTANCE

SECTION 4

4.1 DECLARING AN EMERGENCY

An emergency condition is classified in accordance with the degree of danger or hazard being experienced, as follows:

- *Distress* — A condition of being threatened by serious and/or imminent danger and requiring immediate assistance.
- *Urgency* — A condition concerning the safety of an aircraft or other vehicle, or of some person on board or within sight, which does not require immediate assistance.

The radiotelephone distress signal MAYDAY and the radiotelephone urgency signal PAN PAN must be used at the commencement of the first distress and urgency communication, respectively, and, if considered necessary, at the commencement of any subsequent communication.

4.2 ACTION BY THE PILOT DURING EMERGENCY CONDITIONS

Pilots should:

- a. precede the distress or urgency message by the appropriate radiotelephone distress signal, preferably spoken 3 times;
- b. transmit on the air/ground frequency in use at the time;
- c. include in the distress or urgency message as many as possible of the following elements:
 1. name of the station addressed (time and circumstances permitting);
 2. the identification of the aircraft;
 3. the nature of the distress or urgency condition;
 4. intention of the person in command;
 5. present position, altitude or flight level, and heading.

NOTE:

- a. *The above procedures do not preclude the possibility of the following courses of action:*
 - *the pilot making use of any available frequency, or of broadcasting the message;*
 - *the pilot using any means at his/her disposal to attract attention and make known his/her conditions;*
 - *any person taking any means at his/her disposal to assist the emergency aircraft.*
- b. *The station addressed will normally be that station communicating with the aircraft.*

International emergency frequencies are 121.5 and 243.0 MHz. In Canada, 126.7 MHz should, whenever practicable, be continuously monitored in uncontrolled air-

**CA 4
AIRCRAFT EMERGENCY ASSISTANCE**

space. When aircraft are equipped with dual VHF equipment, it is strongly suggested that frequency 121.5 MHz be monitored at all times.

- c. 121.5 MHz may also be used to establish communications when the aircraft is not equipped with the published frequencies or when equipment failure precludes the use of normal channels.*

4.3 TRANSPONDER ALERTING

If unable to establish communication immediately with an ATC unit, a pilot wishing to alert ATC to an emergency situation should adjust the transponder to reply on Mode A/3, Code 7700. Thereafter, communication with ATC should be established as soon as possible.

In the event of a communication failure, the transponder should be adjusted to reply on Mode A/3, Code 7600, to alert ATC to the situation.

This action does not relieve the pilot of the requirement to comply with CAR 602.137 *Two-Way Radio Communication Failure in IFR Flight*.

In the event of unlawful interference (hijack), the transponder should be adjusted to reply to Mode A/3, Code 7500, to alert ATC to the situation (see ATC — GENERAL — Unlawful Interference for further details.)

4.4 RADAR ALERTING MANEUVERS

ATC GENERAL — Canadian Forces Radar Assistance describes the radar assistance that is available through Canadian Forces facilities. However, when lost or in distress and unable to make radio contact, a pilot should attempt to alert *all available radar systems as follows*:

- a. activate the identification, friend or foe (IFF) system and selective identification feature (SIF) to EMERGENCY;
- b. guard emergency frequencies;
- c. fly two triangular patterns as depicted, resume course and repeat at five minute intervals.

Since the greater the altitude of the aircraft, the better its chance of being detected, low flying aircraft should attempt to climb. Also, if flying in limited visibility or at night, landing lights and navigation lights should be turned “on” to assist the interceptor.

CA 4 AIRCRAFT EMERGENCY ASSISTANCE

Once radar contact is established, and if it is possible to do so, a rescue aircraft will be dispatched to intercept. Upon successful interception, the interceptor and distressed aircraft should attempt radio contact. If this is not possible, use the visual interception signals (see para. 4.6). If, in a particular case, it is not possible for the Canadian Forces to send out an intercepting aircraft, flying of the triangular pattern will serve to position the distressed aircraft and thus narrow any search area.

Figure 4.1 — Canadian Radar Coverage Provided by NAV CANADA and DND

NOTE: The opportunity for an aircraft to be detected by radar increases with altitude.

The map shows the area of radar coverage in Canada provided by both DND and NAV CANADA installations. Pilots should be aware that if they are flying in an area outside of radar coverage, flying a triangular pattern for alerting purposes would not be a valid maneuver.

4.5 EMERGENCY RADIO FREQUENCY CAPABILITY

Where an aircraft is required by the laws of Canada to install two-way VHF radio communication equipment, no person shall operate that aircraft unless the radio communication equipment is capable of providing communication on VHF aeronautical emergency frequency 121.5 MHz.

CA 4
AIRCRAFT EMERGENCY ASSISTANCE

A person operating an aircraft within a sparsely settled area, or a Canadian aircraft over water at a horizontal distance of more than 50 NM from the nearest shoreline, shall monitor continuously the VHF aeronautical emergency frequency 121.5 MHz unless:

- a. that person is carrying out communications on other VHF aeronautical frequencies; or
- b. aircraft electronic equipment limitations or essential cockpit duties do not permit simultaneous monitoring of the 2 VHF aeronautical frequencies.

4.6 INTERCEPTION PROCEDURES (CAR 602.144)

- (1) No person shall give an interception signal or an instruction to land except:
 - (a) a peace officer of a police authority or an officer of the Canadian Forces acting within the scope of their duties; or
 - (b) a person authorized to do so by the Minister pursuant to subsection (2).
- (2) The Minister may authorize a person to give an interception signal or an instruction to land if such authorization is in the public interest and is not likely to affect aviation safety.
- (3) The pilot-in-command of an aircraft who receives an instruction to land from a person referred to in subsection (1) shall, subject to any direction received from an air traffic control unit, comply with the instruction.
- (4) The pilot-in-command of an intercepting aircraft and the pilot-in-command of an intercepted aircraft shall comply with the rules of interception set out in the *Canada Flight Supplement* and repeated below.

SCHEDULE I Procedures to be Followed in the Event of Interception

The pilot-in-command of an aircraft intercepted by another aircraft shall immediately:

- a. follow the radio and visual instructions given by the intercepting aircraft, interpreting and responding to visual signals in accordance with Schedule II;
- b. notify, if possible, the appropriate air traffic services unit;
- c. attempt to establish radio communication with the intercepting aircraft by making a general call on aeronautical emergency frequency 121.5 MHz and repeating this call on emergency frequency 243.0 MHz, if practicable giving the identity and position of the aircraft and the nature of the flight; and
- d. if equipped with a transponder, select Mode A Code 7700 unless otherwise instructed by the appropriate air traffic services unit.

If any instructions received by radio from any sources conflict with those given by the intercepting aircraft by visual or radio signals, the intercepted aircraft shall request immediate clarification while continuing to comply with the instructions given by the intercepting aircraft.

CA 4
AIRCRAFT EMERGENCY ASSISTANCE

SCHEDULE II Signals for Use in the Event of Interception

Signals Initiated by Intercepting Aircraft and Response by Intercepted Aircraft				
Series	Intercepting Aircraft Signal	Meaning	Intercepted Aircraft Response	Meaning
1.	DAY – Rocking wings from a position in front and, normally, to the left of intercepted aircraft and, after acknowledgement, a slow level turn, normally to the left, on to the desired heading. NIGHT – Same and, in addition, flashing navigational lights at irregular intervals. DAY or NIGHT – Flares dispensed in immediate vicinity. NOTE: 1. <i>Meteorological conditions or terrain may require the intercepting aircraft to take up a position in front and to the right of the intercepted aircraft, and to make the subsequent turn to the right.</i> 2. <i>If the intercepted aircraft is not able to keep pace with the intercepting aircraft, the latter is expected to fly a series of racetrack patterns and to rock its wings each time it passes the intercepted aircraft.</i>	You have been intercepted. Follow me.	AIRPLANES: DAY – Rocking wings and following. NIGHT – Same and, in addition flashing navigational lights at irregular intervals. HELICOPTERS: DAY or NIGHT – Rocking aircraft, flashing navigational lights at irregular intervals and following. NOTE: <i>Additional action by intercepted aircraft is prescribed in Schedule I.</i>	Understood, will comply.
2.	DAY or NIGHT – An abrupt breakaway maneuver from the intercepted aircraft consisting of a climbing turn of 90 degrees or more without crossing the line of flight of the intercepted aircraft.	You may proceed.	AIRPLANES: DAY or NIGHT – Rocking wings HELICOPTERS: DAY or NIGHT – Rocking aircraft.	Understood, will comply.

CA 4
AIRCRAFT EMERGENCY ASSISTANCE

Signals Initiated by Intercepting Aircraft and Response by Intercepted Aircraft				
Series	Intercepting Aircraft Signal	Meaning	Intercepted Aircraft Response	Meaning
3.	DAY – Circling airport, lowering landing gear and overflying runway in direction of landing or, if the intercepted aircraft is a helicopter, overflying helicopter landing area. NIGHT – Same, and in addition, showing steady landing lights.	Land at this airport.	AIRPLANES: DAY – Lowering landing gear, following the intercepting aircraft and, if after overflying the runway landing is considered safe, proceeding to land. NIGHT – Same, and in addition, showing steady landing lights (if carried). HELICOPTERS: DAY or NIGHT – Following the intercepting aircraft and proceeding to land, showing a steady landing light (if carried).	Understood, will comply.

Signals Initiated by Intercepted Aircraft and Response by Intercepting Aircraft				
Series	Intercepted Aircraft Signal	Meaning	Intercepting Aircraft Response	Meaning
4.	AIRPLANES: DAY – Raising landing gear while passing over landing runway at a height exceeding 300m (1000 ft) but not exceeding 600m (2000 ft) AAE, and continuing to circle the airport.	Airport you have designated is inadequate.	DAY or NIGHT – If it is desired that the intercepted aircraft follow the intercepting aircraft to an alternate airport, the intercepting aircraft raises its landing gear and uses the Series 1 signals prescribed for intercepting aircraft.	Understood, follow me.

CA 4
AIRCRAFT EMERGENCY ASSISTANCE

Signals Initiated by Intercepted Aircraft and Response by Intercepting Aircraft				
Series	Intercepted Aircraft Signal	Meaning	Intercepting Aircraft Response	Meaning
	NIGHT – Flashing landing lights while passing over landing runway at a height exceeding 300m (1000 ft) but not exceeding 600m (2000 ft) AAE, and continuing to circle the airport. If unable to flash landing lights, flash any other lights available.		If it is decided to release the intercepted aircraft, the intercepting aircraft uses the Series 2 signals prescribed for intercepting aircraft.	Understood, you may proceed.
5.	AIRPLANES: Day or NIGHT – Regular switching on and off of all available lights but in such a manner as to be distinct from flashing lights.	Cannot comply.	DAY or NIGHT – Use Series 2 signals prescribed for intercepting aircraft.	Understood.
6.	AIRPLANES: DAY or NIGHT – Irregular flashing of all available lights. HELICOPTERS: DAY or NIGHT – Irregular flashing of all available lights.	In distress.	DAY or NIGHT – Use Series 2 signals prescribed for intercepting aircraft.	Understood.

4.7 DOWNED AIRCRAFT PROCEDURES

4.7.1 Ground-to-Air Signals

Even if no ELT or distress signal has been received, a visual search will commence at the time indicated in the flight plan or flight itinerary. The search will typically extend up to 15 NM on either side of the flight-planned route, starting from the aircraft's last known position and concluding just beyond its destination. In mountainous regions, the search area will be defined to best suit the terrain and route of flight.

Some searches may last at least 24 hr before rescue is accomplished. Make the accident site as conspicuous as possible. Searchers will be looking for anything out of the ordinary, and their eyes will be drawn to any unnatural feature on the ground. The aircraft has the best chance of being spotted if large portions of its wings and tail are painted in vivid colors. Keep the aircraft cleared of snow.

As soon as possible after landing, and with due concern for spilled fuel or vapors, build a campfire. Collect a large pile of green material (e.g. tree boughs, fresh leaves, grasses) to quickly place on the fire, should an aircraft be seen or heard. Three signal fires forming a triangle is the standard distress signal, but even one large smoky fire should attract the attention of searchers.

CA 4
AIRCRAFT EMERGENCY ASSISTANCE

One of the best high-visibility items now available on the market is a cloth panel of brilliant fluorescent color, often referred to as a “conspicuity panel.” It is staked to the ground during the day and used as a highly effective ground signal. It can also be used as a lean-to shelter and can supply some warmth as a blanket. Other means of attracting attention are reflecting sunlight using signal mirrors or shiny pieces of metal during daylight; or using flashlights, headlamps, strobes, or even camera flashes during hours of darkness.

The following symbols are to be used to communicate with aircraft when an emergency exists. Symbols 1 to 5 are internationally accepted; 6 to 9 are for use in Canada only.

No.	MESSAGE	CODE SYMBOL
1	Require assistance	V
2	Require medical assistance	X
3	No or Negative	N
4	Yes or Affirmative	Y
5	Proceeding in this direction	↑
6	All is well	LL
7	Require food and water	F
8	Require fuel and oil	L
9	Need repairs	W

NOTE:

- a. Use strips of fabric or parachutes, pieces of wood, stones or any other available material to make the symbols.*
- b. Endeavour to provide as big a color contrast as possible between the material used for the symbols and the background against which the symbols are exposed.*
- c. Symbols should be at least 8 ft in height or larger, if possible. Care should be taken to lay out symbols exactly as depicted to avoid confusion with other symbols.*
- d. A space of 10 ft should separate the elements of symbol 6.*

4.7.2 Survival

Ability to assist the search can depend on the success of survival efforts. The emergency equipment detailed in CARs 602.61, 602.62 and 602.63 emphasizes being prepared for the geographical location and anticipated seasonal climatic variations.

If the aircraft lands in an uninhabited area, stay near the aircraft; the search is to locate the aircraft. Past experience has demonstrated that persons with a knowledge of survival techniques have saved their own and other's lives. Similarly, survivors invariably comment that a better knowledge of how to stay alive would have been invaluable.

CA 4
AIRCRAFT EMERGENCY ASSISTANCE

There are several good books on survival skills widely available from bookstores and through the Internet.

4.8 CANADA SHIPPING ACT, 2001 (2001, C. 26) Extract—Part 5, Sections 130–133

4.8.1 SEARCH AND RESCUE

4.8.1.1 *Designation of rescue coordinators*

The Minister may designate persons as rescue coordinators to organize search and rescue operations.

4.8.1.2 *Power of rescue coordinators*

On being informed that a person, a vessel or an aircraft is in distress or is missing in Canadian waters or on the high seas off any of the coasts of Canada under circumstances that indicate that they may be in distress, a rescue coordinator may

- a. direct all vessels within an area that the rescue coordinator specifies to report their positions;
- b. direct any vessel to take part in a search for that person, vessel or aircraft or to otherwise render assistance;
- c. give any other directions that the rescue coordinator considers necessary to carry out search and rescue operations for that person, vessel or aircraft; and
- d. use any lands if it is necessary to do so for the purpose of saving the life of a shipwrecked person.

4.8.1.3 *Duty to comply*

Every vessel or person on board a vessel in Canadian waters and every vessel or person on board a vessel in any waters that has a master who is a qualified person shall comply with a direction given to it or them under subsection 4.8.1.2.

4.8.2 ANSWERING DISTRESS SIGNAL

Subject to this section, the master of a vessel in Canadian waters and every qualified person who is the master of a vessel in any waters, on receiving a signal from any source that a person, a vessel or an aircraft is in distress, shall proceed with all speed to render assistance and shall, if possible, inform the persons in distress or the sender of the signal.

4.8.2.1 *Distress signal — no assistance*

If the master is unable or, in the special circumstances of the case, considers it unreasonable or unnecessary to proceed to the assistance of a person, a vessel or an aircraft in distress, the master is not required to proceed to their assistance and is to enter the reason in the official log book of the vessel.

CA 4
AIRCRAFT EMERGENCY ASSISTANCE

4.8.2.2 ***Ships requisitioned***

The master of any vessel in distress may requisition one or more of any vessels that answer the distress call to render assistance. The master of a requisitioned vessel in Canadian waters and every qualified person who is the master of a requisitioned vessel in any waters shall continue to proceed with all speed to render assistance to the vessel in distress.

4.8.2.3 ***Release from obligation***

The master of a vessel shall be released from the obligation imposed by subsection 4.8.2 when the master learns that another vessel is complying with a requisition referred to in subsection 4.8.2.2.

4.8.2.4 ***Further release***

The master of a vessel shall be released from an obligation imposed by subsection 4.8.2 or 4.8.2.2 if the master is informed by the persons in distress or by the master of another vessel that has reached those persons that assistance is no longer necessary.

4.8.3 **ASSISTANCE**

The master of a vessel in Canadian waters and every qualified person who is the master of a vessel in any waters shall render assistance to every person who is found at sea and in danger of being lost.

4.8.4 **AIRCRAFT TREATED AS IF VESSEL**

All sub-sections above in Section 4.8 apply in respect of aircraft on or over Canadian waters as they apply in respect of vessels in Canadian waters, with any modifications that the circumstances require.

CA 5
TRANSPORTATION SAFETY BOARD OF CANADA

SECTION 5

5.1 AVIATION SAFETY INVESTIGATION

The purpose of an aviation safety investigation into an aircraft accident or incident is to prevent a recurrence; it is not to determine or apportion blame or liability. The TSB, established under the *Canadian Transportation Accident Investigation and Safety Board Act* (CTAISB Act), is responsible for investigating all aviation occurrences in Canada involving civil aircraft registered both in Canada and abroad. A team of investigators is on 24-hr standby. The following text is mainly taken from the recently updated *Transportation Safety Board of Canada Regulations*. The complete text of both the CTAISB Act as well as the updated *Regulations* can be found on the Department of Justice Web site.

5.2 DEFINITIONS

Under the CTAISB Act, “*Aviation Occurrence*” means

- a. any accident or incident associated with the operation of aircraft; and
- b. any situation or condition that the Board has reasonable grounds to believe could, if left unattended, induce an accident or incident described in paragraph a.

The following definitions are taken from the *Transportation Safety Board of Canada Regulations*.

“*Collision*” means an impact, other than an impact associated with normal operating circumstances, between aircraft or between an aircraft and another object or terrain.

“*Dangerous goods*” has the same meaning as in section 2 of the *Transportation of Dangerous Goods Act*, 1992.

“*Operation*” means the activities for which an aircraft is used from the time any person boards the aircraft with the intention of flight until they disembark.

“*Risk of collision*” means a situation in which an aircraft comes so close to being involved in a collision that a threat to the safety of any person, property or the environment exists.

“*Serious injury*” means:

- a. a fracture of any bone, except simple fractures of fingers, toes or the nose;
- b. lacerations that cause severe hemorrhage or nerve, muscle or tendon damage;
- c. an injury to an internal organ;
- d. second or third degree burns, or any burns affecting more than 5% of the body surface;
- e. a verified exposure to infectious substances or injurious radiation; or
- f. an injury that is likely to require hospitalization.

5.3 REPORTING AN AVIATION OCCURRENCE

The owner, operator, pilot-in-command, any crew member of the aircraft and any person providing air traffic services that have direct knowledge of an occurrence must report the following aviation occurrences to the Board if they result directly from the operation of an aircraft.

CA 5
TRANSPORTATION SAFETY BOARD OF CANADA

5.3.1 Accidents

In the case of an accident,

- a. a person is killed or sustains a serious injury as a result of:
 1. being on board the aircraft,
 2. coming into direct contact with any part of the aircraft, including parts that have become detached from the aircraft, or
 3. being directly exposed to jet blast, rotor down wash or propeller wash,
- b. the aircraft sustains structural failure or damage that adversely affects the aircraft's structural strength, performance or flight characteristics and would normally require major repair or replacement of any affected component, except for:
 1. engine failure or damage, when the damage is limited to the engine, its cowlings or accessories, or
 2. damage limited to propellers, wing tips, antennae, tires, brakes, fairings or small dents or puncture holes in the aircraft's skin, or
- c. the aircraft is missing or inaccessible.

5.3.2 Mandatory Reportable Incidents

In the case of an incident involving an aircraft having a maximum certificated take-off weight greater than 2250 kg, or of an aircraft being operated under an air operator certificate issued under Part VII of the *Canadian Aviation Regulations*:

- a. an engine fails or is shut down as a precautionary measure,
- b. a power train transmission gearbox malfunction occurs,
- c. smoke is detected or a fire occurs on board,
- d. difficulties in controlling the aircraft are encountered owing to any aircraft system malfunction, weather phenomena, wake turbulence, uncontrolled vibrations or operations outside the flight envelope,
- e. the aircraft fails to remain within the intended landing or take-off area, lands with all or part of the landing gear retracted or drags a wing tip, an engine pod or any other part of the aircraft,
- f. a crew member whose duties are directly related to the safe operation of the aircraft is unable to perform their duties as a result of a physical incapacitation which poses a threat to the safety of persons, property or the environment,
- g. depressurization of the aircraft occurs that requires an emergency descent,
- h. a fuel shortage occurs that requires a diversion or requires approach and landing priority at the destination of the aircraft,
- i. the aircraft is refuelled with the incorrect type of fuel or contaminated fuel,

CA 5
TRANSPORTATION SAFETY BOARD OF CANADA

- j. a collision, a risk of collision or a loss of separation occurs,
- k. a crew member declares an emergency or indicates an emergency that requires priority handling by air traffic services or the standing by of emergency response services,
- l. a slung load is released unintentionally or as a precautionary or emergency measure from the aircraft, or
- m. any dangerous goods are released in or from the aircraft.

5.3.3 Information to Report

The report must contain the following information:

- a. the type, model, nationality and registration marks of the aircraft;
- b. the name of the owner, operator, pilot-in-command and, if applicable, hirer of the aircraft;
- c. the last point of departure and the intended destination of the aircraft, including the date and time of the departure;
- d. the date and time of the occurrence;
- e. the name of the person providing air traffic services related to the occurrence;
- f. the number of crew members, passengers and other persons involved in the occurrence and the number of those who were killed or sustained serious injuries as a result of the occurrence;
- g. the location of the occurrence by reference to an easily defined geographical point, or by latitude and longitude;
- h. a description of the occurrence and the extent of any resulting damage to the environment and to the aircraft and any other property;
- i. a list of any dangerous goods carried on board or released from the aircraft, including the shipping name or UN number and consignor and consignee information;
- j. if the aircraft is missing or inaccessible:
 - 1. the last known position of the aircraft by reference to an easily defined geographical point, or by latitude and longitude, including the date and time that the aircraft was at that position, and
 - 2. the actions taken or planned to locate or gain access to the aircraft;
- k. a description of any action taken or planned to protect persons, property and the environment;
 - l. the name and title of the person making the report and the phone number and address at which they can be reached; and
- m. any information specific to the occurrence that the Board requires.

The person making the report must send to the Board as soon as possible and by the quickest means available, all the information required that is available at the time of the occurrence; and

CA 5 TRANSPORTATION SAFETY BOARD OF CANADA

the remainder of that information as soon as it becomes available within 30 days after the occurrence.

5.3.4 Other Occurrences

Any other incident indicative of a deficiency or discrepancy in the Canadian air transportation system may be reported in writing to the TSB. Sufficient details concerning the incident should be provided to enable the identification of action required to remedy the deficiency or discrepancy.

5.3.5 Contacting the TSB

Aviation occurrences are to be reported to a regional TSB office, using the telephone numbers listed in OFFICES OF THE TSB.

For Canadian-registered aircraft operating outside of Canada, in addition to the reporting required by the state of occurrence, a report shall be made to the TSB regional office nearest to the company's headquarters or, for private aircraft, nearest to the aircraft's home base.

5.4 KEEPING AND PRESERVATION OF EVIDENCE

Every person having possession of or control over evidence relating to a transportation occurrence must keep and preserve the evidence unless the Board provides otherwise. This is not to be construed as preventing any person from taking the necessary measures to ensure the safety of any person, property or the environment. Any person who takes these measures must, to the extent possible in the circumstances and before taking those measures, record the evidence by the best means available and advise the Board of their actions.

5.5 SECURITAS PROGRAM

The SECURITAS program provides a means for individuals to report incidents and potentially unsafe acts or conditions relating to the Canadian transportation system that would not normally be reported through other channels. It should be noted that this multi-modal confidential safety reporting system replaces the Confidential Aviation Safety Reporting Program (CARSP).

Each report is assessed by SECURITAS analysts. When a reported concern is validated as a safety deficiency, the TSB normally forwards the information, often with suggested corrective action, to the appropriate regulatory authority or in some cases, the transportation company, organization or agency. No information will be released that could reasonably be expected to reveal the reporter's identity without the reporter's written consent.

5.5.1 How to Report to SECURITAS

SECURITAS is primarily concerned with unsafe acts and conditions relating to commercial and public transportation systems. When contacting SECURITAS, ensure the following is included in your message:

- your name, address and phone number
- your profession and experience
- your involvement in the unsafe situation being reported
- where else you may have reported this unsafe situation or safety concern

CA 5
TRANSPORTATION SAFETY BOARD OF CANADA

- complete identification of the aircraft or related facility/equipment
- the name of the owner/operator of the equipment

Also, please describe the unsafe act or safety concern.

For example:

- How was the unsafe act/condition discovered?
- If you are describing an event, tell SECURITAS
 - what happened;
 - where it happened;
 - when it happened (the date and the local time); and
 - why you think it happened.
- What actions/inactions resulted, or could have resulted?
- How do you think the situation could be corrected?

5.5.2 What to Report to SECURITAS

These are some examples of the types of situations that could affect air transportation safety and that your report might help correct.

Unsafe conditions:

- chronic lack of repair of aircraft, poor maintenance practices
- unsafe runway or airport conditions
- inadequate or poor air traffic services in a particular area
- poor reception of navigation signals, weak radio coverage, inadequate weather services
- errors in aeronautical publications: unsafe procedures published in manuals of instructions for pilots, cabin crew, ground crew, aircraft maintenance or air traffic services

Unsafe procedures and practices:

- routinely descending below minimum enroute altitude or approach in IMC
- non-compliance with airworthiness directives, minimum equipment list
- pilots flying in excess of regulatory flight-time limits
- unsafe aircraft circuit procedures and/or communications
- air traffic control practices that could jeopardize the safety of flight, e.g., use of non-standard phraseology, compromising separation criteria, inadequate manning and supervision
- unsafe cabin baggage stowage procedures, unsafe passenger seating or cargo securing arrangements
- aircraft maintenance procedures not completed correctly but signed off

CA 5
TRANSPORTATION SAFETY BOARD OF CANADA

- shortcuts in following checklist procedures
- crew scheduling problems: inadequate crew composition, unqualified crew, inadequate crew rest
- scheduling personnel who are not professionally or medically qualified for the assigned duties
- the use of unapproved parts, time-expired equipment

5.5.3 Where to Submit a SECURITAS Report

To submit a report, contact SECURITAS at:

SECURITAS

**CANADA
SEARCH AND RESCUE FACILITIES**

CANADA REGION

CANADA
ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

GENERAL

In general, the Emergency, Unlawful Interference, Communications Failure, Interception and Search and Rescue procedures are in conformity with ICAO Standards, Recommended Practices and Procedures.

EMERGENCY PROCEDURES

TRANSPONDER OPERATIONS

Whenever pilots are faced with an emergency situation, ATC expects the pilot to take whatever action is considered necessary. ATC will assist pilots in any way possible whenever an emergency is declared. Pilots are requested to advise ATC of any deviations from IFR altitudes or routes necessitated by an emergency situation as soon as it is practicable in order that every effort can be made to minimize conflicts with other aircraft.

Pilots of transponder-equipped aircraft, when experiencing an emergency and unable to establish communications immediately with an ATC unit, may indicate "Emergency" to ATC by adjusting the transponder to reply to Mode A/3 Code 7700. Thereafter, radio communications should be established with ATC as soon as possible.

It should be pointed out, however, that when Code 7700 is used, the signal may not be detected because the aircraft may not be within the range of SSR coverage.

DISTRESS FREQUENCIES

International emergency frequencies are 121.5 and 243.0 MHz. In Canada, 126.7 MHz should, whenever practicable, be continuously monitored in uncontrolled airspace. When aircraft are equipped with dual very high frequency (VHF) equipment, it is strongly recommended that frequency 121.5 MHz be monitored at all times.

121.5 MHz may also be used to establish communications when the aircraft is not equipped with the published frequencies or when equipment failure precludes the use of normal channels.

EMERGENCY RADAR ASSISTANCE

The Canadian Forces can provide assistance in an emergency to civil aircraft operating within the Air Defence Identification Zone (ADIZ).

No responsibility for the direct control of aircraft is accepted and radar assistance does not absolve the captain of the responsibility of complying with ATC clearances or other required procedures. Assistance consists of:

- a. track and ground speed checks (speeds in KT);
- b. position of the aircraft in geographic reference, or by bearing and distance from the station (distances are in NM and bearings in degrees True); and
- c. position of heavy cloud in relation to the aircraft.

To obtain assistance in the NWS Area, call "Radar Assistance" on 126.7 MHz or when circumstances require a MAYDAY call, use 121.5 MHz, giving all the necessary details. When assistance is required in ADIZ areas contact will have to be made on the 121.5 MHz frequency or on

CANADA ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

the UHF frequencies 243.0 MHz or 364.2 MHz. Initial contact should be made at the highest practicable altitude. If air defence commitments preclude the granting of radar assistance, the ground station will transmit the word "UNABLE" and no further explanation will be given.

RADAR ALERTING MANEUVERS

When lost or in distress and unable to make radio contact, a pilot should attempt to alert *all* available radar systems as follows:

- Activate the identification, friend or foe (IFF) system and selective identification feature (SIF) to EMERGENCY;
- Guard emergency frequencies;
- Fly two triangular patterns as depicted, resume course and repeat at five-minute intervals.

Since the greater the altitude of the aircraft, the better its chance of being detected, low-flying aircraft should attempt to climb. Also, if flying in limited visibility or at night, landing lights and navigation lights should be turned on to assist the interceptor.

Once radar contact is established, and if it is possible to do so, a rescue aircraft will be dispatched to intercept. Upon successful interception, the interceptor and distressed aircraft should attempt radio contact. If this is not possible, use the visual interception signals. If, in a particular case, it is not possible for the Canadian Forces to send out an intercepting aircraft, flying of the triangular pattern will serve to position the distressed aircraft and thus narrow any search area.

FUEL DUMPING

Whenever it is necessary to jettison fuel, the pilot should immediately notify ATC and provide information such as the course to be flown, the period of time and weather conditions. To allow for adequate vaporization, fuel dumping should be carried out at least 2000 ft above the highest obstacle within 5 NM of the track to be flown. ATC may suggest an alternate area where fuel should be dumped; aircraft will be encouraged to dump fuel on a constant heading over unpopulated areas and clear of heavy traffic. When necessary information has been obtained, ATC will broadcast on appropriate frequencies a "fuel dumping" advisory. Pilots should advise ATC immediately when fuel dumping has been completed.

MINIMUM FUEL ADVISORY

Pilots may experience situations where traffic, weather or other delays result in concern about the aircraft's fuel state. The term MINIMUM FUEL describes a situation where the aircraft's fuel supply has reached a state where the flight is committed to land at a specific aerodrome and no additional delay can be accepted. The pilot should advise ATC as soon as possible that a MINI-

CANADA

ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

MUM FUEL condition exists. This is not an emergency situation, but merely an advisory that indicates an emergency is possible should any undue delay occur.

A minimum fuel advisory does not imply an ATC traffic priority; however, ATC special flight handling procedures are as follows:

- a. Be alert for any occurrence or situation that might delay the aircraft;
- b. Respond to the declaration and keep the pilot informed of any anticipated delay as soon as you become aware, using the following phraseology:

ROGER or

ROGER NO DELAY EXPECTED or

ROGER EXPECT (delay information).

- c. Inform the next sector or unit of the minimum fuel status of the aircraft and
- d. Record the information in the unit log, reduce unnecessary radio transmissions and ensure appropriate responses; use of internationally recognized fuel-related phraseology among pilots and controllers is essential.

Traffic priority is given to a pilot who declares an emergency for fuel by broadcasting MAYDAY MAYDAY MAYDAY FUEL. Use of standardized pilot phraseology distinguishes minimum fuel from a fuel emergency, assuring pilot intent without further verification.

UNLAWFUL INTERFERENCE

Canada, along with other nations, has adopted a special secondary surveillance radar (SSR) transponder code (7500) for use by pilots of aircraft subjected to an act of unlawful interference. Air traffic control (ATC) does not assign this code (7500) unless the pilot informs ATC of an act of unlawful interference in progress.

Selection of the code activates an alarm system and points out the aircraft on radar displays. If the controller doubts that an aircraft is the subject of an act of unlawful interference (as could occur when a code change was requested and the act of unlawful interference code appeared rather than the assigned code), the controller will say, "CONFIRM SQUAWK SEVEN FIVE ZERO ZERO". If the pilot answers yes, the controller will alert the ATC system. If the pilot replies no, the controller will re-assign the proper code. If the pilot does not reply, the controller will take this as confirmation that the use of Code 7500 is intentional. If, after using Code 7500, an aircraft changes to Code 7700 or transmits a message including the phrase "TRANSPONDER SEVEN SEVEN ZERO ZERO", this indicates that the aircraft is threatened by grave and imminent danger and requires immediate assistance.

COMMUNICATIONS FAILURE

In the event of a communication failure, the pilot should adjust the transponder to reply on Code 7600 to alert ATC to the situation. This does not relieve the pilot of the requirement to comply with the appropriate communications failure procedures for IFR flight.

CANADA

ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

IFR FLIGHT PLAN

Visual Meteorological Conditions (VMC)

If the failure occurs in VMC, or if VMC are encountered after the failure, the pilot-in-command shall continue the flight under VFR and land as soon as practicable.

NOTE: This procedure applies in any class of airspace. The primary purpose is to preclude extended IFR operation in controlled airspace in VMC. However, it is not intended that the requirement to "land as soon as practicable" be construed to mean "land as soon as possible". The pilot retains the prerogative of exercising his/her best judgment and is not required to land at an unauthorized airport, at an airport unsuitable for the type of aircraft flown, or to land only minutes short of destination.

Instrument Meteorological Conditions (IMC)

If the failure occurs in IMC, or if the flight cannot be continued under VMC, the pilot-in-command shall continue the flight according to the following:

Route

- a. by the route assigned in the last ATC clearance received and acknowledged;
- b. if being radar vectored, by the direct route from the point of communications failure to the fix, route, or airway specified in the vector clearance;
- c. in the absence of an assigned route, by the route that ATC has advised may be expected in a further clearance; or
- d. in the absence of an assigned route or route that ATC has advised may be expected in a further clearance, by the route filed in the flight plan.

Altitude

At the *highest* of the following altitudes or flight levels for *the route segment being flown*:

- a. the altitude(s) or flight level(s) assigned in the last ATC clearance received and acknowledged;
- b. the minimum IFR altitude; or
- c. the altitude or flight level ATC has advised may be expected in a further clearance. (The pilot shall commence climb to this altitude/FL at the time or point specified by ATC to expect further clearance/ altitude change.)

NOTE:

- a. *The intent of this is that an aircraft that has experienced a communications failure will, during any segment of a flight, be flown at an altitude that provides the required obstacle clearance.*
- b. *If the failure occurs while being vectored at a radar vectoring altitude that is lower than a published IFR altitude, the pilot shall immediately climb to and maintain the appropriate minimum IFR altitude until arrival at the fix, route or airway specified in the clearance.*

CANADA ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

Descent for Approach

Maintain enroute altitude to the navigation facility or the approach fix to be used for the instrument approach procedure selected and commence an appropriate descent procedure at whichever of the following times is the most recent:

- a. the expected time of arrival [ETA as calculated from takeoff time plus the estimated time enroute filed or amended (with ATC)];
- b. the ETA last notified to and acknowledged by ATC; or
- c. the expected approach time (EAT) last received and acknowledged.

If failure occurs after receiving and acknowledging a holding instruction, hold as directed and commence an instrument approach at the expected approach time or expected further clearance time, whichever has been issued.

NOTE:

- a. *If the holding fix is not a fix from which an approach begins, leave the fix at the expected further clearance time if one has been received. If none has been received, proceed to a fix from which an approach begins upon arrival over the clearance limit. Commence descent and/or approach as close as possible to the ETA as calculated from the filed estimated time enroute or as amended with ATC.*
- b. *If cleared for a standard terminal arrival (STAR), maintain the appropriate altitude described in the ATC section and proceed to the final approach fix (FAF):*
 1. *via the published routing;*
 2. *via the published routing to the segment where radar vectors are depicted to commence, then direct to the facility or fix serving the runway advised by ATIS or specified in the ATC clearance, for a straight-in approach, if able, or for the full procedure if one is published;*
 3. *for a CLOSED RNAV STAR, by flying the arrival as published, including any vertical and speed restraints depicted in the procedure, and intercepting the final approach course for a straight-in approach; or*
 4. *for an OPEN RNAV STAR, by flying the arrival as published, including any vertical and speed restraints depicted in the procedure. The pilot is expected to delete the heading leg at the downwind termination waypoint (DTW), to initiate an auto-turn at the DTW and final approach course fix (FACF) and to intercept the final approach course for a straight-in approach.*

For flights to the United States, communication failure procedures are essentially the same, but it is the pilot's responsibility to consult the appropriate American publications.

Some instrument procedures do not include a procedure turn, but include the statement "RADAR OR RNAV REQUIRED" as part of the procedure. The initial approach segment of these instrument procedures is being provided by ATC radar vectors. Without ATC radar vectoring, the instrument procedure may not have a published initial approach segment.

CANADA

ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

Should an aircraft communications failure occur while being vectored on one of these approaches, separately or as part of a STAR, the pilot is expected to comply with the communications failure procedure by selecting the transponder to Mode A/3 Code 7600 immediately. Pilots should always be aware of the traffic situation. For example, ATC may have indicated that your aircraft was second for an approach to Runway 06L; under these circumstances, the flight should be continued along the route that normally would have been expected under radar vectoring. In some cases of communications failure, pilots may need to revert to dead reckoning navigation (DR) to the final approach course. It is important to other aircraft and ATC for the aircraft experiencing a communications failure to continue the flight along a route that would permit the aircraft to conduct a straight-in approach and landing without unexpected maneuvering. Pilots are expected to exercise good judgment in these cases. Unexpected maneuvers, such as turns away from the final approach course, may cause traffic disruptions and conflicts.

If the communications failure occurs while being vectored at a radar vectoring altitude which is lower than a published IFR altitude (i.e., Minimum Sector Altitude 25 NM), the pilot shall immediately climb to and maintain the appropriate minimum IFR altitude until arrival at a fix associated with the instrument procedure.

Modern technology has introduced new on board communications capabilities, such as airborne telephone communications. Pilots who are confronted with an aircraft communications failure may, if circumstances permit, use this new on board technology to establish communications with the appropriate ATC units.

COMMUNICATIONS FAILURE — NORTH ATLANTIC TRAFFIC

The following procedures are intended to provide general guidance for North Atlantic aircraft experiencing a communications failure. These procedures are intended to complement, not supersede, state procedures and regulations as contained in ATC section. It is impossible to provide guidance for all possible situations associated with a communications failure.

GENERAL

- If the aircraft is so equipped, a pilot experiencing a two-way radio communications failure shall operate the transponder in Mode C and squawk Code 7600.
- The pilot shall also attempt to contact any ATC facility, inform controllers of the difficulty, and request that information be relayed to the ATC facility.

Communications Failure Prior to Entering NAT Oceanic Airspace

- If operating with a received and acknowledged oceanic clearance, the pilot should enter oceanic airspace at the cleared oceanic entry point, flight level, and speed, and proceed in accordance with the received and acknowledged oceanic clearance. Any flight level or speed changes required to comply with oceanic clearance should be completed within the vicinity of the oceanic entry point. The cleared oceanic flight level is the flight level contained in the oceanic clearance.
- If operating without a received and acknowledged oceanic clearance, the pilot should enter oceanic airspace at the first oceanic entry point, flight level, and speed contained in the filed

CANADA ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

flight plan, and proceed via the filed flight plan route to landfall. The first oceanic flight level and speed shall be maintained to landfall.

Communications Failure Prior To Exiting NAT Oceanic Airspace

- If the oceanic clearance includes the flight planned oceanic exit point, the pilot should proceed in accordance with the last received and acknowledged oceanic clearance, including flight level and speed, to the last specified oceanic exit point. The pilot should continue on the flight plan route and, after passing the last specified oceanic exit point, conform to the relevant state procedures and regulations.
- If cleared on a route that contains an oceanic exit point other than the one contained in the flight plan, the pilot should proceed in accordance with the last received and acknowledged oceanic clearance, including flight level and speed, to the last specified oceanic route point. After passing this point, the pilot should conform to the relevant state procedures and regulations, rejoining the filed flight plan route by proceeding, via published ATS routes where possible, to the next significant point west of the last oceanic route point contained in the filed flight plan.

SEARCH AND RESCUE

MISSING AIRCRAFT NOTICE (MANOT)

When an aircraft is reported missing, the appropriate JRCC will issue a Missing Aircraft Notice (MANOT) to the ATS units that are providing services in or near the search area. MANOTs will be communicated to pilots planning to overfly the search area by notices posted on flight information boards, orally during the filing of flight plans, or by radio communication.

Pilots receiving MANOTs are requested to maintain a thorough visual lookout and, insofar as it is practicable, a radio watch on 121.5 MHz when operating in the vicinity of the track the missing aircraft had planned to follow.

Once a MANOT has been issued, a major search effort will be initiated. Such an operation will be published in a NOTAM, and will involve a large number of military and civilian aircraft flying in a relatively confined area. Aircraft that are not participating in the search will be requested to keep a sharp lookout for other traffic, report any probable crash sightings to the closest FIC or JRCC and remain clear of active search areas, if possible.

On termination of the search, another MANOT will be issued and designated as final.

GROUND-AIR VISUAL SIGNAL CODES FOR USE BY SURVIVORS

The following symbols are to be used to communicate with aircraft when an emergency exists. Symbols 1 to 5 are internationally accepted; 6 to 9 are for use in Canada only.

No.	MESSAGE	CODE SYMBOL
1	Require assistance	V
2	Require medical assistance	X

CANADA
ICAO DIFFERENCES OR STATE SPECIAL PROCEDURES

No.	MESSAGE	CODE SYMBOL
3	No or Negative	N
4	Yes or Affirmative	Y
5	Proceeding in the direction	↑
6	All is well	LL
7	Require food and water	F
8	Require fuel and oil	L
9	Need repairs	W

VISUAL DISTRESS SIGNAL — SMALL CRAFT

Pilots should be familiar with the distress signal which may be used by small boats. It consists of a rectangular, fluorescent orange-red cloth panel on which a black square and disc are displayed.

Emergency

Emergency Procedures - United States

US 6-1

SECTION 1. GENERAL

6-1-1 PILOT RESPONSIBILITY AND AUTHORITY

- a. The pilot-in-command of an aircraft is directly responsible for and is the final authority as to the operation of that aircraft. In an emergency requiring immediate action, the pilot-in-command may deviate from any rule in 14 CFR Part 91, Subpart A, General, and Subpart B, Flight Rules, to the extent required to meet that emergency.

NOTE: *In the event of a pilot incapacitation, an Emergency Autoland system or an emergency descent system may assume operation of the aircraft and deviate to meet that emergency.*

REFERENCE—14 CFR Section 91.3(b).

- b. If the emergency authority of 14 CFR Section 91.3(b) is used to deviate from the provisions of an ATC clearance, the pilot-in-command must notify ATC as soon as possible and obtain an amended clearance.
- c. Unless deviation is necessary under the emergency authority of 14 CFR Section 91.3, pilots of IFR flights experiencing two-way radio communications failure are expected to adhere to the procedures prescribed under “IFR operations, two-way radio communications failure.”

REFERENCE—14 CFR Section 91.185.

6-1-2 EMERGENCY CONDITION — REQUEST ASSISTANCE IMMEDIATELY

- a. An emergency can be either a *distress* or *urgency* condition as defined in the Pilot/Controller Glossary. Pilots do not hesitate to declare an emergency when they are faced with *distress* conditions such as fire, mechanical failure, or structural damage. However, some are reluctant to report an *urgency* condition when they encounter situations which may not be immediately perilous, but are potentially catastrophic. An aircraft is in at least an *urgency* condition the moment the pilot becomes doubtful about position, fuel endurance, weather, or any other condition that could adversely affect flight safety. This is the time to ask for help, not after the situation has developed into a *distress* condition.
- b. Pilots who become apprehensive for their safety for any reason should *request assistance immediately*. Ready and willing help is available in the form of radio, radar, direction finding stations and other aircraft. Delay has caused accidents and cost lives. *Safety is not a luxury! Take action!*

US 6-2

SECTION 2. EMERGENCY SERVICES AVAILABLE TO PILOTS

6-2-1 RADAR SERVICE FOR VFR AIRCRAFT IN DIFFICULTY

- a. Radar equipped ATC facilities can provide radar assistance and navigation service (vectors) to VFR aircraft in difficulty when the pilot can talk with the controller, and the aircraft is within radar coverage. Pilots should clearly understand that authorization to proceed in accordance with such radar navigational assistance does not constitute authorization for the pilot to violate CFRs. In effect, assistance is provided on the basis that navigational guidance information is advisory in nature, and the responsibility for flying the aircraft safely remains with the pilot.
- b. Experience has shown that many pilots who are not qualified for instrument flight cannot maintain control of their aircraft when they encounter clouds or other reduced visibility conditions. In many cases, the controller will not know whether flight into instrument conditions will result from ATC instructions. To avoid possible hazards resulting from being vectored into IFR conditions, a pilot in difficulty should keep the controller advised of the current weather conditions being encountered and the weather along the course ahead and observe the following:
 1. If a course of action is available which will permit flight and a safe landing in VFR weather conditions, noninstrument rated pilots should choose the VFR condition rather than requesting a vector or approach that will take them into IFR weather conditions; or
 2. If continued flight in VFR conditions is not possible, the noninstrument rated pilot should so advise the controller and indicating the lack of an instrument rating, declare a *distress* condition; or
 3. If the pilot is instrument rated and current, and the aircraft is instrument equipped, the pilot should so indicate by requesting an IFR flight clearance. Assistance will then be provided on the basis that the aircraft can operate safely in IFR weather conditions.

6-2-2 TRANSPONDER EMERGENCY OPERATION

- a. When a *distress* or *urgency* condition is encountered, the pilot of an aircraft with a coded radar beacon transponder, who desires to alert a ground radar facility, should squawk Mode 3/A, Code 7700/Emergency and Mode C altitude reporting and then immediately establish communications with the ATC facility.
- b. Radar facilities are equipped so that Code 7700 normally triggers an alarm or special indicator at all control positions. Pilots should understand that they might not be within a radar coverage area. Therefore, they should continue squawking Code 7700 and establish radio communications as soon as possible.

6-2-3 INTERCEPT AND ESCORT

- a. The concept of airborne intercept and escort is based on the Search and Rescue (SAR) aircraft establishing visual and/or electronic contact with an aircraft in difficulty, providing in-flight assistance, and escorting it to a safe landing. If bailout, crash landing or ditching becomes necessary, SAR operations can be conducted without delay. For most incidents, particularly those occurring at night and/or during instrument flight conditions, the availability

US 6-2

SECTION 2. EMERGENCY SERVICES AVAILABLE TO PILOTS

of intercept and escort services will depend on the proximity of SAR units with suitable aircraft on alert for immediate dispatch. In limited circumstances, other aircraft flying in the vicinity of an aircraft in difficulty can provide these services.

- b. If specifically requested by a pilot in difficulty or if a *distress* condition is declared, SAR coordinators *will* take steps to intercept and escort an aircraft. Steps may be initiated for intercept and escort if an *urgency* condition is declared and unusual circumstances make such action advisable.
- c. It is the pilot's prerogative to refuse intercept and escort services. Escort services will normally be provided to the nearest adequate airport. Should the pilot receiving escort services continue onto another location after reaching a safe airport, or decide not to divert to the nearest safe airport, the escort aircraft is not obligated to continue and further escort is discretionary. The decision will depend on the circumstances of the individual incident.

6-2-4 EMERGENCY LOCATOR TRANSMITTER (ELT)

a. General.

- 1. ELTs are required for most General Aviation airplanes.

REFERENCE—14 CFR SECTION 91.207.

- 2. ELTs of various types were developed as a means of locating downed aircraft. These electronic, battery operated transmitters operate on one of three frequencies. These operating frequencies are 121.5 MHz, 243.0 MHz, and the newer 406 MHz. ELTs operating on 121.5 MHz and 243.0 MHz are analog devices. The newer 406 MHz ELT is a digital transmitter that can be encoded with the owner's contact information or aircraft data. The latest 406 MHz ELT models can also be encoded with the aircraft's position data which can help SAR forces locate the aircraft much more quickly after a crash. The 406 MHz ELTs also transmits a stronger signal when activated than the older 121.5 MHz ELTs.

- (a) The Federal Communications Commission (FCC) requires 406 MHz ELTs be registered with the National Oceanic and Atmospheric Administration (NOAA) as outlined in the ELTs documentation. The FAA's 406 MHz ELT Technical Standard Order (TSO) TSO-C126 also requires that each 406 MHz ELT be registered with NOAA. The reason is NOAA maintains the owner registration database for U.S. registered 406 MHz alerting devices, which includes ELTs. NOAA also operates the United States' portion of the Cospas-Sarsat satellite distress alerting system designed to detect activated 406 MHz ELTs and other distress alerting devices.
- (b) As of 2009, the Cospas-Sarsat system terminated monitoring and reception of the 121.5 MHz and 243.0 MHz frequencies. What this means for pilots is that those aircraft with only 121.5 MHz or 243.0 MHz ELTs onboard will have to depend upon either a nearby air traffic control facility receiving the alert signal or an overflying aircraft monitoring 121.5 MHz or 243.0 MHz detecting the alert and advising ATC.
