IMPORTANT NOTICE REGARDING JEPPESEN'S AIRWAY MANUAL AND VFR MANUAL

Effective February 12, 2021

This Notice may be modified by Boeing Digital Solutions, Inc., d/b/a Jeppesen ("Jeppesen") in its sole discretion. You should always review the most current version of the Notice each time you use this manual and any revisions thereto ("Manual") as it will be binding on you.

This Manual has been developed to provide current information in the condensed form required for air navigation under instrument and/or visual flight conditions. Information contained in the copyrighted charts is independently available from publications of the appropriate governing authority and other third parties.

This Manual is designed for use by experienced pilots who must be thoroughly familiar and competent with the navigation of aircraft. Airway Manual is for use by instrument-rated pilots and VFR Manual is for use by pilots flying under visual flight rules. The user of this Manual should also be thoroughly familiar with the introduction and legend materials which are contained in and/or available for this Manual.

Instrument and VFR procedures are designed, flight-tested, approved, authorized and prescribed by applicable governing authorities. In the United States, instrument flight procedures are incorporated into FAR Part 97 as regulations. Jeppesen does not design or flight-check any of these procedures, and Jeppesen has no authority to alter, modify, add to, or subtract from any flight procedure prescribed by a governing authority. Further, Jeppesen does not review or approve the adequacy, reliability, accuracy, safety or conformance with government standards of any government flight procedure, and it specifically has undertaken no such duty. Jeppesen's flight procedure charts simply depict in a graphic form convenient for the use of knowledgeable, instrument-rated pilots, the flight procedures exactly as designed, flight-tested and prescribed by government authorities.

In addition, this Manual contains a wide variety of information useful to pilots which Jeppesen has obtained from many outside sources. Jeppesen has edited this source material, and has arranged and published it in a convenient, easy-to-use format.

IMPORTANT NOTICE REGARDING JEPPESEN'S TRIP KIT

In the event this Manual was secured for one time use, without revision service, it will be considered a "trip kit". The charts and pages in the trip kit are up-to-date at the time of issue but may become obsolete within a short time. Trip kits should be used immediately and a new trip kit should be purchased from Jeppesen for each subsequent trip. A trip kit is subject to the terms and conditions contained herein.

IN THE INTEREST OF AIR SAFETY, JEPPESEN STRONGLY RECOMMENDS THAT THE ENTIRE TRIP KIT BE DESTROYED UPON COMPLETION OF THE TRIP FOR WHICH IT WAS PURCHASED. DO NOT USE OBSOLETE MATERIAL FOR NAVIGATION PURPOSES!

WARNING

CHART RELATED ALERTS AND NOTICES ("ALERTS") ARE PUBLISHED ON JEPPESEN'S NOTICES AND ALERTS WEBPAGE ACCESSIBLE VIA WWW.JEPPESEN.COM. CHANGES

MAY OCCUR AT ANY TIME AND YOU AGREE TO REGULARLY MONITOR JEPPESEN'S NOTICES AND ALERTS WEBPAGE AS APPROPRIATE FOR YOUR TYPE OF OPERATION.

EXPRESS WARRANTY

JEPPESEN EXPRESSLY WARRANTS FOR YOUR SOLE BENEFIT THAT IT HAS ACCURATELY GRAPHICALLY DEPICTED THE FLIGHT PROCEDURES PRESCRIBED BY APPLICABLE GOVERNMENT AUTHORITIES, AND THAT IT HAS ACCURATELY COMMUNICATED THE INFORMATION FROM OTHER SOURCES ON ITS MAPS AND CHARTS AS SUPPLEMENTED AND/OR REPLACED BY ALERTS AS DESCRIBED ABOVE. THIS EXPRESS WARRANTY IS THE ONLY WARRANTY, EXPRESS OR IMPLIED, ARISING BY LAW OR OTHERWISE, MADE BY JEPPESEN REGARDING THIS MANUAL. JEPPESEN WILL, AT ITS OPTION REPAIR OR REPLACE THE CHART OR REFUND THE MONEY PAID FOR THE CHART WHICH FAILS TO MEET THIS WARRANTY, PROVIDED HOWEVER JEPPESEN'S TOTAL LIABILITY FOR ANY CLAIM FOR BREACH OF THIS EXPRESS WARRANTY IS LIMITED TO GENERAL MONEY DAMAGES, NOT TO EXCEED THE TOTAL AMOUNT PAID BY YOU FOR AIRWAY MANUAL SERVICES IN THE THREE MONTHS IMMEDIATELY PRECEDING THE DATE THAT THE CLAIM AROSE OR, IN THE CASE OF A TRIP KIT, GENERAL MONEY DAMAGES NOT TO EXCEED THE TOTAL AMOUNT PAID BY YOU FOR THE TRIP KIT. THIS SECTION STATES YOUR SOLE AND EXCLUSIVE REMEDY FOR BREACH OF THIS WARRANTY. IF YOU PURCHASED THE MANUAL OR THE TRIP KIT FROM JEPPESEN GMBH IN GERMANY, THE FOLLOWING APPLIES: THE FOREGOING WARRANTY WILL MEAN "GEWÄHRLEISTUNG" AND WILL NOT BE CONSTRUED AS A "GARANTIE". § 443 OF THE GERMAN CIVIL CODE. "BGB" DOES NOT APPLY.

DISCLAIMER

THE CONDITIONS, REPRESENTATIONS, GUARANTEES, OBLIGATIONS, LIABILITIES AND WARRANTIES (IF ANY) OF JEPPESEN AND YOUR REMEDIES SET FORTH HEREIN ARE EXCLUSIVE AND IN SUBSTITUTION FOR, AND YOU HEREBY WAIVE, RELEASE AND RENOUNCE, ALL OTHER WARRANTIES, CONDITIONS, REPRESENTATIONS, GUARANTEES, OBLIGATIONS AND LIABILITIES OF JEPPESEN, AND ANY OTHER RIGHTS, CLAIMS AND REMEDIES YOU MAY HAVE AGAINST JEPPESEN, EXPRESS OR IMPLIED, ARISING BY LAW, EQUITY OR OTHERWISE, WITH RESPECT TO THIS NOTICE, THE MANUAL PROVIDED HEREUNDER AND ANY NONCONFORMANCE OR DEFECT IN THE DESIGN, ADEQUACY, ACCURACY, RELIABILITY, SAFETY, OR CONFORMANCE WITH GOVERNMENT STANDARDS OR REGULATIONS OF THIS MANUAL INCLUDING BUT NOT LIMITED TO: (I) ANY IMPLIED WARRANTY OF MERCHANTABILITY, SATISFACTORY QUALITY, OR FITNESS; (II) ANY IMPLIED WARRANTY ARISING FROM COURSE OF PERFORMANCE, COURSE OF DEALING OR USAGE OF TRADE; (III) ANY OBLIGATION, LIABILITY, RIGHT, CLAIM OR REMEDY IN STRICT LIABILITY OR TORT, WHETHER OR NOT ARISING FROM THE NEGLIGENCE OF JEPPESEN; AND (IV) ANY OBLIGATION, LIABILITY, RIGHT, CLAIM OR REMEDY FOR LOSS OF OR DAMAGE TO ANY PROPERTY, INCLUDING WITHOUT LIMITATION ANY AIRCRAFT. JEPPESEN WILL HAVE NO OBLIGATION OR LIABILITY WHATSOEVER, (1) WHETHER ARISING IN LAW, EQUITY, CONTRACT (INCLUDING BUT NOT LIMITED TO WARRANTY), TORT (INCLUDING BUT NOT LIMITED TO THE NEGLIGENCE OF

JEPPESEN), STRICT LIABILITY OR OTHERWISE AND (2) WHETHER SUCH LOSSES OR DAMAGES ARE DIRECT, INDIRECT OR OTHERWISE FOR LOSS OF USE, REVENUE, PROFIT, ANTICIPATED SAVINGS, BUSINESS VALUE, OPPORTUNITY OR GOODWILL OR FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, EXEMPLARY OR PURE ECONOMIC LOSSES OR DAMAGES.

For purposes of this Section, the term “Jeppesen” includes (i) Jeppesen , (ii) The Boeing Company, (iii) their respective parents, subsidiaries, and affiliates, (iv) the assignees of each, and (v) their respective directors, officers, contractors, licensors, subcontractors, employees and agents.

TERMINAL CHARTS
TERMINAL

Akureyri, Iceland, Construction work will be
ongoing Northwest of terminal as a new
apron is being built (based on SUP 007-21).

Horta, Azores, (10-3C) Due to VSM VORDME
not available modify SIDs VSM 3G & 3H to
read: '...intercept 146° bearing from FIL to
OLDEK, turn LEFT direct to ZUPAZ'.

Due to VSM VORDME not available STAR
VSM 9A (10-2E) and SIDs VSM 3E & 3W
(10-3C) u/s.

Keflavik, Iceland, (10-9A) Construction works
to build an extension to the north (interna-
tional) terminal, the so called "East wing" -
ACFT stand 2 will be closed during the whole
construction period (based on SUP
017-22). Refer also latest NOTAMs.

(10-9A) The estimated construction period is
from April 2023 - stand 10 will be closed. In
summer 2023 remote stands 77 and 79 will
be changed and the current primary stands
will be removed but current secondary stands
remain. Refer to the latest NOTAMs. Based
on SUP 003-23.

(10-9A) The estimated construction period is
from January 2023 - stand 10 will be closed.
In spring 2023 remote stands 77 and 79 will
be changed and the current primary stands
will be removed but current secondary stands
remain. Refer to the latest NOTAMs. Based
on SUP 019-22.

(10-9B) Concrete reparation at Apron stands,
SW of hangar. Stands 128 thru 138 are only
permitted for ACFT to be towed-in
or -out with engines shut down (based on
SUP 008-22). Refer also to latest NOTAMs.

Construction works at TWY G1 and G2 (based
on SUP 003-22). Refer to 10-8A chart and
latest NOTAMs.

ATLANTIC

Construction works on new twy & rapid exit twy (based on SUP 020-22). Refer to temp chart 10-8B and latest NOTAMs.

Temporary building on stand 6 - the building is a temporary border area. Stand 6 is closed. Stand 2 is already closed due to other projects. Based on SUP 018-22.

Lajes, Azores, (Lajes AB), (11-2) ILS Rwy 15 Expect Missed Approach instructions by ATC.

(11-3) ILS Rwy 33: Expect radar vectors for ILS.

Based on MIL SUP 007-23:

- (11-5) ILS Rwy 15 (MILITARY): Expect missed approach instructions by ATC.
- (11-6) ILS Rwy 33 (MILITARY): Expect radar vectors for ILS.
- (14-1) TACAN Rwy 15: Expect missed approach instructions by ATC.
- (14-2) TACAN Rwy 33: Procedure suspended.

TWY G closed (based on SUP 050-22, Eff 6 OCT 22 based on SUP 058-22, & MIL SUP 017-22).

Maniitsoq, Greenland, MAG VAR changed to 29°W. All bearings reduced by 2°.

Ponta Delgada, Azores, (Joao Paulo II), Due to VSM VORDME not available STAR VSM 8B (10-2E) is limited to RNAV 5 (GNSS only); SID VSM 9R (10-3E) u/s.

Santa Maria, Azores, Due to VSM VORDME not available, for all STARs (10-2) apply the following: RNAV 5 (GNSS only); all SIDs (10-3 through 10-3D) u/s.

VOR DME VSM VOR Part unservicable (based on SUP 26-23).

Following procedures not available: VOR Rwy 18 (13-1), VOR Z Rwy 36 (13-2) and VOR Y Rwy 36 (13-3).

ILS or LOC Rwy 18 (11-1) base turn suspended, temporary missed apch: Climb

STRAIGHT AHEAD to 3500' and contact Approach.

Thule, Greenland, (Thule AB), (12-1) Amend number changed from 5 to 6

Vagar, Faroe Is, (10-3B) RWY 12 departure limitation due to wind speed - permissible sector when wind more than 15 KT under clarification, caution advised.

TERMINAL CHARTS

GENERAL

Due to a change of the FAA's statute mile equivalent value for RVR, approach charts with a visibility of RVR 55 or 1 1/4 should be RVR 55 or 1.

ILS Procedures RVR 1800 Statute Mile Equivalent-U.S. FAA Airports

On a number of ILS approach procedures at U.S. FAA airports, the published landing visibility value of RVR 1800 depicts a Statute Mile equivalent value of 3/8 Statute Mile. According to FAA FAR and AIM publications, the Statute Mile equivalent for RVR 1800 should be 1/2 Statute Mile

Beginning with the revision dated 20 May 2016 affected U.S. ILS approach charts will be updated to depict the appropriate Statute Mile equivalent visibility of 1/2 Statute Mile.

MALSR & SSALR RAIL out Lighting Condition - U.S. FAA Locations

The FAA has confirmed that for MALSR and SSALR approach light systems, the RAIL out, or partial system condition, is not applicable when determining landing visibilities

When any component of a MALSR or SSALR approach light system is inoperative, such as RAIL out, the landing visibilities should be determined as if the entire lighting system were inoperative (ALS out). Therefore, the RAIL out visibility column should be disregarded.

TERMINAL

Enroute Data - Atlantic

ATLANTIC HF COMMUNICATIONS - NORTH AND SOUTH ATLANTIC REGION

ATLANTIC

HF COMMUNICATIONS - NORTH AND SOUTH ATLANTIC REGION

ATLANTIC

1.1 New York Oceanic Airspace

ATC applies 50 NM lateral separation between aircraft authorized RNP 10 or RNP 4 within the West Atlantic Route System (WATRS) (that is, New York Oceanic West airspace). ATC similarly applies 50 NM lateral separation in the Atlantic portion of the Miami Oceanic CTA as well as the San Juan CTA/FIR. ATC may apply 50 NM lateral separation between aircraft authorized RNP 10 or RNP 4 in airspace outside of WATRS (that is, New York Oceanic East).

Aircraft authorized RNP 10 or RNP 4 will have a better chance of obtaining their preferred routing and altitude in the most densely used airspace (that is, below FL410) because of their ability to participate in ATC's use of 50 NM lateral separation. Non-RNP 10 or non-RNP 4 aircraft will be spaced at least 90 NM laterally from other aircraft.

ATC will not apply 50 NM lateral separation on routes that are defined by reference to ICAO standard ground-based navigation aids. In addition, 50 NM lateral separation is not applied to aircraft on the following route segments, at and above FL310, because the routes are considered within ATC radar and VHF radio coverage:

- M201 between VIRST and VEGAA

NOTE: SLOP is not to be used while flying these route segments.

Flight plan filing and addressing requirements are detailed in Flight Plan Filing Requirements.

Operators of aircraft not authorized RNP 10 or RNP 4 are expected to follow the procedures for alerting ATC of their RNP status. Those operators are expected to indicate their "non-RNP 10" status in Item 18 of their ATC flight plan. In addition, pilots are expected to inform ATC of their "non-RNP 10" status on initial call to ATC on WATRS routes and when reading back a clearance to descend through FL410.

Filing a flight plan for, and conducting operations under, RNP 10 or RNP 4 navigation specifications require the aircraft to be equipped with two operable long-range navigation systems (LRNS). Operators who indicate RNP 10 or RNP 4 capability on their ATC flight plans, and subsequently experience a LRNS failure while operating on a WATRS route, must alert ATC to this failure. If the pilot believes the aircraft can continue to be navigated within 10 NM of the cleared route with the single LRNS, ATC should be informed; as such, ATC may continue the aircraft on the cleared route.

In the event of LRNS failure prior to joining a WATRS route, pilots must inform ATC of the failure and ensure ATC is aware the aircraft is no longer qualified for the RNP level indicated in the flight plan. In addition to this notification, pilots should request ATC amend their flight plan to remove the RNP capability indication in Item 18 of the flight plan.

Information regarding operations in WATRS can be found in the West Atlantic Route System, Gulf of Mexico, and Caribbean Resource Guide for U.S. Operators which is available at: http://www.faa.gov/about/office_headquarters/offices/avs/offices/afx/afs/afs400/afs410/media.WATRS.pdf

ATLANTIC

1.2 Operation on Routes within the WATRS Plus CTAs

The 50 NM lateral separation is applied at all altitudes above the floor of controlled airspace. Lateral separation of 100 NM will continue to be provided in the Houston Oceanic, Monterrey, and Merida CTA/FIRs to aircraft not authorized RNP 10 or RNP 4. Similarly, those aircraft will experience 90 NM lateral separation in Miami Oceanic CTA/FIR.

Operations on certain routes that fall within the boundaries of affected CTAs are not affected by the introduction of 50 NM lateral separation. Operation on the following routes is not affected:

- Routes that are flown by reference to ICAO standard ground-based navigation aids (VOR, VOR/DME, NDB); and
- Special Area Navigation (RNAV) routes Q100, Q102 and Q105 in the Houston, Jacksonville and Miami CTAs.

1.3 Provisions for Accommodation of Non-RNP10 Aircraft (Not Authorized RNP10 or RNP4)

Operators of Non-RNP 10 aircraft must:

- Annotate ICAO flight plan Item 18 as follows:
 - “RMK/NON-RNP10” (no space between letters and numbers).
 - Use of flight plan item 18 codes “PBN/A1” or “PBN/L1” are restricted to operators and aircraft specifically authorized for RNP 10 or RNP 4, as applicable.
- Pilots of non-RNP 10 aircraft that operate in GoMex CTAs must report the lack of authorization by stating “Negative RNP 10”:
 - On initial call to ATC in a Gulf of Mexico CTA; or
 - When approval status is requested by the controller.

Non-RNP 10 operators/aircraft may file any route at any altitude in a Gulf of Mexico CTA. They will be cleared to operate on their preferred routes and altitudes as traffic permits. 50 NM lateral separation will not be applied to non-RNP 10 aircraft.

Non-RNP 10 aircraft should plan on completing their climb to or descent from higher FLs within radar coverage, if possible.

In order to maximize operational flexibility provided by 50 NM lateral separation, operators capable of meeting RNP 10 or RNP 4 that operate on oceanic routes or areas in the Gulf of Mexico CTAs should obtain authorization for RNP 10 or RNP 4 and annotate the ICAO flight plan accordingly.

NOTE: RNP 10 is the minimum Navigation Specification (NavSpec) required for the application of 50 NM lateral separation. RNP 4 is an operator option; operators/aircraft authorized RNP 4 are not required to also obtain RNP 10 authorization.

ATLANTIC

1.4 RNP 10 or RNP 4 Authorization Policy and Procedures for Aircraft and Operators

The following is ICAO guidance on the state authority responsible for authorizations such as RNP 10, RNP 4, and RVSM:

- International commercial operators: The State of Registry makes the determination that the aircraft meets the applicable RNP requirements. The State of Operator issues operating authority (for example, Operations Specifications (OpSpecs)).
- International general aviation (IGA) operators: The State of Registry makes the determination that the aircraft meets the applicable RNP requirements and issues operating authority (for example, Letter of Authorization (LOA)).

Guidance Material

FAA Advisory Circular (AC) 90-105, Approval Guidance for RNP Operations and Barometric Vertical Navigation in the U.S. National Airspace System and in Oceanic and Remote Continental Airspace, provides operational approval guidance for RNP 4 and 10. It identifies minimum aircraft capabilities and operator procedural and training requirements in order to qualify for RNP 4 or 10. AC 90-105 is consistent with the ICAO PBN Manual discussed below. Pertinent FAA and ICAO documents are posted online in the West Atlantic Route System, Gulf of Mexico and Caribbean Resource Guide for U.S. Operators described below.

ICAO Performance-based Navigation (PBN) Manual (ICAO Doc 9613). Guidance for authorization of RNP 10 and RNP 4 is provided in ICAO Doc 9613. RNP 10 is addressed in Volume II, Part B; Chapter 1. RNP 4 is addressed in Volume II, Part C; Chapter 1.

Operators and authorities are encouraged to use the RNP 10 or RNP 4 Job Aids posted on the FAA Resource Guide for U.S. Operators described above. For U.S. operators, a set of RNP 10 and RNP 4 Job Aids provides references to FAA documents. An RNP 4 Job Aid, which references the ICAO PBN Manual, is also available on the ICAO European and North Atlantic Office website. These Job Aids address the operational and airworthiness elements of aircraft and operator authorization and provide references to appropriate document paragraphs. The Job Aids provide a method for operators to develop and authorities to track the operator/aircraft program elements required for RNP 10 or RNP 4 authorization.

1.5 Flight Planning Requirements

Operators must make ICAO flight plan annotations in accordance with this paragraph and, if applicable, Provisions for Accommodation of Non-RNP 10 Aircraft (Not Authorized RNP 10 or RNP 4).

ICAO flight plans must be filed for operation on oceanic routes and areas in the Houston Oceanic CTA/FIR, the Gulf of Mexico portion of the Miami CTA/FIR, the Monterrey CTA and Merida High CTA.

To inform ATC that they have obtained RNP 10 or RNP 4 authorization and are eligible for 50 NM lateral separation, operators must:

- Annotate ICAO Flight Plan Item 10 (Equipment) with the letter “R”; and

ATLANTIC

- Annotate Item 18 (Other Information) with, as appropriate, “PBN/A1” for RNP 10 aircraft or “PBN/L1” for RNP 4 aircraft (no space between letters and numbers).

NOTE: The letter “R” indicates that the performance-based navigation specification (for example, RNP 10 or RNP 4) is specified in Item 18 following the indicator “PBN/.”

1.6 Pilot and Dispatcher Basic and In-flight Contingency Procedures

The RNP 10 and RNP 4 Job Aids contain references to pilot and, if applicable, dispatcher procedures contained in Advisory Circular 90-105 and ICAO PBN Manual, Volume II, Parts B and C, Chapter 1.

Pilots should use SLOP procedures in the course of regular oceanic operations. SLOP procedures are published in ICAO Document 4444, 15th Edition, Amendment 2, paragraph 16.5.

Strategic Lateral Offset Procedure (SLOP) While Within Oceanic Airspace

These procedures have been developed in accordance with the ICAO PANS ATM, 16.5.

It has been determined that allowing aircraft conducting oceanic flight to fly lateral offsets, in increments of .1 nautical mile (NM) up to a maximum of 2 NM right of centerline, will provide an additional safety margin and mitigate the risk of conflict when non-normal events, such as aircraft navigation errors, altitude deviation errors, and turbulence-induced altitude-keeping errors occur.

These procedures are authorized in U.S.-controlled Oceanic Airspace and also the airspace surrounding the island of Bermuda.

These procedures provide for offsets within the following guidelines: Along a route or track there will be 21 positions that an aircraft may fly: on centerline or at increments of .1 NM (for example, .1, .2, .3, .4 1.8, 1.9, 2.0) right of centerline out to a maximum offset of 2 NM. Offsets must not exceed 2 NM right of centerline. The intent of this procedure is to reduce risk (add safety margin) by distributing aircraft laterally across the 21 available positions.

Pilots must fly the track centerline if their aircraft does not have automatic offset programming capability. Pilots of aircraft unable to offset at .1 NM increments should fly on the track centerline, or at the 1.0 NM or 2.0 NM positions right of centerline when using SLOP.

An aircraft overtaking another aircraft should offset within the confines of this procedure, if capable, so as to create the least amount of wake turbulence for the aircraft being overtaken.

Pilots should also fly one of the available offset positions shown above to avoid wake turbulence.

Pilots should use whatever means available to determine the best flight path to fly.

Aircraft should not offset to the left of center line nor offset more than 2 NM right of center line. Pilots may contact other aircraft on VHF frequency 123.45, as necessary, to coordinate the best wake turbulence offset option.

NOTE: It is recognized that pilots will use their judgment to determine the action most appropriate to any given situation and have the final authority and responsibility for the safe operations of the aircraft.

ATLANTIC

Pilots may apply an offset outbound after the oceanic entry point. Aircraft transiting Bermuda airspace may remain on their established offset.

There is no ATC clearance required for this procedure and it is not necessary that ATC be advised.

In-flight Contingency Procedures in Oceanic Airspace

Special Procedures for In-Flight Contingencies and Weather Deviation Procedures are in force in New York Oceanic West (WATRS). For details refer to Jeppesen ATC-Chapter Air Traffic Control Data Atlantic “Special Procedures for In-Flight Contingencies in NAT Oceanic Airspace”.

When pilots suspect a navigation system malfunction, in addition to the actions suggested in the Jeppesen ATC-Chapter above, the following actions should be taken:

- Immediately inform ATC of navigation system malfunction or failure;
- Accounting for wind drift, fly magnetic compass heading to maintain track; and
- Request radar vectors from ATC, when available.

Pilot Report of Non-RNP 10 Status

The pilot must report the lack of RNP 10 or RNP 4 status in accordance with the following:

- When the operator/aircraft is not authorized RNP 10 or RNP 4

If approval status is requested by the controller:

- The pilot must communicate approval status using the following phraseology as below:

Controller Request	Pilot Response
“(Call sign) confirm RNP10 or 4 approved”.	“Affirm RNP10 approved” or “Affirm RNP4 approved” as appropriate, or “Negative RNP10”.

ATLANTIC CPDLC COVERAGE

CPDLC OVERVIEW

**ATLANTIC
CPDLC COVERAGE**

Data Link Services

Airspace	CPDL C	ADS-C	Logon	Remarks
Barcelona FIR/UIR	O	N	LECB Traffic overflying Barcelona UIR logon may be initiated any time prior to entry into Barcelona UIR, preferably 10 minutes before. Traffic departing from airports within Barcelona FIR logon should be initiated as soon as possible after crossing FL145 except traffic departing: – Valencia via MANDY, CENTA, ASTRO and NARGO; or – Alicante (Alicante-Elche Miguel Hernandez) via CATON, ASTRO, YES and RESTU; which shall directly logon to LECM.	CPDLC services are available above FL285. ATN B1. Data communication via FANS 1/A will not be supported.
Bodo Oceanic FIR	O	O	ENOB Logon should be initiated 20 minutes prior to entry into Bodo Oceanic FIR.	CPDLC position reports are not accepted in Bodo FIR. The use of data link services do not exempt the requirement of establishing voice communications with Bodo Radio at or before the FIR boundary, whether on HF or VHF, even if a CPDLC connection is established. CPDLC will be the primary means of communication. Voice will be used as the alternate means of communication.

**ATLANTIC
CPDLC COVERAGE****Data Link Services (continued)**

Airspace	CPDL C	ADS-C	Logon	Remarks
Bordeaux ACC	O	N	LFBB Logon should be initiated 15 minutes prior to entry into Bordeaux ACC.	CPDLC services are available above FL195. ATN B1. Data communication via FANS 1/A will not be supported. The use of CPDLC services is not mandatory and is conducted at the discretion of ATC. Should CPDLC dialogues be pending, voice remains in any case the primary means of communication.
Brest ACC	O	N	LFRR Logon should be initiated 15 minutes prior to entry into Brest ACC.	CPDLC services are available above FL195. ATN B1. Data communication via FANS 1/A will not be supported. The use of CPDLC services is not mandatory and is conducted at the discretion of ATC. Should CPDLC dialogues be pending, voice remains in any case the primary means of communication.

ATLANTIC CPDLC COVERAGE

Data Link Services (continued)

Airspace	CPDLC	ADS-C	Logon	Remarks
Canaries FIR/UIR	O	O	GCCC FANS 1/A: Traffic with origin GC** exiting Canaries FIR/UIR via Santa Maria Oceanic FIR, Sal Oceanic FIR/UIR or Dakar FIR/UIR shall logon during climbing as soon as possible after crossing FL145. Traffic with destination GC** entering Canaries FIR/UIR via Santa Maria Oceanic FIR, Sal Oceanic FIR/UIR or Dakar FIR/UIR or overflying traffic shall logon at least 30 minutes before entering Canaries UIR. ATN B1: Traffic with origin GC** exiting Canaries FIR/UIR via Lisbon FIR or Casablanca FIR and traffic without FANS equipment with origin GC** exiting Canaries FIR/UIR via Santa Maria Oceanic FIR, Sal Oceanic FIR/UIR or Dakar FIR/UIR shall logon during climbing, as soon as possible after crossing FL145. Traffic with destination GC** entering Canaries FIR/UIR via Lisbon FIR or Casablanca FIR/UIR or traffic without FANS equipment	FANS 1/A and ATN B1. ATN CPDLC: Voice communications will remain as priority means of communication over CPDLC. FANS CPDLC: Compulsory in oceanic environment for equipped aircraft due to technical limitations of VHF or HF voice communication. ATN B1 data link services are available in Canaries UIR, in the area defined by the lateral limits of Canaries TMA to the north of 26N parallel and to the east of 19W meridian from FL285, and in Canaries FIR/UIR, within the same lateral limits, below that flight level, according to coverage and/or availability of VDL2 stations, subject to the established logon procedures.

**ATLANTIC
CPDLC COVERAGE**

Data Link Services (continued)

Airspace	CPDLC	ADS-C	Logon	Remarks
			with origin GC** exiting Canaries FIR/UIR via Santa Maria Oceanic FIR, Sal Oceanic FIR/UIR or Dakar FIR/UIR shall logon preferably 15 minutes, before entering Canaries UIR.	
Edmonton FIR	O	O	CZEG Logon should be initiated 15 to 45 minutes prior to entry into Edmonton FIR from airspace where no ATS data link service are being received.	CPDLC services are available above FL290.
Gander Oceanic FIR	O	O	CZQX Logon should be initiated 15 to 45 minutes prior to entry into Gander Oceanic FIR from airspace where no ATS data link service are being received.	In addition to Gander FIR (CZQX), Gander provides air traffic services at and above FL200 in that part of the Nuuk FIR (BGGL) which lies south of 6330N. CPDLC services are provided within Gander's service area.
Gander Domestic/Oceanic FIR	O	N/O	CZQX (Gander Oceanic) CDQX (Gander Domestic) Logon should be initiated 15 to 45 minutes prior to entry into Gander Oceanic FIR from airspace where no ATS data link service are being received.	Gander Domestic at FL290 and above, Gander Oceanic below FL290. Pilots submitting a request for clearance must use an oceanic entry and exit points located within GOTA and not a boundary fix along the Montreal CTA boundary. Flight crews submitting a request for clearance based on Montreal CTA boundary will cause system errors and may affect the ocean profile.

ATLANTIC CPDLC COVERAGE

Data Link Services (continued)

Airspace	CPDLC	ADS-C	Logon	Remarks
Gander Domestic FIR	O	N	CDQX Logon should be initiated 15 to 45 minutes prior to entry into Gander Domestic FIR from airspace where no ATS data link service are being received.	CPDLC services are available above FL290.
Lisbon FIR	O	N	LPPC Logon should be initiated 10 to 15 minutes prior to entry into Lisbon FIR, except for east-bound traffic entering Lisbon FIR from Santa Maria Oceanic through 15W, who should expect ATN coverage starting at 14W or later. For aircraft departing from an aerodrome in close proximity to Lisbon FIR, logon can be initiated on the ground, if Lisbon ACC is the first CPDLC-capable unit.	CPDLC services are guaranteed above FL285, below FL285 the services are available including the TMAs located within Lisbon FIR where a reduced usage of CPDLC communication should be expected. Between 14W and 15W an ATN coverage is not guaranteed. CPDLC should only be used for non-time-critical requests. Voice communication and radiotelephone have priority over CPDLC instructions. A clearance request via CPDLC should subsequently issued via CPDLC and a clearance request via radiotelephone should also be issued by radiotelephone. ATN B1.
London FIR/UIR	O	O	EGTT	CPDLC services are available from FL285 and above and will be provided at FL195 and above where possible. CPDLC services are provided to ATN B1, FANS 1/A and FANS 1/A+ equipped aircraft.

**ATLANTIC
CPDLC COVERAGE**

Data Link Services (continued)

Airspace	CPDL C	ADS-C	Logon	Remarks
Madrid FIR/UIR	O	N	LECM Traffic overflying Madrid UIR logon may be initi- ated any time prior to entry into Madrid UIR, preferably 10 minutes before. Traffic departing from airports within Madrid FIR logon should be initi- ated as soon as possible after crossing FL145.	CPDLC services are available above FL285. ATN B1. Data communication via FANS 1/A will not be supported.
Moncton FIR	O	N	CZQM Logon should be initi- ated 15 to 45 minutes prior to entry into Mon- cton ACC.	CPDLC services are available above FL290.
Montreal FIR	O	N	CZUL Logon should be initi- ated 15 to 45 minutes prior to entry into Mon- treal FIR from airspace where no ATS data link service are being re- ceived.	CPDLC services are available above FL290.
New York Oceanic FIR	O	O	KZWY Logon should be initi- ated 15 to 45 minutes prior to entry into New York Oceanic FIR.	Do not use CPDLC for position re- porting. Use ADS-C or voice only. SELCAL check via HF are required for all FANS connected aircraft prior to entering the CTA/FIR. Do not send a CPDLC position re- port to confirm CDA prior to, or upon crossing the FIR.

ATLANTIC CPDLC COVERAGE

Data Link Services (continued)

Airspace	CPDLC	ADS-C	Logon	Remarks
Paris ACC	O	N	LFFF Logon should be initiated 15 minutes prior to entry into Paris ACC.	CPDLC services are available above FL195. ATN B1. Data communication via FANS 1/A will not be supported. The use of CPDLC services is not mandatory and is conducted at the discretion of ATC. Should CPDLC dialogues be pending, voice remains in any case the primary means of communication.
Reykjavik Oceanic FIR	O	O	BIRD Logon should be initiated prior to entry Reykjavik CTA: – 30 minutes from Edmonton or Shanwick Oceanic; – 20 minutes from Bodo, Gander or Murmansk; – 15 minutes from Scottish Domestic or Stavanger.	Confirm CPDLC CDA: Free text up-link. Report revised ETA: Next waypoint ETA error 3 minutes or more, use free text REVISED ETA [position] [time]. In addition to Reykjavik FIR, Reykjavik provides air traffic services at and above FL200 in that part of the Nuuk FIR which lies north of 6330N. CPDLC services are provided south of 80N in Reykjavik's service area.

**ATLANTIC
CPDLC COVERAGE**

Data Link Services (continued)

Airspace	CPDL C	ADS-C	Logon	Remarks
Sal Oceanic FIR/UIR	O	O	GVSC Entering from Canaries, Dakar and Santa Maria ACC: – if 10 minutes before reaching the common boundary point the automatic logon with Sal Oceanic ACC has not been successful, pilots shall start a manual logon to Sal Oceanic ACC; – aircraft coming from airspace where FANS 1/A services have not been provided, pilots are requested to perform a manual logon between 15 and 45 minutes before the common boundary point.	

**ATLANTIC
CPDLC COVERAGE**

Data Link Services (continued)

Airspace	CPDLC	ADS-C	Logon	Remarks
Santa Maria Oceanic FIR	O	O	LPPO Flights entering from Lisbon FIR or Madrid FIR logon should be initiated as soon as operationally feasible prior the FIR boundary estimated time and before submitting their oceanic clearance request. All other adjacent FIRs offer FANS 1/A datalink services, therefore the AFN logon transfer is expected to be done automatically without crew intervention.	CPDLC is the primary means of communication for FANS 1/A equipped aircraft, with voice communications used as backup.
Scottish UIR	O	O	EGPX	CPDLC services are available from FL285 and above and will be provided at FL195 and above where possible. CPDLC services are provided to ATN B1, FANS 1/A and FANS 1/A+ equipped aircraft.
Shannon UIR, NOTA and SOTA	O	O	EISN For westbound aircraft logon should be initiated 5 minutes before Shannon boundary.	ATN B1 and FANS 1/A. CPDLC available above FL285 in the Shannon UIR, SOTA and NOTA but may be available in certain sectors from FL160 and above. Aircraft departing from Irish airports and planning to enter the Shannon UIR, SOTA and NOTA above FL285 are requested to only logon climbing through FL160.

**ATLANTIC
CPDLC COVERAGE**

Data Link Services (continued)

Airspace	CPDLC	ADS-C	Logon	Remarks
Shanwick Oceanic FIR	O	O	EGGX	Report revised ETA: Next waypoint ETA error 3 minutes or more, use free text REVISED ETA [position] [time].
Toronto FIR	O	N	CZYZ Logon should be initiated 15 to 45 minutes prior to entry into Toronto FIR from airspace where no ATS data link service are being received.	CPDLC services are available above FL290.
Winnipeg FIR	O	N	CZWG Logon should be initiated 15 to 45 minutes prior to entry into Winnipeg FIR from airspace where no ATS data link service are being received.	CPDLC services are available above FL290.

NOTE: O = Operational, T = Trial, N = Not available

**ATLANTIC
NORTH AMERICAN ROUTE PROGRAM (NRP)**

INTRODUCTION

- a. The North American Route Program (NRP) is a joint FAA and NAV CANADA program the objective of which is to harmonize and adopt common procedures, to the extent possible, for application to random route flight operations at and above FL290 within the conterminous U.S. and Canada.
- b. The NRP has been implemented through various phases with the end goal of allowing all international and domestic flight operations to participate in the NRP throughout the conterminous U.S., Alaska, and Canada.
- c. Flights may participate in the NRP under specific guidelines and filing requirements:
 1. provided the flight originates and terminates within conterminous U.S. and Canada; or,
 2. for North Atlantic international flights operating within the North American Route (NAR) System.

FAA/NAV CANADA COMMON PROCEDURES

The following common FAA and NAV CANADA procedures apply:

- a. Flights to operate at or above FL290.
- b. For that portion of flight within 200 NM of the departure or destination airport, flights shall be filed and operated via Standard Instrument Departures (SIDs), Departure Procedures (DPs), Standard Terminal Arrival Routes (STARs) or published Preferred IFR Routes. If none of the above are available, airways may be used.
- c. NRP flights are not normally subject to routing restrictions such as published Preferred IFR Routes or airways, beyond a 200 NM radius of both the departure and destination airports.
- d. Flight planning requirements are:
 1. routes shall contain at least one significant point in each delegated area of airspace jurisdiction for each FAA Air Route Traffic Control Center (ARTCC) or Canadian FIR/CTA;
 2. significant points may be a navigational aid or waypoint defined in fix-radial distance (FRD) format from a navigational aid. Within Canadian airspace a significant point may also be a coordinate described in degrees and minutes of latitude/longitude;
 3. for routes that cross the U.S./Canadian border, a significant point within 30 NM of either side of the border shall be filed;
 4. significant points should be filed for all turnpoints;
 5. route(s) shall avoid active Class "F" airspace;
 6. "NRP" shall be entered in the Remarks section of the flight plan; and
 7. flight plans to be filed at least one hour prior to departure.
- e. In the event that a NRP aircraft has to be recleared due to weather or tactical reasons, ATC will attempt to return the aircraft to the original NRP routing as soon as practical. Aircraft that

ATLANTIC NORTH AMERICAN ROUTE PROGRAM (NRP)

depart from the NRP routing due to a pilot request or an ATC clearance authorizing a direct routing will be considered as a non participant of the NRP.

- f. Unless published routing restrictions are in effect, North Atlantic International flights planning to operate within the NAR System may file NRP routes beyond 200 NM of the NAR identified system airport and the published Inland Navigation Fixes (INFs).

SPECIFIC FAA REQUIREMENTS

The following specific FAA requirements apply:

- a. Flights may not be filed via a DP/STAR within offshore transition areas (12 NM or more off the U.S. shoreline).
- b. Flights may be filed and flown on the complete transition of DPs and/or STARs for specific airports in lieu of the 200 NM route planning requirement described in **COMMON PROCEDURES**, paragraph "b" above. For listing of the airports refer to the current FAA Advisory Circular – NRP.
- c. Flights not meeting the above guidelines are to be requested through the FAA nonpreferred route programs. Those requests will be approved/disapproved on a workload permitting basis.

SPECIFIC NAV CANADA REQUIREMENTS

The following specific Canadian requirements apply:

- a. When a significant point is defined by latitude and longitude the following applies:
 1. for flights operating on predominately north or south tracks (315°T clockwise through 045°T or the reciprocals), tracks shall be defined by reference to significant points formed by the intersection of whole degrees on longitude with specified parallels of latitude spaced at 5° of latitude expressed in longitude by degrees and minutes and latitude by degrees;
 2. for flights operating on predominately east or west tracks (046°T clockwise through 134°T or the reciprocals), tracks shall be defined by reference to significant points formed by the intersection of half or whole degrees of latitude with meridians spaced at intervals of 10° expressed in longitude by degrees and latitude by degrees and minutes.
- b. All flights to remain north of N48°15'00" W90°00'00" or south of N47°30'00" W90°00'00".
- c. *Toronto International (CYYZ)*. For aircraft landing at CYYZ, those aircraft inbound from the northwest are to terminate the NRP portion and join the BOXUM arrival at OTNIK.
- d. *Vancouver International (CYVR)*. For aircraft landing at CYVR, those aircraft arriving from the east and north of the Canada/USA border are to arrange routing to be north of J500 no later than the intersection LOCAN (N49°30.7' W117°33.1').
- e. *Ottawa/Macdonald-Cartier International (CYOW)*. For aircraft landing at CYOW, those aircraft inbound from the west are to terminate the NRP portion and join a mandatory arrival routing no later than the intersection SMARE (N49°19.6' W78°9.8').

ATLANTIC
NORTH AMERICAN ROUTE PROGRAM (NRP)

- f. *Montreal/Pierre Elliott Trudeau International (CYUL)*. For aircraft landing at CYUL, those aircraft inbound from the west-northwest are to terminate the NRP portion and join a mandatory arrival routing no later than BEMOG provided the route proceeds over or north of BEMOG (N46°09.0' W075°34.4'). For routes that do not comply with this requirement, terminate the NRP portion and join a mandatory arrival routing no later than BEMOG.

ATLANTIC NORTH AMERICAN ROUTES (NARS) FOR NORTH ATLANTIC TRAFFIC

GENERAL

The objectives of the NAR system are as follows:

- a. To expedite flight planning;
- b. To reduce the complexity of route clearances and thereby minimize the confusion and error potential inherent in lengthy transmissions and readbacks; and
- c. To minimize the time spent in the route clearance delivery function.

The NAR System is designed to accommodate major airports in North America where the volume of North Atlantic (NAT) traffic and route complexity dictate a need to meet the above objectives. It is for the use of traffic entering/exiting the NAT and consists of a series of preplanned routes from/to coastal fixes and identified system airports. Most routes are divided into two portions:

- a. Common Portion: That portion of the route between a specified coastal fix or an oceanic entry/exit point and a specified Inland Navigation Fix (INF). Some routes have a common portion only (N598A–N700A); and
- b. Non-common Portion: That portion of the route between a specified INF and a system airport. The routes are within the high level airspace structure with a transition to/from system airports.

The routes are prefixed by the abbreviation “N” with the numbering for the common portions orientated geographically from south to north. The odd numbers have eastbound applications while the even numbers apply to westbound. Following a one-to-three-digit number, an alpha character indicates the validation codes and forms part of the route identifier. Validation codes are associated to amendments to the common routes only and not to non-common route portions.

Since a primary function of the NAR system is to complement the NAT traffic flow, a limited number of NAR routes, appropriate for the coastal fixes or oceanic entry/exit points serving the Organized Track System (OTS) and the domestic traffic organization, are included in the daily NAT/OTS message published by the Gander and Shanwick Oceanic Area Centers.

Aircraft can only join the NAR System:

- a. At an identified coastal fix or oceanic entry/exit point; or
- b. On departure from one of the identified system airports; or
- c. At an identified INF.

FLIGHT PLANNING

WESTBOUND

- a. Westbound routes begin at the oceanic exit points, thence along common route portions to an INF and then fan-out along non-common routes to selected system airports;
- b. For aircraft proceeding to an identified system airport and the route of flight to destination is described by a single NAR designator, use the designator;

ATLANTIC NORTH AMERICAN ROUTES (NARS) FOR NORTH ATLANTIC TRAFFIC

- c. For aircraft proceeding to a non system airport, but the route of flight is described by the common route portion to an identified INF, use the designator to the INF followed by a detailed routing to the destination.

EASTBOUND

- a. Eastbound routes only have a common portion from the INF to a coastal fix or oceanic entry point;
- b. When the route of flight is described by a single NAR designator, use the designator;
- c. For aircraft departing from a non-system airport, file via an appropriate detailed routing to the applicable INF and thence via the common portion to the coastal fix or oceanic entry point using the NAR designator;

GENERAL

For those cases not described above, a detailed routing is required.

NAR — REQUIREMENT

- a. There is no requirement to flight plan and operate using the NAR system with the following exceptions:
 1. Eastbound aircraft intending to operate on the NAR OTS and operating wholly on or south of a line between the intersections BAREE and TUDEP shall flight plan and operate using one of the NARs published on the daily OTS message.
 2. Westbound aircraft exiting the ocean via oceanic/coastal fixes JEBBY CARAC, BOBTU JAROM or RAFIN must file via one of the published NAR common portions as specified unless re-entering NY oceanic via M201/M202/M203:
 - JEBBY CARAC – N26B, N28B, N30B, N32B, N34B
 - BOBTU JAROM – N46G, N48G, N50G, N52G, N54G, N56G, N58D, N60D, N62C
 - RAFIN – N76A, N78A, N80A, N82A, N84A, N86A, N88A, N90A.
- b. NARs may be assigned by air traffic control for the tactical management of air traffic in Canadian Domestic airspace.
- c. For operators who elect not to use the NAR system, the rules of the North American Route Program (NRP) apply.

ROUTE CLEARANCES

For aircraft operating within the NAR system, the ATC routing clearance and pilot readback will be indicated by the NAR designator, e.g., “North American Route 105B.”

For aircraft operating in the NAR system but only using the common route portion, the ATC routing clearance and pilot readback will be indicated by the NAR designator followed by the detailed routing.

ATLANTIC NORTH AMERICAN ROUTES (NARS) FOR NORTH ATLANTIC TRAFFIC

For aircraft not operating in the NAR system, the ATC routing clearance and pilot readback will be via a detailed route.

Aircraft cleared to a system airport via a NAR designator are to follow the common and the non-common portion of the route to a system airport. If either the common or non-common portion of the issued NAR is incompatible or unacceptable, the pilot is to advise ATC accordingly.

DOCUMENTATION

It is expected that the following NAR documentation will be carried on the flight deck of each aircraft operating within the NAR system:

- a. The current publications of NAV Canada, Canadian Flight Supplement, or Federal Aviation Administration Airport/Facility Directory (Northeast) or the Jeppesen — ENROUTE — North American Routes (NARs) for North Atlantic Traffic which provides the current NAR; and
- b. the information in the current NAT/OTS message.

Changes to the NAR routes are advertised in the monthly publication Notices to Airman Publication (NTAP).

BOSTON ARTCC NORTH ATLANTIC ADVISORY

The Boston ARTCC North Atlantic Advisory is published daily and establishes required routing for aircraft that transition into the North American Route structure and the North Atlantic Track system. The North Atlantic Advisory provides specific routing for international traffic transitioning Boston ARTCC airspace and proceeding across the North Atlantic with the following exceptions:

Departures from ATL, CLT, DFW, IAD, IAH, MCO, MIA, RDU via eastbound routes that will traverse Boston ARTCC airspace may file the following:

- a. Via RBV LLUND
 1. LLUND BAYYS PUT QUBIS/TAFFY/MILS/TOPPS/EBONY
 2. LLUND BAYYS PUT WITCH ALLEX
 3. LLUND BAYYS PUT TUSKY/BRADD/KANNI
- b. Via RBV J62 RIFLE SHHAR TUSKY/BRADD/KANNI/WHALE/VITOL
- c. Via J174 RIFLE SHHAR TUSKY/BRADD/KANNI/WHALE/VITOL
- d. When the tracks are ALLEX and North, users may file to the most southern INF published on the daily track message
 1. Via RBV J62 RIFLE ACK (then direct to the most southern published INF)
 2. Via J174 RIFLE ACK (then direct to the southernmost published INF)

The Boston ARTCC North Atlantic Advisory is effective between the hours of 2000–0500 UTC.

ATLANTIC
NORTH AMERICAN ROUTES FOR NORTH ATLANTIC TRAFFIC NAR OVERVIEW

EXPLANATION OF LISTINGS

- a. Official location identifiers are used in the route description for navaid facilities.
- b. Intersection names are spelled out.
- c. Where two navaids, an intersection and a navaid, a navaid and a navaid radial and distance point, or any navigable combination of these route descriptions follow in succession, the route is direct.
- d. Radials/bearings and distances are included for uncharted, direct North American Routes within Canada.
- e. Change bars denote new or changed information. The effective date of such changes is shown at the top of each affected page. All other information is effective upon receipt.

SECURITY CONTROL OF AIR TRAFFIC

SHORT TITLE

1. This order may be cited as the Security Control of Air Traffic Order.

INTERPRETATION

2. (1) In this Order,
 - (a) "Air Defense Identification Zone" or "ADIZ" means the airspace extending upward from the surface of the earth in those areas of Canada and off the coasts of Canada illustrated on Enroute CA-5.
 - (b) "Defense Flight Notification" means a flight notification that
 - (i) includes the information required in a flight notification as set out in the Flight Plans and Flight Notifications Order; and
 - (ii) states the flight level or altitude above sea level and the true airspeed to be flown.
 - (c) "DVFR Flight Plan" means a flight plan that

CANADA

CANADA AIR DEFENSE IDENTIFICATION ZONES-ADIZ

- (i) includes the information required in a VFR flight plan as set out in the Flight Plans and Flight Notifications Order; and
 - (ii) states the flight level or altitude above sea level to be flown.
 - (d) “North Warning System Beacon” or “NWS Beacon” means a non-directional radio navigation aid beacon lying within the ADIZ.
 - (e) “SCATANA Rules” means the rules for the Security Control of Air Traffic and Air Navigation Aids as set out in Part III.
- (2) In this Order, a reference to a time or estimated time shall be to Coordinated Universal Time (UTC).

PART I**General Provisions Affecting All Flights**

3. No person shall operate an aircraft into or within the ADIZ unless he has filed an IFR Flight Plan, a DVFR Flight Plan or a Defense Flight Notification with an appropriate Air Traffic Services Unit, and unless
- (a) that aircraft is equipped with a two-way radio capable of permitting the communications required by this Order; and
 - (b) that person maintains a listening watch on a frequency that will permit the receipt of the instructions issued pursuant to this Order.
4. No deviation shall be made from a flight plan or flight notification submitted for a flight into or within the ADIZ unless
- (a) prior notification is given to the appropriate air traffic services unit;
 - (b) where prior notification is not possible, the deviation is reported to an appropriate air traffic services unit as soon as practicable.
5. Where due to an emergency, the pilot-in-command of an aircraft is unable to comply with any provisions of this Order, he shall submit a detailed report of the emergency in writing to the Minister of Transport, within forty-eight hours of the emergency.
6. The pilot-in-command of an aircraft who, because of communication failure, is unable to comply with paragraph 3(b) shall, if
- (a) operating in, or cleared to enter, controlled airspace in IFR flight, comply with the Communication Failure in IFR Flight Order; or
 - (b) in VFR flight, or in IFR flight other than IFR flight referred to in paragraph (a)
 - (i) proceed in accordance with his flight plan or flight notification, or
 - (ii) land at the nearest suitable aerodrome, except that if he has previously been notified that the SCATANA Rules are in effect, he shall land at the nearest suitable aerodrome.

CANADA
CANADA AIR DEFENSE IDENTIFICATION ZONES-ADIZ

PART II

Air Defense Identification Zone Rules

7. The pilot-in-command of an aircraft departing from a location
 - (a) that is his last location before the aircraft penetrates the ADIZ; and
 - (b) that has facilities for the immediate transmission of flight plan information shall
 - (i) before take-off, submit an IFR flight plan, a DVFR flight plan or a defense flight notification to an appropriate air traffic services unit;
 - (ii) include in such flight plan or flight notification the estimated time and place of ADIZ penetration;
 - (iii) establish radio telephone communication with an appropriate air traffic services unit as soon as possible and make a position report including the estimated time and place of ADIZ penetration; and
 - (iv) upon request by an air traffic services unit, advise that facility as to the difference in time and distance between any revised estimated time and place of ADIZ penetration and the time and place of ADIZ penetration indicated in the flight plan or flight ADIZ notification.
8. The pilot-in-command of an aircraft departing from a location
 - (a) that is within the ADIZ; and
 - (b) that has facilities for the immediate transmission of flight plan information shall
 - (i) before take-off, submit an IFR flight plan, a DVFR flight plan or a defense flight notification to an appropriate air traffic services unit; and
 - (ii) as soon as possible after take-off, establish radio telephone communication with an air traffic services unit and make a position report.
9. The pilot-in-command of an aircraft departing from a location that
 - (a) is his last location before the aircraft penetrates the ADIZ; or
 - (b) is within the ADIZ and that does not have facilities for the immediate transmission of flight plan information shall
 - (i) as soon as possible after take-off, establish radio telephone communication with an appropriate air traffic services unit and submit an IFR flight plan, a DVFR flight plan or a defense flight notification;
 - (ii) include in such flight plan or flight notification the estimated time and place of ADIZ penetration where applicable; and
 - (iii) when requested to do so by an appropriate air traffic services unit, fly at a speed of less than 150 knots for a period of not less than 5 minutes for positive identification.

CANADA
CANADA AIR DEFENSE IDENTIFICATION ZONES-ADIZ

10. The pilot-in-command of an aircraft shall revise his estimate with an appropriate air traffic services unit when the aircraft will not be within
- (a) a time tolerance of plus or minus 5 minutes of the estimated time over
 - (i) a reporting point,
 - (ii) the point of penetration of the ADIZ, or
 - (iii) the point of destination within the ADIZ; or
 - (b) a distance tolerance of 20 nautical miles from
 - (i) the estimated point of penetration of the ADIZ, or
 - (ii) the center line of the route of flight indicated in the flight plan or flight notification.
11. The pilot-in-command of an aircraft operating on an IFR flight plan and in accordance with an ATC clearance on a flight that will penetrate the ADIZ is not required to include estimated time and place of ADIZ penetration in the filed flight plan or in a routine in-flight position report.

PART III

Security Control of Air Traffic and Air Navigation Aids Rules

12. When notified that the SCATANA Rules are in effect, the pilot-in-command of an aircraft penetrating or operating within Canadian domestic airspace or the ADIZ shall comply with those rules, which are as follows:
- (a) the pilot-in-command shall comply with all instructions from an appropriate air traffic services unit to change course or altitude or to land;
 - (b) before take-off, the pilot-in-command shall obtain approval for the flight from an appropriate air traffic services unit; and
 - (c) the pilot-in-command shall provide an appropriate air traffic services unit with position reports, as required by the instrument flight rules
 - (i) when within controlled airspace, and
 - (ii) at least every 30 minutes when outside controlled airspace.

CANADA MANDATORY IFR ROUTES

GENERAL INFORMATION

A system of mandatory IFR routes has been established to:

- a. guide pilots in planning their route of flight;
- b. minimize route changes during the operational phase of flight; and
- c. to aid in the efficient and orderly management of the air traffic.

The mandatory IFR routes are designed to serve the needs of the airspace user and to provide for a systematic flow of air traffic in the major terminal and enroute phases. Cooperation by all pilots in filing mandatory IFR routes will result in fewer traffic delays in clearance delivery and will better provide for efficient departure, enroute, and arrival air traffic service.

The following explains the terms and abbreviations used in the listing.

Mandatory Route structure principals:

- Each route includes a start or end waypoint/navigation aid (pitch/catch concept)
- Does not contain MOCA or MEA
- Does not start with AIRWAY
- Only routes with less than 250 NM between city pairs are designated (otherwise default to pitch/catch as in 1).
- Route to/from a cardinal point is also acceptable (N, S, E, W, NE, NW, SE, SW).
- Each route is compliant with ARINC 424 coding (machine-readable for flight planning/flight management systems).
- By default, mandatory routes are applicable for all route types unless specified otherwise (i.e. RNAV)
- Mandatory routes are shown in table format, one route per record, with up to 3 sections per FIR: general information/message, location-to-location/Cardinal point enter/exit route and over-flights.
- ICAO idents and abbreviations applied throughout.
- Mandatory IFR routes are published for the airports under Canadian ATS control.

When filing routes between two navigational facilities or fixes, pilots are responsible for ensuring that the filed altitude will meet the minimum obstacle clearance requirements, that the navigational signal coverage is adequate and that the route will not penetrate Class F airspace.

In Controlled Airspace between Edmonton and Calgary, altitudes and flight levels which are not appropriate for the direction of flight may be assigned by ATC at any time to an aircraft at FL280 and below on the mandatory IFR route.

CZEG EDMONTON FIR

In Controlled Airspace between Edmonton and Calgary, altitudes and flight levels which are not appropriate for the direction of flight may be assigned by ATC at any time to an aircraft operating to a maximum of FL280 on the mandatory IFR routes.

NORTHBOUND DEPARTURES overflying CYEG - from CYBW or CYYC

Pilots should be aware that with the introduction of RNAV routes within the EG FIR, there are 2 northbound routes if overflying CYEG to destinations not listed in mandatory routes. These routes are type specific and should be flight planned as follows:

- **NON-JETS** – SAXOL T761 ALKIK
- **JETS** – AVROM MAPUX

CYBW ARRIVALS

In addition to the mandatory routes listed, the following arrival routes are available:

- From the EAST or NORTHEAST, arrivals between BOMIP and SHAWI are permitted via BIR-KO MADYN ARR
- From the SOUTH or SOUTHEAST, arrivals between VESDO and TOVUM are permitted via EBGAL ELBOW ARR
- From the SOUTHWEST, arrivals between ANTAK and MENBO are permitted via TULOB T707 IGVEP BRAGG ARR or via SEDEL T703 IGVEP BRAGG ARR

CANADA

CZEG EDMONTON FIR

CYEG ARRIVALS

From the WEST, CYEG arrivals are permitted between ROMRA and YZU via ESKIE ESKIE ARR

CYYC ARRIVALS

Pilots should be aware that STAR Arrivals for CYYC are segregated between JETS and NON-JETS and are required to file the appropriate STAR for type of aircraft. In addition to the mandatory routes listed, the following arrival routes are available.

NON JETS

- From the SOUTH or SOUTHEAST, arrivals are permitted between VESDO and TOVUM via EBGAL TIDUK ARR
- From the SOUTHWEST, arrivals are permitted between ANTAK and MENBO via TULOB T707 IGVEP VESGA ARR or via SEDEL T703 IGVEP VESGA ARR
- From the EAST or NORTHEAST, arrivals are permitted between BOMIP and SHAWI via BIR-KO TOTUB ARR

JETS

- From the SOUTH or SOUTHEAST, arrivals are permitted between VESDO and TOVUM via EBGAL EBGAL ARR
- From the SOUTHWEST, arrivals are permitted between ANTAK and MENBO via TULOB T707 IGVEP IGVEP ARR or via SEDEL T703 IGVEP IGVEP ARR
- From the EAST or NORTHEAST, arrivals are permitted between BOMIP and SHAWI via BIR-KO BIRKO ARR

----- Effective thru 19 Apr: -----

CANADA
CZWG WINNIPEG FIR

Pilots, when applicable, should file the appropriate departure route and connect it to an Arrival route that best matches their desired route of flight.

If no mandatory departure route is published, file direct to the first enroute point.

STARs where published are the mandatory routes into airports. Pilots are expected to file the appropriate STAR. If no mandatory Arrival route or STAR is published, file direct to the airport.

If the route of flight is to extend outside of Winnipeg FIR, connect the routes published herein to the external route at the most logical point.

Routings through Cold Lake MTCA, Moose Jaw MTCA below FL320, and all CYRs and CYAs within the Winnipeg FIR, when active, are to be avoided.

NORTHERN CONTROL AREA TRACKS (NCA):

NCA 20 Westbound only between YYZ and YRL

NCA 21 Eastbound only between YRL YZE YYZ

CANADA

----- Effective thru 19 Apr: -----

CZYZ TORONTO FIR**LEAD-IN INFORMATION:**

- Pilots shall first verify if their point of departure has a mandatory routing. If no route is published file direct to the first enroute point.
- Pilots arriving at an airport within Toronto FIR should verify if that airport has a mandatory route for arrival. If none exists, file direct.
- If the route is to include a significant portion of "overflight" or enroute cruise through Toronto FIR, verify if an overflight route is published.
- If the route of flight is to extend outside of Toronto FIR, connect the routes published herein to the external route at the most logical point. Refer to Montreal or Winnipeg FIR as appropriate after the last given point.

RNAV Routes

- If unable to fly the listed RNAV routing, file an alternate routing via navaids and/or airway, adhering as closely as possible to the mandatory route and include RMK/NON RNAV.
- If unable to fly an RNAV SID and/or an RNAV STAR, file via the RNAV fixes within the procedure and include: RMK/NO RNAV SID and/or RMK/NO RNAV STAR.
- For U.S. destinations, a conventional STAR may be filed; no remark is required.

Single engine aircraft wishing to stay close to land, file RMK/NO OVER WATER.

Eastbound Routes:

- Routings via MIGLO are valid only for flights landing within the Montreal TCU.
- Routings via ELSUB are valid only for flights landing within the Ottawa TCU.
- Routings via MIVOK are valid only for flights landing within the Ottawa TCU or CYFJ or for NONJETS at 13,000 & BLW continuing towards PESAC.

DEPARTURES FROM THE FIR

Pilots departing the airports listed below should file the appropriate departure route, and connect it to the overflight or arrival route that best matches their desired route of flight. Where SIDs and STARs are filed, ensure a published transition point is used.

FAA airports: FAA agreement dictates that aircraft departing CYYZ and area, and arriving at airports contained within this document must file the mandatory routing listed. Aircraft departing CYYZ satellite airports for these destinations should join the mandatory route listed under CYYZ departures.

CANADA

CZYZ TORONTO FIR

ARRIVALS WITHIN THE FIR

Pilots arriving at the airports listed below should file the appropriate arrival route, and connect it to the departure route or overflight route that best matches their desired route of flight. Refer to the adjacent FIR as required. Where STARs are filed, ensure a published transition point is used.

EASTBOUND OVERFLIGHTS (refer to Montreal FIR after last listed waypoint)

No eastbound flights will be permitted via MENKO, KENLU, ILUSI or YSO.

Routes entering via FNT, HOCKE, a track DAYYY-RUBKI or north of DAYYY-RUBKI: random routing over or north of LIDAG to INF or coastal fix.

Routes entering from SVM or DJB: join via DERLO SIKBO towards IPTOS, LORKA, OLABA, MIGLO or MIVOK.

Routes entering from FNT or HOCKE: join via NUBER SIKBO towards IPTOS, LORKA, OLABA, RAKAM, TULEG, MIGLO or MIVOK.

WESTBOUND OVERFLIGHTS (refer to Montreal FIR prior to the first listed waypoint)

No westbound overflights will be permitted via IPTOS, LORKA, MIGLO, or OLABA.

Excluding KORD arrivals, random routing is acceptable for flights entering:

- North of LIDAG to SSM, ASP, or HOCKE
- North of a track LETAK Q824 TAGUM or LETAK-TVC
- North of a track YEE-YXU

Flights landing at airports listed below must file an appropriate routing through the Toronto FIR to join the arrival route listed.

CANADA

CZUL MONTREAL FIR

Pilots shall first verify if their point of departure has a mandatory departure routing. If no route is published, file direct to the first enroute point. If the route is to include a significant portion of enroute cruise through Montreal FIR, verify if an overflight route is published.

Pilots arriving at an airport within Montreal FIR shall verify if that airport has a mandatory route for arrival. If none exists, file direct.

If the route of flight extends outside of Montreal FIR, refer to the adjacent FIR mandatory route section for instructions. If none exists, connect the routes published herein to the external route at the most logical point.

Pilots departing from an airport within the Montreal Terminal airspace and filing a below listed routing over BOBKI MELTI must maintain an IAS of 240 kts or greater until 16,000 feet. If unable they must advise ATC.

Routings through the Bagotville (CYBG) Military Restricted areas CYR628, CYR629, CYR630, CYR664, CYR665 and CYR666 are to be avoided when areas are in operation.

Except for polar flights, westbound overflights transiting from Edmonton FIR to Montreal FIR north of 63N shall file over or west of AYROU.

Note for non-RNAV equipped aircraft:

The airspace route structure is based on unidirectional flows. In order to facilitate the flight, non-RNAV route planning shall be done by choosing NAVAID defined airways closest to the listed mandatory RNAV routes.

Where NAVAID based airways are not available, NAVAID direct NAVAID navigation can be used.

CANADA

CZEG EDMONTON FIR

In Controlled Airspace between Edmonton and Calgary, altitudes and flight levels which are not appropriate for the direction of flight may be assigned by ATC at any time to an aircraft operating to a maximum of FL280 on the mandatory IFR routes.

NORTHBOUND DEPARTURES overflying CYEG - from CYBW or CYYC

Pilots should be aware that with the introduction of RNAV routes within the EG FIR, there are 2 northbound routes if overflying CYEG to destinations not listed in mandatory routes. These routes are type specific and should be flight planned as follows:

- **NON-JETS** – SAXOL Q965 ALKIK
- **JETS** – AVROM Q933 MAPUX

CANADA

CZEG EDMONTON FIR

CYBW ARRIVALS

In addition to the mandatory routes listed, the following arrival routes are available:

- From the EAST or NORTHEAST, arrivals between IGVUX and SHAWI are permitted via BIR-KO MADYN ARR
- From the SOUTH or SOUTHEAST, arrivals between VESDO and TOVUM are permitted via EBGAL ELBOW ARR
- From the SOUTHWEST, arrivals between ANTAK and MENBO are permitted via TULOB T707 IGVEP BRAGG ARR or via SEDEL T703 IGVEP BRAGG ARR

CYEG ARRIVALS

From the WEST, CYEG arrivals are permitted between ROMRA and YZU via ESKIE ESKIE ARR

CYYC ARRIVALS

Pilots should be aware that STAR Arrivals for CYYC are segregated between JETS and NON-JETS and are required to file the appropriate STAR for type of aircraft. In addition to the mandatory routes listed, the following arrival routes are available:

NON JETS

- From the SOUTH or SOUTHEAST, arrivals are permitted between VESDO and TOVUM via EBGAL TIDUK ARR
- From the SOUTHWEST, arrivals are permitted between ANTAK and MENBO via TULOB T707 IGVEP VESGA ARR or via SEDEL T703 IGVEP VESGA ARR
- From the EAST or NORTHEAST, arrivals are permitted between IGVUX and SHAWI via BIR-KO TOTUB ARR

JETS

- From the SOUTH or SOUTHEAST, arrivals are permitted between VESDO and TOVUM via EBGAL EBGAL ARR
- From the SOUTHWEST, arrivals are permitted between ANTAK and MENBO via TULOB T707 IGVEP IGVEP ARR or via SEDEL T703 IGVEP IGVEP ARR
- From the EAST or NORTHEAST, arrivals are permitted between IGVUX and SHAWI via BIR-KO BIRKO ARR

CANADA

----- Effective thru 19 Apr: -----

OVERFLIGHTS					CZEG
DIREC-TION	NAV-AID	AD	LIMITATIONS	PROC	ROUTE OF FLIGHT
S-bound	YMM	CYYC	JET	RNAV	YMM CACHO IGVUX DUDNI BIRKO ARR

CZWG WINNIPEG FIR

Pilots, when applicable, should file the appropriate departure route and connect it to an Arrival route that best matches their desired route of flight.

If no mandatory departure route is published, file direct to the first enroute point.

CANADA
CZWG WINNIPEG FIR

STARs where published are the mandatory routes into airports. Pilots are expected to file the appropriate STAR. If no mandatory Arrival route or STAR is published, file direct to the airport.

If the route of flight is to extend outside of Winnipeg FIR, connect the routes published herein to the external route at the most logical point.

Routings through Cold Lake MTCA, Moose Jaw MTCA below FL320, and all CYRs and CYAs within the Winnipeg FIR, when active, are to be avoided.

NORTHERN CONTROL AREA TRACKS (NCA):

NCA 20 Westbound only between YYZ and YRL

NCA 21 Eastbound only between YRL YZE YYZ

CZYZ TORONTO FIR

LEAD-IN INFORMATION:

- Pilots shall first verify if their point of departure has a mandatory routing. If no route is published file direct to the first enroute point.
- Pilots arriving at an airport within Toronto FIR should verify if that airport has a mandatory route for arrival. If none exists, file direct.
- If the route is to include a significant portion of “overflight” or enroute cruise through Toronto FIR, verify if an overflight route is published.
- If the route of flight is to extend outside of Toronto FIR, connect the routes published herein to the external route at the most logical point. Refer to Montreal or Winnipeg FIR as appropriate after the last given point.

RNAV Routes

- If unable to fly the listed RNAV routing, file an alternate routing via nav aids and/or airway, adhering as closely as possible to the mandatory route and include RMK/NON RNAV.
- If unable to fly an RNAV SID and/or an RNAV STAR, file via the RNAV fixes within the procedure and include: RMK/NO RNAV SID and/or RMK/NO RNAV STAR.
- For U.S. destinations, a conventional STAR may be filed; no remark is required.

Single engine aircraft wishing to stay close to land, file RMK/NO OVER WATER.

Eastbound Routes:

- Routings via MIGLO are valid only for flights landing within the Montreal TCU.
- Routings via ELSUB are valid only for flights landing within the Ottawa TCU.
- Routings via MIVOK are valid only for flights landing within the Ottawa TCU or CYFJ or for NONJETS at 13,000 & BLW continuing towards PESAC.

CANADA

CYYZ TORONTO FIR

DEPARTURES FROM THE FIR

Pilots departing the airports listed below should file the appropriate departure route, and connect it to the overflight or arrival route that best matches their desired route of flight. Where SIDs and STARs are filed, ensure a published transition point is used.

FAA airports: FAA agreement dictates that aircraft departing CYYZ and area, and arriving at airports contained within this document must file the mandatory routing listed. Aircraft departing CYYZ satellite airports for these destinations should join the mandatory route listed under CYYZ departures.

ARRIVALS WITHIN THE FIR

Pilots arriving at the airports listed below should file the appropriate arrival route, and connect it to the departure route or overflight route that best matches their desired route of flight. Refer to the adjacent FIR as required. Where STARs are filed, ensure a published transition point is used.

EASTBOUND OVERFLIGHTS (refer to Montreal FIR after last listed waypoint)

No eastbound flights will be permitted via MENKO, KENLU, ILUSI or YSO.

Routes entering via FNT, HOCKE, a track DAYYY-RUBKI or north of DAYYY-RUBKI: random routing over or north of LIDAG to INF or coastal fix.

Routes entering from SVM or DJB: join via DERLO SIKBO towards IPTOS, LORKA, OLABA, MIGLO or MIVOK.

Routes entering from FNT or HOCKE: join via NUBER SIKBO towards IPTOS, LORKA, OLABA, RAKAM, TULEG, MIGLO or MIVOK.

WESTBOUND OVERFLIGHTS (refer to Montreal FIR prior to the first listed waypoint)

No westbound overflights will be permitted via IPTOS, LORKA, MIGLO, or OLABA.

Excluding KORD arrivals, random routing is acceptable for flights entering:

- North of LIDAG to SSM, ASP, or HOCKE
- North of a track LETAK Q824 TAGUM or LETAK-TVC
- North of a track YEE-DERLO

Flights landing at airports listed below must file an appropriate routing through the Toronto FIR to join the arrival route listed.

CANADA

----- Effective 20 Apr: -----

CZYZ TORONTO FIR**LEAD-IN INFORMATION:**

CZUL MONTREAL FIR

Pilots shall first verify if their point of departure has a mandatory departure routing. If no route is published, file direct to the first enroute point. If the route is to include a significant portion of enroute cruise through Montreal FIR, verify if an overflight route is published.

Pilots arriving at an airport within Montreal FIR shall verify if that airport has a mandatory route for arrival. If none exists, file direct.

If the route of flight extends outside of Montreal FIR, refer to the adjacent FIR mandatory route section for instructions. If none exists, connect the routes published herein to the external route at the most logical point.

Pilots departing from an airport within the Montreal Terminal airspace and filing a below listed routing over BOBKI MELTI must maintain an IAS of 240 kts or greater until 16,000 feet. If unable they must advise ATC.

Routings through the Bagotville (CYBG) Military Restricted areas CYR628, CYR629, CYR630, CYR664, CYR665 and CYR666 are to be avoided when areas are in operation.

Except for polar flights, westbound overflights transiting from Edmonton FIR to Montreal FIR north of 63N shall file over or west of AYROU.

Note for non-RNAV equipped aircraft:

The airspace route structure is based on unidirectional flows. In order to facilitate the flight, non-RNAV route planning shall be done by choosing NAVAID defined airways closest to the listed mandatory RNAV routes. Where NAVAID based airways are not available, NAVAID direct NAV-AID navigation can be used.

----- Effective thru 19 Apr: -----

ANCHORAGE ARCTIC FIR

DESCRIPTION

The Anchorage Arctic FIR generally consists of that airspace lying between 141° west longitude and 168° 58.38' west longitude south of the geographic North Pole running approximately to 72° north latitude. The material which follows also incorporates that portion of the Anchorage Domestic FIR which overlies the north coast of the Alaskan land mass.

Traffic flows in this airspace consist of: 1. a generally east/west flow for flights transiting between North American and Asian airports via the Russian Polar airspace (commonly referred to as "Cross Polar" flights) and, 2. an east/west flow of flights transiting between northern European and Alaskan airports (commonly referred to as "Trans Polar" flights).

FLIGHT PLANS AND PREFERRED ROUTES

a. Flight Plans

All operators planning IFR flight operations in the Anchorage Arctic and Domestic Flight Information Regions north of 70° north latitude must file flight plans with both PAZAZQZX and PAZNZQZX. Failure to file with both system addresses may result in delay of ATC services.

b. Cross Polar

All flight planned routes must conform to the requirements of the current Anchorage (PAZA) Arctic FIR NOTAM.

c. Trans Polar

1. Operators shall flight plan through the Anchorage Arctic and Domestic FIRs via the following KARLL-COALL, ARBEZ-JESRU, or HARVZ-TAYTA. This requirement applies to both westbound and eastbound flights.

CANADA

2. Flights filing between FYU and 141° west longitude shall flight plan via ADREW J160 or POTAT J167.

Preferred routes connecting with ANC terminal area are as follows:

NORTHBOUND

Anchorage (TED)–J115–Fairbanks (FAI) direct KARLL direct COALL

Anchorage (TED)–J115–Fairbanks (FAI) direct ARBEZ direct JESRU

Anchorage (TED)–J115–Fairbanks (FAI) direct HARVZ direct TAYTA

Anchorage (TED)–J115–Fairbanks (FAI) J120–Ft Yukon (FYU)–J160–ADREW

Anchorage (TED)–J115–Fairbanks (FAI) J120–Ft Yukon (FYU)–J167–POTAT

SOUTHBOUND

COALL direct KARLL direct Talkeetna (TKA)–J125–Anchorage (TED)

JESRU direct ARBEZ direct Nenana (ENN)–J125–Anchorage (TED)

TAYTA direct HARVZ direct Nenana (ENN)–J125–Anchorage (TED)

ADREW J160 Ft Yukon (FYU) J120 Fairbanks (FAI) direct Nenana (ENN) J125–Anchorage (TED)

POTAT J167 Ft Yukon (FYU) J120 Fairbanks (FAI) direct Nenana (ENN) J125–Anchorage (TED)

Subpart B — Designated Air Defense Identification Zones

99.41	General.
99.43	Contiguous U.S. ADIZ.
99.45	Alaska ADIZ.
99.47	Guam ADIZ.
99.49	Hawaii ADIZ.

Subpart A — General

99.1 Applicability

- (a) This subpart prescribes rules for operating all aircraft (except for Department of Defense and law enforcement aircraft) in a defense area, or into, within, or out of the United States through an Air Defense Identification Zone (ADIZ) designated in Subpart B.
- (b) Except for §§99.7, 99.13, and 99.15 this subpart does not apply to the operation of any aircraft—
 - (1) Within the 48 contiguous States and the District of Columbia, or within the state of Alaska, on a flight which remains within 10 nautical miles of the point of departure.
 - (2) Operating at true airspeed of less than 180 knots in the Hawaii ADIZ or over any island, or within 12 nautical miles of the coastline of any island, in the Hawaii ADIZ;
 - (3) Operating at true airspeed of less than 180 knots in the Alaska ADIZ while the pilot maintains a continuous listening watch on the appropriate frequency;

or

 - (4) Operating at true airspeed of less than 180 knots in the Guam ADIZ.
- (c) An FAA ATC Center may exempt the following operations from this subpart (except §99.7), on a local basis only, with the concurrence of the U.S. military commanders concerned, or pursuant to an agreement with a U.S. Federal security or intelligence agency;
 - (1) Aircraft operations that are conducted wholly within the boundaries of an ADIZ and are not currently significant to the air defense system;

**UNITED STATES
AIR DEFENSE IDENTIFICATION ZONES**

- (2) Aircraft operations conducted in accordance with special procedures prescribed by a U.S. military authority, or a U.S. Federal security or intelligence agency concerned.

99.3 Definitions

Aeronautical facility — means, for the purposes of this subpart, a communications facility where flight plans or position reports are normally filed during flight operations.

Air defense identification zone (ADIZ) — means an area of airspace over land or water in which the ready identification, location, and control of all aircraft (except for Department of Defense and law enforcement aircraft) is required in the interest of national security.

Defense area — means any airspace of the contiguous United States that is not an ADIZ in which the control of aircraft is required for reasons of national security.

Defense visual flight rules (DVFR) flight — means, for the purposes of this subpart, a flight within an ADIZ conducted by any aircraft (except for Department of Defense and law enforcement aircraft) in accordance with visual flight rules in part 91 of this title.

99.5 Emergency situations

In an emergency that requires immediate decision and action for the safety of the flight, the pilot in command of an aircraft may deviate from the rules in this part to the extent required by that emergency. He shall report the reasons for the deviation to the communications facility where flight plans or position reports are normally filed (referred to in this part as “an appropriate aeronautical facility”) as soon as possible.

99.7 Special security instructions

Each person operating an aircraft in an ADIZ or Defense Area must, in addition to the applicable rules of this part, comply with special security instructions issued by the Administrator in the interest of national security, pursuant to agreement between the FAA and the Department of Defense, or between the FAA and a U.S. Federal security or intelligence agency.

99.9 Radio requirements

- (a) A person who operates a civil aircraft into an ADIZ must have a functioning two-way radio, and the pilot must maintain a continuous listening watch on the appropriate aeronautical facility's frequency
- (b) No person may operate an aircraft into, within, or whose departure point is within an ADIZ unless—
 - (1) The person files a DVFR flight plan containing the time and point of ADIZ penetration, and
 - (2) The aircraft departs within five minutes of the estimated departure time contained in the flight plan.
- (c) If the pilot operating an aircraft under DVFR in an ADIZ cannot maintain two-way radio communications, the pilot may proceed, in accordance with original DVFR flight plan, or land as

**UNITED STATES
AIR DEFENSE IDENTIFICATION ZONES**

soon as practicable. The pilot must report the radio failure to an appropriate aeronautical facility as soon as possible.

- (d) If a pilot operating an aircraft under IFR in an ADIZ cannot maintain two-way radio communications, the pilot must proceed in accordance with §91.185 of this chapter.

99.11 ADIZ flight plan requirements

- (a) No person may operate an aircraft into, within, or from a departure point within an ADIZ unless the person files, activates, and closes a flight plan with the appropriate aeronautical facility, or is otherwise authorized by air traffic control.
- (b) Unless ATC authorizes an abbreviated flight plan,—
 - (1) A flight plan for IFR flight must contain the information specified in 91.169; and
 - (2) A flight plan for VFR flight must contain the information specified in 91.153(a)(a) through (6).
 - (3) If airport of departure is within the Alaskan ADIZ and there is no facility for filing a flight plan then;
 - (i) Immediately after takeoff or when within range of an appropriate aeronautical facility, comply with provisions of paragraph (b)(1) or (b)(2) as appropriate.
 - (ii) Proceed according to the instructions issued by the appropriate aeronautical facility.
- (c) The pilot shall designate a flight plan for VFR flight as a DVFR flight plan.
- (d) The pilot in command of an aircraft for which a flight plan has been filed must file an arrival or completion notice with an appropriate aeronautical facility.

99.12 [RESERVED]

99.13 Transponder-on requirements

- (a) All civil aircraft equipped with an operable radar beacon transponder must be operated with that transponder turned on including the altitude encoder, if installed, and reply on the appropriate code or a code assigned by ATC.
- (b) *ATC transponder equipment and use.* Effective September 7, 1990, unless otherwise authorized by ATC, no person may operate a civil aircraft into or out of the United States into, within, or across the contiguous U.S. ADIZ designated in subpart B of this part unless that aircraft is equipped with a coded radar beacon transponder.
- (c) *ATC transponder and altitude reporting equipment and use.* Effective December 30, 1990, unless otherwise authorized by ATC, no person may operate a civil aircraft into or out of the United States into, within, or across the contiguous U.S. ADIZ unless that aircraft is equipped with a coded radar beacon transponder and automatic pressure altitude reporting equipment having altitude reporting capability that automatically replies to interrogations by transmitting pressure altitude information in 100-foot increments.

UNITED STATES
AIR DEFENSE IDENTIFICATION ZONES

- (d) Paragraphs (b) and (c) of this section do not apply to the operation of an aircraft which was not originally certificated with an engine-driven electrical system and which has not subsequently been certified with such a system installed, a balloon, or a glider.

99.15 Position reports

- (a) The pilot of an aircraft operating in or penetrating an ADIZ under IFR—
- (1) In controlled airspace, must make the position reports required in §91.183; and
 - (2) In uncontrolled airspace, must make the position reports required in this section.
- (b) No pilot may operate an aircraft penetrating an ADIZ under DVFR unless—
- (1) The pilot reports to an appropriate aeronautical facility before penetration: the time, position, and altitude at which the aircraft passed the last reporting point before penetration and the estimated time of arrival over the next appropriate reporting point along the flight route;
 - (2) If there is no appropriate reporting point along the flight route, the pilot reports at least 15 minutes before penetration: The estimated time, position, and altitude at which the pilot will penetrate; or
 - (3) If the departure airport is within an ADIZ or so close to the ADIZ boundary that it prevents the pilot from complying with paragraphs (b)(1) or (2) of this section, the pilot must report immediately after departure: the time of departure, the altitude, and the estimated time of arrival over the first reporting point along the flight route.
- (c) In addition to any other reports as ATC may require, no pilot in command of a foreign civil aircraft may enter the United States through an ADIZ unless that pilot makes the reports required in this section or reports the position of the aircraft when it is not less than one hour and not more than 2 hours average direct cruising distance from the United States.

99.17 Deviation from flight plans and ATC clearances and instructions

- (a) No pilot may deviate from the provisions of an ATC clearance or ATC instruction except in accordance with §91.123 of this chapter.
- (b) No pilot may deviate from the filed IFR flight plan when operating an aircraft in uncontrolled airspace unless that pilot notifies an appropriate aeronautical facility before deviating.
- (c) No pilot may deviate from the filed DVFR flight plan unless that pilot notifies an appropriate aeronautical facility before deviating.

UNITED STATES

1 INTRODUCTION

1.1 The FAA is expanding the number of area navigation (RNAV) routes both over the Atlantic coastal states and within the Atlantic High Offshore Airspace. High Offshore Airspace is considered Class A airspace in accordance with 14 CFR Part 71, §71.1 and §71.33. These routes will be situated to enable ATC radar surveillance of, and VHF communications with, aircraft flying them. The offshore RNAV routes will be charted as “Y” routes. Existing Y-routes remain active and will be part of the final offshore Y-route network.

2 GENERAL REQUIREMENTS

2.1 The Y-routes are designated RNAV 2 with GNSS required. Aircraft flying the Y-routes must be equipped with GNSS and able to meet RNAV 2 performance requirements. RNAV systems relying solely on DME/DME or inertial navigation are not suitable (and therefore not authorized) for use on any Y-route.

2.2 In order to fly the Y-routes, U.S. certificated operators require operations specification/management specification B035, Class I Navigation in the U.S. Class A Airspace using Area or Long-Range Navigation Systems, indicating aircraft equipage with GNSS. Foreign commercial operators should obtain authorization for operations with RNAV 2 and equipage with GNSS as required by their applicable civil aviation authority.

2.3 General aviation operators (ICAO Annex 6 Part II) do not require any specific authorization to fly on a Y-route. Nevertheless, the requirements for GNSS equipage and RNAV 2 performance remain. General aviation operators should refer to Advisory Circular (AC) 90-100, U.S. Terminal and Enroute Area Navigation (RNAV) Operations, in order to verify their aircraft meets the airworthiness and installation criteria for RNAV 2. A current list of RNAV 2 compliant equipment can be found in the AC 90-100 Compliance Table posted on the Performance-Based Flight Systems Branch website at: http://www.faa.gov/about/office_org/headquarters_offices/avs/offices/afs/afs400/afs470/pbn. Operators may contact their local Flight Standards District Office, or applicable International Field Office, for help in determining aircraft eligibility as needed.

2.4 Pilots must indicate on their ATC flight plan at least the minimum equipment and capability required for RNAV 2 with GNSS. Item 10 of the flight plan must indicate G and R. Item 18 must indicate PBN/C2.

3 OPERATIONAL REQUIREMENTS

3.1 Pilots are expected to fly the route centerline, as defined by the aircraft RNAV system. Pilots must not use strategic lateral offset procedures (SLOP) while on the Y-routes.

3.2 Operators must check predicted RAIM availability for the expected duration of their flight on a Y-route. Five (5) minutes is the maximum predicted continuous loss of RAIM allowed for flight on a Y-route.

4 PILOT KNOWLEDGE

4.1 AC 90-100 contains pilot knowledge subject matter that is generally applicable to any RNAV operation. General aviation pilots in particular should use the RNAV subject matter contained in AC 90-100 in preparation for any flight on an RNAV route, including Y-routes.

UNITED STATES

1.1 New York Oceanic Airspace

ATC applies 50 NM lateral separation between aircraft authorized RNP 10 or RNP 4 within the West Atlantic Route System (WATRS) (that is, New York Oceanic West airspace). ATC similarly applies 50 NM lateral separation in the Atlantic portion of the Miami Oceanic CTA as well as the San Juan CTA/FIR. ATC may apply 50 NM lateral separation between aircraft authorized RNP 10 or RNP 4 in airspace outside of WATRS (that is, New York Oceanic East).

Aircraft authorized RNP 10 or RNP 4 will have a better chance of obtaining their preferred routing and altitude in the most densely used airspace (that is, below FL410) because of their ability to participate in ATC's use of 50 NM lateral separation. Non-RNP 10 or non-RNP 4 aircraft will be spaced at least 90 NM laterally from other aircraft.

ATC will not apply 50 NM lateral separation on routes that are defined by reference to ICAO standard ground-based navigation aids. In addition, 50 NM lateral separation is not applied to aircraft on the following route segments, at and above FL310, because the routes are considered within ATC radar and VHF radio coverage:

- M201 between VIRST and VEGAA

NOTE: SLOP is not to be used while flying these route segments.

Flight plan filing and addressing requirements are detailed in Flight Plan Filing Requirements.

Operators of aircraft not authorized RNP 10 or RNP 4 are expected to follow the procedures for alerting ATC of their RNP status. Those operators are expected to indicate their "non-RNP 10" status in Item 18 of their ATC flight plan. In addition, pilots are expected to inform ATC of their "non-RNP 10" status on initial call to ATC on WATRS routes and when reading back a clearance to descend through FL410.

Filing a flight plan for, and conducting operations under, RNP 10 or RNP 4 navigation specifications require the aircraft to be equipped with two operable long-range navigation systems (LRNS). Operators who indicate RNP 10 or RNP 4 capability on their ATC flight plans, and subsequently experience a LRNS failure while operating on a WATRS route, must alert ATC to this failure. If the pilot believes the aircraft can continue to be navigated within 10 NM of the cleared route with the single LRNS, ATC should be informed; as such, ATC may continue the aircraft on the cleared route.

In the event of LRNS failure prior to joining a WATRS route, pilots must inform ATC of the failure and ensure ATC is aware the aircraft is no longer qualified for the RNP level indicated in the flight plan. In addition to this notification, pilots should request ATC amend their flight plan to remove the RNP capability indication in Item 18 of the flight plan.

Information regarding operations in WATRS can be found in the West Atlantic Route System, Gulf of Mexico, and Caribbean Resource Guide for U.S. Operators which is available at: http://www.faa.gov/about/office_headquarters/offices/avs/offices/afx/afs/afs400/afs410/media.WATRS.pdf.

UNITED STATES

1.2 Operation on Routes within the WATRS Plus CTAs

The 50 NM lateral separation is applied at all altitudes above the floor of controlled airspace. Lateral separation of 100 NM will continue to be provided in the Houston Oceanic, Monterrey, and Merida CTA/FIRs to aircraft not authorized RNP 10 or RNP 4. Similarly, those aircraft will experience 90 NM lateral separation in Miami Oceanic CTA/FIR.

Operations on certain routes that fall within the boundaries of affected CTAs are not affected by the introduction of 50 NM lateral separation. Operation on the following routes is not affected:

- Routes that are flown by reference to ICAO standard ground-based navigation aids (VOR, VOR/DME, NDB); and
- Special Area Navigation (RNAV) routes Q100, Q102 and Q105 in the Houston, Jacksonville and Miami CTAs.

1.3 Provisions for Accommodation of Non-RNP10 Aircraft (Not Authorized RNP10 or RNP4)

Operators of Non-RNP 10 aircraft must:

- Annotate ICAO flight plan Item 18 as follows:
 - “RMK/NON-RNP10” (no space between letters and numbers).
 - Use of flight plan item 18 codes “PBN/A1” or “PBN/L1” are restricted to operators and aircraft specifically authorized for RNP 10 or RNP 4, as applicable.
- Pilots of non-RNP 10 aircraft that operate in GoMex CTAs must report the lack of authorization by stating “Negative RNP 10”:
 - On initial call to ATC in a Gulf of Mexico CTA; or
 - When approval status is requested by the controller.

Non-RNP 10 operators/aircraft may file any route at any altitude in a Gulf of Mexico CTA. They will be cleared to operate on their preferred routes and altitudes as traffic permits. 50 NM lateral separation will not be applied to non-RNP 10 aircraft.

Non-RNP 10 aircraft should plan on completing their climb to or descent from higher FLs within radar coverage, if possible.

In order to maximize operational flexibility provided by 50 NM lateral separation, operators capable of meeting RNP 10 or RNP 4 that operate on oceanic routes or areas in the Gulf of Mexico CTAs should obtain authorization for RNP 10 or RNP 4 and annotate the ICAO flight plan accordingly.

NOTE: RNP 10 is the minimum Navigation Specification (NavSpec) required for the application of 50 NM lateral separation. RNP 4 is an operator option; operators/aircraft authorized RNP 4 are not required to also obtain RNP 10 authorization.

UNITED STATES

1.4 RNP 10 or RNP 4 Authorization Policy and Procedures for Aircraft and Operators

The following is ICAO guidance on the state authority responsible for authorizations such as RNP 10, RNP 4, and RVSM:

- International commercial operators: The State of Registry makes the determination that the aircraft meets the applicable RNP requirements. The State of Operator issues operating authority (for example, Operations Specifications (OpSpecs)).
- International general aviation (IGA) operators: The State of Registry makes the determination that the aircraft meets the applicable RNP requirements and issues operating authority (for example, Letter of Authorization (LOA)).

Guidance Material

FAA Advisory Circular (AC) 90-105, Approval Guidance for RNP Operations and Barometric Vertical Navigation in the U.S. National Airspace System and in Oceanic and Remote Continental Airspace, provides operational approval guidance for RNP 4 and 10. It identifies minimum aircraft capabilities and operator procedural and training requirements in order to qualify for RNP 4 or 10. AC 90-105 is consistent with the ICAO PBN Manual discussed below. Pertinent FAA and ICAO documents are posted online in the West Atlantic Route System, Gulf of Mexico and Caribbean Resource Guide for U.S. Operators described below.

ICAO Performance-based Navigation (PBN) Manual (ICAO Doc 9613). Guidance for authorization of RNP 10 and RNP 4 is provided in ICAO Doc 9613. RNP 10 is addressed in Volume II, Part B; Chapter 1. RNP 4 is addressed in Volume II, Part C; Chapter 1.

Operators and authorities are encouraged to use the RNP 10 or RNP 4 Job Aids posted on the FAA Resource Guide for U.S. Operators described above. For U.S. operators, a set of RNP 10 and RNP 4 Job Aids provides references to FAA documents. An RNP 4 Job Aid, which references the ICAO PBN Manual, is also available on the ICAO European and North Atlantic Office website. These Job Aids address the operational and airworthiness elements of aircraft and operator authorization and provide references to appropriate document paragraphs. The Job Aids provide a method for operators to develop and authorities to track the operator/aircraft program elements required for RNP 10 or RNP 4 authorization.

1.5 Flight Planning Requirements

Operators must make ICAO flight plan annotations in accordance with this paragraph and, if applicable, Provisions for Accommodation of Non-RNP 10 Aircraft (Not Authorized RNP 10 or RNP 4).

ICAO flight plans must be filed for operation on oceanic routes and areas in the Houston Oceanic CTA/FIR, the Gulf of Mexico portion of the Miami CTA/FIR, the Monterrey CTA and Merida High CTA.

To inform ATC that they have obtained RNP 10 or RNP 4 authorization and are eligible for 50 NM lateral separation, operators must:

- Annotate ICAO Flight Plan Item 10 (Equipment) with the letter “R”; and

UNITED STATES

- Annotate Item 18 (Other Information) with, as appropriate, “PBN/A1” for RNP 10 aircraft or “PBN/L1” for RNP 4 aircraft (no space between letters and numbers).

NOTE: The letter “R” indicates that the performance-based navigation specification (for example, RNP 10 or RNP 4) is specified in Item 18 following the indicator “PBN/.”

1.6 Pilot and Dispatcher Basic and In-flight Contingency Procedures

The RNP 10 and RNP 4 Job Aids contain references to pilot and, if applicable, dispatcher procedures contained in Advisory Circular 90-105 and ICAO PBN Manual, Volume II, Parts B and C, Chapter 1.

Pilots should use SLOP procedures in the course of regular oceanic operations. SLOP procedures are published in ICAO Document 4444, 15th Edition, Amendment 2, paragraph 16.5.

Strategic Lateral Offset Procedure (SLOP) While Within Oceanic Airspace

These procedures have been developed in accordance with the ICAO PANS ATM, 16.5.

It has been determined that allowing aircraft conducting oceanic flight to fly lateral offsets, in increments of .1 nautical mile (NM) up to a maximum of 2 NM right of centerline, will provide an additional safety margin and mitigate the risk of conflict when non-normal events, such as aircraft navigation errors, altitude deviation errors, and turbulence-induced altitude-keeping errors occur.

These procedures are authorized in U.S.-controlled Oceanic Airspace and also the airspace surrounding the island of Bermuda.

These procedures provide for offsets within the following guidelines: Along a route or track there will be 21 positions that an aircraft may fly: on centerline or at increments of .1 NM (for example, .1, .2, .3, .4 ... 1.8, 1.9, 2.0) right of centerline out to a maximum offset of 2 NM. Offsets must not exceed 2 NM right of centerline. The intent of this procedure is to reduce risk (add safety margin) by distributing aircraft laterally across the 21 available positions.

Pilots must fly the track centerline if their aircraft does not have automatic offset programming capability. Pilots of aircraft unable to offset at .1 NM increments should fly on the track centerline, or at the 1.0 NM or 2.0 NM positions right of centerline when using SLOP.

An aircraft overtaking another aircraft should offset within the confines of this procedure, if capable, so as to create the least amount of wake turbulence for the aircraft being overtaken.

Pilots should also fly one of the available offset positions shown above to avoid wake turbulence.

Pilots should use whatever means available to determine the best flight path to fly.

Aircraft should not offset to the left of center line nor offset more than 2 NM right of center line. Pilots may contact other aircraft on VHF frequency 123.45, as necessary, to coordinate the best wake turbulence offset option.

NOTE: It is recognized that pilots will use their judgment to determine the action most appropriate to any given situation and have the final authority and responsibility for the safe operations of the aircraft.

UNITED STATES

Pilots may apply an offset outbound after the oceanic entry point. Aircraft transiting Bermuda airspace may remain on their established offset.

There is no ATC clearance required for this procedure and it is not necessary that ATC be advised.

In-flight Contingency Procedures in Oceanic Airspace

Special Procedures for In-Flight Contingencies and Weather Deviation Procedures are in force in New York Oceanic West (WATRS). For details refer to Jeppesen ATC-Chapter Air Traffic Control Data Atlantic “Special Procedures for In-Flight Contingencies in NAT Oceanic Airspace”.

When pilots suspect a navigation system malfunction, in addition to the actions suggested in the Jeppesen ATC-Chapter above, the following actions should be taken:

- Immediately inform ATC of navigation system malfunction or failure;
- Accounting for wind drift, fly magnetic compass heading to maintain track; and
- Request radar vectors from ATC, when available.

Pilot Report of Non-RNP 10 Status

The pilot must report the lack of RNP 10 or RNP 4 status in accordance with the following:

- When the operator/aircraft is not authorized RNP 10 or RNP 4

If approval status is requested by the controller:

- The pilot must communicate approval status using the following phraseology as below:

Controller Request	Pilot Response
“(Call sign) confirm RNP10 or 4 approved”.	“Affirm RNP10 approved” or “Affirm RNP4 approved” as appropriate, or “Negative RNP10”.

UNITED STATES CPDLC COVERAGE

CPDLC OVERVIEW

**UNITED STATES
CPDLC COVERAGE**

Data Link Services

Airspace	CPDLC	ADS-C	Logon Address	Remarks
Anchorage and Anchorage Arctic (south of N73 and east of W165) FIR	O	N	PAZA	CPDLC voice transfer: CONTACT PAZA CENTER [frequency] Confirm CPDLC CDA: One CPDLC position report at FIR boundary.
Anchorage Oceanic and Anchorage Arctic (between the North Pole and N73) and Anchorage (south of N63 and west of W165) FIR	O	O	PAZN	CPDLC voice transfer: CONTACT PAZA CENTER [frequency] Confirm CPDLC CDA: One CPDLC position report at FIR boundary.
Edmonton FIR	O	O	CZEG Logon should be initiated 15 to 45 minutes prior to entry into Edmonton FIR from airspace where no ATS data link service are being received.	CPDLC services are available above FL290.
Gander Oceanic FIR	O	O	CZQX Logon should be initiated 15 to 45 minutes prior to entry into Gander Oceanic FIR from airspace where no ATS data link service are being received.	In addition to Gander FIR (CZQX), Gander provides air traffic services at and above FL200 in that part of the Nuuk FIR (BGGL) which lies south of 6330N. CPDLC services are provided within Gander's service area.

**UNITED STATES
CPDLC COVERAGE**

Data Link Services (continued)

Airspace	CPDLC	ADS-C	Logon Address	Remarks
Gander Domestic/ Oceanic FIR	O	N/O	CZQX (Gander Oceanic) CDQX (Gander Domestic) Logon should be initiated 15 to 45 minutes prior to entry into Gander Oceanic FIR from airspace where no ATS data link service are being received.	Gander Domestic at FL290 and above, Gander Oceanic below FL290. Pilots submitting a request for clearance must use an oceanic entry and exit points located within GOTA and not a boundary fix along the Montreal CTA boundary. Flight crews submitting a request for clearance based on Montreal CTA boundary will cause system errors and may affect the ocean profile.
Gander Domestic FIR	O	N	CDQX Logon should be initiated 15 to 45 minutes prior to entry into Gander Domestic FIR from airspace where no ATS data link service are being received.	CPDLC services are available above FL290.
Moncton FIR	O	N	CZQM Logon should be initiated 15 to 45 minutes prior to entry into Moncton ACC.	CPDLC services are available above FL290.
Montreal FIR	O	N	CZUL Logon should be initiated 15 to 45 minutes prior to entry into Montreal FIR from airspace where no ATS data link service are being received.	CPDLC services are available above FL290.

**UNITED STATES
CPDLC COVERAGE**

Data Link Services (continued)

Airspace	CPDLC	ADS-C	Logon Address	Remarks
New York Oceanic FIR	O	O	KZWY Logon should be initiated 15 to 45 minutes prior to entry into New York Oceanic FIR.	DO NOT use CPDLC for position reporting. Use ADS-C or voice only. SELCAL check via HF are required for all FANS connected aircraft prior to entering the CTA/FIR. DO NOT send a CPDLC position report to confirm CDA prior to, or upon crossing the FIR.
Oakland FIR	O	O	KZAK Logon should be initiated 15 to 45 minutes prior to entry into Oakland OCA/FIR.	CPDLC voice transfer: CONTACT KSFO CENTER [frequency] <i>NOTE: KSFO (San Francisco Radio) will provide all primary and secondary HF frequencies, and HF transfer points along the route of flight.</i>
Toronto FIR	O	N	CZYZ Logon should be initiated 15 to 45 minutes prior to entry into Toronto FIR from airspace where no ATS data link service are being received.	CPDLC services are available above FL290.

**UNITED STATES
CPDLC COVERAGE**

Data Link Services (continued)

Airspace	CPDLC	ADS-C	Logon Address	Remarks
Vancouver FIR	O	N	CZVR Logon should be initiated 15 to 45 minutes prior to entry into Vancouver/ FIR	CPDLC services are available above FL290.
Winnipeg FIR	O	N	CZWG Logon should be initiated 15 to 45 minutes prior to entry into Winnipeg FIR from airspace where no ATS data link service are being received.	CPDLC services are available above FL290.

NOTE: O = Operational, T = Trial, N = Not available

UNITED STATES

PREFERRED IFR ROUTES

A system of preferred routes has been established to guide pilots in planning their route of flight, to minimize route changes during the operational phase of flight, and to aid in the efficient orderly management of the air traffic, using federal airways. The preferred IFR routes which follow are designed to serve the needs of airspace users and to provide for a systematic flow of air traffic in the major terminal and enroute flight environments. Cooperation by all pilots in filing preferred routes will result in fewer traffic delays and will better provide for efficient departure, enroute and arrival air traffic service.

The following lists contain preferred IFR routes for the low altitude stratum and the high altitude stratum. The high altitude list is in two sections; the first section showing terminal to terminal routes and the second section showing single direction route segments. Also, on some high altitude routes low altitude airways are included as transition routes.

THE HIGH ALTITUDE LISTINGS ARE RECEIVED ONLY BY THOSE HAVING SUBSCRIPTIONS TO THE HIGH ALTITUDE ENROUTE CHARTS.

Changebars denote new or changed information. The effective date of such changes is shown at the top of each affected page. All other information is effective upon receipt.

EXPLANATION OF LISTINGS

- a. Preferred routes beginning/ending with an airway number indicate that the airway essentially overlies the airport and flights are normally cleared directly on the airway.
- b. Preferred IFR routes beginning/ending with a fix indicate that aircraft may be routed to/from these fixes via a Standard Instrument Departure (SID) route, radar vectors (RV), or a Standard Terminal Arrival Route (STAR).
- c. Preferred IFR routes for major terminals selected are listed alphabetically under the name of the departure airport. Where several airports are in proximity they are listed under the principal airport and categorized as a metropolitan area; e.g., New York Metro Area.
- d. Preferred IFR routes used in one direction only for selected segments, irrespective of point of departure or destination, are listed numerically showing the segment fixes and the direction and times effective.
- e. Where more than one route is listed the routes have equal priority for use.
- f. Official location identifiers are used in the route description for VOR/VORTAC nav aids.
- g. Intersection names are spelled out.
- h. Navaid and distance fixes (e.g., ARD201113) have been used in the route description in an expediency and intersection names will be assigned as soon as routine processing can be accomplished. Navaid radial (no distance stated) may be used to describe a route to intercept a specified airway (e.g., MIV MIV101 V39); another navaid radial (e.g., UIM UIM255 GSW081); or an intersection (e.g., GSW081 FITCH).

UNITED STATES

- i. Where two nav aids, an intersection and a nav aid, a nav aid and a nav aid radial and distance point, or any navigable combination of these route descriptions follow in succession, the route is direct.
- j. The effective times for the routes are in UTC. During periods of daylight saving time effective times will be one hour earlier than indicated. All states observe daylight saving time except Arizona, Puerto Rico and the Virgin Islands. Pilots planning flight between the terminals or route segments listed should file for the appropriate preferred IFR route.
- k. (90–170 incl) altitude flight level assignment in hundreds of feet.
- l. The notations “pressurized” and “unpressurized” for certain low altitude preferred routes to Kennedy Airport indicate the preferred route based on aircraft performance.
- m. All Preferred IFR Routes are in effect continuously unless otherwise noted.
- n. Use current SIDs and STARs for flight planning.
- o. For high altitude routes, the portion of the routes contained in brackets [] is suggested but optional. The portion of the route outside the brackets will likely be required by the facilities involved.

Q ROUTE DME FACILITIES

Q1, Q3, Q5, Q7, Q9 and Q11 are preferred single direction (Southbound) Q routes; flight planning Northbound not authorized.

Q routes are RNAV routes that require the use of GNSS or DME/DME/IRU RNAV, unless otherwise indicated. Please note that this section does not apply to Q routes in the Gulf of Mexico.

GNSS and DME/DME/IRU RNAV operations are authorized along Q routes at FL180 and above. GNSS and DME/DME/IRU RNAV MEAs will only be published if above FL180.

DME facilities that have been assessed for RNAV operations are listed below. Q routes with no DME facilities listed are limited to GNSS RNAV operations only. Those routes will have an enroute chart note "GNSS REQUIRED".

DME Facilities Assessed for Q Routes

Route	Segment	DME Facilities
Q1	POINT REYES – ETCHY	LIN, ECA, RBL, SAC, OAK, PYE
	ETCHY – TOCOS	RBL, PYE, SAC, OAK, LIN, ECA, ENI

US HAR UNITED STATES

The purpose of these Special High Altitude Routes is to present user routing options for flight within the initial HAR Phase I expansion airspace. Users are able to fly user-preferred routes, referred to as non-restrictive routing (NRR), between specific fixes described by pitch (entry into) and catch (exit out of) fixes in the HAR airspace. Pitch points indicate an end of departure procedures, preferred IFR routings, or other established routing programs where a flight can begin a segment of NRR. The catch point indicates where a flight ends a segment of NRR and joins published arrival procedures, preferred IFR routing, or other established routing programs.

The HAR Phase I expansion airspace is defined as that airspace at and above FL350 in fourteen of the western and southern Air Route Traffic Control Centers (ARTCCs). The airspace includes Minneapolis (ZMP), Chicago (ZAU), Kansas City (ZKC), Denver (ZDV), Salt Lake City (ZLC), Oakland (ZOA), Seattle Centers (ZSE), Los Angeles (ZLA), Albuquerque (ZAB), Fort Worth (ZFW), Memphis (ZME), and Houston (ZHU). Jacksonville (ZJX) and Miami (ZMA) are included for east-west routes only.

To develop a flight plan, select pitch and catch points based upon your desired route across the Phase I airspace. Filing requirements to pitch points, and from catch points, remain unchanged from current procedures. For the portion of the route between the pitch and catch points, non-restrictive routing is permitted.

Where pitch points for a specific airport are not identified aircraft should file an appropriate departure procedure (DP), or any other user preferred routing prior to the NRR portion of their routing. Where Catch points for a specific airport are not identified aircraft should file, after the NRR portion of their routing, an appropriate arrival procedure or other user preferred routing to their destination.

Additionally, information concerning the location and schedule of Special Use Airspace (SUA) and Air Traffic Control Assigned Airspace (ATCAA) can be found on the Web Site:

<http://sua.faa.gov/sua/Welcome.do>

ATCAA refers to airspace in the high altitude structure supporting military and other special operations. Users are encouraged to file around these areas when they are scheduled to be active, thereby avoiding unplanned reroutes around them.

In conjunction with the HAR program RNAV routes have been established to provide for a systematic flow of air traffic in specific portions of the enroute flight environment. The designator for these RNAV routes begin with the letter Q, for example, Q-501. Where those routes aid in the efficient orderly management of air traffic they will be published as preferred IFR routes.

US HAR
UNITED STATESHIGH ALTITUDE REDESIGN (HAR) PHASE I RNAV ROUTING, PITCH
AND CATCH POINTS**HAR Special High Altitude *Pitch (entry) Points* for non-restrictive routing for Airports Located *Outside* HAR Phase I Expansion Airspace**

Westbound traffic originating outside of HAR airspace entering ZAU, ZKC, ZMP and ZME can begin non-restrictive routing over any of the following pitch points (list from north to south):

DLH, CESNA, GEP, BAE, MKG, GRR, PMM, GSH, CADIZ, FWA, VHP, FLM, IIU, PXY, SGF, RZC, BNA, SALMS, VUZ, BOYDD, or MIE.

Traffic originating outside of HAR airspace may also begin non-restrictive routing upon crossing the pitch line depicted on the associated graphic.

High Altitude Redesign (HAR) Phase 1 Expansion Airspace

Except as noted, flights entering HAR expansion airspace may pitch at the airspace boundary, at the vertical pitch line, or at the points listed on the HIGH ALTITUDE REDESIGN (HAR) PHASE I RNAV ROUTING, PITCH AND CATCH POINTS pages in this section.

Vertical Pitch Line: 86 degrees west longitude from the ZMP/ ZAU boundary to the ZME/ZID boundary; except between PMM and GSH, then following the ZME east boundary south to the ZHU boundary. Then west to 90 degrees west longitude, then 90 degrees west longitude to the ZHU southern boundary. No westbound traffic between PMM and GSH.

**UNITED STATES
NORTH AMERICAN ROUTE PROGRAM (NRP)**

INTRODUCTION

- a. The North American Route Program (NRP) is a joint venture between the Federal Aviation Administration (FAA) and NAV CANADA. The aim of the NRP is to harmonize and adopt common procedures, to the extent possible, applicable to random route flight operations at and above flight level 290 within the conterminous United States and Canada. The NRP has been carried out through various phases with the end result of allowing all international and domestic flight operations to take part in the NRP throughout the conterminous United States, Alaska, and Canada. This program allows aircraft operators to select beneficial routings. These route selections may be based on factors such as minimum time, cost, fuel, weather avoidance, aircraft limitations, and/or other factors.
- b. Flights may take part in the NRP within the conterminous United States and Canada, and for North Atlantic international flights. NRP aircraft are not subject to route limiting restrictions (e.g., published preferred instrument flight rules (IFR) routes) beyond a 200 nautical mile (NM) radius of their point of egress or outside a 200NM radius of their ingress. Operators should refer to the Canadian Flight Supplement for specific requirements while operating within Canadian airspace.

PROCEDURES

- a. Flights should be filed and flown via published Departure Procedures (DP), Standard Terminal Arrival Routes (STAR), or published preferred IFR routes for at least that portion of flight which is within 200NM from the point of egress or ingress, (except as stated in paragraph (b) below). If the procedure(s) above are less than 200NM, published airways may be used for the remainder of the 200NM. If published procedures do not exist, published airways may be used for the entire 200NM.
- b. Flights may be filed and flown on the complete transition of all published DPs and/or STARs. DP/STARs can be flown instead of the 200NM ingress/egress filing requirements described in paragraph (a) above.
- c. Flights should not be filed via DP/NRP/STAR transitions within offshore transition areas (12NM or more off the United States shoreline).
- d. Operators should make certain that the route of flight contains no less than one navigational aid (NAVAID), or waypoint (in the fix radial distance format) in each delegated area of airspace jurisdiction for each FAA air route traffic control center (ARTCC) in which a direct route segment traverses. These NAVAIDs or waypoints must be located within 200NM of the preceding FAA ARTCC's boundary. Additional route description fixes for each turn point should be defined. Within Canadian airspace, a significant point should be filed for each area control centre in which a direct route segment traverses.
- e. For routes that cross the United States/Canadian border, a significant point within 30NM of either side of the border should be filed.
- f. Operators within the United States should make certain that the route avoids active restricted areas and prohibited areas by at least 3NM unless permission has been obtained from

UNITED STATES NORTH AMERICAN ROUTE PROGRAM (NRP)

the using agency to operate in that airspace and the proper air traffic control facility has been advised.

- g. Operators should make sure that "NRP" is entered in the remarks section of each flight plan.

NOTE: "NRP" will be kept in the remarks section of the flight plan if the aircraft is moved due to weather, traffic, or other tactical reasons. In these cases, every effort will be made to return the aircraft to the original filed flight plan/altitude as soon as conditions permit. If the route of flight is altered due to pilot requested or controller initiated direct route, "NRP" will be removed from the remarks section of the flight plan, and the flight will be considered as a nonparticipant of the NRP.

- h. Flight plans should be filed at least 1 hour prior to departure.
- i. Operators should not file a NRP route that conforms to published preferred IFR route(s).
- j. Flights that do not meet FAA guidelines specified in these procedures are to be requested through the FAA nonpreferred route program. Those requests will be approved or disapproved on a workload-permitting basis.

SPECIFIC NAV CANADA REQUIREMENTS

The following specific Canadian requirements apply:

- a. When a significant point is defined by latitude and longitude the following applies:
1. for flights operating on predominately north or south tracks (315°T clockwise through 045°T or the reciprocals), tracks shall be defined by reference to significant points formed by the intersection of whole degrees on longitude with specified parallels of latitude spaced at 5° of latitude expressed in longitude by degrees and minutes and latitude by degrees;
 2. for flights operating on predominately east or west racks (046°T clockwise through 134°T or the reciprocals), tracks shall be defined by reference to significant points formed by the intersection of half or whole degrees of latitude with meridians spaced at intervals of 10° expressed in longitude by degrees and latitude by degrees and minutes.
- b. All flights to remain north of N48°15'00" W90°00'00" or south of N47°30'00" W90°00'00".
- c. *Toronto International (CYYZ)*. For aircraft landing at CYYZ, those aircraft inbound from the northwest are to terminate the NRP portion and join the BOXUM arrival at OTNIK.
- d. *Vancouver International (CYVR)*. For aircraft landing at CYVR, those aircraft arriving from the east and north of the Canada/USA border are to arrange routing to be north of J500 no later than the intersection LOCAN (N49°30.7' W117°33.1').
- e. *Ottawa/Macdonald-Cartier International (CYOW)*. For aircraft landing at CYOW, those aircraft inbound from the west are to terminate the NRP portion and join a mandatory arrival routing no later than the intersection SMARE (N46°19.6' W78°9.8').
- f. *Montreal/Pierre Elliot Trudeau International (CYUL)*. For aircraft landing at CYUL, those aircraft inbound from the west-north- west are to terminate the NRP portion and join a mandatory arrival routing no later than the Mirabel VOR/DME (YMX) (N45°53.3' W74°22.6') provi-

UNITED STATES
NORTH AMERICAN ROUTE PROGRAM (NRP)

ded the route proceeds over or north of Maniwaki (YMW) N46°12.5' W75°57.4'). For routes that do not comply with this requirement terminate the NRP portion and join a mandatory arrival routing no later than Maniwaki.

TOWER ENROUTE CONTROL (TEC) SOUTHERN CALIFORNIA TERMINAL ROUTES

UNITED STATES

Within the national airspace system it is possible for a pilot to fly IFR from one point to another without leaving approach control airspace. This is referred to as “Tower Enroute” which allows flight beneath the enroute structure. The tower enroute concept has been expanded (where practical) by reallocating airspace vertically/geographically to allow flight planning between city pairs while remaining within approach control airspace. Pilots are encouraged to use the TEC route descriptions provided in the Southwest U.S. Chart Supplement when filing flight plans. Other airways which appear to be more direct between two points may take the aircraft out of approach control airspace thereby resulting in additional delays or other complications. All published TEC routes are designed to avoid enroute airspace and the majority are within radar coverage. The following items should be noted before using the graphics and route descriptions.

- a. The graphic is not to be used for navigation nor detailed flight planning. Not all city pairs are depicted. It is intended to show geographic *areas* connected by tower enroute control. Pilots should refer to route descriptions for specific flight planning.
- b. The route description contains four columns of information after geographic area listed in the heading, where the departure airport is located; i.e., the airport/airports of intended landing using FAA three letter/letter-two number identifiers, the coded route number (this should be used when filing the flight plan and will be used by ATC in lieu of reading out the full route description), the specific route (airway, radial, etc.), the altitude allowed for type of aircraft and the routes.
- c. The word “DIRECT” will appear as the route when radar vectors will be used or no airway exists. Also this indicates that a Standard Instrument Departure (SID) or Standard Terminal Arrival (STAR) may be applied by ATC.
- d. When a NAVAID or intersection identifier appears with no airway immediately preceding or following the identifier, the routing is understood to be DIRECT to or from that point unless otherwise cleared by ATC or radials are listed (See item e).
- e. Routes beginning and ending with an airway indicate that the airway essentially overflies the airport or radar vectors will be applied.
- f. Where more than one route is listed to the same destination, ensure you file correct route for type of aircraft which is denoted after the route in the altitude column using J, M, P, or Q. These are listed after item j under Aircraft Classification.
- g. Although all airports are not listed under the destination column, IFR flight may be planned to satellite airports in the proximity to major airports via the same routing.
- h. Los Angeles International Airport (LAX) and four other airports (ONT–SAN–TOA–SNA) have two options due to winds and these affect the traffic flows and runways in use. To indicate the difference the following symbols are used after the airport: Runway Number, W for west indicating normal conditions, E for East, and N for North indicating other than normal operation. If nothing follows the airport use this route on either West, East, or North plan. Other destinations have different arrivals due to LAX being East and they have the notation “(LAXE)”. Torrance Airport is also unique in that the airport is shared between Los Angeles and Coast area of Southern California TRACON; for Runway 11 departures use Coast area routings and for Runway 29 departures use Los Angeles area routings.

UNITED STATES

- i. When filing flight plans, the coded route identifier, i.e. SANL2, VTUL4, POML3 may be used in lieu of the route of flight.
- j. Aircraft types i.e. J, M, P, and Q are listed at the beginning of the altitude and should be used with the route of flight filed. (See Aircraft Classification below). The altitudes shown are to be used for the route. This allows for separation of various arrival routes, departure routes, and overflights to, from, and over all airports in the Southern California area.

AIRCRAFT CLASSIFICATION

(J)	=	Jet powered
(M)	=	Turbo Props/Special (cruise speed 190 knots or greater)
(P)	=	Non-jet (cruise speed 190 knots or greater)
(Q)	=	Non-jet (cruise speed 189 knots or less)

UNITED STATES

TOWER ENROUTE CONTROL (TEC) NORTHERN CALIFORNIA TERMINAL ROUTES

UNITED STATES

Within the national airspace system it is possible for a pilot to fly IFR from one point to another without leaving approach control airspace. This is referred to as “Tower Enroute” which allows flight beneath the enroute structure. The tower enroute concept has been expanded (where practical) by reallocating airspace vertically/geographically to allow flight planning between city pairs while remaining within approach control airspace. Pilots are encouraged to use the TEC route descriptions provided in the Southwest U.S. Chart Supplement when filing flight plans. Other airways which appear to be more direct between two points may take the aircraft out of approach control airspace thereby resulting in additional delays or other complications. All published TEC routes are designed to avoid enroute airspace and the majority are within radar coverage. The following items should be noted before using the graphics and route descriptions.

- a. The graphic is not to be used for navigation nor detailed flight planning. Not all city pairs are depicted. It is intended to show geographic areas connected by these routes. Pilots should refer to route descriptions for specific flight planning.
- b. The route description contains four columns of information after geographic area listed in the heading, where the departure airport is located; i.e., the airport/airports of intended landing using FAA three letter/letter-two number identifiers, the coded route number (this should be used when filing the flight plan and will be used by ATC in lieu of reading out the full route description), the specific route (airway, radial, etc.), the altitude allowed for type of aircraft and the routes.
- c. The word “DIRECT” will appear as the route when radar vectors will be used or no airway exists. Also this indicates that a Standard Instrument Departure (SID) or Standard Terminal Arrival (STAR) may be applied by ATC.
- d. When a NAVAID or intersection identifier appears with no airway immediately preceding or following the identifier, the routing is understood to be DIRECT to or from that point unless otherwise cleared by ATC or radials are listed (See item e).
- e. Routes beginning and ending with an airway indicate that the airway essentially overflies the airport or radar vectors will be applied.
- f. Where more than one route is listed to the same destination, ensure you file correct route for type of aircraft which is denoted after the route in the altitude column using J, M, P, or Q. These are listed after item i under Aircraft Classification.
- g. Although all airports are not listed under the destination column, IFR flight may be planned to satellite airports in the proximity of major airports via the same routing.
- h. The runway in use at San Francisco International Airport (SFO) determines which route to file in Northern California. When SFO is landing Runways 28/01, file the applicable SFOW route. When SFO is landing Runways 19/10, file the applicable SFOE route. If there is no direction listed, the route may be filed regardless of the runway in use at SFO.
- i. Aircraft types (i.e. J, M, P, and Q) are listed at the beginning of the altitude and should be used with the route of flight filed. (See Aircraft Classification below). The altitudes shown are to be used for the route. This allows for separation of various arrival routes, departure routes, and overflights to, from, and over all airports in the Northern California area.

TOWER ENROUTE CONTROL (TEC)

Within the national airspace system it is possible for a pilot to fly IFR from one point to another without leaving approach control airspace. This is referred to as “tower enroute” which allows flight beneath the enroute structure. The tower enroute concept has been expanded (where practical) by reallocating airspace vertically/geographically to allow flight planning between city pairs while remaining within approach control airspace. Pilots are encouraged to solicit tower enroute information from FSS's and to use the route descriptions provided in this directory when filing flight plans. Other airways which appear to be more direct between two points may take the aircraft out of approach control airspace thereby resulting in additional delays or other complications. All published TEC routes are designed to avoid enroute airspace and the majority are within radar coverage. Additional routes and other changes will appear in forthcoming editions as necessary. The acronym “TEC” should be included in the remarks section of the flight plan. This will advise ATC that the pilot intends to remain within approach control airspace for the entire flight. The following items should be noted before using the graphics and route descriptions:

- a. The graphic is not to be used for navigation nor detailed flight planning. Not all city pairs are depicted. It is intended to show general geographic *areas* connected by tower enroute control. Pilots should refer to route descriptions for specific flight planning.
- b. The route description contains four columns of information; i.e., the approach control area (listed alphabetically) within which the departure airport is located (check appropriate flight information publications), the specific route (airway, radial, etc.), the highest altitude allowed for the route, and the destination airport (listed alphabetically). Be advised, many destination airports are associated with a larger primary airport. Check the legend preceding this listing for this association.
- c. The word “DIRECT” will appear as the route when radar vectors will be used or no airway exists. Also, this indicates that a Standard Instrument Departure (SID) or Standard Terminal Arrival Route (STAR) may be applied by ATC.
- d. When a NAVAID or intersection identifier appears with no airway immediately preceding or following the identifier, the routing is understood to be DIRECT to or from that point unless otherwise cleared by ATC.
- e. Routes beginning or ending with an airway indicate that the airway essentially overflies the airport or radar vectors will be applied.
- f. Where more than one route is listed to the same destination, the pilot may select which route is desired. Unless otherwise stated, all routes may be flown in either direction.
- g. Routes are effective only during each respective terminal facility's normal operating hours. Pilots are cautioned to check NOTAMS to ensure appropriate terminal facilities will be operating for the planned flight time.
- h. All identifiers used for NAVAIDS, airports, and intersections are official identifiers.
- i. Altitudes are listed in thousands of feet. ATC may require altitude changes to maintain flight within approach control airspace. ATC will provide radar monitoring and if necessary, course

UNITED STATES

guidance if the highest altitude assigned by ATC is below the minimum Enroute Altitude (MEA).

- j. Although all airports are not listed under the destination column, IFR flight may be planned to satellite airports in proximity to major airports via the same routing.
- k. Flight plans should be filed with a Flight Service Station (FSS).

TOWER ENROUTE CONTROL CITY PAIRS
